From the principle we have juſt laid down, we may gather a confirmation of what we advanced concerning the cauſe of the advanced price of bullion in the Engliſh market.

When people buy bullion with current money at a determinate price, that operation, in conjunction with the courſe of exchange, ought naturally to mark the actual value of the pound Sterling with great exactneſs.

If therefore the price of ſtandard bullion in the Engliſh market, when no demand is found for the exportation of the metals, that is to ſay, when paper is found for paper upon exchange, and when merchants verſed in theſe matters judge exchange (that is, remittances) to be at par, if then ſilver bullion cannot be brought at a lower price than 65 pence the ounce, it is evident that this bullion might be bought with 65 pence in ſhillings, of which 65 might be coined out of the pound troy Engliſh ſtandard ſilver; ſince 65 per ounce implies 65 ſhillings for the 12 ounces or pound troy.

This plainly ſhews how ſtandard ſilver bullion ſhould ſell for 65 pence the ounce, in a country where the ounce of ſtandard ſilver in the coin is worth no more than 62; and were the market-price of bullion to ſtand uniformly at 65 pence per ounce, that would ſhew the value of the pound Sterling to be tolerably fixed. All the heavy ſilver coin is now carried off; becauſe it was intrinſically worth more than the gold it paſſed for in curreucy. The ſilver therefore which remains is worn down to the market proportion of the metals,

Money. metals, as has been faid; that is to fay, 20 fhillings in filver currency are worth 113 grains of fine gold, at the proportion of 1 to 14.5 between gold and filver. Now,

as 1 is to 14.5, fo is 113 to 1638:

fo the 20 fhillings current weigh but 1638 grains fine filver, inftead of 1718.7, which they ought to do according to the ftandard.

Now let us fpeak of ftandard filver, fince we are examining how far the Englifh coin muft be worn by ufe.

The pound troy contains 5760 grains. This, according to the ftandard, is coined into 62 fhillings; confequently, every fhilling ought to weigh 92.9 grains. Of fuch fhillings it is impoffible that ever ftandard bullion fhould fell at above 62 pence *per* ounce. If therefore fuch bullion fells for 65 pence, the fhillings with which it is bought muft weigh no more than 88.64 grains ftandard filver; that is, they muft lofe 4.29 grains, and are reduced to $\frac{1}{65}$ of a pound troy.

But it is not neceffary that bullion be bought with fhillings; no ftipulation of price is ever made farther, than at fo many pence Sterling *per* ounce. Does not this virtually determine the value of fuch currency with regard to all the currencies in Europe? Did a Spaniard, a Frenchman, or a Dutchman, know the exact quantity of filver bullion which can be bought in the London market for a pound Sterling, would he inform himfelf any farther as to the intrinfic value of that money-unit; would he not underftand the value of it far better from that circumftance than by the courfe of any exchange, fince exchange does not mark the intrinfic value of money, but only the value of that money tranfported from one place to another?

The price of bullion, therefore, when it is not influenced by extraordinary demand, (fuch as for the payment of a balance of trade, or for making an extraordinary provifion of plate), but when it ftands at what every body knows to be meant by the common market price, is a very tolerable meafure of the value of the actual money-ftandard in any country.

If it be therefore true, that a pound Sterling cannot purchafe above 1638 grains of fine filver bullion, it will require not a little logic to prove that it is really, or has been for thefe many years, worth any more; notwithftanding that the ftandard weight of it in England is regulated by the laws of the kingdom at 1718.7 grains of fine filver.

If to this valuation of the pound Sterling drawn from the price of bullion, we add the other drawn from the courfe of exchange; and by this we find, that when paper is found for paper upon exchange, a pound Sterling cannot purchafe above 1638 grains of fine filver in any country in Europe: upon thefe two authorities we may very fafely conclude (as to the matter of fact at leaft) that the pound Sterling is not worth more, either in London or in any other trading city; and if this be the cafe, it is juft worth 20 fhillings of 65 to the pound troy.

If therefore the mint were to coin fhillings at that rate, and pay for filver bullion at the market price, that is, at the rate of 65 pence *per* ounce in thofe new coined fhillings, they would be in proportion to the gold; filver would be carried to the mint equally with gold, and would be as little fubject to be exported or melted down. Money.

It may be inquired in this place, how far the coining the pound troy into 65 fhillings is contrary to the laws of England?

The moment a ftate pronounces a certain quantity of gold to be worth a certain quantity of filver, and orders thefe refpective quantities of each metal to be received as equivalents of each other and as lawful money in payments, that moment gold is made a ftandard as much as filver. If therefore too fmall a quantity of gold be ordered or permitted to be confidered as an equivalent for the unit, the filver ftandard is from that moment debafed; or indeed, more properly fpeaking, all filver money is from that moment profcribed; for who, from that time, will ever pay in filver, when he can pay cheaper in gold? Gold, therefore, by fuch a law, is made the ftandard, and all declarations to the contrary are againft the matter of fact.

Were the king, therefore, to coin filver at 65 fhillings in the pound, it is demonftration, that by fuch an act he would commit no adulteration upon the ftandard: the adulteration is already committed. The ftandard has defcended to where it is by flow degrees, and by the operation of political caufes only; and nothing prevents it from falling lower but the ftandard of the gold coin. Let guineas be now left to feek their value as they did formerly, and let light filver continue to go by tale, we fhall fee the guineas up at 30 fhillings in 20 years time, as was the cafe in 1695.

It is as abfurd to fay that the ftandard of Queen Elizabeth has not been debafed by enacting that the Englifh unit fhall be acquitted with 113 grains of fine gold, as it would be to affirm that it would not be debafed from what it is at prefent by enacting that a pound of butter fhould every where be received in payment for a pound Sterling; although the pound Sterling fhould continue to confift of 3 ounces, 17 pennyweights, and 10 grains of ftandard filver, according to the ftatute of the 43d of Elizabeth. In that cafe moft debtors would pay in butter, and filver would, as at prefent, acquire a conventional value as a metal, but would be looked upon no longer as a ftandard, or as money.

If therefore, by the law of England, a pound Sterling muft confift of 1718.7 grains troy of fine filver; by the law of England alfo, 113 grains of gold muft be of the fame value: but no law can eftablifh that proportion; confequently, in which ever way a reformation be brought about, fome law muft be reverfed; confequently, expediency, and not compliance with law, muft be the motive in reforming the abufe.

From what has been faid, it is not at all furprifing that the pound Sterling fhould in fact be reduced nearly to the value of the gold. Whether it ought to be kept at that value is another queftion. All that we here decide, is, that coining the pound troy into 65 fhillings would reftore the proportion of the metals, and render both fpecies common in circulation. But reftoring the weight and proportion of the coin is not the difficulty which prevents a reformation of the Englifh coinage.

8. *Cir-*

8. *Circumftances to be attended to in a new Regulation of the Britifh Coin.*

To people who do not underftand the nature of fuch operations, it may have an air of juftice to fupport the unit at what is commonly believed to be the ftandard of Queen Elizabeth, *viz.* at 1718.7 grains of fine filver.

The regulating the ftandard of both filver and gold to $\frac{11}{12}$ fine, and the pound Sterling to four ounces ftandard filver, as it ftood during the reign of Queen Mary I. has alfo its advantages, as Mr Harris has obferved. It makes the crown-piece to weigh juft one ounce, the fhilling four penny-weight, and the penny eight grains; confequently, were the new ftatute to bear, that the weight of the coin fhould regulate its currency upon certain occafions, the having the pieces adjufted to certain aliquot parts of weight would make weighing eafy, and would accuftom the common people to judge of the value of money by its weight, and not by the ftamp.

In that cafe, there might be a conveniency in ftriking the gold coins of the fame weight with the filver; becaufe the proportion of their values would then conftantly be the fame with the proportion of the metals. The gold crowns would be worth at prefent, 3*l.* 12*s.* 6*d.* the half crowns 1*l.* 16*s.* 3*d.* the gold fhillings 14*s.* and 6*d.* and the half 7*s.* and 3*d.* This was anciently the practice in the Spanifh mints.

The interefts within the ftate can be nowife perfectly protected but by permitting converfions of value from the old to the new ftandard, whatever it be, and by regulating the footing of fuch converfions by act of parliament, according to circumftances.

For this purpofe, we fhall examine thofe interefts which will chiefly merit the attention of government, when they form a regulation for the future of acquitting permanent contracts already entered into. Such as may be contracted afterwards will naturally follow the new ftandard.

The landed intereft is, no doubt, the moft confiderable in the nation. Let us therefore examine, in the firft place, what regulations it may be proper to make, in order to do juftice to this great clafs, with refpect to the land-tax on one hand, and with refpect to their leffees on the other.

The valuation of the lands of England was made many years ago, and reafonably ought to be fupported at the real value of the pound Sterling at that time, according to the principles already laid down. The general valuation, therefore, of the whole kingdom will rife according to this fcheme. This will be confidered as an injuftice; and no doubt it would be fo, if, for the future, the land-tax be impofed as heretofore, without attending to this circumftance; but as that impofition is annual, as it is laid on by the landed-intereft itfelf, who compofe the parliament, it is to be fuppofed that this great clafs will at leaft take care of their own intereft.

Were the valuation of the lands to be ftated according to the valuation of the pound Sterling of 1718.7 grains of filver, which is commonly fuppofed to be the ftandard of Elizabeth, there would be no great injury done: this would raife the valuation only 5 *per cent.* and the land-tax in proportion.

There is no clafs of inhabitants in all England fo much at their eafe, and fo free from taxes, as the clafs of farmers. By living in the country, and by confuming the fruits of the earth without their fuffering any alienation, they avoid the effect of many excifes, which, by thofe who live in corporations, are felt upon many articles of their confumption, as well as on thofe which are immediately loaded with thefe impofitions. For this reafon it will not, perhaps, appear unreafonable, if the additional 5 *per cent.* on the land-tax were thrown upon this clafs, and not upon the landlords.

With refpect to leafes, it may be obferved, that we have gone upon the fuppofition that the pound Sterling in the year 1728, was worth 1718.7 grains of fine filver, and 113 grains of fine gold.

There would be no injuftice done the leffees of all the lands in the kingdom, were their rents to be fixed at the mean proportion of thefe values. We have obferved how the pound Sterling has been gradually diminifhing in its worth from that time by the gradual rife of the filver. This mean proportion, therefore, will nearly anfwer to what the value of the pound Sterling was in 1743; fuppofing the rife of the filver to have been uniform.

It may be farther alleged in favour of the landlords, that the gradual debafement of the ftandard has been more prejudicial to their intereft in letting their lands, than to the farmers in difpofing of the fruits of them. Proprietors cannot fo eafily raife their rents upon new leafes, as farmers can raife the prices of their grain according to the debafement of the value of the currency.

The pound Sterling, thus regulated at the mean proportion of its worth, as it ftands at prefent, and as it ftood in 1728, may be realized in 1678.6 grains of fine filver, and 115.76 grains fine gold: which is 2.4 *per cent.* above the value of the prefent currency. No injury, therefore, would be done to leffees, and no unreafonable gain would accrue to the landed intereft, in appointing converfions of all land-rents at $2\frac{1}{2}$ *per cent.* above the value of the prefent currency.

Without a thorough knowledge of every circumftance relating to Great Britain, it is impoffible to lay down any plan. It is fufficient here briefly to point out the principles upon which it muft be regulated.

The next intereft to be confidered is that of the nation's creditors. The right regulation of their concerns will have a confiderable influence in eftablifhing public credit upon a folid bafis, by making it appear to all the world, that no political operation upon the money of Great Britain can in any refpect either benefit or prejudice the intereft of thofe who lend their money upon the faith of the nation. The regulating alfo the intereft of fo great a body, will ferve as a rule for all creditors who are in the fame circumftances, and will, upon other accounts, be productive of greater advantages to the nation in time coming.

In 1749, a new regulation was made with the public creditors, when the intereft of the whole redeemable national debt was reduced to 3 *per cent.* This circumftance infinitely facilitates the matter with refpect to this clafs, fince, by this innovation of all former contracts, the whole national debt may be confidered as contracted at, or pofterior to, the 25th of December 1749.

Were

Were the ftate, by any arbitrary operation upon money, (which every reformation muft be), to diminifh the value of the pound Sterling in which the parliament at that time bound the nation to acquit thofe capitals and the intereft upon them, would not all Europe fay, That the Britifh parliament had defrauded their creditors? If therefore the operation propofed to be performed fhould have a contrary tendency, *viz.* to augment the value of the pound Sterling with which the parliament at that time bound the nation to acquit thofe capitals and interefts, muft not all Europe alfo agree, That the Britifh parliament had defrauded the nation?

This convention with the ancient creditors of the ftate, who, in confequence of the debafement of the ftandard, might have juftly claimed an indemnification for the lofs upon their capitals, lent at a time when the pound Sterling was at the value of the heavy filver, removes all caufe of complaint from that quarter. There was in the year 1749 an innovation in all their contracts; and they are now to be confidered as creditors only from the 25th of December of that year.

Let the value of the pound Sterling be inquired into during one year preceding and one pofterior to the tranfaction of the month of December 1749. The great fums borrowed and paid back by the nation during that period, will furnifh data fufficient for that calculation. Let this value of the pound be fpecified in troy grains of fine filver and fine gold bullion, without mentioning any denomination of money according to the exact proportion of the metals at that time. And let this pound be called the *pound of national credit.*

This firft operation being determined, let it be enacted, that the pound Sterling, by which the ftate is to borrow for the future, and that in which the creditors are to be paid, fhall be the exact mean proportion between the quantities of gold and filver above fpecified, according to the actual proportion of the metals at the time fuch payments fhall be made: or that the fums fhall be borrowed or acquitted, one half in gold and one half in filver, at the refpective requifitions of the creditors or of the ftate, when borrowing. All debts contracted pofterior to 1749 may be made liable to converfions.

The confequence of this regulation will be the infenfible eftablifhment of a bank-money. Nothing would be more difficult to eftablifh, by a pofitive revolution, than fuch an invariable meafure; and nothing will be found fo eafy as to let it eftablifh itfelf by its own advantages. This bank-money will be liable to much fewer inconveniencies than that of Amfterdam. There the perfons tranfacting muft be upon the fpot; here, the Sterling currency may, every quarter of a year, be adjufted by the exchequer to this invariable ftandard, for the benefit of all debtors and creditors, who incline to profit of the ftability of this meafure of value.

This fcheme is liable to no inconvenience from the variation of the metals, let them be ever fo frequent, or hard to be determined; becaufe upon every occafion where there is the fmalleft doubt as to the actual proportion, the option competent to creditors to be paid half in filver and half in gold will remove.

Such a regulation will alfo have this good effect, that it will give the nation more juft ideas of the nature of money, and confequently of the influence it ought to have upon prices.

If the value of the pound Sterling fhall be found to have been by accident lefs in December 1749 than it is at prefent; or if at prefent the currency be found below what has commonly been fince 1749; in juftice to the creditors, and to prevent all complaints, the nation may grant them the mean proportion of the value of the pound fterling from 1749 to 1760, or any other which may to parliament appear reafonable.

This regulation muft appear equitable in the eyes of all Europe; and the ftrongeft proof of it will be, that it will not produce the fmalleft effect prejudicial to the intereft of the foreign creditors. The courfe of exchange with regard to them will ftand precifely as before.

A Dutch, French, or German creditor, will receive the fame value for his intereft in the Englifh ftocks as heretofore. This muft filence all clamours at home, being the moft convincing proof, that the new regulation of the coin will have made no alteration upon the real value of any man's property, let him be debtor or creditor.

The intereft of every other denomination of creditors, whofe contracts are of a frefh date, may be regulated upon the fame principles. But where debts are of an old ftanding, juftice demands, that attention be had to the value of money at the time of contracting. Nothing but the ftability of the Englifh coin, when compared with that of other nations, can make fuch a propofal appear extraordinary. Nothing is better known in France than this ftipulation added to obligations, *Argent au cours de ce jour;* that is to fay, That the fum fhall be repaid in coin of the fame intrinfic value with what has been lent. Why fhould fuch a claufe be thought reafonable for guarding people againft arbitrary operations upon the numerary value of the coin, and not be found juft upon every occafion where the numerary value of it is found to be changed, let the caufe be what it will?

The next intereft we fhall examine is that of trade. When men have attained the age of 21, they have no more occafion for guardians. This may be applied to traders: they can parry with their pen every inconvenience which may refult to other people from the changes upon money, provided only the laws permit them to do themfelves juftice with refpect to their engagements. This clafs demands no more than a right to convert all reciprocal obligations into denominations of coin of the fame intrinfic value with thofe they have contracted in.

The next intereft is that of buyers and fellers; that is, of manufacturers with regard to confumers, and of fervants with refpect to thofe who hire their perfonal fervice.

The intereft of this clafs requires a moft particular attention. They muft, literally fpeaking, be put to fchool, and taught the firft principles of their trade, which is buying and felling. They muft learn to judge of price by the grains of filver and gold they receive: they are children of a mercantile mother, however warlike the father's difpofition. If it be the intereft of the ftate that their bodies be rendered robuft and active, it

Money. it is no leſs the intereſt of the ſtate that their minds be inſtructed in the firſt principles of the trade they exerciſe.

For this purpoſe, tables of converſion from the old ſtandard to the new muſt be made, and ordered to be put up in every market, in every ſhop. All duties, all exciſes, muſt be converted in the ſame manner. Uniformity muſt be made to appear every where. The ſmalleſt deviation from this will be a ſtumbling-block to the multitude.

Not only the intereſt of the individuals of the claſs we are at preſent conſidering, demands the nation's care and attention in this particular; but the proſperity of trade, and the well-being of the nation, are alſo deeply intereſted in the execution.

The whole delicacy of the intricate combinations of commerce depends upon a juſt and equable vibration of prices, according as circumſtances demand it. The more therefore the induſtrious claſſes are inſtructed in the principles which influence prices, the more eaſily will the machine move. A workman then learns to ſink his price without regret, and can raiſe it without avidity. When principles are not underſtood, prices cannot gently fall, they muſt be pulled down; and merchants dare not ſuffer them to riſe, for fear of abuſe, even although the perfection of an infant-manufacture ſhould require it.

The laſt intereſt is that of the bank of England, which naturally muſt regulate that of every other.

Had this great company followed the example of other banks, and eſtabliſhed a bank-money of an invariable ſtandard as the meaſure of all their debts and credits, they would not have been liable to any inconvenience upon a variation of the ſtandard.

The bank of England was projected about the year 1694, at a time when the current money of the nation was in the greateſt diſorder, and government in the greateſt diſtreſs both for money and for credit. Commerce was then at a very low ebb; and the only, or at leaſt the moſt profitable, trade of any, was jobbing in coin, and carrying backwards and forwards the precious metals from Holland to England. Merchants profited alſo greatly from the effects which the utter diſorder of the coin produced upon the price of merchandiſe.

At ſuch a juncture the reſolution was taken to make a new coinage; and upon the proſpect of this, a company was found, who, for an excluſive charter to hold a bank for 13 years, willingly lent the government upwards of a million Sterling at 8 *per cent.* (in light money we ſuppoſe), with a proſpect of being repaid both intereſt and capital in heavy. This was not all: part of the money lent was to be applied for the eſtabliſhment of the bank; and no leſs than 4000l. a-year was allowed to the company, above the full intereſt, for defraying the charge of the management.

Under ſuch circumſtances the introduction of bank-money was very ſuperfluous, and would have been very impolitic. That invention is calculated againſt the raiſing of the ſtandard: but here the bank profited of that riſe in its quality of creditor for money lent; and took care not to commence debtor by circulating their paper, until the effect of the new regulation took place in 1695; that is, after the general re-coinage of all the clipped ſilver.

From that time till now, the bank of England has been the baſis of the nation's credit, and with great reaſon has been conſtantly under the moſt intimate protection of every miniſter. Money.

The value of the pound Sterling, as we have ſeen, has been declining ever ſince the year 1601, the ſtandard being fixed to ſilver during all that century, while the gold was conſtantly riſing. No ſooner had the proportion taken another turn, and ſilver begun to riſe, than the government of England threw the ſtandard virtually upon the gold, by regulating the value of the guineas at the exact proportion of the market. By theſe operations, however, the bank has conſtantly been a gainer (in its quality of debtor) upon all the paper in circulation; and therefore has loſt nothing by not having eſtabliſhed a bank-money.

The intereſt of this great company being eſtabliſhed upon the principles we have endeavoured to explain, it is very evident, that the government of England never will take any ſtep in the reformation of the coin which in its conſequences can prove hurtful to the bank. Such a ſtep would be contrary both to juſtice and to common ſenſe. To make a regulation which, by raiſing the ſtandard, will prove beneficial to the public creditors, to the prejudice of the bank, (which we may call the *public debtor)* would be an operation upon public credit, like that of a perſon who is at great pains to ſupport his houſe by props upon all ſides, and who at the ſame time blows up the foundation of it with gunpowder.

We may therefore conclude, that with regard to the bank of England, as well as every other private banker, the notes which are conſtantly payable upon demand muſt be made liable to a converſion at the actual value of the pound Sterling at the time of the new regulation.

That the bank will gain by this, is very certain; but the circulation of their notes is ſo ſwift, that it would be abſurd to allow to the then poſſeſſors of them that indemnification which naturally ſhould be ſhared by all thoſe through whoſe hands they have paſſed, in proportion to the debaſement of the ſtandard during the time of their reſpective poſſeſſion.

Beſides theſe conſiderations, which are in common to all ſtates, the government of Great Britain has one peculiar to itſelf. The intereſt of the bank, and that of the creditors, are diametrically oppoſite: every thing which raiſes the ſtandard, hurts the bank; every thing which can ſink it, hurts the creditors: and upon the right management of the one and the other, depends the ſolidity of public credit. For theſe reaſons, without the moſt certain proſpect of conducting a reſtitution of the ſtandard to the general advantage as well as approbation of the nation, no miniſter will probably ever undertake ſo dangerous an operation.

We ſhall now propoſe an expedient which may remove at leaſt ſome of the inconveniencies which would reſult from ſo extenſive an undertaking as that of regulating the reſpective intereſts in Great Britain by a poſitive law, upon a change in the value of their money of account.

Suppoſe then, that, before any change is made in the coin, government ſhould enter into a tranſaction with the public creditors, and aſcertain a permanent value

value for the pound ſterling for the future, ſpecified in a determined proportion of the fine metals in common bullion, without any regard to money of account, or to any coin whatever.

This preliminary ſtep being taken, let the intended alteration of the ſtandard be proclaimed a certain time before it is to commence. Let the nature of the change be clearly explained, and let all ſuch as are engaged in contracts which are diſſolvable at will upon the preſtations ſtipulated, be acquitted between the parties, or innovated as they ſhall think proper; with certification, that, poſterior to a certain day, the ſtipulations formerly entered into ſhall be binding according to the denominations of the money of account in the new ſtandard.

As to permanent contracts, which cannot at once be fulfilled and diſſolved, ſuch as leaſes, the parliament may either preſcribe the methods and terms of converſion; or a liberty may be given to the parties to annul the contract, upon the debtor's refuſing to perform his agreement according to the new ſtandard. Contracts, on the other hand, might remain ſtable, with reſpect to creditors who would be ſatisfied with payments made on the footing of the old ſtandard. If the riſe intended ſhould not be very conſiderable, no great injuſtice can follow ſuch a regulation.

Annuities are now thoroughly underſtood, and the value of them is brought to ſo nice a calculation, that nothing will be eaſier than to regulate theſe upon the footing of the value paid for them, or of the ſubject affected by them. If by the regulation, land-rents are made to riſe in denomination, the annuities charged upon them ought to riſe in proportion; if in intrinſic value, the annuity ſhould remain as it was.

9. *Regulations which the Principles of this Inquiry point out as expedient to be made by a new Statute for regulating the Britiſh Coin.*

Let us now examine what regulations it may be proper to make by a new ſtatute concerning the coin of Great Britain, in order to preſerve always the ſame exact value of the pound Sterling realized in gold and in ſilver, in ſpite of all the incapacities inherent in the metals to perform the functions of an invariable ſcale or meaſure of value.

1. The firſt point is to determine the exact number of grains of fine gold and fine ſilver which are to compoſe it, according to the then proportion of the metals in the London market.

2. To determine the proportion of theſe metals with the pound troy; and in regard that the ſtandard of gold and ſilver is different, let the mint price of both metals be regulated according to the pound troy fine.

3. To fix the mint-price within certain limits; that is to ſay, to leave to the king and council, by proclamation, to carry the mint price of bullion up to the value of the coin, as is the preſent regulation, or to ſink it to *per cent.* below that price, according as government ſhall incline to impoſe a duty upon coinage.

4. To order, that ſilver and gold coin ſhall be ſtruck of ſuch denominations as the king ſhall think fit to appoint; in which the proportion of the metals above-determined ſhall be conſtantly obſerved through every denomination of the coin, until neceſſity ſhall make a new general coinage unavoidable.

5. To have the number of grains of the fine metal in every piece marked upon the exergue, or upon the legend of the coin, in place of ſome initial letters of titles, which not one perſon in a thouſand can decypher; and to make the coin of as compact a form as poſſible, diminiſhing the ſurface of it as much as is conſiſtent with beauty.

6. That it ſhall be lawful for all contracting parties to ſtipulate their payments either in gold or ſilver coin, or to leave the option of the ſpecies to one of the parties.

7. That where no particular ſtipulation is made, creditors ſhall have power to demand payment, half in one ſpecies, half in the other; and when the ſum cannot fall equally into gold and ſilver coins, the fractions to be paid in ſilver.

8. That in buying and ſelling, when no particular ſpecies has been ſtipulated, and when no act in writing has intervened, the option of the ſpecies ſhall be competent to the buyer.

9. That all ſums paid or received by the king's receivers, or by bankers, ſhall be delivered by weight, if demanded.

10. That all money which ſhall be found under the legal weight, from whatever cauſe it may proceed, may be rejected in every payment whatſoever; or if offered in payment of a debt above a certain ſum, may be taken according to its weight, at the then mint price, in the option of the creditor.

11. That no penalty ſhall be incurred by thoſe who melt down or export the nation's coin; but that waſhing, clipping, or diminiſhing the weight of any part of it ſhall be deemed felony, as much as any other theft, if the perſon ſo degrading the coin ſhall afterwards make it circulate for lawful money.

To prevent the inconveniencies proceeding from the variation in the proportion between the metals, it may be provided,

12. That upon every variation of proportion in the market-price of the metals, the price of both ſhall be changed, according to the following rule:

Let the price of the pound troy fine gold in the coin be called *G*.

Let the price of ditto in the ſilver be called *S*.

Let the new proportion between the market-price of the metals be called *P*.

Then ſtate this formula;

$\frac{G}{2P}+\frac{S}{2}=$ to a pound troy fine ſilver, in Sterling currency.

$\frac{S}{2}+P+\frac{G}{2}=$ to a pound troy fine gold, in Sterl. currency.

This will be a rule for the mint to keep the price of the metals conſtantly at par with the price of the market; and coinage may be impoſed, as has been deſcribed, by fixing the mint price of them at a certain rate below the value of the fine metals in the coin.

13. As long as the variation of the market-price of the metals ſhall not carry the price of the riſing metal ſo high as the advanced price of the coin above the bullion, no alteration need be made on the denomination of either ſpecies.

14. So soon as the variation of the market price of the metals shall give a value to the rising species, above the difference between the coin and the bullion; then the king shall alter the denominations of all the coin, silver and gold, adding to the coins of the rising metal exactly what is taken from those of the other. An example will make this plain:

Let us suppose that the coinage has been made according to the proportion of 14.5 to 1; that 20 shillings, or 4 crown-pieces, shall contain, in fine silver, 14.5 times as many grains as the guinea, or the gold pound, shall contain grains of fine gold. Let the new proportion of the metals be supposed to be 14 to 1. In that case, the 20 shillings, or the 4 crowns, will contain $\frac{1}{28}$ more value than the guinea. Now since there is no question of making a new general coinage upon every variation, in order to adjust the proportion of the metals in the weight of the coins, that proportion must be adjusted by changing their respective denominations according to this formula:

Let the 20 shillings, or 4 crowns, in coin, be called *S*. Let the guinea be called *G*. Let the difference between the old proportion and the new, which is $\frac{1}{29}$, be called *P*. Then say,

$$S - \frac{P}{2} = \text{a pound sterling, and } G + \frac{P}{2} = \text{a pound sterl.}$$

By this it appears that all the silver coin must be raised in its denomination $\frac{1}{58}$, and all the gold coin must be lowered in its denomination $\frac{1}{58}$; yet still S+G will be equal to two pounds Sterling, as before, whether they be considered according to the old or according to the new denominations.

But it may be observed, that the imposition of coinage rendering the value of the coin greater than the value of the bullion, that circumstance gives a certain latitude in fixing the new denominations of the coin, so as to avoid minute fractions. For, providing the deviation from the exact proportion shall fall within the advanced price of the coin, no advantage can be taken by melting down one species preferably to another; since, in either case, the loss incurred by melting the coin must be greater than the profit made upon selling the bullion. The mint price of the metals, however, may be fixed exactly, that is, within the value of a farthing upon a pound of fine silver or gold. This is easily reckoned at the mint; although upon every piece in common circulation the fractions of farthings would be inconvenient.

15. That notwithstanding of the temporary variations made upon the denomination of the gold and silver coins, all contracts formally entered into, and all stipulations in pounds shillings and pence, may continue to be acquitted according to the old denominations of the coins, paying one-half in gold, and one-half in silver: unless in the case where a particular species has been stipulated; in which case, the sums must be paid according to the new regulation made upon the denomination of that species, to the end that neither profit or loss may result to any of the parties.

16. That notwithstanding the alterations on the mint price of the metals, and in the denomination of the coins, no change shall be made upon the weight of the particular pieces of the latter, except in the case of a general re-coinage of one denomination at least: that is to say, the mint must not coin new guineas, crowns, &c. of a different weight from those already in currency, although by so doing the fractions might be avoided. This would occasion confusion, and the remedy would cease to be of any use upon a new change in the proportion of the metals. But it may be found convenient, for removing the small fractions in shillings and sixpences, to recoin such denominations all together, and to put them to their integer numbers, of twelve and of six pence, without changing in any respect their proportion of value to all other denominations of the coin: this will be no great expence, when the bulk of the silver coin is put into 5 shilling pieces.

By this method of changing the denominations of the coin, there never can result any alteration in the value of the pound Sterling; and although fractions of value may now and then be introduced, in order to prevent the abuses to which the coin would otherwise be exposed by the artifice of those who melt it down, yet still the inconvenience of such fractions may be avoided in paying, according to the old denominations, in both species, by equal parts. This will also prove demonstratively, that no change is thereby made in the true value of the national unit of money.

17. That it be ordered, that shillings and sixpences shall only be current for 20 years; and all other coins, both gold and silver, for 40 years, or more. For ascertaining which term, there may be marked, upon the exergue of the coin, the last year of their currency, in place of the date of their fabrication. This term elapsed, or the date effaced, that they shall have no more currency whatsoever; and, when offered in payment, may be received as bullion at the actual price of the mint, or refused, at the option of the creditor.

18. That no foreign coin shall have any *legal* currency, except as bullion at the mint price.

By these and the like regulations may be prevented, 1*mo*, The melting or exporting of the coin in general. 2*do*, The melting or exporting one species, in order to sell it as bullion at an advanced price. 3*tio*, The profit in acquitting obligations preferably in one species to another. 4*to*, The degradation of the standard, by the wearing of the coin, or by a change in the proportion between the metals. 5*to*, The circulation of the coin below the legal weight. 6*to*, The profit that other nations reap by paying their debts more cheaply to Great Britain than Great Britain can pay her's to them.

And the great advantage of it is, that it is an uniform plan, and may serve as a perpetual regulation, compatible with all kinds of denominations of coins, variations in the proportion of the metals, and with the imposition of a duty upon coinage, or with the preserving it free; and further, that it may in time be adopted by other nations, who will find the advantage of having their money of account preserved perpetually at the same value, with respect to the denominations of all foreign money of account established on the same principles.

A TABLE

A TABLE OF COINS,

Shewing the Quantity of Fine Metal contained in them.

The number of grains of fine metal in every coin is fought for in the regulations of the mint of the country where it is coined, and is expreffed in the grains in ufe in that mint. From that weight it is converted into thofe of other countries according to the following proportions:

3840 Troy gains, 4676.35 Paris grains, 5192.8 Holland aces or grains, and 4649.06 Colonia grains, are fuppofed to be equal weights; and the coins in the Table are converted according to thofe proportions.

	TABLE of COINS, reduced to Grains of fine Metal, according to the Troy, Paris, Colonia, and Holland weights.	GOLD COINS. Troy.	Paris.	Colonia.	Holland.	SILVER COINS. Troy.	Paris.	Colonia.	Holland.

Monk.

MONK, a person who wholly dedicates himself to the service of religion, in some monastery, under the direction of particular statutes and rules.

The most probable account of the original of the monks is, that in the Decian persecution, in the middle of the third century, many persons in Egypt, to avoid the fury of the storm, fled to the neighbouring desarts and mountains, where they not only found a safe retreat, but also more time and liberty to exercise themselves in acts of piety and divine contemplations; which sort of life became so agreeable, that, when the persecution was over, they refused to return to their habitations again, choosing rather to continue in those cottages and cells which they had made for themselves in the wilderness. From that time to the reign of Constantine, monachism was confined to the hermits or anachorets, who lived in private cells in the wilderness: but when Pachomius had erected MONASTERIES, other countries presently followed the example.

The manner of admission to the monastic life was usually by some change of habit; not to signify any religious mystery, but only to express their gravity and contempt of the world. Long hair was always thought an indecency in men, and favouring of secular vanity; and therefore they polled every monk at his admission, to distinguish him from seculars; but they never shaved them, lest they should look like the priests of Isis. St Jerom, speaking of the habits of the monks, intimates that it differed from that of others only in this, that it was cheaper, coarser, and meaner raiment. We read of no solemn vow, or profession, required at their admission; but they underwent a triennial probation, during which time they were inured to the exercises of the monastic life. If, after that time was was expired, they chose to continue the same exercises, they were then admitted, without any farther ceremony, into the community. As the monasteries had no standing revenues, all the monks were obliged to maintain themselves by their daily labour: they had no idle mendicants among them; but looked upon a monk who did not work, as a covetous defrauder. Every ten monks were subject to one, who was called the *decanus*, or *dean*, from his presiding over ten; and every hundred had another officer called *centenarius*, from his presiding over an hundred; and above these were the fathers of the monasteries, also called *abbots*. The business of the deans was to exact every man's daily task, and carry it to the steward, who gave a monthly account of it to the abbot. See ABBOT.

For a particular account of the present monastic orders, see AUGUSTINS, BENEDICTINES, CARMELITES, DOMINICANS, FRANCISCANS, &c.

MONK (George), a personage memorable for having been the principal agent in restoring Charles II. to his crown, was descended from a very ancient family, and born in Devonshire in 1608. Being an unprovided younger son, he dedicated himself to arms from his youth, and obtained a pair of colours in the expedition to the Isle of Rhée: he served afterwards in the Low Countries with reputation in both king Charles's northern expeditions; and did such service in quelling the Irish rebellion, that he was appointed governor of Dublin,

Dublin, but was ſuperſeded by parliamentary authority. Being made major-general of the Iriſh brigade employed in the ſiege of Nantwich in Cheſhire, he was taken priſoner by Sir Thomas Fairfax, and remained confined in the tower of London until the year 1646; when, as the means of liberty, he took the Covenant, and accepted a command in the Iriſh ſervice under the parliament. He obtained the command in chief of all the parliamentary forces in the north of Ireland, where he did ſignal ſervices, until he was called to account for a treaty made with the Iriſh rebels; a circumſtance which was only obliterated by his future good fortune. He ſerved againſt Charles II. under Oliver Cromwell with ſuch ſucceſs, that Oliver left him there as commander in chief; and he was one of the commiſſioners for uniting that kingdom with the new-erected commonwealth. He ſerved at ſea alſo againſt the Dutch; and was treated ſo kindly on his return, that Oliver is ſaid to have grown jealous of him. He was, however, again ſent to Scotland as commander in chief, and continued there five years: when he diſſembled ſo well, and improved circumſtances ſo dextrouſly, that he aided the deſires of a wearied people, and reſtored the king without any diſturbance; for which he was immediately rewarded both with honours and profits. See Britain, n° 194, &c.—He was created duke of Albemarle, with a grant of 7000l. *per annum* eſtate, beſide other emoluments; and enjoyed the confidence of his maſter without forfeiting that of the people. After his death, in 1670, there was publiſhed a treatiſe compoſed by him while he remained priſoner in the tower, intitled, *Obſervations on military and political affairs*, a ſmall folio.

Monkey, in zoology. See Ape, and Simia.

Monks-*Hood*, or *Wolf's-bane*. See Aconitum.

Since the time of Theophraſtus, moſt of the ſpecies of monks-hood have been reckoned a deadly poiſon both to men and brutes. Dioſcorides, however, recommends the external application of common monks-hood for pains of the eyes. The flowers of a great many ſpecies communicate their noxious quality by being ſmelled to; and thoſe of the ſpecies called *napellus* being placed on the head, occaſion a violent megrim. Of the bad qualities of theſe plants we ſometimes avail ourſelves to get rid of vermin. A decoction of the roots deſtroys bugs; the ſame part being powdered and adminiſtered in bread or ſome other palatable vehicle, to rats and mice, corrodes and inflames their inteſtines, and ſoon proves mortal. The juice of the plant is uſed to poiſon fleſh with, for the deſtruction of wolves, foxes, and other ravenous beaſts. The beſt antidote to the poiſon of the different monks-hoods is ſaid to be the root of a ſpecies of the ſame genus, hence termed *healthful* or *wholeſome monks-hood*. It is the *aconitum anthora* of Linnæus. The ſame plant is regarded as efficacious againſt bites of ſerpents and other venomous creatures. The roots have a bitter acrid taſte; the leaves are only bitter: the former are chiefly uſed in medicine; and, beſides the excellent quality juſt mentioned, are ſtomachic, and promote perſpiration. The peaſants, who gather the plants on the Alps and Pyrenees, are ſaid to uſe it with ſucceſs againſt the biting of mad dogs, and to cure the colic. It is remarkable, that the monks-hoods with blue flowers are much more virulent than the yellow or white-flowered kinds. Miller aſſerts that the huntſmen of the wolves and other wild beaſts on the Alps, dip their arrows into the juice of thoſe plants, which renders the wounds made by them deadly.

MONMOUTH (James, duke of), ſon to Charles II. by Mrs Lucy Walters, was born at Rotterdam in 1649. Upon the Reſtoration, he was called over to England, where the king received him with all imaginable joy, created him earl of Orkney (which was changed into that of Monmouth), and he took his ſeat in the houſe of peers in the enſuing ſeſſion of parliament. He married Anne, the heireſs of Francis earl of Buccleugh; and hence it came to paſs that he had alſo the title of *Buccleugh*, and took the ſirname of *Scot*, according to the cuſtom of Scotland. In 1668 his father made him captain of his life-guard of horſe; and in 1672 he attended the French king in the Netherlands, and gave proofs of bravery and conduct. In 1673 the king of France made him lieutenant-general of his army, with which he came before Maeſtricht, and behaved himſelf with incredible gallantry, being the firſt who entered it himſelf. He returned to England, was received with all poſſible reſpect, and was elected chancellor of the univerſity of Cambridge. After this he went to aſſiſt the prince of Orange to raiſe the ſiege of Mons, and did not a little contribute towards it. He returned to England; and was ſent, in quality of his father's general, to quell an inſurrection in Scotland, which he effected: but ſoon after he fell into diſgrace; for, being a Proteſtant, he was deluded into ambitious ſchemes, upon the hopes of the excluſion of the duke of York: he conſpired againſt his father and the duke; and when the latter came to the throne by the title of *James II.* he openly appeared in arms, encouraged by the Proteſtant army; but coming to a deciſive battle before he had ſufficient forces to oppoſe the royal army, he was defeated, taken ſoon after concealed in a ditch, tried for high-treaſon, condemned, and beheaded in 1685, aged 36. See Britain, n° 242. 249—265.

Monmouth, the capital of the county of Monmouthſhire in England. It has its name from its ſituation at the conflux of the Monow, or Mynwy, and Wye. Here was a caſtle in William the Conqueror's time, which Henry III. took from John baron of Monmouth. It afterwards came to the houſe of Lancaſter, who beſtowed many privileges upon the town. Here Henry V. ſirnamed *of Monmouth*, was born. The famous hiſtorian Geoffrey was alſo born at this place. Formerly it gave the title of *earl* to the family of Carey, and of *duke* to king Charles the ſecond's eldeſt natural ſon; but now of *earl* to the Mordaunts, who are alſo earls of Peterborough. It is a populous and well-built place, and carries on a conſiderable trade with Briſtol by means of the Wye. W. Long. 2. 30. N. Lat. 51. 47.

Monmouthshire, a county of England; anciently reckoned a part of Wales, but in Charles the ſecond's time taken into the Oxford circuit, and made an Engliſh county. It has Brecknockſhire and Herefordſhire on the north, from the latter of which it is ſeparated by the Monow; Glouceſterſhire on the eaſt, from which it is ſeparated by the Wye; Glamorganſhire on the weſt, and the river Rumney running between them; and on the ſouth it is bounded by the

Severn fea, into which thefe rivers, and alfo the Ufk, difcharge themfelves. It is about 29 miles in length, and 20 in breadth. The country is in fome parts woody, and in others hilly: yet the air is nowhere bad, nor the foil barren; for the hills feed large flocks of black cattle, fheep and goats, and the valleys produce plenty of corn. It is alfo well watered; and fo plentifully fupplied with coal, that the pooreft cottager can afford to keep a good fire all the winter. The county fends three members to parliament. The principal manufacture is flannel.

MONOCHORD, a mufical inftrument with only one ftring, ufed to try the variety and proportion of founds. It is formed of a rule, divided and fubdivided into feveral parts, on which there is a moveable ftring ftretched upon two bridges at each extreme. In the middle between thefe is a moveable bridge, by means of which, in applying to it the different divifions of the line, the founds are found to bear the fame proportion to each other as the divifion of the line cut by the bridge. There are alfo monochords with 48 fixed bridges. This inftrument is alfo called the *harmonical canon*, or the *canonical rule*, becaufe it ferves to meafure the degrees of gravity or acutnefs.—*Monochord* is alfo ufed for any mufical inftrument that confifts of only one ftring or chord; in this fenfe the trumpet marine may properly be called a *monochord.*

MONODON, in ichthyology, a genus of fifhes belonging to the order of cete. It has a long wreathed tooth in the upper jaw, which perforates the upper lip, and has the appearance of a horn; from this circumftance it has got the name of the *unicorn-fifh.* It is the *narwhal* of Pontopiddan, and is of the whale kind. Sometimes it grows to 25 feet in length; but the ufual fize is from 16 to 20.

MONODY, in ancient poetry, a mournful kind of fong, fung by a perfon all alone, to give vent to his grief. The word is derived from μονος "alone," and ᾀδω "I fing."

MONOECIA, from μονος "alone," and οικια "a houfe;" the name of the 21ft clafs in Linnæus's fexual method. See Botany, nº 1296.

MONOGRAM, a character or cypher, compofed of one, two, or more letters, interwoven; being a kind of abbreviation of a name, anciently ufed as a feal, badge, arms, &c.

MONOGYNIA, from μονος "alone," and γυνη "a woman;" the name of the firft order or fubdivifion in the firft 13 claffes of Linnæus's fexual method; confifting of plants which, befides their ageement in their claffic character, generally derived from the number of their ftamina, have only one ftile, or female organ.

MONOMOTAPA, a country of Africa, has the maritime kingdom of Sofala on the eaft, the river Del Spiritu Santo on the fouth, the mountains of Caffraria on the weft, and the river Cauma on the north, which parts it from Monoemugi. The air of this country is very temperate; the land fertile in paftures and all the neceffaries of life, being watered by feveral rivers. The inhabitants are rich in black cattle, which they value more than gold. They have a vaft number of elephants, as appears from the great quantity of ivory that is exported from hence. There are many gold-mines, and the rivers that run through their veins carry a great deal of gold-duft along with

them. The inhabitants are lovers of war, which is the employment followed by all thofe who do not apply themfelves to commerce. This country is divided into feven provinces or petty kingdoms, vaffals to the king; viz. Monomotapa Proper, Quiteve, Manica, Inhambàna, Inhemior, Sabia, and Sofala.

MONOPETALOUS, in botany, a term applied to flowers that have only one petal or flower-leaf.

MONOPOLY, one or more perfons making themfelves the fole mafters of the whole of a commodity, manufacture, and the like, in order to make private advantage of it, by felling it again at a very advanced price. Or it is a licence or privilege allowed by the king for the fole buying and felling, making, working, or ufing any thing whatfoever.—Monopolies had been carried to an enormous height during the reign of queen Elizabeth; and were heavily complained of by Sir Edward Coke, in the beginning of the reign of king James the firft: but were in great meafure remedied by ftatute 21 Jac. I. c. 3. which declares fuch monopolies to be contrary to law, and void; (except as to patents, not exceeding the grant of fourteen years, to the authors of new inventions; and except alfo patents concerning printing, faltpetre, gunpowder, great ordinance, and fhot); and monopolifts are punifhed with the forfeiture of treble damages and double cofts, to thofe whom they attempt to difturb; and if they procure any action, brought againft them for thefe damages, to be ftayed by any extrajudicial order, other than of the court wherein it is brought, they incur the penalties of *præmunire.* Combinations alfo among victuallers or artificers, to raife the price of provifions, or any commodities, or the rate of labour, are in many cafes feverely punifhed by particular ftatute; and, in general, by ftatute 2 & 3 Edward VI. c. 15. with the forfeiture of 10 *l.* or twenty days imprifonment, with an allowance of only bread and water, for the firft offence; 20 *l.* or the pillory, for the fecond; and 40 *l.* for the third, or elfe the pillory, lofs of one ear, and perpetual infamy. In the fame manner, by a conftitution of the emperor Zeno, all monopolies and combinations to keep up the price of merchandife, provifions, or workmanfhip, were prohibited, upon pain of forfeiture of goods and perpetual banifhment.

MONOSYLLABLE, in grammar, a word that confifts only of one fyllable, and is compofed either of one or more letters pronounced at the fame time. The too frequent ufe of monofyllables has a very bad effect in Englifh poetry, as Mr Pope both intimates and exemplifies in the fame verfe, viz.

> "And ten flow words oft creep in one dull line."

MONOTONY, an uniformity of found, or a fault in pronunciation, when a long feries of words are delivered in one unvaried tone. See Reading.

MONOTROPA, Bird's-nest; a genus of the monogynia order, belonging to the decandria clafs of plants. There are two fpecies; of which the only remarkable one is the hippopithys, a native of Britain and fome of the more northerly kingdoms of Europe It is about five inches high, having no other leaves than oval fcales, and terminated with a nodding fpike of flowers, which in the feeding-ftate becomes erect: the whole plant is of a pale-yellow colour, fmelling like the primrofe, or like beans in bloffom. The country-people in Sweden give the dried plant to

Monro.

cattle that have a cough.

MONRO (Dr Alexander, fenior), a moft eminent phyfician and anatomift, was defcended by his father from the family of Monro of Milton, which had large poffeffions in the county of Rofs; and by his mother, from that of Forbes of Culloden.

His father John, youngeft fon of Sir Alexander Monro of Bearcrofts, was bred to phyfic and furgery, and ferved for fome years as a furgeon in the army under king William in Flanders: but, for feveral fucceffive years, obtaining leave of abfence from the army in the winter, he during that feafon refided with his wife in London, where his fon Alexander was born in the 1697. About three years thereafter, he quitted the army, and went to fettle as a furgeon at Edinburgh; where his knowledge in his profeffion, and engaging manners, foon introduced him into an extenfive practice.

The fon fhewed an early inclination to the ftudy of phyfic; and the father, after giving him the beft education that Edinburgh then afforded, fent him fucceffively to London, Paris, and Leyden, to improve himfelf further in his profeffion. At London, he attended the lectures of Meffrs Hawkfbee and Whifton on experimental philofophy, and the anatomical demonftrations of Mr Chefelden. At Paris, he attended the hofpitals, and the lectures which were read on the different branches of phyfic and furgery at that time. Towards the end of autumn 1718, he went to Leyden, and ftudied under the great Boerhaave; by whom he was particularly efteemed.

On his return to Edinburgh in autumn 1719, Meffrs Drummond and Macgill, who were then conjunct nominal profeffors and demonftrators of anatomy to the furgeons company, having refigned in his favour, his father prevailed on him to read fome public lectures on anatomy, and to illuftrate them by fhewing the curious anatomical preparations which he had made and fent home when abroad. He at the fame time perfuaded Dr Alfton, then a young man, to give fome public lectures on botany. Accordingly, in the beginning of the winter 1720, thefe two young profeffors began to give regular courfes of lectures, the one on the materia medica and botany, the other on anatomy and furgery; which were the firft regular courfes of lectures on any of the branches of medicine that had ever been read at Edinburgh, and may be looked upon as the opening of that medical fchool which has fince acquired fuch great reputation all over Europe.

In fummer 1721 and 1722, Dr Monro, by the perfuafion of his father, read fome lectures on chirurgical fubjects; particularly on wounds and tumours, which he never would publifh, having wrote them in a hurry and before he had much experience; but inferted from time to time the improvements he thought might be made in furgery, in the volumes of Medical Effays and Obfervations to be hereafter mentioned.

About the year 1720, his father communicated to the phyficians and furgeons at Edinburgh, a plan, which he had long formed in his own mind, of having the different branches of phyfic and furgery regularly taught at Edinburgh; which was highly approved of by them, and by their intereft regular profefforfhips of anatomy and medicine were inftituted in the univerfity. His fon, Dr Monro, was firft made univerfity-profeffor of anatomy; and two or three years afterwards, Drs Sinclair, Rutherford, Innes, and Plummer, were made profeffors of medicine; the profefforfhip of materia medica and botany, which Dr Alfton then held, having been added to the univerfity many years before. Immediately after thefe gentlemen were elected profeffors, they began to deliver regular courfes of lectures on the different branches of medicine, and they and their fucceffors have uniformly continued fo to do every winter.

Monro.

The plan for a medical education at Edinburgh was ftill incomplete without an hofpital, where ftudents could fee the practice of phyfic and furgery, as well as hear the lectures of the profeffors. A fcheme was therefore propofed by Dr Monro's father, and others, particularly the members of the royal college of phyficians and board of furgeons, for raifing by fubfcription a fund for building and fupporting an hofpital for the reception of difeafed poor; and our author publifhed a pamphlet fetting forth the advantages that would attend fuch an inftitution. In a fhort time a confiderable fum of money was raifed, a fmall houfe was fitted up, and patients were admitted into it, and regularly attended by many of the phyficians and furgeons in town. The fund for this charity increafing very confiderably, in a great meafure from the activity and influence of that very worthy citizen and magiftrate George Drummond, Efq. the foundation was laid of the prefent large, commodious, and ufeful hofpital, the *Royal Infirmary;* in the planning of which Dr Monro fuggefted many ufeful hints, and in particular the elegant room for chirurgical operations was defigned and executed under his direction. Provoft Drummond and he were nominated the building committee; and the fabric was entirely completed in a fhort fpace of time. It has fince been fo largely endowed, as to be capable of receiving a great number of difeafed poor, whofe cafes the ftudents of phyfic and furgery have an opportunity of feeing daily treated with the greateft attention and care by phyficians and furgeons eminent in their profeffion; and a regifter of the particulars of all the cafes which have been received into the houfe fince its firft opening has been kept, in books appropriated for that purpofe, for the ufe of the ftudents.

In order to make the hofpital of ftill further ufe to the ftudents, Dr Monro frequently, while he continued profeffor of anatomy, gave lectures on the chirurgical cafes; and the late judicious phyfician, Dr Rutherford profeffor of the practice of phyfic, began, in the year 1748, to deliver clinical lectures, to be continued every winter, on the moft remarkable cafes in the hofpital.

Doctor Monro, though he was elected profeffor of anatomy in the year 1721, was not received into the univerfity till the year 1725, when he was inducted along with that great mathematician the late Mr Colin Maclaurin, with whom he ever lived in the ftricteft friendfhip. From this time he regularly every winter gave a courfe of lectures on anatomy and furgery, from October to May, upon a moft judicious and comprehenfive plan: A tafk in which he perfevered with the greateft affiduity, and without the leaft interruption, for near forty years; and fo great was the reputation he had acquired, that ftudents flocked to him from the moft diftant corners of his majefty's dominions.

In

In 1759, our profeffor entirely relinquifhed the bufinefs of the anatomical theatre to his fon Dr Alexander, who had returned from abroad, and had affifted him in the courfe of lectures the preceding year. But after this refignation, he ftill endeavoured to render his labours ufeful to mankind, by reading clinical lectures at the hofpital for the improvement of the ftudents; of which Dr Duncan, who was one of his pupils, has given the following acccount. " There I had myfelf the happinefs of being a pupil, who profited by the judicious conduct of his practice, and was improved by the wifdom and acutenefs of his remarks. I have indeed to regret that I attended only the laft courfe of his lectures in which he had ever a fhare, and at a time when he was fubjected to a difeafe which proved at length fatal. Still, however, from what I faw and from what I heard, I can venture to affert, that it is hardly poffible to conceive a phyfician more attentive to practice, or a preceptor more anxious to communicate inftructions. His humanity, in the former of thefe characters, led him to beftow the moft anxious care on his patients while they were alive; and his zeal in the latter induced him to make them the fubject of ufeful leffons when they happened to die.——In the different ftations of phyfician, of lecturer, and of manager in the hofpital, he took every meafure for inquiring into the caufes of difeafes by diffection. He perfonally attended the opening of every body; and he not only dictated to the ftudents an accurate report of the diffection, but with nice difcrimination contrafted the difeafed and found ftate of every organ. Thus, in his own perfon, he afforded to the ftudents a confpicuous example of the advantages of early anatomical purfuits, as the happieft foundation for a medical fuperftructure. His being at once engaged in two departments, the anatomical theatre and clinical chair, furnifhed him with opportunities both on the dead and living body, and placed him in the moft favourable fituation for the improvement of medicine; and from thefe opportunities he derived every poffible advantage which they could afford."

His father, old Mr Monro, lived to an advanced age; and enjoyed the unfpeakable pleafure of beholding a fon, efteemed and regarded by mankind, the principal actor in the execution of his favourite plan, the great object of his life, the founding a feminary of medical education in his native country: The fon, who furvived him near 30 years, had the fatisfaction to behold this feminary of medical education frequented yearly by 300 or 400 ftudents, many of whom came from the moft diftant corners of his majefty's dominions, and to fee it arrive to a degree of reputation far beyond his moft fanguine hopes, being equalled by few, and inferior to none, in Europe.

Few men were members of more focieties than Dr Monro; ftill fewer equally affiduous in their attendance of thofe which in any way tended to promote public utility. He was a manager of many public charities; and not only a member of different medical focieties, but likewife of feveral others inftituted for promoting literature, arts, fciences, and manufactures in Scotland, and was one of their moft ufeful members. While he was held in high eftimation at home, he was equally efteemed and refpected abroad, and was elected member of the royal fociety of London, and an honorary member of the royal academy of furgery at Paris.

He was not only very active in the line of his own profeffion, but as a citizen and general member of the community; for, after he had refigned the anatomical chair to his fon, he executed with the ftricteft punctuality the duties of feveral engagements both of a civil and political nature: He was a director of the Bank of Scotland, a Juftice of the Peace, a Commiffioner of High-roads, &c.

At length, after a life fpent in the moft active induftry, he became afflicted with a tedious and painful difeafe, which he bore with equal courage and refignation till his death, which happened on July 10th 1767, in the 70th year of his age.

Dr Monro was a man of great humanity and fweetnefs of temper, and endowed with a fingular liberality of fentiment. He was a fincere friend, and an agreeable companion; an affectionate hufband, and a kind father; and was never more happy than when he could ferve thofe whom he thought deferving.

Of his works, the firft in order is his Ofteology, which was written for the ufe of ftudents, but is capable alfo of affording inftruction to the oldeft and moft experienced practitioner; as, befides a minute defcription of the parts copied from nature, it every where abounds with new and important obfervations immediately applicable to practice. It has been tranflated into many different languages; has paffed through numerous editions; and has been reprinted in foreign countries in the moft fuperb manner, accompanied with elegant and mafterly engravings. His defcription of the Lacteal Sac and Thoracic Duct contains the moft accurate account of that important part of the body which has been yet publifhed; and his Anatomy of the Nerves will tranfmit to pofterity an excellent example of accurate diffection, faithful defcription, and ingenious reafoning. The fix volumes of Medical Effays and Obfervations, publifhed by a fociety in Edinburgh, are univerfally known and efteemed. To that fociety he was appointed fecretary; but, after the publication of the firft volume, to which he had largely contributed, the members growing remifs in their attendance, he became the fole collector and publifher of the work: To him we are therefore in a great meafure indebted for thofe numerous and important difcoveries with which this publication has enriched every department of medical knowledge. In the two firft volumes of the Phyfical and Literary Effays, publifhed by the phyfical fociety of Edinburgh, in which he had the rank of one of the prefidents, we find feveral papers written by him, which are not the leaft ornaments of that collection. His account of the Succefs of Inoculation in Scotland may be confidered as his laft publication: It demonftrates his extenfive correfpondence and indefatigable induftry, and has had great influence in promoting that falutary practice. Befides thefe, he was alfo the author of feveral other elegant and mafterly productions, which were either never publifhed, or were publifhed without his knowledge and from incorrect copies. A collection of all his works, properly arranged, corrected, and illuftrated with copperplates, has been publifhed by Dr Alexander Monro, his fon and fucceffor in the anatomical chair, in a fplendid quarto volume, printed for Elliot, Edinburgh, 1781; to which is prefixed a life of the author, by another of his fons, Dr Donald, phyfician in London. The obfervation of an excellent judge,

judge, the illuftrious Haller, concerning our author's Medical Effays and Obfervations, which now form a part of this collection, may with no lefs juftice be applied to the whole: It is a "book which ought to be in the poffeffion of every medical practitioner."

MONS, an ancient, large, handfome, rich, and very ftrong city of the Auftrian Netherlands, in Hainault. There is a chapter, confifting of 30 ladies of diftinction, who have the liberty of leaving the community when they intend to marry. They have feveral manufactures, and a good trade. It was taken by the allies in 1709, and by the French in July 1746; but rendered back by the treaty of Aix-la-Chapelle, after the fortifications were demolifhed. It ftands partly on a hill and partly on a plain, in a marfhy foil, on the rivers Haine and Trouillie, by which the country about it may be overflowed when they pleafe. E. Lon. 3. 39. N. Lat. 50. 25.

Mons *Sacer*, (anc. geog.), a mountain of the Sabines beyond the Anio, to the eaft of Rome; whither the common people retired once and again to avoid the tyranny of the patricians. From this fecefion, and the altar of *Jupiter Terribilis* erected there, the mountain took its name.

MONSEIGNEUR, "My lord;" a title of honour ufed by the French in writing or fpeaking to dukes, peers, archbifhops, bifhops, and prefidents à mortier. *Monfeigneur*, abfolutely ufed, is a title now reftrained to the dauphin of France; thus it is faid an officer belonging to *Monfeigneur:* but this cuftom was not introduced till the reign of Lewis XIV. the dauphin before that time being called *Monfieur le Dauphin.*

MONSIEUR, a title of civility ufed by the French, in fpeaking to or of their equals, or thofe that are but little below them. Thus a duke or a marquis, fpeaking to an equal or inferior, ufes the word *Monfieur;* and a mechanic fpeaking to a mechanic, gives him the fame title: but nobody calls the French king *Monfieur*, except the children of France The word is compounded of *mon*, "my," and *fieur*, "fir."

In France, the infcriptions of all letters run thus: *A monfieur monfieur* fuch-a-one. *Monfieur* abfolutely ufed, is a title given to the fecond fon of France, and to the king's brother.

MONSOON, in phyfiology, a fpecies of trade-wind in the Eaft Indies, which, for fix months, blows conftantly the fame way, and the contrary way the other fix months. See Wind.

MONSON (Sir William), a brave Englifh admiral, third fon of Sir John Monfon of South Carlton in Lincolnfhire, was born in 1569. He was employed in many expeditions againft the Spaniards in Queen Elizabeth's time, and was highly honoured; the queen knighted him for his fervices in the earl of Effex's expedition to Cadiz, where he affifted much by his wife and moderate counfel to the earl. Military men were no favourites with James I. therefore, on the death of the queen, he received no recompence or pay beyond the ordinary fervice in which he was engaged: neverthelefs, as admiral of the narrow feas, he fupported the honour of the Britifh flag againft the infant infolence of the Dutch ftates, of which he frequently complains in his Navy Tracts; and protected our trade againft the encroachments of France. He had the misfortune to fall into difgrace by his vigilance, and was imprifoned in the Tower through the refentment of fome powerful courtiers; yet he was difcharged, and wrote a vindication of his own conduct, intitled, "Concerning the infolencies of the Dutch, and a Juftification of Sir William Monfon." He fpent his latter days in peace and privacy, which he employed in digefting his Navy Tracts; and died in 1643. Part of thefe tracts were printed in 1682; and they were afterwards all included in Churchill's Collection of Voyages.

MONSTER; a birth or production of a living thing degenerating from the proper and ufual difpofition of parts in the fpecies it belongs to. As, when there are too many members, or too few; or fome of them are extravagantly out of proportion, either on the fide of defect or excefs. The word comes from the Latin *monftrum*, of *monftrando*, "fhewing." Whence alfo the box wherein relics were anciently kept to be fhewn, was called *monftrum.* Dugdale mentions an inventory of the church of York with this article, *Item unum monftrum cum offibus fancti Petri in Beryl, & crucifixo in fummitate.*

Ariftotle defines a monfter to be a defect of nature, when acting towards fome end, it cannot attain to it, by reafon fome of its principles are corrupted.

Monfters do not propagate their kind; for which reafon fome rank mules among the number of monfters; as alfo hermaphrodites.

Females which bring forth twins, are found moft liable to produce monfters. The reafon, probably, is owing to this; that though the twins are covered with one common chorion, yet they have each their feparate amnios, which, by their contiguity may chance to grow together, and fo occafion a confufion or blending of the parts. Hence fo many double creatures.

F. Malebranche accounts for the production of monfters in the animal-world, thus: The creator has eftablifhed fuch a communication between the feveral parts of his creation, that we are not only naturally led to imitate one another, i. e. have a difpofition to do the fame things and affume the fame manners with thofe with whom we converfe; but alfo have certain natural difpofitions which incline us to compaffion as well as imitation. Thefe things moft men feel, and are fenfible of; and therefore need not be proved. The animal-fpirits, then, are not only naturally carried into the refpective parts of the body to perform the fame actions and the fame motions which we fee others do, but alfo to receive in fome manner their wounds, and take part in their fufferings.

Experience tells us, that when we look attentively on any perfon feverely beaten, or that hath a large wound, ulcer, or the like, the fpirits immediately flow into thofe parts of our body which anfwer to thofe we fee fuffer in the other; unlefs their courfe be ftopped from fome other principle. This flux of fpirits is very fenfible in perfons of a delicate conftitution, who frequently fhudder, and find a kind of trembling in the body on thefe occafions; and this fympathy in bodies produces compaffion in the mind.

Now, it muft be obferved, that the view of a wound, &c. wounds the perfon who views it the more ftrongly and fenfibly, as the perfon is more weak and delicate; the fpirits making a ftronger impreffion on the fibres of a delicate body, than in thofe of a robuft one. Thus ftrong, vigorous men, &c. fee an execution without much concern, while women, &c. are ftruck with pity and horror. As to children ftill in their mother's

Monster. Montague. womb, the fibres of their flesh being incomparably finer than those in women, the course of the animal-spirits must necessarily produce much greater alterations.

These things being laid down, monsters are easily accounted for. Suppose, *v. gr.* a child born a fool, and with all its legs and arms broke in the same manner as those of criminals in some countries are; which case we choose to instance in, because we are told from Paris that such a monster was actually born there, and lived in one of their hospitals 20 years: the cause of this accident, according to the principles laid down, was, that the mother seeing a criminal executed, every stroke given to the poor man, struck forcibly the imagination of the woman; and, by a kind of counter-stroke, the tender and delicate brain of the child. Now, though the fibres of the woman's brain were strangely shaken by the violent flux of animal-spirits on this occasion, yet they had strength and consistence enough to prevent an entire disorder; whereas the fibres of the child's brain being unable to bear the shock of those spirits, were quite ruined, and the ravage was great enough to deprive him of reason all his lifetime.

Again; the view of the execution frighting the woman, the violent course of the animal-spirits was directed forcibly from the brain to all those parts of the body corresponding to the suffering parts of the criminal; and the same thing must happen in the child. But in regard the bones of the mother were strong enough to resist the impulse of those spirits, they were not damaged: And yet the rapid course of these spirits could easily overpower and break the tender and delicate fibres of the bones of the child; the bones being the last parts of the body that are formed, and having a very slender consistence while the child is yet in the womb.

To which it may be here added, that had the mother determined the course of these spirits towards some other part of her body by tickling or scratching herself vehemently, the child would not in all probability have had its bones broken; but the part answering that to which the motion of the spirits was determined, would have been the sufferer. Hence appears the reason, why women in the time of gestation, seeing persons, &c. marked in such a manner in the face, impress the same mark on the same parts of the child: and why, upon rubbing some hidden part of the body when startled at the sight of any thing or agitated with any extraordinary passion, the mark or impression is fixed on that hidden part rather than on the face of the child. From the principles here laid down, may most, if not all, the phenomena of monsters be easily accounted for.

MONTAGUE (Edward), earl of Sandwich, an illustrious Englishman, who shone from the age of 19, and united the qualifications of general, admiral, and statesman; yet there were strange inconsistencies in his character. He acted early against Charles I.; he persuaded Cromwell, whom it is said he admired, to take the crown; and he was zealous for the restoration of Charles II. All this is imputed to a fond and unaccountable passion which he had for royalty. Upon general Monk's coming into England, he sailed with the fleet to Holland, and soon after he had the honour to convoy his majesty to England. For this he was created knight of the garter; and on the 12th of July 1660 he was created baron Montague of St Neots in the county of Huntingdon, Viscount Hinchinbrooke in the same county, and earl of Sandwich in Kent, sworn one of his majesty's most honourable privy-council, made master of the king's wardrobe, admiral of the Narrow Seas, and lieutenant-admiral to the duke of York, as lord high admiral of England.

When the Dutch war broke out in 1664, and the duke of York took upon himself the command of a fleet as high-admiral, his lordship commanded the blue squadron, and by his industry and care abundance of the enemies ships were taken; and in the great battle fought on the third of June 1665, in which the Dutch lost admiral Opdam, and had 18 men of war taken and 14 destroyed, a large share of the honour of the victory was justly given to the conduct of the earl of Sandwich. On the return of the English navy, the command of the whole fleet was given to the earl of Sandwich, which he was ordered to put as speedily as possible in a condition to return to the coast of Holland. Accordingly the earl sailed on the fifth of July with 60 men of war to the Dutch coast; when finding that their East India and Smyrna fleets were to return home north about, he steered for the coast of Norway, and found they had taken shelter in the port of Bergen, where the fleet were attacked: but leaving them there, and sailing back towards the coast of Holland, he met with four Dutch East Indiamen, with several other merchant-ships, under a good convoy, and took eight men of war, two of their East India ships, and 20 sail of merchant-men; and a few days after, a part of the fleet falling in with 18 of the Hollanders, the greatest part of them were also taken, with four Dutch men of war, and above 1000 prisoners. On his return he was received by the king with distinguished marks of favour; and soon after, he was sent ambassador-extraordinary to the court of Madrid, to mediate a peace between the crowns of Spain and Portugal; when he had the happiness to conclude a peace between the two nations to their mutual satisfaction.

On the breaking out of the last Dutch war, his lordship went to sea with the duke of York, and commanded the blue squadron; the French admiral, count d'Estrees, commanding the white. The fleet was at sea in the beginning of the month of May, and coming to an anchor in Southwold-bay in order to take in water, we are told, that on the 27th many officers and seamen were permitted to go on shore, and were at Southwold, Dunwich, and Aldborough; when, the weather being hazy, the earl gave it as his opinion, that, the wind standing as it did, the fleet rode in danger of being surprised by the Dutch; and indeed, between two and three the next morning, they were informed of their approach, upon which his royal highness made the signal for weighing anchor. The blue squadron was out first, the red next, and the white was much a-stern. The earl of Sandwich in the Royal James, which carried 100 guns, began the fight, and fell furiously on the squadron of Van Ghent in order to give the rest of his fleet time to form; when captain Brakel, in the Great Holland, attacked the Royal James; but was soon disabled, as were several other men of war, and three fire-ships sunk. By this time most of his men were killed; and the hull of the Royal James was so pierced with shot, that it was impossible to carry her off. In this distress he might have been relieved

by

Montague. by his vice-admiral Sir Joſeph Jordan, had not that gentleman been more ſolicitous about aſſiſting the duke. When therefore he ſaw him ſail by, heedleſs of the condition in which he lay, he ſaid to thoſe who were about him, "There is nothing left for us now, but to defend the ſhip to the laſt man." Being at length grappled by a fourth fire-ſhip, he begged his captain Sir Richard Haddock, and all his ſervants, to get into the boat and ſave themſelves, which they did: yet ſome of the ſailors refuſed to quit the admiral, and ſtaying endeavoured to extinguiſh the fire, but in vain; the ſhip blew up about noon. His lordſhip's body was found about a fortnight after, and was interred with great ſtate in Henry VII.'s chapel.

We have of his lordſhip's writing, 1. The Art of Metals, in which is declared the manner of their generation, tranſlated from the Spaniſh of Albaro Alonzo Barba, 8vo. 2. Several letters during his embaſſy to Spain, publiſhed with Arlington's letters. 3. A letter to ſecretary Thurloe. 4. Original letters and negociations of Sir Richard Fanſhaw, the earl of Sandwich, the earl of Sunderland, and Sir William Godolphin, wherein divers matters between the three crowns of England, Spain, and Portugal, from the year 1663 to 1678, are ſet in a clear light, 2 vols 8vo.

MONTAGUE (Lady Mary Wortley,) eminent by her *Letters*, was daughter of the firſt duke of Kingſton, and died in 1762.

MONTAGUE (Edward Wortley), ſon of the former, paſſed through ſuch variegated ſcenes, that a bare recital of them would ſavour of the marvellous. From Weſtminſter ſchool, where he was placed for education, he ran away three ſeveral times. He exchanged clothes with a chimney-ſweeper, and he followed for ſome time that ſooty occupation. He next joined himſelf to a fiſherman, and cried flounders in Rotherhithe. He then ſailed as a cabin-boy to Spain; where he had no ſooner arrived, than he ran away from the veſſel, and hired himſelf to a driver of mules. After thus vagabondizing it for ſome time, he was diſcovered by the conſul, who returned him to his friends in England. They received him with a joy equal to that of the father of the prodigal ſon in the goſpel. A private tutor was employed to recover thoſe rudiments of learning which a life of diſſipation, of blackguardiſm, and of vulgarity, might have obliterated. Wortley was ſent to the Weſt-Indies, where he remained ſome time; then returned to England, acted according to the dignity of his birth, was choſen a member, and ſerved in two ſucceſſive parliaments. His expences exceeding his income, he became involved in debt, quitted his native country, and commenced that wandering traveller he continued to the time of his death. Having viſited moſt of the eaſtern countries, he contracted a partiality for their manners. He drank little wine; a great deal of coffee; wore a long beard; ſmoked much; and, even whilſt at Venice, he was habited in the eaſtern ſtyle. He ſat croſs-legged in the Turkiſh faſhion through choice. With the Hebrew, the Arabic, the Chaldaic, and the Perſian languages, he was as well acquainted as with his native tongue. He publiſhed ſeveral pieces. One on the "Riſe and Fall of the Roman Empire." Another an exploration of "The Cauſes of Earthquakes."—As this gentleman was remarkable for the uncommon incidents which attended his life, the cloſe of that life was no leſs marked with ſingularity. He had been early married to a woman, who aſpired to no higher a character than that of an induſtrious waſherwoman. As the marriage was ſolemnized in a frolic, Wortley never deemed her ſufficiently the wife of his boſom to cohabit with her. She was allowed a maintenance. She lived contented, and was too ſubmiſſive to be troubleſome on account of the conjugal rites. Mr Montague, on the other hand, was a perfect patriarch in his manners. He had wives of almoſt every nation. When he was with Ali Bey in Egypt, he had his houſehold of Egyptian females, each ſtriving who ſhould be the happy ſhe who could gain the greateſt aſcendency over this Anglo-Eaſtern baſhaw. At Conſtantinople, the Grecian women had charms to captivate this unſettled wanderer. In Spain a Spaniſh brunette, in Italy the olive-complexioned female, were ſolicited to partake the honours of the bridal-bed. It may be aſked what became of this group of wives? Mr Montague was continually ſhifting the place, and conſequently varying the ſcene. Did he travel with his wives, as the patriarchs did with their flocks and herds? No ſuch thing. Wortley, conſidering his wives as bad travelling companions, generally left them behind him. It happened, however, that news reached his ears of the death of the original Mrs Montague the waſherwoman. Wortley had no iſſue by her; and without iſſue male, a very large eſtate would revert to the ſecond ſon of lord Bute. Wortley, owing the family no obligations, was determined, if poſſible, to defeat their expectations. He reſolved to return to England and marry. He acquainted a friend with his intentions, and he commiſſioned that friend to advertiſe for any young decent woman who might be in a pregnant ſtate. Several ladies anſwered it. One out of the number was ſelected, as being the moſt eligible object. She waited with eagerneſs for the arrival of her expected bridegroom; but, behold, whilſt he was on his journey, death very impertinently arreſted him in his career.

MONTAGUE (Charles), earl of Halifax, fourth ſon of George Montague of Harton in Northamptonſhire, Eſq; ſon of Henry the firſt earl of Mancheſter, was born in 1661. He was educated at Weſtminſter-ſchool and Cambridge, ſhewed very early a moſt pregnant genius, and quickly made great progreſs in learning. In 1684, he wrote a poem on the death of king Charles II. in which he diſplayed his genius to ſuch advantage, that he was invited to London by the earl of Dorſet; and upon his coming thither he ſoon increaſed his fame, particularly by a piece which he wrote in conjunction with Prior, publiſhed at London in 1687, under the title of *The Hind and the Panther tranſverſed to the Story of the Country-mouſe and the City-mouſe*. Upon the abdication of king James II. he was choſen one of the members of the convention, and recommended by the earl of Dorſet to king William, who immediately allowed him a penſion of 500 l. *per annum*. Having given proofs of his great abilities in the houſe of commons, he was made one of the commiſſioners of the treaſury, and ſoon after chancellor of the exchequer; in which poſt he brought about that great work of recoining all the current money of the nation. In 1698, he was appointed firſt commiſſioner of the treaſury; and in 1679, was created a peer of England, by the title of *Baron Halifax* in the county of

of York. In 1701, the houfe of commons impeached him of fix articles, which were difmiffed by the houfe of Lords. He was attacked again by the houfe of commons in 1702, but without fuccefs. In 1705, he wrote, An anfwer to Mr Bromley's fpeech in relation to the occafional Conformity-bill. In 1706, he was one of the commiffioners for the union with Scotland; and upon paffing the bill for the naturalization of the illuftrious houfe of Hanover, and for the better fecurity of the fucceffion of the crown in the Proteftant line, he was made choice of to carry that act to Hanover. Upon the death of Queen Anne, when the king had taken poffeffion of his throne, his lordfhip was appointed firft commiffioner of the treafury, and created earl of Halifax and knight of the garter. He died in 1715. His lordfhipfhip wrote feveral other pieces befides thofe abovementioned; all which, with fome of his Speeches, were publifhed together in 1716, in an octavo volume.

MONTAIGNE (Michael de), a French gentleman, was born in Perigord in 1533. His father educated him with great care, and made him learn Latin as other children learn their mother-tongue. His tutors were Nicholas Gronchi, who wrote *De Comitiis Romanorum;* William Guerenti, who wrote on Ariftotle; George Buchanan; and M. Anthony Muret. He was alfo taught Greek by way of recreation; and becaufe fome think that ftarting children out of their fleep fpoils their underftanding, he was awakened every morning with the found of mufic. He was counfellor for a while in the parliament of Bourdeaux; afterwards made mayor of Bourdeaux. He publifhed his *Effays*, fo much known in the world, in 1580. Montaigne had a great deal of wit and fubtlety, but no fmall fhare of conceit and vanity. The learned and ingenious are much divided in their opinion about his works. He died in 1592.

MONTANISTS, Chriftian heretics, who fprung up about the year 171, in the reign of the emperor Marcus Aurelius. They were fo called from their leader, the herefiarch Montanus, a Phrygian by birth; whence they are fometimes ftyled *Phrygians* and *Cataphrygians*.

Montanus, it is faid, embraced Chriftianity in hopes of rifing to the dignities of the church. He pretended to infpiration; and gave out, that the Holy Ghoft had inftructed him in feveral points, which had not been revealed to the apoftles. Prifcilla and Maximilla, two enthufiaftic women of Phrygia, prefently became his difciples; and in a fhort time he had a great number of followers. The bifhops of Afia, being affembled together, condemned his prophecies, and excommunicated thofe who difperfed them. Afterwards they wrote an account of what had paffed to the weftern churches, where the pretended prophecies of Montanus and his followers were likewife condemned.

The Montanifts, finding themfelves expofed to the cenfure of the whole church, formed a fchifm, and fet up a diftinct fociety under the direction of thofe who called themfelves *prophets*. Montanus, in conjunction with Prifcilla and Maximilla, was at the head of the fect.

Thefe fectaries made no alteration in the creed. They only held, that the Holy Spirit made Montanus his organ for delivering a more perfect form of difcipline than what was delivered by the apoftles. They refufed communion for ever to thofe who were guilty of notorious crimes, and believed that the bifhops had no authority to reconcile them. They held it unlawful to fly in time of perfecution. They condemned fecond marriages, allowed the diffolution of marriage, and obferved three lents.

The Montanifts became feparated into two branches; one of which were the difciples of Proclus, and the other of Æfchines. The latter are charged with following the heterodoxy of Praxeas and Sabellius concerning the Trinity.

MONTANUS (Benedict Arias), a moft learned Spanifh theologian, born in the diocefe of Badajox, about the year 1528. He affifted at the council of Trent with great reputation; and his merit and writings recommended him to Philip II. of Spain, who employed him in publifhing a new polyglot bible after the Complutenfian edition, which was printed by the care of cardinal Ximenes. This bible was printed at Antwerp, whither Montanus went in 1571; and on his return to Spain he refufed the bifhopric which Philip offered him for his reward, but fpent the reft of his days at Sevilla, where he died about the year 1598. Montanus had not only vaft erudition, but great good fenfe; he loved folitude, was very laborious, never drank wine, and feldom ate flefh.

MONTECUCULI (Raymond de), generaliffimo of the emperor's army, and one of the greateft commanders of his time, was born in the duchy of Modena, of a diftinguifhed family in 1608. Erneft Montecuculi his uncle, who was general of the artillery in the Imperial army, refolved that he fhould ferve firft as a common foldier, and that he fhould pafs through all the military degrees, before he was raifed to command. This the young Montecuculi did with applaufe. In 1644, when he was at the head of 2000 horfe, he furprifed by a precipitate march 10,000 Swedes, who laid fiege to Nemeffau in Silefia, and obliged them to abandon their artillery and baggage; but a fhort time after, he was defeated and taken prifoner by the general Banier. Having obtained his liberty at the end of two years, he joined his troops to thofe of John de Wert; and defeated general Wrangel in Bohemia, who was killed in the battle. In 1657, the emperor made him general marfhal de camp; and fent him to the affiftance of John Cafimir, king of Poland. Montecuculi vanquifhed Ragotzi prince of Tranfilvania, drove out the Swedes, and diftinguifhed himfelf in an extraordinary manner againft the Turks in Tranfilvania and Hungary. In 1673, he commanded the Imperial army againft the French, and took Bonne; he then proceeded with feint marches in order to deceive Turenne, in which he obtained great honour. However, the command of that army was taken from him the next year; but it was reftored to him in 1675, in order that he might make head againft the great Turenne. All Europe had their eyes fixed on thefe two able warriors, who then made ufe of all the ftratagems which genius and military knowledge were capable of fuggefting. The marfhal de Turenne was obtaining the fuperiority, when he was taken off by a cannon-ball. Montecuculi wept at the death of fo formidable an enemy, and beftowed upon him the greateft praifes. The great prince of Conde was the only French general that could deprive Montecuculi of the fuperiority he had obtained by Turenne's death. That prince was

was therefore fent to the Rhine, and ftopped the Imperial general; who confidered this laft campaign as the moft glorious of his life, not for his being conqueror, but for his not being conquered, when he was oppofed by a Turenne and a Conde. He fpent the reft of his life at the Imperial court; and died at Lintz, in 1680. He wrote *Memoirs;* the beft edition of which is that of Strafburg, in 1735.

MONTESQUIEU (Charles de Secondat) baron, a moft illuftrious Frenchman defcended from an ancient and noble family of Guienne, was born at the caftle of La Brede, near Bourdeaux, in 1689. The greateft care was taken of his education; and at the age of 20 he had actually prepared materials for his *Spirit of Laws*, by well-digefted extracts from thofe immenfe volumes of civil law which he had ftudied, not barely as a civilian, but as a philofopher. He became a counfellor of the parliament of Bourdeaux in 1714, and was received prefident à mortier two years after. In 1721 he publifhed his *Perfian Letters;* in which, under the fcreen of Oriental manners, he fatirized thofe of France, and treated of feveral important fubjects by delicate tranfient glances: he did not avow this publication; but was no fooner pointed out as the author, than zeal without knowledge, and envy under the mafk of it, united at once againft the Perfian Letters. He was received into the French academy in 1728; and having previoufly quitted his civil employments, he entirely devoted himfelf to his genius, and was no longer a magiftrate but a man of letters. Having thus fet himfelf at liberty, he travelled through Germany, Italy, Switzerland, Holland, and England, in which laft country he refided three years, and contracted intimacies with the greateft men then alive; for Locke and Newton were dead. The refult of his obfervations was, "that Germany was fit to travel in, Italy to fojourn in, England to think in, and France to live in." On his return he retired for two years to his eftate at La Brede, where he finifhed his work *On the Caufes of the Grandeur and Declenfion of the Romans;* which appeared in 1734. The reputation acquired by this laft work only cleared the way for his greater undertaking, the *Spirit of Laws*, which was printed at Geneva in 2 vols 4to. 1750. This was immediately attacked by the adverfaries of his Perfian Letters, in a multitude of anonymous pamphlets; containing all the reproaches to which a liberal mind is expofed from craft and ignorance. M. Montefquieu drew up a defence of this work; which, for truth, moderation, and delicacy of ridicule, may be regarded as a model in its way. This great man was peaceably enjoying that fulnefs of efteem which his great merits had procured him, when he fell fick at Paris, and died on the 10th of February 1755.—The following character of this great man is drawn by Lord Chefterfield. "His virtues did honour to human nature, his writings juftice. A friend to mankind, he afferted their undoubted and unalienable rights with freedom, even in his own country; whofe prejudices in matters of religion and government he had long lamented, and endeavoured, not without fome fuccefs, to remove. He well knew, and juftly admired, the happy conftitution of this country, where fixed and known laws equally reftrain monarchy from tyranny, and liberty from licentioufnefs. His works will illuftrate his name, and furvive him, as long as right reafon, moral obligation, and the true fpirit of laws, fhall be underftood, refpected, and maintained."—As to his perfonal qualities, we are told by his elogift M. d'Alembert, that "he was of a fweet, gay, and even temper. His converfation was fpirited, agreeable, and inftructive. Nobody told a ftory in a more lively manner, or with more grace and lefs affectation. He had frequent abfence of mind; but always awaked from it by fome unexpected ftroke that re-animated the languifhing converfation. Tho' he lived with the great, he retired whenever he could to his eftate in the country, and there met his books, his philofophy, and his repofe. Surrounded at his leifure-hours with peafants, after having ftudied man in the commerce of the world, he ftudied him in thofe fimple people folely inftructed by nature. With them he cheerfully converfed; he endeavoured, like Socrates, to find out their genius, and appeared as happy with them as in the moft brilliant affemblies; efpecially when he reconciled their differences, and by his beneficence relieved them from their diftreffes."

Befides the works already mentioned, M. Montefquieu wrote feveral fmall pieces, as the Temple of Gnidus, Lyfimachus, and Effay upon Tafte, which is left unfinifhed. His works have been collected fince his death, and printed at Paris in a fplendid edition, in quarto. They have likewife all of them been tranflated into Englifh.

MONTFAUCON (Bernard de), a very learned Benedictine of the congregation of St Maur, fingularly famous for his knowledge in Pagan and ecclefiaftical antiquities, was born of an ancient and noble family in Languedoc, in 1655. He ferved for fome time in the army; but the death of his parents mortified him fo with regard to the world, that he commenced Benedictine monk in 1675, and applied himfelf intenfely to ftudy. Though Montfaucon's life was long, healthy, retired, and laborious, his voluminous publications feem fufficiently to have employed the whole; exclufive of his greateft undertaking, for which he will be always memorable. This was his *Antiquité expliqué*, written in Latin and French, illuftrated with elegant plates, in 10 vols folio, to which he added a fupplement of 5 vols more. He died at the abbey of St Germain in 1741.

MONTFERRAT, a province of Italy, with the title of a duchy; bounded on the eaft by the duchy of Milan, and part of the territory of Genoa; on the north, by the Vercellefe and Canavefe; on the weft, by Piedmont properly fo called; and on the fouth by the territory of Genoa, from whence it is feparated by the Appennine mountains. It contains 200 towns and caftles; and is very fertile and well cultivated, abounding in corn, wine, oil, and filk. It belongs to the king of Sardinia. Cafal is the capital town.

MONTGOMERY, the capital of a county of the fame name in North Wales, took its name from Roger de Montgomery earl of Shrewfbury, who built the caftle; but it is called by the Welfh *Tre Valdwin*, that is, Baldwin's town; having been built by Baldwin, lieutenant of the marches of Wales, in the reign of William I. The Welfh, after having put the garrifon to the fword, demolifhed it in 1095; but Henry III. rebuilt it, and granted it the privileges of a free borough, with other liberties. It is a large and tolerably well built town, in a healthful fituation and fertile foil. It fends a member to parliament, and has the

the title of an earldom. It had also formerly a tower and castle; but they were demolished in the civil wars. W. Long. 3. 10. N. Lat. 52. 36.

MONTGOMERYSHIRE, a county of North Wales, 35 miles in length and 34 in breadth; bounded on the north by Merionethshire and Denbighshire, on the east by Shropshire, on the south by Radnor and Cardiganshires, and on the west by another part of Merionethshire. It contains about 34,000 inhabitants, and between 5000 and 6000 houses. The county is full of high hills, with a few valleys and meadows fit for corn and pasture. The air is sharp and cold on the mountains, but is more mild in the valleys.

MONTH, the twelfth part of a year. See ASTRONOMY, n° 136.

MONTMORENCY, a town of France, with the title of a duchy, remarkable for the tombs of the dukes of this name. It is seated on a hill, near a large valley, fertile in fruits, especially excellent cherries. E. Long. 2. 24. N. Lat. 48. 59.

MONTMORENCY (Anne de), a peer, marshal, and constable, of France, and one of the greatest generals of the 16th century, defended, in 1512, the city of Mezieres against the emperor Charles V. and obliged the count of Nassau to raise the siege. The following year he was made marshal of France; and in 1525 following king Francis I. into Italy, he was taken with that prince at the battle of Pavia, which was fought contrary to his advice. The important services he afterwards rendered the state were rewarded by the sword of constable of France, with which he was presented by the king on the 10th of February 1538. He afterwards underwent various revolutions of fortune both at court and in the field. At last, being wounded at the battle of St Denis, which he gained on the 10th of November 1567, he died of his wounds two days after, at 74 years of age. It is said, that a cordelier attempting to prepare him for death, when he was covered with blood and wounds, after the battle of St Denis, he replied in a firm and steady voice: "Do you think that a man who has lived near 80 years with honour, has not learnt to die for a quarter of an hour?"

MONTPELIER, one of the handsomest towns of France, and the most considerable in Languedoc excepting Tholouse, is situated in E. Long. 4. 20. N. Lat. 45. 58. It hath a citadel, a bishop's see, a famous university where the art of medicine is taught, a royal academy of sciences, and a mint. The streets are very narrow and crooked; but always clean, because lying on a descent. The inhabitants are reckoned about 30,000 in number, among whom are a great number of physicians and apothecaries. This place is celebrated for its medicinal compositions, which are distributed all over Europe; particularly Hungary-water, oil of lavender, syrup of capillaire, essences, and perfumes. The air is extremely healthy, for which reason valetudinarians come hither from all parts for their recovery. It is seated on a hill, on the river Merdanson, which passes into several parts of the town through subterranean vaults.

MONT-REAL, an island of North America, in the river St Lawrence, about 28 miles long and 10 broad. The soil is very fertile, and the air wholesome. It belonged to the French; but was taken by the generals Amherst and Murray on the 8th of September 1760, without firing a gun. According to the terms of capitulation, all the French forces were to be sent to Old France; and, consequently, all Canada became subject to the crown of Great Britain: this cession was confirmed by the peace of 1763. The town is pretty well fortified; and has a pleasant situation, with wide open streets. It is built on the side of the river, from whence there is a gradual easy ascent to what is called the *Upper Town*. The Hôtel Dieu, the magazines, and the place of arms, are in the Lower Town; which is also the residence of the merchants. The seminary or school, the parish-church, the monks called *Recolets*, the Jesuits, and the nuns, are in the Upper; where likewise the late governor, and most of the officers, resided. There are also a general hospital, and a church belonging to the Jesuits, which is large and well-built. The inhabitants carry on a trade with the savages in skins and furs. It is 120 miles south-west of Quebec, and 110 north of Albany. W. Long. 72. 4. N. Lat. 45 35.

MONTROSE, a handsome town of North Britain, in the shire of Angus, situated at the mouth of the river Esk, on the German Ocean, 46 miles north-east of Edinburgh.

Steel spaws are very numerous in the country round Montrose. Besides these, there is a well near this town, whose water is of a whitish colour, soft taste, and faintly discovering a mineral quality, and is of a different nature from the steel one. It is universally diuretic; and has been found useful in stranguries, scorbutic disorders, flatulencies, &c.

MONTROSE (Marquis of). See GRAHAM; and BRITAIN, n° 137, 138, 143, 165.

MONTSERRAT, an high mountain of Spain, in Catalonia, on which is a famous monastery and chapel, dedicated to the Virgin Mary, whose image is said to perform many miracles; so that numbers of pilgrims resort hither. It is inhabited by monks of several nations, who entertain all that come out of devotion or curiosity, for three days gratis. This mountain is said to be 10 miles in circumference, and five high, from the top of which there is a view of the country to the distance of 150 miles. It is 25 miles N. W. of Barcelona. E. Long 2. 35. N. Lat. 41. 40.

MONTSERRAT, one of the Caribbee Isles belonging to Great Britain. It is a very small, but very pleasant island, so called by Columbus from its resemblance to a famous mountain near Barcelona in Catalonia. It lies in W. Long. 61. 0. N. Lat. 16. 50. having Antigua to the north-east, St Christopher's and Nevis to the north-west, and Guadaloupe lying south south-east at the distance of about nine leagues. In its figure it is nearly round, about nine miles in extent every way, 27 in circumference, and is supposed to contain about 40,000 or 50,000 acres. The climate is warm, but less so than in Antigua, and is esteemed very healthy. The soil is mountainous, but with pleasant valleys, rich and fertile, between them; the hills are covered with cedars and other fine trees. Here are all the animals as well as vegetables and fruits that are to be found in the other islands, and not at all inferior them in quality. The inhabitants raised formerly a considerable quantity of indigo, which was none of the best, but which they cut four times a-year. The present product is cotton, rum, and sugar. There is no good harbour, but three tolerable

lerable roads at Plymouth, Old Harbour, and Ker's-bay, where they ſhip the produce of the iſland. Public affairs are adminiſtered here as in the other iſles, by a lieutenant-governor, council, and aſſembly, compoſed of no more than eight members, two from each of the four diſtricts into which it is divided. The wonderful effects of induſtry and experience in meliorating the gifts of nature have been no where more conſpicuous than in theſe iſlands, and particularly in this, by gradually improving their produce, more eſpecially of late years, ſince the art of planting hath been reduced to a regular ſyſtem, and almoſt all the defects of ſoil ſo thoroughly removed by proper management and manure, that, except from the failure of ſeaſons, or the want of hands, there is ſeldom any fear of a crop. In 1770 there were exported from this iſland to Great Britain 167 bags of cotton, 1670l.; 740 hogſheads of rum, 7400l. To Ireland 133 ditto, 1330l.; 4338 hogſheads 232 tierces 202 barrels of ſugar, 79,507l.; in the whole 89,907l. To North America 12,633l. There are a few ſhips employed in trading to this iſland from London and from Briſtol. As to the number of inhabitants, according to the moſt probable accounts, they conſiſt of between 1200 and 1500 whites, and from 10,000 to 12,000 negroes, tho' ſome ſay not ſo many.

MONUMENT, in architecture, a building deſtined to preſerve the memory, &c. of the perſon who raiſed it, or the perſon for whom it was raiſed; ſuch are a mauſoleum, a triumphal arch, a pyramid, &c.

MOOD, or Mode. See Mode.

Moods *of Syllogiſm*. See Logic, n° 85.

Mood, or *Mode*, in grammar, the different manner of conjugating verbs. See Grammar.

MOON, in aſtronomy. See Astronomy, *paſſim*.

Moon-*Wort* in botany. See Lunaria.

MOOR, in country affairs, denotes an unlimited tract of land, uſually over-run with heath.

Moor-*Cock*, or *Gor-cock*. See Tetrao.

Moor-*Stone*, a valuable ſtone, much uſed in the coarſer works of the preſent builders; being truly a white granite, of a marbly texture.

MOORE, or More, (Edward), a late ingenious writer, was bred a linen-draper, but quitted buſineſs to join the retinue of the muſes; and he certainly had a very happy and pleaſing talent for poetry. In his *Trial of Selim the Perſian*, he complimented lord Lyttelton in an elegant kind of panegyric, couched under the appearance of accuſation: and his *Fables for the female ſex*, for eaſy verſification, poignant ſatire, and ſtriking morals, approach nearer to the manner of Gay, than any other of the numerous imitations of that author. He wrote alſo three dramatic pieces; The Gameſter, a tragedy; The Foundling, and Gil Blas, comedies. The ſucceſs of theſe was not ſuch as they merited; the firſt of them having met with a cold reception, for no other apparent reaſon but becauſe it too nearly touched a favourite and faſhionable vice; and the ſecond having been condemned for its ſuppoſed reſemblance to Sir Richard Steele's *Conſcious Lovers*, but to which good judges have been inclined to give it greatly the preference. Mr Moore married a lady of the name of *Hamilton*, daughter to Mr Hamilton table-decker to the princeſſes; who had herſelf a very poetical turn, and has been ſaid to have aſſiſted him in the writing of his tragedy. One ſpecimen of her poetry, however, was handed about before their marriage, and has ſince appeared in print in different collections of ſongs, particularly in one called the *Goldfinch*. It was addreſſed to a daughter of the famous Stephen Duck; and begins with the following ſtanza:

> Would you think it, my Duck, for the fault I muſt own,
> Your Jenny, at laſt, is quite covetous grown:
> Tho' millions if Fortune ſhould laviſhly pour,
> I ſtill ſhou'd be wretched, if I had not More.

And after half a dozen ſtanzas more, in which, with great ingenuity and delicacy, and yet in a manner that expreſſes a ſincere affection, ſhe has quibbled on our author's name, ſhe concludes with the following lines:

> You will wonder, my girl, who this dear one can be,
> Whoſe merit can boaſt ſuch a conqueſt as me:
> But you ſhan't know his name, tho' I told you before,
> It begins with an M, but I dare not ſay More.

In the year 1753, Mr Moore commenced a weekly miſcellaneous paper, intitled *The World, by Adam Fitz-Adam*; in which undertaking he was aſſiſted by lord Cheſterfield with ſome eſſays. This paper was collected into volumes, and Mr Moore died ſoon after.

MOORING, the act of confining and ſecuring a ſhip in a particular ſtation, by chains or cables, which are either faſtened to the adjacent ſhore, or to anchors in the bottom.

A ſhip may be either moored by the head, or by the head and ſtern: that is to ſay, ſhe may be ſecured by anchors before her, without any behind; or ſhe may have anchors out, both before and behind her; or her cables may be attached to poſts, rings, or moorings, which anſwer the ſame purpoſe.

When a ſhip is moored by the head with her own anchors, they are diſpoſed according to the circumſtances of the place where ſhe lies, and the time ſhe is to continue therein. Thus wherever a tide ebbs and flows, it is uſual to carry one anchor out towards the flood, and another towards the ebb, particularly where there is little room to range about; and the anchors are laid in the ſame manner, if the veſſel is moored head and ſtern in the ſame place. The ſituation of the anchors, in a road or bay, is uſually oppoſed to the reigning winds, or thoſe which are moſt dangerous; ſo that the ſhip rides therein with the effort of both her cables. Thus if ſhe rides in a bay, or road, which is expoſed to a northerly wind and heavy ſea from the ſame quarter, the anchors paſſing from the oppoſite bows ought to lie eaſt and weſt from each other: hence both the cables will retain the ſhip in her ſtation with equal effort againſt the action of the wind and ſea.

MOOSE, or Elk. See Cervus.

MOOT, a difficult caſe argued by the young barriſters and ſtudents at the inns of court, by way of exerciſe, the better to qualify them for practice, and to defend the cauſes of their clients. This, which is called *mooting*, is the chief exerciſe of the inns of court. Particular times are appointed for the arguing moot-caſes: the place where this exerciſe is performed was anciently called *moot-hall;* and there is a bailiff, or ſurveyor of the moots, annually choſen by the bench, to appoint the moot-men for the inns of chancery, and to keep an account of the performance of exerciſes.—The word is formed either from the Saxon *metan*, *gemetan*, "meeting;" or from the French *mot*, "word."

MORAL PHILOSOPHY, OR MORALS.

MORAL PHILOSOPHY is "The ſcience of MANNERS or DUTY; which it traces from man's "nature and condition, and ſhews to terminate in his "happineſs." In other words, it is "The knowledge "of our DUTY and FELICITY;" or, "The art of being VIRTUOUS and HAPPY."

It is denominated an *art*, as it contains a ſyſtem of rules for becoming virtuous and happy. Whoever practiſes theſe rules, attains an habitual power or facility of becoming virtuous and happy. It is likewiſe called a *ſcience*, as it deduces thoſe rules from the principles and conncteions of our nature, and proves that the obſervance of them is productive of our happineſs.

It is an art, and a ſcience, of the higheſt dignity, importance, and uſe. Its object is man's duty, or his conduct in the ſeveral moral capacities and connections which he ſuſtains. Its office is to direct that conduct; to ſhew whence our obligations ariſe, and where they terminate. Its uſe, or end, is the attainment of happineſs; and the means it employs are rules for the right conduct of our moral powers.

Moral Philoſophy has this in common with Natural Philoſophy, that it appeals to nature or fact; depends on obſervation; and builds its reaſonings on plain uncontroverted experiments, or upon the fulleſt induction of particulars of which the ſubject will admit. We muſt obſerve, in both theſe ſciences, how nature is affected, and what her conduct is in ſuch and ſuch circumſtances. Or, in other words, we muſt collect the appearances of nature in any given inſtance; trace theſe to ſome general principles, or laws of operation; and then apply theſe principles or laws to the explaining of other phænomena.

Therefore Moral Philoſophy inquires, not how man might have been, but how he is, conſtituted: not into what principles or diſpoſitions his actions may be artfully reſolved; but from what principles and diſpoſitions they actually flow: not what he may, by education, habit, or foreign influence, come to be, or do; but what, by his nature, or original conſtituent principles, he is formed to be and do. We diſcover the office, uſe, or deſtination of any work, whether natural or artificial, by obſerving its ſtructure, the parts of which it conſiſts, their connection or joint action. It is thus we underſtand the office and uſe of a watch, a plant, an eye, or hand. It is the ſame with a living creature, of the rational, or brute kind. Therefore, to determine the office, duty, or deſtination of man; or, in other words, what his buſineſs is, or what conduct he is obliged to purſue; we muſt inſpect his conſtitution, take every part to pieces, examine their mutual relations one to the other, and the common effort or tendency of the whole.

PART I.

CHAP. I.

Of MAN *and his* CONNECTIONS.

1 Man's infant ſtate. MAN is born a weak, helpleſs, delicate creature, unprovided with food, cloathing, and whatever elſe is neceſſary for ſubſiſtence or defence. And yet, expoſed as the infant is to numberleſs wants and dangers, he is utterly incapable of ſupplying the *former*, or ſecuring himſelf againſt the *latter*. But, though thus feeble and expoſed, he finds immediate and ſure reſources in the *affection* and *care* of his parents, who refuſe no labours, and forego no dangers, to nurſe and rear up the tender babe. By theſe powerful inſtincts, as by ſome mighty chain, does nature link the *parent* to the *child*, and form the ſtrongeſt *moral connection* on his part, before the child has the leaſt apprehenſion of it. *Hunger* and *thirſt*, with all the ſenſations that accompany or are connected with them, explain themſelves by a language ſtrongly expreſſive, and irreſiſtibly moving. As the ſeveral ſenſes bring in notices and informations of ſurrounding objects, we may perceive in the young ſpectator early ſigns of a growing *wonder* and *admiration*. Bright objects and ſtriking ſounds are beheld and heard with a ſort of commotion and ſurpriſe. But, without reſting on any, he eagerly paſſes on from object to object, ſtill pleaſed with whatever is moſt new. Thus the *love* of *novelty* is formed, and the paſſion of *wonder* kept awake. By degrees he comes acquainted with the moſt familiar objects, his parents, his brethren, and thoſe of the family who are moſt converſant with him. He contracts a *fondneſs* for them, is uneaſy when they are gone, and charmed to ſee them again. Theſe feelings become the foundation of a *moral attachment* on his ſide, and by this reciprocal ſympathy he forms the domeſtic alliance with his parents, brethren, and other members of the family. Hence he becomes intereſted in their concerns, and feels *joy* or *grief*, *hope* or *fear*, on their account, as well as his own. As his affections now point beyond himſelf to others, he is denominated a *good* or *ill* creature, as he ſtands *well* or *ill affected* to them. Theſe then are the firſt links of the *moral chain*, the early rudiments, or outlines of his character, his firſt rude eſſays towards agency, freedom, manhood.

When he begins to make excurſions from the nurſery, and extends his acquaintance abroad, he forms 2 His childhood. a little circle of companions, engages with them in play, or in queſt of adventures, and leads, or is led by them, as his genius is more or leſs aſpiring. Tho' this is properly the ſeaſon in which *appetite* and *paſſion* have the *aſcendant*, yet his *imagination* and *intellectual* powers open apace; and as the various images of things paſs before the mental eye, he forms variety

riety of taſtes; reliſhes ſome things, and diſlikes others, as his parents, companions, and a thouſand other circumſtances, lead him to combine agreeable or diſagreeable ſets of ideas, or repreſent to him objects in alluring or odious lights.

As his views are enlarged, his *active* and *ſocial* powers expand themſelves in proportion; the *love of action*, of *imitation*, and of *praiſe*, *emulation*, *curioſity*, *docility*, *a paſſion for command*, and *fondneſs of change*. His paſſions are quick, variable, and pliant to every impreſſion; his attachments and diſguſts quickly ſucceed each other. He compares things, diſtinguiſhes actions, judges of characters, and loves or hates them, as they appear well or ill affected to himſelf, or to thoſe he holds dear. Mean while he ſoon grows ſenſible of the conſequences of his own actions, as they attract applauſe, or bring contempt; he triumphs in the former, and is aſhamed of the latter; wants to hide them, and bluſhes when they are diſcovered. By means of theſe powers he becomes a fit ſubject of culture, the moral tie is drawn cloſer, he feels that he is accountable for his conduct to others as well as to himſelf, and thus is gradually ripening for ſociety and action.

3 His youth. As man advances from *childhood* to *youth*, his paſſions as well as perceptions take a more extenſive range. New ſenſes of pleaſure invite him to new purſuits; he grows ſenſible to the attractions of beauty, feels a peculiar ſympathy with the ſex, and forms a more tender kind of attachment than he has yet experienced. This becomes the cement of a *new moral relation*, and gives a ſofter turn to his paſſions and behaviour. In this turbulent period he enters more deeply into a *reliſh of friendſhip*, *company*, *exerciſes*, and *diverſions*; the *love of truth*, of *imitation*, and of *deſign*, grows upon him; and as his connections ſpread among his neighbours, fellow-citizens, and country-men, his *thirſt of praiſe*, *emulation*, and *ſocial affections* grow more intenſe and active. Mean while, it is impoſſible for him to have lived thus long without having become ſenſible of thoſe more auguſt ſignatures of order, wiſdom, and goodneſs, which are ſtamped on the viſible creation; and of thoſe ſtrong ſuggeſtions within himſelf of a parent-mind, the ſource of all intelligence and beauty; an object as well as ſource of that activity, and thoſe aſpirations which ſometimes rouſe his inmoſt frame, and carry him out of himſelf to an almighty and all-governing power: Hence ariſe thoſe ſentiments of *reverence*, and thoſe affections of *gratitude*, *reſignation*, and *love*, which link the ſoul with the Author of Nature, and form that moſt ſublime and god-like of all connections.

4 His manhood. Man having now reached his prime, either new paſſions ſucceed, or the old ſet are wound up to an higher pitch. For, growing more ſenſible of his connections with the public, and that particular community to which he more immediately belongs; and taking withal a larger proſpect of human life, and its various wants and enjoyments; he forms more intimate friendſhips, graſps at power, courts honour, lays down cooler plans of intereſt, and becomes more attentive to the concerns of ſociety; he enters into family connections, and indulges thoſe charities which ariſe from thence. The *reigning* paſſions of this period powerfully prompt him to provide for the decays of life; and in it *compaſſion* and *gratitude* exert their influence in urging the *man*, now in full vigour, to requite the affection and care of his parents, by ſupplying their wants and alleviating their infirmities.

5 Old age. At length human life verges downwards; and *old age* creeps on apace, with its *anxiety*, *love of eaſe*, *intereſtedneſs*, *fearfulneſs*, *foreſight*, and *love of offſpring*. The experience of the aged is formed to direct, and their coolneſs to temper, the heat of youth; the former teaches them to look back on paſt follies, and the latter to look forward into the conſequences of things, and provide againſt the worſt. Thus every age has its peculiar genius and ſet of paſſions correſponding to that period, and moſt conducive to the proſperity of the reſt. And thus are the *wants* of one period ſupplied by the *capacities* of another, and the *weakneſſes* of one age tally to the *paſſions* of another.

6 Paſſions of every age. Beſides theſe, there are other paſſions and affections of a leſs *ambulatory* nature, not peculiar to one period, but belonging to every age, and acting more or leſs in every breaſt throughout life. Such are *ſelf-love*, *benevolence*, *love of life*, *honour*, *ſhame*, *hope*, *fear*, *deſire*, *averſion*, *joy*, *ſorrow*, *anger*, and the like. The two firſt are affections of a cooler ſtrain, one pointing to the good of the individual, the other to that of the ſpecies; *joy* and *ſorrow*, *hope* and *fear*, ſeem to be only modifications, or different exertions, of the ſame *original* affections of *love* and *hatred*, *deſire* and *averſion*, ariſing from the different circumſtances or poſition of the object deſired or abhorred, as it is preſent or abſent. From theſe likewiſe ariſe other *ſecondary* or *occaſional* paſſions, which depend, as to ther exiſtence and ſeveral degrees, upon the original affections being gratified or diſappointed, as *anger*, *complacence*, *confidence*, *jealouſy*, *love*, *hatred*, *dejection*, *exaltation*, *contentment*, *diſguſt*, which do not form *leading* paſſions, but rather hold of them.

7 Their joint effects. By theſe ſimple but powerful ſprings, whether *periodical* or *fixed*, the life of man, weak and indigent as he is, is preſerved and ſecured, and the creature is prompted to a conſtant round of action, even to ſupply his own numerous and ever-returning *wants*, and to guard againſt the various *dangers* and *evils* to which he is obnoxious. By theſe links men are connected with each other, formed into families, drawn into particular communities, and all united as by a common league into one ſyſtem or body, whoſe members feel and ſympathize one with another. By this admirable adjuſtment of the conſtitution of *man* to his *ſtate*, and the gradual evolution of his powers, order is maintained, ſociety upheld, and human life filled with that variety of paſſion and action which at once enliven and diverſify it.

8 The directing power. This is a ſhort ſketch of the *principal movements* of the human mind. Yet, theſe movements are not the whole of man; they impel to action, but do not direct it; they need a *regulator* to guide their motions, to meaſure and apply their forces: and accordingly they have one that naturally *ſuperintends* and *directs* their action. We are conſcious of a principle within us, which examines, compares, and weighs things, notes the differences, obſerves the forces, and foreſees the conſequences of affections and actions. By this

this power we look back on paſt times, and forward into futurity, gather experiences, eſtimate the real and comparative value of objects, lay out ſchemes, contrive means to execute them, and ſettle the whole order and œconomy of life. This power we commonly diſtinguiſh by the name of *reaſon* or *reflection*, the buſineſs of which is not to ſuggeſt any original notices or ſenſations, but to canvaſs, range, and make deductions from them.

9 The judging or approving powers.

We are intimately conſcious of another principle within us, which approves of certain *ſentiments*, *paſſions*, and *actions*, and diſapproves of their contraries. In conſequence of the deciſions of this inward judge, we denominate ſome actions and principles of conduct *right*, *honeſt*, *good*; and others *wrong*, *diſhoneſt*, *ill*. The former excite our *eſteem*, *moral complacence*, and *affection*, immediately and originally of themſelves, without regard to their conſequences, and whether they affect our intereſt or not. The latter do as naturally and neceſſarily call forth our *contempt*, *ſcorn*, and *averſion*. That power by which we perceive this difference in affections and actions, and feel a conſequent reliſh or diſlike, is commonly called *conſcience* or the *moral ſenſe*. Whether ſuch a power belongs to human nature or not, muſt be referred to every one's experience of what paſſes within himſelf.

10 Theſe powers different from affections.

Theſe two powers of *reaſon* and *conſcience* are evidently principles different in *nature* and *kind* from the paſſions and affections. For the paſſions are mere *force* or *power*, *blind impulſes*, acting violently and without choice, and ultimately tending each to their reſpective objects, without regard to the intereſt of the others, or of the whole ſyſtem. Whereas the *directing* and *judging* powers diſtinguiſh and aſcertain the different forces, mutual proportions and relations, which the paſſions bear to each other and to the whole; recognize their ſeveral degrees of merit, and judge of the whole temper and conduct, as they reſpect either the individual or the ſpecies; and are capable of directing or reſtraining the blind impulſes of paſſion in a due conſiſtency one with the other, and a regular ſubordination to the whole ſyſtem.

11 Diviſion of the paſſions.

This is ſome account of the *conſtituent principles* of our nature, which, according to their different mixtures, degrees, and proportions, mould our character and ſway our conduct in life. In reviewing that large train of affections which fill up the different ſtages of human life, we perceive this obvious diſtinction among them; that ſome of them reſpect the *good* of the *individual*, and others carry us beyond ourſelves to the *good* of the *ſpecies* or *kind*. The former have therefore been called *private*, and the latter *public* affections. Of the firſt ſort are, *love of life*, of *pleaſure*, of *power*, and the like. Of the laſt are *compaſſion*, *gratitude*, *friendſhip*, *natural affection*, and the like. Of the *private* paſſions *, ſome reſpect merely the *ſecurity* and *defence* of the creature, ſuch as *reſentment*

12 Defenſive paſſions.

and *fear*; whereas others aim at ſome *poſitive* advantage or good, as *wealth*, *eaſe*, *fame*. The former ſort therefore, becauſe of this difference of objects, may be termed *defenſive* paſſions. Theſe anſwer to our *dangers*, and prompt us to avoid them if we can, or boldly to encounter them when we cannot.

13 Private or appetitive paſſions.

The other claſs of *private* paſſions, which purſue *private poſitive* good, may be called *appetitive*. However, we ſhall ſtill retain the name of *private*, in contradiſtinction to the *defenſive* paſſions. Man has a great variety of wants to ſupply, and is capable of many enjoyments, according to the ſeveral periods of his life, and the different ſituations in which he is placed. To theſe therefore a ſuitable train of *private* paſſions correſpond, which engage him in the purſuit of whatever is neceſſary for his ſubſiſtence or welfare.

14 Public paſſions.

Our *public* or *ſocial* affections are adapted to the ſeveral *ſocial connections* and *relations* which we bear to others, by making us ſenſible of their dangers, and intereſting us in their wants, and ſo prompting us to ſecure them againſt one and ſupply the other.

This is the firſt ſtep then to diſcover the *duty* and *deſtination* of man, the having analyſed the principles of which he is compoſed. It is neceſſary, in the next place, to conſider in what *order*, *proportion*, and *meaſure* of thoſe inward principles, *virtue*, or a ſound moral temper and right conduct conſiſts; that we may diſcover whence *moral obligation* ariſes.

CHAP. II.

Of DUTY, *or* MORAL OBLIGATION.

15 The meaſure of powers.

IT is by the end or deſign of any power or movement that we muſt direct its motions, and eſtimate the degree of force neceſſary to its juſt action. If it wants the force requiſite for the obtaining its end, we reckon it defective; if it has too much, ſo as to be carried beyond it, we ſay it is overcharged; and in either caſe it is imperfect and ill-contrived. If it has juſt enough to reach the ſcope, we eſteem it right and as it ſhould be. Let us apply this reaſoning to the paſſions.

16 Meaſure of the defenſive paſſions.

The *defence* and *ſecurity* of the individual being the *aim* of the *defenſive paſſions*, that *ſecurity* and *defence* muſt be the *meaſure* of their *ſtrength* or *indulgence*. If they are ſo *weak* as to prove inſufficient for that end, or if they *carry us beyond it*, i. e. raiſe unneceſſary commotions, or continue longer than is needful, they are unfit to anſwer their original deſign, and therefore are in an unſound and unnatural ſtate. The exerciſe of *fear* or of *reſentment* has nothing deſirable in it, nor can we give way to either without painful ſenſations. Without a certain degree of them, we are naked and expoſed. With too high a proportion of them, we are miſerable, and often injurious to others. Thus *cowardice* or *timidity*, which is the exceſs of fear, inſtead of ſaving us in danger, gives it too formidable an appearance, makes us incapable of attending to the beſt means of preſervation, and diſarms us of *courage*, our natural armour. *Fool-hardineſs*, which is the want of a due meaſure of *fear*, leads us heedleſsly into danger, and lulls us into a pernicious ſecurity. *Revenge*, i. e. *exceſſive reſentment*, by the violence of its commotion, robs us of that *preſence of mind* which is often the beſt guard againſt injury, and inclines us to purſue the aggreſſor with more ſeverity than ſelf-defence requires. *Puſillanimity*, or the want of a juſt indignation againſt wrong, leaves us quite unguarded, and tends to ſink the mind into a paſſive

* Here we uſe paſſions and affections without diſtinction. Their difference will be marked afterwards.

enervated tameneſs. Therefore " To keep the de-
" fenſive paſſions duly proportioned to our dangers, " is their natural pitch and tenor."

17 Meaſure of the private paſſions.

The *private* paſſions lead us to purſue ſome *poſitive* ſpecies of *private* good: that *good* therefore which is the object and end of each muſt be the *meaſure* of their reſpective force, and direct their operation. If they are too *weak* or *ſluggiſh* to engage us in the purſuit of their ſeveral objects, they are evidently *deficient*; but if they defeat their end by their *impetuoſity*, then are they ſtrained beyond the juſt tone of nature. Thus *vanity*, or an *exceſſive paſſion for applauſe*, betrays into ſuch meanneſſes and little arts of popularity as makes us forfeit the honour we ſo anxiouſly court. On the other hand, a *total indifference about the eſteem of mankind* removes a ſtrong guard and ſpur to virtue, and lays the mind open to the moſt abandoned proſecutions. Therefore, " to keep " our private paſſions and deſires proportioned to our " *wants*, is the juſt meaſure and pitch of this claſs of " affections."

18 Comparative force.

The *defenſive* and *private* paſſions do all agree in general, in their tendency or conduciveneſs to the intereſt or good of the individual. Therefore, when there is a colliſion of intereſt, as may ſometimes happen, that *aggregate of good* or *happineſs*, which is compoſed of the particular goods to which they reſpectively tend, muſt be the common ſtandard by which their *comparative degrees* of ſtrength are to be meaſured: that is to ſay, if any of them, in the degree in which they prevail, are incompatible with the greateſt aggregate of good or moſt extenſive intereſt of the individual, then are they unequal and diſproportionate. For, in judging of a particular *ſyſtem* or *conſtitution* of powers, we call that the *ſupreme* or *principal* end in which the aims of the ſeveral parts or powers coincide, and to which they are ſubordinate; and reckon them in due proportion to each other, and right with regard to the whole, when they maintain that ſubordination of ſubſerviency. Therefore, " To " proportion our defenſive and private paſſions in ſuch " meaſure to our dangers and wants as beſt to ſecure " the individual, and obtain the greateſt aggregate of " private good or happineſs, is their juſt balance or " comparative ſtandard in caſe of competition."

19 Meaſure of the public affections.

In like manner as the *public* or *ſocial* affections point at the good of others, that *good* muſt be the meaſure of their force. When a particular *ſocial* affection, as *gratitude* or *friendſhip*, which belongs to a particular *ſocial connection*, *viz*. that of a *benefactor* or of a *friend*, is too feeble to make us act the *grateful* or *friendly* part, that affection, being inſufficient to anſwer its end, is *defective* and *unſound*. If, on the other hand, a particular paſſion of this claſs counteract or defeat the intereſt it is deſigned to promote, by its violence or diſproportion, then is that paſſion *exceſſive* and *irregular*. Thus *natural affection*, if it degenerates into a *paſſionate* fondneſs, not only hinders the parents from judging coolly of the intereſt of their offspring, but often leads them into a moſt partial and pernicious indulgence.

20 Colliſion of ſocial affections.

As every kind affection points at the good of its particular object, it is poſſible there may be ſometimes a colliſion of intereſts or goods. Thus the regard due to a *friend* may interfere with that which we owe to a *community*. In ſuch a competition of intereſts, it is evident that the *greateſt* is to be choſen; and that is the greateſt intereſt which contains the greateſt ſum or aggregate of public good, greateſt in *quantity* as well as *duration*. This then is the *common ſtandard* by which the reſpective forces and ſubordinations of the ſocial affections muſt be adjuſted. *Therefore* we conclude, that " This claſs of affections are ſound and " regular when they prompt us to purſue the *intereſt* " of *individuals* in an intire conſiſtency with the *public good*," or, in other words, " When they are duly " proportioned to the *dangers* and *wants* of others, " and to the various *relations* in which we ſtand to " *individuals* or to *ſociety*."

Thus we have found, by an induction of particulars, the *natural pitch* or *tenor* of the *different orders of affection*, conſidered apart by themſelves. Now as the *virtue* or *perfection* of every creature lies in following its nature, or acting ſuitably to the juſt proportion and harmony of its ſeveral powers; therefore, " The VIRTUE of a creature endowed with ſuch " affections as *man* muſt conſiſt in obſerving or acting " agreeably to their *natural pitch and tenor*."

21 Balance of affection.

But, as there are no independent affections in the fabric of the mind, no paſſion that ſtands by itſelf, without ſome relation to the reſt, we cannot pronounce of any one, conſidered APART, that it is either *too ſtrong* or *too weak*. Its ſtrength and juſt proportion muſt be meaſured not only by its ſubſerviency to its own immediate end, but by the reſpect it bears to the whole ſyſtem of affection. Therefore, we ſay a paſſion is *too ſtrong*, not only when it defeats its own end, but when it impairs the force of other paſſions, which are equally neceſſary to form a *temper of mind* ſuited to a certain *œconomy* or *ſtate*; and too weak, not merely on account of its inſufficiency to anſwer its end, but becauſe it cannot ſuſtain its *part* or *office* in the balance of the whole ſyſtem. Thus the *love of life* may be *too ſtrong* when it takes from the *regard* due to one's country, and will not allow one bravely to encounter dangers, or even death on its account. Again, the *love of fame* may be *too weak* when it throws down the fences which render virtue more ſecure, or weakens the incentives which make it more active and public-ſpirited.

22 Limits of private affections.

If it be aſked, " How far may the affections to- " wards private good or happineſs be indulged?" One limit was before fixed for the particular indulgence of each, *viz*. their ſubordination to the common aggregate of good to the private ſyſtem. In theſe therefore a due regard is always ſuppoſed to be had to *health*, *reputation*, *fortune*, the *freedom of action*, the *unimpaired exerciſe of reaſon*, the *calm enjoyment of one's ſelf*, which are all private goods. Another limit now reſults from the balance of affection juſt named, *viz*. " The ſecurity and happineſs of others;" or, to expreſs it more generally, " a *private* affection may be ſafely indulged, when, by that indul- " gence, we do not violate the obligations which re- " ſult from our higher relations or public connections." A juſt reſpect therefore being had to theſe boundaries which nature has fixed in the breaſt of every man, what ſhould limit our purſuits of private happineſs?

Is

Is nature ſullen and penurious? Or does the God of nature envy the happineſs of his offspring?

[22] Colliſion of intereſts. Whether there is ever a real colliſion of intereſts between the *public* and *private* ſyſtem of affections, or the *ends* which each claſs has in view, will be afterwards conſidered; but where there is no colliſion, there is little or no danger of carrying either, but eſpecially the *public* affections, to exceſs, provided both kinds are kept ſubordinate to a diſcreet and cool *ſelf-love*, and to a calm and univerſal *benevolence*, which principles ſtand as guards at the head of each ſyſtem.

23 Reſult. This then is the conduct of the paſſions, conſidered as *particular* and *ſeparate* forces, carrying us out to their reſpective ends; and this is their balance or œconomy, conſidered as *compound* powers, or powers mutually related, acting in conjunction towards a *common* end, and conſequently as forming a *ſyſtem* or *whole*.

24 Subordination of powers. Now, whatever adjuſts or maintains this *balance*, whatever in the human conſtitution is formed for *directing* the paſſions ſo as to keep them from defeating their own end or interfering with each other, muſt be a principle of a *ſuperior* nature to them, and *ought* to direct their meaſures and govern their proportions. But it was found that *reaſon* or reflection is ſuch a principle, which points out the tendency of our paſſions, weighs their influence upon private and public happineſs, and ſhews the beſt means of attaining either. It having been likewiſe found that there is another directing or controling principle, which we call CONSCIENCE or the MORAL SENSE, which, by a native kind of authority, judges of affections and actions, pronouncing ſome *juſt* and *good*, and others *unjuſt* and *ill*; it follows that the paſſions, which are mere impulſe or blind forces, are principles inferior and ſubordinate to this *judging* faculty. *Therefore*, we would follow the order of nature, *i. e.* obſerve the mutual reſpects and the ſubordination which the different parts of the human conſtitution bear one to another, the paſſions ought to be ſubjected to the direction and authority of the *leading* or *controuling* principles.

25 In what it conſiſts. We conclude therefore, from this *induction*, that “the *conſtitution* or *juſt œconomy* of *human nature* conſiſts in a regular *ſubordination* of the *paſſions* and *affections* to the *authority* of *conſcience* and the *direction* of *reaſon*.”

26 Oeconomy of nature, or right temper. That *ſubordination* is *regular*, when the proportion formerly mentioned is maintained; that is to ſay, “When the *defenſive* paſſions are kept proportioned to our *dangers*; when the *private* paſſions are proportioned to our *wants*; and when the *public* affections are adapted to our *public connections*, and proportioned to the wants and dangers of others.”

27 Human virtue and perfection. But the *natural ſtate*, or the *ſound* and *vigorous conſtitution* of any creature, or the *juſt œconomy* of its powers, we call its *health* and *perfection*; and the acting agreeably to theſe, its *virtue* or *goodneſs*. Therefore, “the *health* and *perfectoin* of man muſt lie in the aforeſaid *ſupremacy* of *conſcience* and *reaſon*, and in the *ſubordination* of the paſſions to their *authority* and *direction*. And his *virtue* or *goodneſs* muſt conſiſt in acting agreeably to that *order* or *œconomy*.”

28 How conformable to reaſon. That ſuch an ornament of the mind, and ſuch a conduct of its powers and paſſions, will ſtand the teſt of *reaſon*, cannot admit of any diſpute. For, upon a fair examination into the conſequences of things, or the relations and aptitudes of *means* to *ends*, *reaſon* evidently demonſtrates, and *experience* confirms it, that, “To have our *defenſive paſſions* duly proportioned to our *dangers*, is the ſureſt way to avoid or get clear of them, and obtain the ſecurity we ſeek after.—To proportion our *private paſſions* to our *wants*, is the beſt means to ſupply them;—and, to adapt our *public affections* to our *ſocial relations*, and the *good* of others, is the moſt effectual method of fulfilling *one*, and procuring the *other*.” In this ſenſe, therefore, *virtue* may be ſaid to be a “*conduct* conformable to *reaſon*,” as reaſon diſcovers an apparent *aptitude*, in ſuch an *order* and *œconomy* of powers and paſſions, to anſwer the end for which they are *naturally* formed.

29 Connection between affections and ends, not the idea of moral obligation. If the idea of *moral obligation* is to be deduced merely from this *aptitude* or *connection* between certain paſſions, or a certain order and balance of paſſions, and certain ends obtained or to be obtained by them, then is *reaſon* or *reflection*, which perceives that aptitude or connection, the proper judge of *moral obligation*; and on this ſuppoſition it may be defined, as hath been done by ſome, the connection between the *affection* and the *end*, or, which is the ſame thing, between the *action* and the *motive*; for the *end* is the *motive* or the *final cauſe*, and the *affection* is the *action*, or its immediate natural cauſe. A man, from mere ſelf-love, may be induced to fulfil that obligation which is founded on the connection between the *defenſive* paſſions and their *ends*, or the *private* paſſions and their *ends*; becauſe in that caſe his own intereſt will prompt him to indulge them in the due proportion required. But if he has no affections which point beyond himſelf, no principle but *ſelf-love*, or ſome ſubtle modification of it, what ſhall intereſt him in the happineſs of others, where there is no connection between it and his own; or what ſenſe can he have of *moral obligation* to promote it? upon this ſcheme, therefore, without public or ſocial affection there could be no *motive*, and conſequently no moral obligation, to a beneficent diſintereſted conduct.

But if the mere connection between certain paſſions, or a certain order of paſſions and certain ends, are what conſtitutes or gives us the idea of *moral obligation*, then why may not the appoſiteneſs of any temper or conduct, nay, of any piece of machinery to obtain its end, form an equally ſtrict *moral obligation*? for the connection and aptitude are as ſtrong and invariable in the latter inſtances as in the former. But as this is confounding the moſt obvious differences of things, we muſt trace the idea of *moral obligation* to another and a more natural ſource.

30 Idea of it from experience. Let us appeal, therefore, to our inmoſt ſenſe and experience, “how we ſtand affected to thoſe different ſets of paſſions, in the juſt meaſure and balance of which we found a right temper to conſiſt.” For this is entirely a matter of experience, in which we muſt

muſt examine, as in any other natural inquiry, "what "are the genuine feelings and operations of nature, "and what affections or ſymptoms of them appear in "the given inſtance."

31 Why the defenſive paſſions approved.

The defenſive paſſions, as *anger* and *fear*, give us rather pain than pleaſure, yet we cannot help feeling them when provoked by injury, or expoſed to harm. We account the creature imperfect that wants them, becauſe they are neceſſary to his defence. Nay, we ſhould in ſome meaſure condemn ourſelves, did we want the neceſſary degree of *reſentment* and *caution*. But if our *reſentment* exceeds the wrong received, or our *caution* the evil dreaded, we then blame ourſelves for having over-acted our part. Therefore, while we are in danger to be totally deſtitute of them we reckon a *blameable defect*, and to feel them in a juſt, *i. e.* neceſſary meaſure, we *approve*, as ſuited to the nature and condition of ſuch a creature as man. But our ſecurity obtained, to continue to indulge them, we not only *diſapprove* as *hurtful*, but *condemn* as *unmanly*, *unbecoming*, and *mean-ſpirited*: Nor will ſuch a conduct afford any ſelf-approving joy when we coolly reflect upon it.

32 Why the private.

With regard to the *private* paſſions, ſuch as *love of life*, *pleaſure*, *eaſe*, and the like, as theſe aim at private good, and are neceſſary to the perfection and happineſs of the individual, we ſhould reckon any creature *defective*, and even *blameable*, that was deſtitute of them. Thus, we condemn the man who imprudently ruins his fortune, impairs his health, or expoſes his life; we not only pity him as an unfortunate creature, but feel a kind of *moral indignation* and contempt of him, for having made himſelf ſuch. On the other hand, though a diſcreet ſelf-regard does not attract our eſteem and veneration, yet we approve of it in ſome degree, in an higher and different degree from what we would regard a well-contrived machine, as neceſſary to conſtitute a finiſhed creature, nay, to complete the virtuous character, as exactly ſuited to our preſent indigent ſtate. There are ſome paſſions reſpecting private good, towards which we feel higher degrees of approbation, as the *love of knowledge*, of *action*, of *honour*, and the like. We eſteem them as marks of an ingenuous mind; and cannot help thinking the character in which they are wanting remarkably ſtupid, and in ſome degree *immoral*.

33 Why the public.

With regard to the ſocial affections, as *compaſſion*, *natural affection*, *friendſhip*, *benevolence*, and the like, we approve, admire, and love them in ourſelves, and, in all in whom we diſcover them, with an eſteem and approbation, if not different in kind, yet ſurely far ſuperior in degree, to what we feel towards the other paſſions. Theſe we reckon neceſſary, juſt, and excellently fitted to our ſtructure and ſtate; and the creature which wants them we call defective, ill-conſtituted, a kind of abortion. But the *public* affections we eſteem as ſelf-worthy, originally and eternally amiable.

34 Diſtinction between vehement and calm affections.

But among the *ſocial* affections we make an obvious and conſtant diſtinction, *viz.* between thoſe particular paſſions which urge us with a ſudden violence, and uneaſy kind of ſenſation, to purſue the good of their reſpective objects, as *pity*, *natural affection*, and the like; and thoſe calm diſpaſſionate affections and deſires which prompt us more ſteadily and uniformly to promote the happineſs of others. The former we generally call *paſſions*, to diſtinguiſh them from the other ſort, which go more commonly by the name of *affections*, or *calm deſires*. The firſt kind we approve indeed, and delight in; but we feel ſtill higher degrees of approbation and moral complacence towards the *laſt*, and towards all limitation of the particular inſtincts, by the principle of *univerſal benevolence*. The more objects the calm affections take in and the worthier theſe are, their dignity riſes in proportion, and with this our approbation keeps an exact pace. A character, on the other hand, which is quite diveſted of theſe public affections, which feels no love for the ſpecies, but inſtead of it entertains malice, rancour, and ill-will, we reckon totally immoral and unnatural.

Such then are the ſentiments and diſpoſitions we feel when theſe ſeveral orders of affection paſs before the mental eye.

35 Moral obligation.

Therefore, "that ſtate in which we feel ourſelves "moved, in the manner above deſcribed, towards "thoſe affections and paſſions, as they come under "the mind's review, and in which we are, inſtantaneouſly and independently of our choice or volition, "prompted to a *correſpondent* conduct, we call a "ſtate of *moral obligation*." Let us ſuppoſe, for inſtance, a parent, a friend, a benefactor, reduced to a condition of the utmoſt indigence and diſtreſs, and that it is in our power to give them immediate relief. To what conduct are we *obliged?* What *duty* does nature dictate and require in ſuch a caſe? Attend to nature, and nature will tell, will tell with a voice irreſiſtibly audible and commanding to the *human heart*, with an authority which no man can ſilence without being ſelf-condemned, and which no man can elude but at his peril: "That immediate relief *ought* to given." Again, let a friend, a neighbour, or even a ſtranger, have lodged a *depoſit* in our hands, and after ſome time reclaim it, no ſooner do theſe ideas of the confidence repoſed in us, and of property not *transferred*, but *depoſited*, occur, than we immediately and unavoidably feel and recognize the *obligation* to reſtore it. In both theſe caſes we ſhould condemn and even loathe ourſelves if we acted otherwiſe, as having done, or omitted doing, what we *ought* not, as having acted beneath the dignity of our nature;—contrary to our moſt intimate ſenſe of *right* and *wrong*:—we ſhould accuſe ourſelves as guilty of ingratitude, injuſtice, and inhumanity,—and be conſcious of deſerving the cenſure, and therefore dread the reſentment, of all rational beings.—But in complying with the *obligation*, we feel joy and ſelf-approbation,—are conſcious of an inviolable harmony between our nature and duty, and think ourſelves intitled to the applauſe of every impartial ſpectator of our conduct.

36 Moral obligation.

To *deſcribe* therefore what we cannot perhaps *define*, a ſtate of *moral obligation* is "that ſtate in "which a creature, endued with ſuch ſenſes, powers, "and affections of man, would condemn himſelf, and "think he deſerved the condemnation of all others, "ſhould he refuſe to fulfil it; but would approve him"ſelf, and expect the approbation of all others, upon "complying with it."

And

37 Moral agent. And we call him a MORAL AGENT, who is in ſuch a *ſtate*, or is ſubject to *moral obligation*. Therefore, as man's *ſtructure* and *connections* often ſubject him to ſuch a ſtate of *moral obligation*, we conclude that *he* is a *moral agent*. But as man may ſometimes act without *knowing* what he does, as in caſes of *frenſy* or *diſeaſe*, or in many *natural functions*; or, knowing what he does, he may act without *choice* or *affection*, as in caſes of *neceſſity* or *compulſion*; therefore to

38 Moral action good and bad. denominate an action *moral*, i. e. *approveable*, or *blameable*, it muſt be done *knowingly* and *willingly*, or *from affection* and *choice*. "A *morally good action* then is to fulfil a *moral obligation* knowingly "and willingly." And a *morally bad action*, or an *immoral action*, is, "to violate a *moral obligation* "knowingly and willingly."

39 Moral character and temper good and bad. As not an *action*, but a *ſeries of actions*, conſtitute a *character*; as not an *affection*, but a *ſeries of affections*, conſtitute a *temper*; and as we denominate things by the groſs, *à fortiori*, or by the qualities which chiefly prevail in them; therefore we call that a "*morally good character*, in which a *ſeries of morally good actions* prevail;" and that a "*morally good temper*, in which a *ſeries of morally good affections* have the aſcendant." A bad character and bad temper are the reverſe. But where the above mentioned *order* or *proportion* of paſſions is maintained, there a *ſeries* of *morally* good *affections and actions* will prevail. *Therefore*, "to maintain that order "and proportion, is to have a *morally good temper* "*and character*." But a "morally good temper and "character is *moral rectitude*, *integrity*, *virtue*, or "the *completion of duty*."

40 How we come by the idea of moral obligation. If it be aſked, after all, "how we come by the idea "of *moral obligation* or *duty*?" We may anſwer, that we come by it in the ſame way as by our other *original* and *primary* perceptions. We receive them all from nature, or the great Author of nature. For this idea of *moral obligation* is not a creature of the mind, or dependent on any previous act of volition, but ariſes on certain occaſions, or when certain other ideas are preſented to the mind, as neceſſarily, inſtantaneouſly, and unavoidably, as *pain* does upon too near an approach to the fire, or *pleaſure* from the fruition of any good. It does not, for inſtance, depend on our choice, whether we ſhall feel the *obligation* to ſuccour a diſtreſſed parent, or to reſtore a depoſit intruſted to us when it is recalled. We cannot call this a *compound idea* made up of one or more ſimple ideas. We may indeed, nay we muſt, have ſome ideas antecedent to it, *e. g.* that of a parent—in diſtreſs—of a child—able to relieve—of the relation of one to the other—of a truſt—of right, &c. But none of theſe ideas conſtitute the perception of *obligation*. This is an idea quite diſtinct from, and ſomething ſuperadded to, the ideas of the correlatives, or the relation ſubſiſting between them. Theſe indeed, by a law of our nature, are the occaſion of ſuggeſting it; but they are as totally different from it as colours are from ſounds. By ſenſe of reflection we perceive the correlatives, our memory recals the favours or depoſit we received, the various circumſtances of the caſe are matters of fact or experience; but ſome delicate inward *organ* or *power*, or call it what we pleaſe, does, by a certain inſtantaneous ſympathy, antecedent to the cool deductions of reaſon, and independent of previous inſtruction, art, or volition, *perceive the moral harmony*, the *living*, *irreſiſtible charms of moral obligation*, which immediately intereſts the correſpondent paſſions, and prompts us to fulfil its awful dictates.

We need not apprehend any danger from the quickneſs of its deciſions, nor be frightened becauſe it looks like *inſtinct*, and has been called ſo. Would we approve one for deliberating long, or reaſoning the matter much at leiſure, whether he ſhould relieve a diſtreſſed parent, feed a ſtarving neighbour, or reſtore the truſt committed to him? ſhould we not ſuſpect the reaſoner of knavery, or of very weak affections to virtue? we employ *reaſon*, and worthily employ it, in examining the condition, relations, and other circumſtances of the agent or patient, or of thoſe with whom either of them are connected, or, in other words, the *ſtate of the caſe*: and in complicated caſes, where the circumſtances are many, it may require no ſmall attention to find the true ſtate of the caſe; but when the relations of the agent or patient, and the circumſtances of the action are obvious, or come out ſuch after a fair trial, we ſhould ſcarce approve him who demurs on the obligation to that conduct which the caſe ſuggeſts. 41 The uſe of reaſon in moral caſes.

From what has been ſaid it is evident, that it is not the pleaſure or agreeable ſenſations which accompany the exerciſe of the ſeveral affections, nor thoſe conſequent to the actions, that conſtitute *moral obligation*, or excite in us the idea of it. That pleaſure is poſterior to the idea of obligation, and frequently we are obliged, and acknowledge ourſelves under an obligation, to ſuch affections and actions as are attended with pain; as in the trials of virtue, where we are obliged to ſacrifice private to public good, or a preſent pleaſure to a future intereſt. We have pleaſure in ſerving an aged parent, but it is neither the perception nor proſpect of that pleaſure which gives us the idea of obligation to that conduct. 42 [52] Pleaſure, not the idea of obligation.

CHAP. III.

The FINAL *Cauſes of our moral Faculties of* PERCEPTION *and* AFFECTION.

WE have now taken a *general* proſpect of MAN and of his *moral powers* and *connections*, and on theſe erected a ſcheme of *duty*, or *moral obligation*, which ſeems to be confirmed by *experience*, conſonant to *reaſon*, and approved by his moſt inward and moſt ſacred *ſenſes*. It may be proper in the next place to take a more particular view of the *final cauſes* of thoſe delicate *ſprings* by which he is *impelled* to action, and of thoſe *clogs* by which he is reſtrained from it. By this detail we ſhall be able to judge of their aptitude to anſwer their end, in a creature endued with his *capacities*, ſubject to his *wants*, expoſed to his *dangers*, and ſuſceptible of his *enjoyments*; and from thence we ſhall be in a condition to pronounce concerning the *end* of his *whole ſtructure*, its *harmony* with its *ſtate*, and conſequently its ſubſerviency to anſwer the great and benevolent intentions of its author. 53 The ſurvey propoſed.

The ſupreme Being has ſeen fit to blend in the whole of things a prodigious variety of diſcordant and contrary

[53] *Inward anatomy of the ſyſtem of the mind.* contrary principles, *light* and *darkneſs*, *pleaſure* and *pain*, *good* and *evil*. There are multifarious natures, *higher* and *lower*, and many intermediate ones between the wide-diſtant extremes. Theſe are differently ſituated, variouſly adjuſted, and ſubjected to each other, and all of them ſubordinate to the order and perfection of the whole. We may ſuppoſe *man* placed as in a centre amidſt thoſe innumerable orders of beings, by his *outward* frame drawing to the *material* ſyſtem, and by his *inward* connected with the INTELLECTUAL or *moral*, and of courſe affected by the laws which govern both, or affected by that good and that ill which reſult from thoſe laws. In this infinite variety of *relations* with which he is ſurrounded, and of *contingencies* to which he is liable, he feels ſtrong attractions to the *good*, and violent repulſions or averſions to the *ill*. But as good and ill are often blended, and wonderfully complicated one with the other; as they ſometimes immediately produce and run up into each other, and at other times lie at great diſtances, yet by means of intervening links introduce one another; and as theſe effects are often brought about in conſequence of hidden relations and general laws, of the energy of which he is an incompetent judge, it is eaſy for him to miſtake *good* for *evil*, and *evil* for *good*, and conſequently he may be frequently attracted by ſuch things as are deſtructive, or repel ſuch as are ſalutary. Thus, by the tender and complicated frame of his body, he is ſubjected to a great variety of ills, to *ſickneſs*, *cold*, *heat*, *fatigue*, and innumerable *wants*. Yet his knowledge is ſo narrow withal, and his reaſon ſo weak, that in many caſes he cannot judge, in the way of inveſtigation or reaſoning, of the connections of thoſe effects with their reſpective cauſes, or of the various latent energies of natural things. He is therefore informed of this connection by the experience of certain *ſenſes* or *organs* of *perception*, which, by a mechanical inſtantaneous motion, feel the *good* and the *ill*; receiving pleaſure from *one*, and pain from the *other*. By theſe, without any reaſoning, he is taught to attract or chuſe what tends to his welfare, and to repel and avoid what tends to his ruin. Thus, by his ſenſes of *taſte* and *ſmell*, or by the *pleaſure* he receives from certain kinds of food, he is admoniſhed which agree with his conſtitution, and by an oppoſite ſenſe of *pain* he is informed which ſorts diſagree, or are deſtructive of it; but is not by means of this inſtructed in the inward natures and conſtitutions of things.

54 *Uſe of appetites and paſſions.* Some of thoſe ſenſes are armed with ſtrong degrees of *uneaſineſs* or *pain*, in order to urge him to ſeek after ſuch objects as are ſuited to them. And theſe reſpect his more immediate and preſſing *wants*; as the ſenſe of *hunger*, *thirſt*, *cold*, and the like; which, by their painful importunities, compel him to provide *food*, *drink*, *raiment*, *ſhelter*. Thoſe inſtincts by which we are thus prompted with ſome kind of commotion or violence to attract and purſue *good*, or to repel and avoid *ill*, we call *appetites* and *paſſions*. By our ſenſes then we are informed of what is *good* or *ill* to the *private ſyſtem*, or the *individual*; and by our *private appetites* and *paſſions* we are impelled to one, and reſtrained from the other.

In conſequence of this machinery, and the great train of wants to which our nature ſubjects us, we are engaged in a continued ſeries of occupations, which often require much application of thought, or great bodily labour, or both. The neceſſaries of life, food, cloaths, ſhelter, and the like, muſt be provided; conveniencies muſt be acquired to render life ſtill more eaſy and comfortable. In order to obtain theſe, arts, induſtry, manufactures, and trade, are neceſſary. And to ſecure to us the peaceable enjoyment of their fruits, civil government, policy, and laws, muſt be contrived, and the various buſineſs of public life carried on: thus while man is concerned and buſied in making proviſion, or obtaining ſecurity for himſelf, he is by degrees engaged in connections with a family, friends, neighbours, a community, or a commonwealth. Hence ariſe new wants, new intereſts, new cares, and new employments. The paſſions of one man interfere with thoſe of another. Intereſts are oppoſed. Competitions ariſe, contrary courſes are taken. Diſappointments happen, diſtinctions are made, and parties formed. This opens a vaſt ſcene of diſtraction and embarraſſment, and introduces a mighty train of good and ill, both public and private. Yet amidſt all this confuſion and hurry, plans of action muſt be laid, conſequences foreſeen or guarded againſt, inconveniencies provided for; and frequently particular reſolutions muſt be taken, and ſchemes executed, without reaſoning or delay. 55 *Man's outward ſtate.*

56 *Proviſions for it.* Now what proviſion has the Author of our nature made for this neceſſitous condition? How has he fitted the actor, man, for playing his part in this perplexed and buſy ſcene?

57 *By public ſenſes and paſſions.* Our ſupreme Parent, watchful for the whole, has not left himſelf without a witneſs here neither, and hath made nothing imperfect, but all things are double one againſt another. He has not left man to be informed, only by the cool notices of reaſon, of the *good* or *ill*, the *happineſs* or *miſery* of his fellow-creatures. He has made him ſenſible of their good and happineſs, but eſpecially of their ill and miſery, by an immediate ſympathy, or quick *feeling* of *pleaſure* and of *pain*.

58 *Pity.* The latter we call PITY or COMPASSION. For the former, though every one, who is not quite diveſted of humanity, feels it in ſome degree, we have not got a name, unleſs we call it CONGRATULATION or *joyful* SYMPATHY, or that *good humour* which ariſes on ſeeing others pleaſed or happy. 59 *Congratulation.* Both theſe feelings have been called in general the PUBLIC or COMMON SENSE, κοινη μνημοσυνη, by which we feel for others, and are intereſted in their concerns as really, though perhaps leſs ſenſibly than in our own.

60 *Reſentment.* When we ſee our fellow-creatures unhappy through the fault or injury of others, we feel *reſentment* or *indignation* againſt the *unjuſt* cauſers of that miſery. If we are conſcious that it has happened through our fault or *injurious* conduct, we feel *ſhame*; and both theſe claſſes of *ſenſes* and *paſſions*, regarding *miſery* and *wrong*, are armed with ſuch ſharp ſenſations of *pain* as not only prove a powerful guard and ſecurity to the *ſpecies*, or *public ſyſtem*, againſt thoſe ills it may, but ſerve alſo to leſſen or remove thoſe ills it does, ſuffer. Compaſſion draws us out of ourſelves to bear a part of the misfortunes of others, powerfully ſolicits us in their favour, melts us at ſight of their diſtreſs,

ſtreſs, and makes us in ſome degree unhappy till they are relieved from it. It is peculiarly well adapted to the condition of human life, becauſe it is much more and oftener in our power to do miſchief than good, and to prevent or leſſen miſery than to communicate poſitive happineſs; and therefore it is an admirable reſtraint upon the more *ſelfiſh* paſſions, or thoſe violent impulſes that carry us to the hurt of others.

61 Public affections.

There are other particular *inſtincts* or *paſſions* which intereſt us in the concerns of others, even while we are moſt buſy about our own, and which are ſtrongly attractive of *good*, and repulſive of *ill* to them. Such are *natural affection, friendſhip, love, gratitude, deſire of fame, love of ſociety*, of *one's country*, and others that might be named. Now as the *private* appetites and paſſions were found to be armed with ſtrong ſenſations of deſire and uneaſineſs, to prompt man the more effectually to ſuſtain labours, and to encounter dangers in purſuit of thoſe goods that are neceſſary to the preſervation and welfare of the individual, and to avoid thoſe ills which tend to his deſtruction; in like manner it was neceſſary, that this *other* claſs of deſires and affections ſhould be prompted with as quick ſenſations of pain, not only to counteract the ſtrength of their antagoniſts, but to engage us in a virtuous activity for our relations, families, friends, neighbours, country. Indeed our *ſenſe* of *right* and *wrong* will admoniſh us that it is our *duty*, and *reaſon* and *experience* farther aſſure us that it is both our *intereſt* and beſt *ſecurity*, to promote the happineſs of others; but that *ſenſe*, that *reaſon*, and that *experience*, would frequently prove but weak and ineffectual prompters to ſuch a conduct, eſpecially in caſes of danger and hardſhip; and amidſt all the importunities of nature, and that conſtant hurry in which the *private* paſſions involve us, without the aid of thoſe particular *kind* affections which mark out to us particular ſpheres of duty, and with an agreeable violence engage and fix us down to them.

62 Contraſt or balance of paſſions.

It is evident, therefore, that thoſe two claſſes of affection, the *private* and *public*, are ſet one againſt the other, and deſigned to control and limit each other's influence, and thereby to produce a juſt balance in the whole *. In general, the violent ſenſations of pain and uneaſineſs which accompany hunger, thirſt, and the other private appetites, or too great fatigue of mind as well as of body, prevent the individual from running to great exceſſes in the exerciſe of the higher functions of the mind, as too intenſe thought in the ſearch of truth, violent application to buſineſs of any kind, and different degrees of romantic heroiſm. On the other hand, the finer ſenſes of *perception*, and thoſe *generous deſires* and *affections* which are connected with them, the *love of action*, of *imitation*, of *truth, honour, public virtue*, and the like, are wiſely placed in the oppoſite ſcale, in order to prevent us from ſinking into the dregs of the *animal* life, and debaſing the dignity of man below the condition of brutes. So that, by the mutual re-action of thoſe oppoſite powers, the bad effects are prevented that would naturally reſult from their acting ſingly and apart, and the good effects are produced which each are ſeverally formed to produce.

* Vid. *Hutcheſon's Conduct of the Paſſions, treat.* 1. § 2.

The ſame wholeſome oppoſition appears likewiſe in the particular counter-workings of the *private* and *public* affections one againſt the other. Thus *compaſſion* is adapted to counterpoiſe the *love of eaſe*, of *pleaſure*, and of *life*, and to diſarm or to ſet bounds to *reſentment*; and *reſentment* of injury done to ourſelves, or to our friends who are dearer than ourſelves, prevents an effeminate *compaſſion* or *conſternation*, and gives us a noble contempt of labour, pain, and death. *Natural affection, friendſhip, love of one's country*, nay, *zeal* for any particular virtue, are frequently more than a match for the whole train of *ſelfiſh* paſſions. On the other hand, without that intimate over-ruling paſſion of *ſelf-love*, and thoſe private deſires which are connected with it, the *ſocial* and *tender inſtincts* of the human heart would degenerate into the wildeſt dotage, the moſt torturing anxiety, and downright frenſy.

63 Contraſt or balance of public and private paſſions.

64 Contraſts among thoſe of the ſame claſſes.

But not only are the different orders or claſſes of affection checks one upon another, but paſſions of the ſame claſſes are mutual clogs. Thus, how many are with-held from the violent outrages of *reſentment* by *fear*? And how eaſily is *fear* controlled in its turn, while mighty wrongs awaken a mighty *reſentment*! The *private* paſſions often interfere, and therefore moderate the violence of each other; and a calm *ſelf-love* is placed at their head, to direct, influence, and control their particular attractions and repulſions. The *public* affections likewiſe reſtrain one the other; and all of them are put under the control of a calm diſpaſſionate *benevolence*, which ought in like manner to direct and limit their particular motions. Thus moſt part, if not all the paſſions, have a twofold aſpect, and ſerve a twofold end. In *one* view they may be conſidered as *powers*, impelling mankind to a certain courſe, with a *force* proportioned to the *apprehended moment* of the good they aim at. In *another* view they appear as *weights*, balancing the action of the *powers*, and controlling the violence of their impulſes. By means of theſe *powers* and *weights* a natural *poiſe* is ſettled in the human breaſt by its all-wiſe Author, by which the creature is kept tolerably ſteady and regular in his courſe, amidſt that variety of ſtages through which he muſt paſs.

65 Particular perceptions or inſtincts of approbation.

But this is not all the proviſion which God has made for the hurry and perplexity of the ſcene in which man is deſtined to act. Amidſt thoſe infinite attractions and repulſions towards private and public good and ill, mankind either cannot often foreſee the *conſequences* or *tendencies* of all their actions towards one or other of theſe, eſpecially where thoſe tendencies are intricate and point different ways, or thoſe conſequences remote and complicated; or though, by careful and cool inquiry, and a due improvement of their rational powers, they might find them out, yet, diſtracted as they are with buſineſs, amuſed with trifles, diſſipated by pleaſure, and diſturbed by paſſion, they either have or can find no leiſure to attend to thoſe conſequences, or to examine how far this or that conduct is productive of private or public good on the whole. Therefore, were it left entirely to the ſlow and ſober deductions of reaſon to trace thoſe tendencies, and make out thoſe conſequences, it is evident, that in many particular inſtances the buſineſs of life muſt ſtand ſtill, and many important occaſions of ac-

tion be loſt, or perhaps the groſſeſt blunders be committed. On this account the Deity, beſides that general approbation which we beſtow on every degree of *kind* affection, has moreover implanted in man many particular *perceptions* or *determinations* to approve of certain *qualities* or *actions*, which, in effect, tend to the advantage of ſociety, and are connected with private good, though he does not always ſee that tendency, nor mind that connection. And theſe *perceptions* or *determinations* do without reaſoning point out, and, antecedent to views of intereſt, prompt to a conduct beneficial to the *public*, and uſeful to the *private* ſyſtem. Such is that *ſenſe of candour and veracity*, that *abhorrence of fraud and falſehood*, that *ſenſe of fidelity, juſtice, gratitude, greatneſs of mind, fortitude, clemency, decorum*; and that *diſapprobation of knavery, injuſtice, ingratitude, meanneſs of ſpirit, cowardice, cruelty*, and *indecorum*, which are natural to the human mind. The *former* of thoſe diſpoſitions, and the actions flowing from them, are approved, and thoſe of the latter kind diſapproved by us, even abſtracted from the view of their tendency or conduciveneſs to the happineſs or miſery of others, or of ourſelves. In one we diſcern a *beauty*, a *ſuperior excellency*, a congruity to the *dignity* of man; in the other a *deformity*, a *littleneſs*, a *debaſement*, of human nature.

66 Others of an inferior order.

There are other principles alſo connected with the good of ſociety, or the happineſs and perfection of the individual, though that connection is not immediately apparent which we behold with real complacency and approbation, though perhaps inferior in degree, if not in kind, ſuch as *gravity, modeſty, ſimplicity of deportment, temperance, prudent œconomy*; and we feel ſome degree of contempt and diſlike where they are wanting, or where the oppoſite qualities prevail. Theſe and the like *perceptions* or *feelings* are either different *modifications* of the *moral ſenſe*, or *ſubordinate* to it, and plainly ſerve the ſame important purpoſe, being expeditious *monitors* in the ſeveral emergencies of a various and diſtracted life, of what is *right*, what is *wrong*, what is to be *purſued*, and what *avoided*; and, by the pleaſant or painful conſciouſneſs which attends them, exerting their influence as powerful *prompters* to a ſuitable conduct.

67 Their general tendencies.

From a ſlight inſpection of the above-named principles, it is evident they all carry a friendly aſpect to *ſociety* and the *individual*, and have a more immediate or a more remote tendency to promote the *perfection* or *good* of both. This tendency cannot be always foreſeen, and would be often miſtaken or ſeldom attended to by a weak, buſy, ſhort-ſighted creature like man, both raſh and variable in his opinions, a dupe to his own paſſions, or to the deſigns of others, liable to ſickneſs, to want, and to error. Principles, therefore, which are ſo nearly linked with *private ſecurity* and *public good*, by directing him, without operoſe reaſoning, where to find *one* and how to promote the *other*; and, by prompting him to a conduct conducive to both, are admirably adapted to the exigencies of his preſent ſtate, and wiſely calculated to obtain the ends of univerſal benevolence.

It were eaſy, by conſidering the ſubject in another light, to ſhew, in a curious detail of particulars, how wonderfully the inſide of man, or that aſtoniſhing train of *moral powers* and *affections* with which he is endued, is fitted to the ſeveral ſtages of that *progreſſive* and *probationary* ſtate through which he is deſtined to paſs. As our faculties are narrow and limited, and riſe from very ſmall and imperfect beginnings, they muſt be improved by exerciſe, by attention, and repeated trials. And this holds true not only of our *intellectual*, but of our *moral* and *active* powers. The former are liable to errors in ſpeculation, the latter to blunders in practice, and both often terminate in miſfortunes and pains. And thoſe errors and blunders are generally owing to our paſſions, or to our too forward and warm *admiration* of thoſe partial *goods* they naturally purſue, or to our fear of thoſe partial *ills* they naturally repel. Thoſe misfortunes, therefore, lead us back to conſider where our miſconduct lay, and whence our errors flowed; and conſequently are ſalutary pieces of trial, which tend to enlarge our views, to *correct* and *refine* our paſſions, and conſequently improve both our *intellectual* and *moral* powers. Our paſſions then are the rude materials of our virtue, which Heaven has given us to work up, to refine and poliſh into an harmonious and divine piece of workmanſhip. They furniſh out the whole machinery, the calms and ſtorms, the lights and ſhades of human life. They ſhew mankind in every attitude and variety of character, and give *virtue* both its ſtruggles and its triumphs. To conduct them well in every ſtate, is merit; to abuſe or miſapply them, is demerit.

68 Paſſions fitted to a ſtate of trial.

69 To a progreſſive ſtate.

The different ſets of *ſenſes, powers*, and *paſſions*, which unfold themſelves in thoſe ſucceſſive ſtages, are both neceſſary and adapted to that *riſing* and *progreſſive* ſtate. Enlarging views and growing connections require new paſſions and new habits; and thus the mind, by theſe continually expanding and finding a progreſſive exerciſe, riſes to higher improvements, and puſhes forward to maturity and perfection.

70, [71] Harmony of our ſtructure and ſtate.

In this beautiful œconomy and harmony of our ſtructure, both outward and inward, with that ſtate we may at once diſcern the great lines of our duty traced out in the faireſt and brighteſt characters, and contemplate with admiration a more auguſt and marvellous ſcene of divine wiſdom and goodneſs laid in the human breaſt, than we ſhall perhaps find in the whole compaſs of nature.

72 In what œconomy virtue conſiſts.

From this detail it appears, that man, by his original frame, is made for a *temperate, compaſſionate, benevolent, active*, and *progreſſive* ſtate. He is ſtrongly *attractive* of the *good*, and *repulſive* of the *ills*, which befal others as well as himſelf. He feels the higheſt *approbation* and *moral complacence* in thoſe affections, and in thoſe actions, which immediately and directly reſpect the *good* of others, and the higheſt *diſapprobation* and *abhorrence* of the contrary. Beſides theſe, he has many particular *perceptions* or *inſtincts* of *approbation*, which, though perhaps not of the ſame kind with the others, yet are accompanied with correſpondent degrees of affection, proportioned to their reſpective tendencies to the *public good*. *Therefore*, by acting agreeably to theſe principles, *man* acts agreeably to his ſtructure, and fulfils the benevolent

nevolent intentions of its author. But we call a thing *good* when it anſwers its *end*, and a creature *good* when he acts in a *conformity* to his *conſtitution*. Conſequently, *man* muſt be denominated *good* or *virtuous* when he acts ſuitably to the *principles* and *deſtination* of his nature.

PART II.

CHAP. I.

The principal Diſtinctions of DUTY *or* VIRTUE.

WE have now conſidered the *conſtitution* and *connections* of *man*, and on thoſe erected a general ſyſtem of *duty* or *moral obligation*, conſonant to *reaſon*, approved by his moſt ſacred and intimate *ſenſe*, ſuitable to his *mixed condition*, and confirmed by the *experience* of mankind. We have alſo traced the *final cauſes* of his *moral faculties* and *affections* to thoſe noble purpoſes they anſwer, with regard both to the *private* and the *public ſyſtem*.

73 General diviſion of duty.

From this induction it is evident, that there is one order or claſs of duties which *man* owes to *himſelf*: another to *ſociety*: and a third to *God*.

74 Duty to one's ſelf.

The duties he owes to *himſelf* are founded chiefly on the *defenſive* and *private* paſſions, which prompt him to purſue whatever tends to *private good* or *happineſs*, and to avoid or ward off whatever tends to *private ill* or *miſery*. Among the various goods which allure and ſolicit him, and the various ills which attack or threaten him, "To be intelligent and accurate in "ſelecting *one*, and rejecting the *other*, or in pre"ferring the moſt *excellent goods*, and avoiding the "moſt *terrible ills*, when there is a competition among "either, and to be diſcreet in uſing the beſt means "to attend the *goods* and avoid the *ills*, is what we "call *prudence*." This, in our *inward* frame, correſponds to *ſagacity*, or *quickneſs of ſenſe* in our *outward*.—"To proportion our *defenſive paſſions* to our "*dangers*, we call *fortitude*;" which always implies "a juſt mixture of calm reſentment or animoſity, and "well-governed caution." And this *firmneſs of mind* anſwers to the *ſtrength* and *muſcling* of the *body*.—And "duly to adjuſt our *private paſſions* to our wants, "or to the reſpective moment of the good we affect "or purſue, we call *temperance*;" which does therefore always imply, in this large ſenſe of the word, "a "juſt balance or command of the paſſions."

75 Duties to ſociety.

The *ſecond claſs* of *duties* ariſes from the *public* or *ſocial affections*, "the juſt harmony or proportion of "which to the *dangers* and *wants* of others, and to "the ſeveral *relations* we bear, commonly goes by "the name of *juſtice*." This includes the whole of our duty to *ſociety*, to its *parent*, and the *general polity* of *nature*; particularly *gratitude*, *friendſhip*, *ſincerity*, *natural affection*, *benevolence*, and the other *ſocial virtues*: This, being the *nobleſt temper*, and *faireſt complection* of the ſoul, correſponds to the *beauty* and *fine proportion* of the perſon. The virtues comprehended under the former claſs, eſpecially *prudence* and *fortitude*, may likewiſe be transferred to this; and according to the various circumſtances in which they are placed, and the more confined or more extenſive ſphere in which they operate, may be denominated *private*, *œconomical*, or *civil prudence*, *fortitude*, &c. Theſe direct our conduct with regard to the *wants* and *dangers* of thoſe leſſer or greater circles with which they are connected.

76 Duties to God.

The *third* claſs of duties reſpects the DEITY, and ariſes from the *public affections*, and the ſeveral glorious *relations* which he ſuſtains to us, as our *creator*, *benefactor*, *lawgiver*, *judge*, &c.

77 Method.

We choſe to conſider this *ſet* of duties in the laſt place, becauſe, though *prior* in dignity and excellency, they ſeem to be *laſt* in order of time, as thinking it the moſt ſimple and eaſy method to follow the gradual progreſs of nature, as it takes its riſe from individuals, and ſpreads through the *ſocial* ſyſtem, and ſtill aſcends upwards, till at length it ſtretches to its almighty Parent and Head, and ſo terminates in thoſe duties which are *higheſt* and *beſt*.

78 Piety.

The duties reſulting from theſe *relations* are, *reverence*, *gratitude*, *love*, *reſignation*, *dependence*, *obedience*, *worſhip*, *praiſe*; which, according to the model of our finite capacities, muſt maintain ſome ſort of proportion to the grandeur and perfection of the object whom we venerate, love, and obey. "This "*proportion* or *harmony* is expreſſed by the general "name of *piety* or *devotion*," which is always ſtronger or weaker according to the greater or leſs apprehended excellency of its object. This ſublime principle of virtue is the enlivening ſoul which animates the *moral ſyſtem*, and that cement which binds and ſuſtains the other duties which *man* owes to *himſelf* or to *ſociety*.

79 [84] Conſcience, and its diviſions.

This then is the general temper and conſtitution of virtue, and theſe are the principal lines or diviſions of duty. To thoſe good diſpoſitions which reſpect the ſeveral objects of our duty, and to all actions which flow from ſuch diſpoſitions, the mind gives its ſanction or teſtimony. And this ſanction or judgment concerning the moral quality, or the goodneſs of actions or diſpoſitions, moraliſts call *conſcience*. When it judges of an action that is to be performed, it is called an *antecedent conſcience*; and when it paſſes ſentence on an action which is performed, it is called a *ſubſequent conſcience*. The tendency of an action to produce happineſs, or its external conformity to a law, is termed its *material* goodneſs. But the good diſpoſitions from which an action proceeds, or its conformity to law in every reſpect, conſtitutes its *formal* goodneſs.

85 Diviſions of conſcience.

When the mind is ignorant or uncertain about the moment of an action, or its tendency to private or public good, or when there are ſeveral circumſtances in the caſe, ſome of which, being doubtful, render the mind dubious concerning the morality of the action, this is called a *doubtful* or *ſcrupulous conſcience*; if it miſtakes concerning theſe, it is called an *erroneous conſcience*. If the *error* or *ignorance* is *involuntary* or *invincible*, the action proceeding from that *error*, or from that *ignorance*, is reckoned *innocent*, or not imputable. If the error or ignorance is *ſupine* or *affected*, *i. e.* the effect of negligence, or of affectation and

and wilful inadvertence, the conduct flowing from ſuch error, or ſuch ignorance, is *criminal* and *imputable.* Not to follow one's conſcience, though erroneous and ill-informed, is *criminal*, as it is the guide of life; and to counteract it, ſhews a depraved and incorrigible ſpirit. Yet to follow an erroneous conſcience is likewiſe criminal, if that error which miſled the conſcience was the effect of inattention, or of any criminal paſſion *.

* *Hutcheſ. Mor. Inſt.* lib. 2. c. 3.

86 How conſcience is to be rectified.

If it be aſked, "How an erroneous conſcience ſhall "be rectified, ſince it is ſuppoſed to be the only guide "of life, and judge of morals?" We anſwer, in the very ſame way that we would rectify reaſon if at any time it ſhould judge wrong, as it often does, *viz.* by giving it proper and ſufficient materials for judging right, *i. e.* by inquiring into the whole ſtate of the caſe, the relations, connections, and ſeveral obligations of the actor, the conſequences and other circumſtances of the action, or the ſurpluſage of private or public good which reſults, or is likely to reſult, from the action or from the omiſſion of it. If thoſe circumſtances are fairly and fully ſtated, the conſcience will be juſt and impartial in its deciſion: for, by a neceſſary law of our nature, it approves and is well affected to the *moral form*; and if it ſeems to approve of *vice* or *immorality*, it is always under the notion or maſk of ſome *virtue*. So that, ſtrictly ſpeaking, it is not conſcience which errs; for its ſentence is always conformable to the view of the caſe which lies before it; and is *juſt*, upon the ſuppoſition that the caſe is truly ſuch as it is repreſented to it. All the fault is to be imputed to the agent, who neglects to be better informed, or who, through weakneſs or wickedneſs, haſtens to paſs ſentence from an imperfect evidence.

CHAP. II.

Of Man's Duty to HIMSELF. *Of the Nature of* GOOD, *and the Chief* GOOD.

87 Diviſions of good.

EVERY creature, by the conſtitution of his nature, is determined to love himſelf; to purſue whatever tends to his preſervation and happineſs, and to avoid whatever tends to his hurt and miſery. Being endued with ſenſe and perception, he muſt neceſſarily receive *pleaſure* from ſome objects, and *pain* from others. Thoſe objects which give pleaſure, are called *good*; and thoſe which give pain, *evil.* To the former he feels that attraction or motion we call *deſire*, or *love*: To the latter, that impulſe we call *averſion*, or *hatred.* To objects which ſuggeſt neither pleaſure nor pain, and are apprehended of no uſe to procure one or ward off the other, we feel neither *deſire* nor *averſion*; and ſuch objects are called *indifferent*. Thoſe objects which do not of themſelves produce pleaſure or pain, but are the *means* of procuring either, we call *uſeful* or *noxious*. Towards them we are affected in a ſubordinate manner, or with an *indirect* and *reflective* rather than a *direct* and *immediate* affection. All the original and particular affections of our nature lead us out to and ultimately reſt in the firſt kind of objects, *viz.* thoſe which give immediate pleaſure, and which we therefore call *good, directly ſo*. The calm affection of *ſelf-love* alone is converſant about ſuch objects as are only *conſequentially good*, or merely uſeful to ourſelves.

88 Moral good.

But, beſides thoſe ſorts of objects which we call *good*, merely and ſolely as they give pleaſure, or are means of procuring it, there is an higher and nobler ſpecies of good, towards which we feel that peculiar movement we call *approbation* or *moral complacency*; and which we *therefore* denominate *moral good.* Such are our affections, and the conſequent actions to them. The perception of this is, as has been already obſerved, quite diſtinct in kind from the perception of other ſpecies; and though it may be connected with *pleaſure* or *advantage* by the benevolent conſtitution of nature, yet it conſtitutes a *good* independent of that pleaſure and that advantage, and far ſuperior not in degree only but in dignity to both. The *other*, *viz.* the *natural good*, conſiſts in obtaining thoſe pleaſures which are adapted to the peculiar ſenſes and paſſions ſuſceptible of them, and is as various as are thoſe ſenſes and paſſions. This, *viz.* the *moral* good, lies in the right conduct of the ſeveral ſenſes and paſſions, or their juſt proportion and accommodation to their reſpective objects and relations; and this is of a more ſimple and invariable kind.

89 Human happineſs.

By our ſeveral ſenſes we are capable of a great variety of pleaſing ſenſations. Theſe conſtitute diſtinct ends, or objects ultimately purſuable for their own ſake. To theſe ends, or ultimate objects, correſpond peculiar appetites or affections, which prompt the mind to purſue them. When theſe ends are attained, there it reſts, and looks no farther. Whatever therefore is purſuable, not on its own account, but as ſubſervient or neceſſary to the attainment of ſomething elſe that is intrinſically valuable for its own ſake, be that value ever ſo great, or ever ſo ſmall, we call a *mean*, and not an *end*. So that *ends* and *means* conſtitute the *materials*, or the very *eſſence* of our *happineſs*. Conſequently happineſs, *i. e. human* happineſs, cannot be one ſimple uniform thing in creatures conſtituted, as we are, with ſuch various ſenſes of pleaſure, or ſuch different capacities of enjoyment. Now the ſame principle, or law of our nature, which determines us to purſue any one end or ſpecies of good, prompts us to purſue every other end or ſpecies of good of which we are ſuſceptible, or to which our Maker has adapted an original propenſion. But, amidſt the great multiplicity of *ends* or *goods* which form the various ingredients of our happineſs, we perceive an evident *gradation* or *ſubordination* ſuited to that gradation of *ſenſes*, *powers*, and *paſſions*, which prevails in our mixed and various conſtitution, and to that aſcending ſeries of connections which open upon us in the different ſtages of our progreſſive ſtate.

90 Gradation of goods.

Thus the goods of the *body*, or of the *external ſenſes*, ſeem to hold the loweſt rank in this gradation or ſcale of goods. Theſe we have in common with the brutes; and though many men are brutiſh enough to purſue the goods of the body with a more than brutal fury, yet, when at any time they come in competition with goods of an higher order, the unanimous verdict of mankind, by giving the laſt the preference, condemns the firſt to the meaneſt place. Goods conſiſting in exterior ſocial connections, as *fame*, *fortune*, *power*, civil

civil authority, ſeem to ſucceed next, and are chiefly valuable as the means of procuring *natural* or *moral* good, but principally the latter. Goods of the *intellect* are ſtill ſuperior, as *taſte*, *knowledge*, *memory*, *judgment*, &c. The higheſt are moral goods of the mind, directly and ultimately regarding ourſelves, as *command of the appetites* and *paſſions*, *prudence*, *fortitude*, *benevolence*, &c. Theſe are the great objects of our purſuit, and the principal ingredients of our happineſs. Let us conſider each of them as they riſe one above the other in this natural ſeries or ſcale, and touch briefly on our obligations to purſue them.

91 Goods of the body. Thoſe of the body are *health*, *ſtrength*, *agility*, *hardineſs*, and *patience of change*, *neatneſs*, and *decency*.

92 Good health. Good health, and a regular eaſy flow of ſpirits, are in themſelves ſweet natural enjoyments, a great fund of pleaſure, and indeed the proper ſeaſoning which gives a flavour and poignancy to every other pleaſure. The want of health unfits us for moſt duties of life, and is eſpecially an enemy to the ſocial and human affections, as it generally renders the unhappy ſufferer peeviſh and ſullen, diſguſted at the allotments of providence, and conſequently apt to entertain ſuſpicious and gloomy ſentiments of its Author. It obſtructs the free exerciſe and full improvement of our reaſon, makes us a burden to our friends, and uſeleſs to ſociety. Whereas the uninterrupted enjoyment of good health is a conſtant ſource of good humour, and good humour is a great friend to openneſs and benignity of heart, enables us to encounter the various ills and diſappointments of life with more courage, or to ſuſtain them with more patience; and, in ſhort, conduces much, if we are otherwiſe duly qualified, to our acting our part in every exigency of life with more firmneſs, conſiſtency, and dignity. Therefore it imports us much to preſerve and improve an habit or enjoyment, without which every other external entertainment is taſteleſs, and moſt other advantages of little avail.

93 How preſerved. And this is beſt done by a ſtrict temperance in diet and regimen, by regular exerciſe, and by keeping the mind ſerene and unruffled by violent paſſions, and unſubdued by intenſe and conſtant labours, which greatly impair and gradually deſtroy the ſtrongeſt conſtitutions.

94 Strength, agility, &c. *Strength*, *agility*, *hardineſs*, and *patience of change*, ſuppoſe health, and are unattainable without it; but they imply ſomething more, and are neceſſary to guard it, to give us the perfect uſe of life and limbs, and to ſecure us againſt many otherwiſe unavoidable ills. The exerciſe of the neceſſary manual, and of moſt of the elegant arts of life, depends on ſtrength and agility of body; perſonal dangers, private and public dangers, the demands of our friends, our families, and country, require them; they are neceſſary in war, and ornamental in peace; fit for the employment of a country and a town life, and they exalt the entertainments and diverſions of both.

95 How attained. They are chiefly obtained by moderate and regular exerciſe.

96 Patience of change. Few are ſo much raiſed above want and dependence, or ſo exempted from buſineſs and care, as not to be often expoſed to inequalities and changes of diet, exerciſe, air, climate, and other irregularities. Now, what can be ſo effectual to ſecure one againſt the miſchiefs ariſing from ſuch unavoidable alterations, as hardineſs, and a certain verſatility of conſtitution which can bear extraordinary labours, and ſubmit to great changes, without any ſenſible uneaſineſs or bad conſequences.

97 How attained. This is beſt attained, not by an over-great delicacy and minute attention to forms, or by an invariable regularity in diet, hours, and way of living, but rather by a bold and diſcreet latitude of regimen. Beſides, deviations from eſtabliſhed rules and forms of living, if kept within the bounds of ſobriety and reaſon, are friendly to thought and original ſentiments, animate the dull ſcene of ordinary life and buſineſs, and agreeably ſtir the paſſions, which ſtagnate or breed ill-humour in the calms of life.

98 Neatneſs, decency, &c. *Neatneſs*, *cleanlineſs*, and *decency*, to which we may add *dignity* of *countenance*, and *demeanour*, ſeem to have ſomething refined and moral in them: at leaſt we generally eſteem them indications of an orderly, genteel, and well-governed mind, conſcious of an inward worth, or the reſpect due to one's nature. Whereas *naſtineſs*, *ſlovenlineſs*, *aukwardneſs*, and *indecency*, are ſhrewd ſymptoms of ſomething mean, careleſs, and deficient, and betray a mind untaught, illiberal, unconſcious of what is due to one's ſelf or to others. How much cleanlineſs conduces to health, needs hardly to be mentioned; and how neceſſary it is to maintain one's character and rank in life, and to render us agreeable to others as well as to ourſelves, is as evident.—There are certain motions, airs, and geſtures, which become the human countenance and form, in which we perceive a *comelineſs*, *openneſs*, *ſimplicity*, *gracefulneſs*; and there are others, which to our ſenſe of decorum appear *uncomely*, *affected*, *diſingenuous*, and *aukward*, quite unſuitable to the native dignity of our face and form. The *firſt* are in themſelves the moſt eaſy, natural, and commodious, give one boldneſs and preſence of mind, a modeſt aſſurance, an addreſs both awful and alluring; they beſpeak candour and greatneſs of mind, raiſe the moſt agreeable prejudices in one's favour, render ſociety engaging, command reſpect, and often love, and give weight and authority both in converſation and buſineſs; in fine, they are the colouring of virtue, which ſhew it to the greateſt advantage in whomſoever it is; and not only imitate, but in ſome meaſure ſupply it where it is wanting. Whereas the laſt, *viz* *rudeneſs*, *affectation*, *indecorum*, and the like, have all the contrary effects; they are burdenſome to one's ſelf, a diſhonour to our nature, and a nuiſance in ſociety.

99 How attained. The former qualities or goods are beſt attained by a liberal education, by preſerving a juſt ſenſe of the dignity of our nature, by keeping the beſt and politeſt company, but, above all, by acquiring thoſe virtuous and ennobling habits of mind which are decency in perfection, which will give an air of unaffected grandeur, and ſpread a luſtre truly engaging over the whole form and deportment.

100 Goods of exterior ſocial connections. We are next to conſider theſe goods which conſiſt in exterior ſocial connections, as *fame*, *fortune*, *civil authority*, *power*.

101 Fame. The firſt has a two-fold aſpect, as a good pleaſant in itſelf, or gratifying to an original paſſion, and then as expedient or uſeful towards a farther end. Honour from the wiſe and good, on the account of a virtuous conduct, is regaling to a good man; for then his heart re-

re-echoes to the grateful ſound. There are few quite indifferent even to the commendation of the vulgar. Though we cannot approve that conduct which proceeds entirely from this principle, and not from good affection or love of the conduct itſelf, yet, as it is often a guard and additional motive to virtue in creatures imperfect as we are, and often diſtracted by interfering paſſions, it might be dangerous to ſuppreſs it altogether, however wiſe it may be to reſtrain it within due bounds, and however laudable to uſe it only as a ſcaffolding to our virtue, which may be taken down when that glorious ſtructure is finiſhed, but hardly till then. To purſue fame for itſelf, is innocent; to regard it only as an auxiliary to virtue, is noble; to ſeek it chiefly as an engine of public uſefulneſs, is ſtill more noble, and highly praiſe-worthy. For though the opinion and breath of men are tranſient and fading things, often obtained without merit, and loſt without cauſe; yet as our buſineſs is with men, and as our capacity of ſerving them is generally increaſed in proportion to their eſteem of us, therefore ſound and well-eſtabliſhed *moral* applauſe may, and will be modeſtly, not oſtentatiouſly, ſought after by the *good;* not indeed as a ſolitary refined ſort of luxury, but as a public and proper inſtrument to ſerve and bleſs mankind. At the ſame time they will learn to deſpiſe that reputation which is founded on rank, fortune, and any other circumſtances or accompliſhments that are foreign to real merit, or to uſeful ſervices done to others, and think that praiſe of little avail which is purchaſed without deſert, and beſtowed without judgment.

102 Fortune, Power, &c. *Fortune, power,* and *civil authority,* or whatever is called influence and weight among mankind, are *goods* of the *ſecond* diviſion, that is, valuable and purſuable only as they are *uſeful,* or as means to a farther end, *viz.* procuring or preſerving the immediate objects of enjoyment or happineſs to ourſelves or others. Therefore to love ſuch goods on their own account, and to purſue them as ends, not the means of enjoyment, muſt be highly prepoſterous and abſurd. There can be no meaſure, no limit, to ſuch purſuit; all muſt be whim, caprice, extravagance. Accordingly ſuch appetites, unlike all the *natural* ones, are increaſed by poſſeſſion, and whetted by enjoyment. They are always precarious, and never without fears, becauſe the objects lie without one's ſelf; they are ſeldom without ſorrow and vexation, becauſe no acceſſion of wealth or power can ſatisfy them.
103 How far purſuable. But if thoſe goods are conſidered only as the materials or means of private or public happineſs, then the ſame obligations which bind us to purſue the latter, bind us likewiſe to purſue the former. We may, and no doubt we ought, to ſeek ſuch a meaſure of wealth as is neceſſary to ſupply all our real wants, to raiſe us above ſervile dependence, and provide us with ſuch conveniencies as are ſuited to our rank and condition in life. To be regardleſs of this meaſure of wealth, is to expoſe ourſelves to all the temptations of poverty and corruption; to forfeit our natural independency and freedom; to degrade, and conſequently to render the rank we hold, and the character we ſuſtain in ſociety, uſeleſs, if not contemptible. When theſe important ends are ſecured, we ought not to murmur or repine that we poſſeſs no more; yet we are not ſecluded by any obligation, moral or divine, from ſeeking more, in order to give us that happieſt and moſt god-like of all powers, the *power* of *doing good.* A ſupine indolence in this reſpect is both abſurd and criminal; *abſurd,* as it robs us of an inexhauſted fund of the moſt refined and durable enjoyments; and *criminal,* as it renders us ſo far uſeleſs to the ſociety to which we belong. "That purſuit of wealth which
"goes beyond the former end, *viz.* the obtaining the 104 Avarice.
"neceſſaries, or ſuch conveniencies of life, as, in the "eſtimation of reaſon, not of vanity or paſſion, are "ſuited to our rank and condition, and yet is not directed to the latter, *viz.* the doing good is what we "call *avarice.*" And "that purſuit of *power,* which,
"after ſecuring one's ſelf, *i. e.* having attained the 105 Ambition.
"proper independence and liberty of a rational ſocial "creature, is not directed to the good of others, is "what we call *ambition,* or the *luſt of power.*" To what extent the ſtrict meaſures of virtue will allow us to purſue either wealth or power, and civil authority, is not perhaps poſſible preciſely to determine. That muſt be left to prudence, and the peculiar character, condition, and other circumſtances of each man. Only thus far a limit may be ſet, that the purſuit of either muſt encroach upon no other duty or obligation which we owe to ourſelves, to ſociety, or to its parent and head. The ſame reaſoning is to be applied to *power* as to *wealth.* It is only valuable as an inſtrument of our own ſecurity, and of the free enjoyment of thoſe original goods it may, and often does, adminiſter to us, and, as an engine of more extenſive happineſs to our friends, our country, and mankind.

Now the beſt, and indeed the only way to obtain a 106 How fame and power are attained.
ſolid and laſting fame, is an uniform inflexible courſe of virtue, the employing one's ability and wealth in ſupplying the wants, and uſing one's power in promoting or ſecuring the happineſs, the rights and liberties of mankind, joined to an univerſal affability and politeneſs of manners. And ſurely one will not miſtake the matter much, who thinks the ſame courſe conducive to the acquiring greater acceſſions both of wealth and power; eſpecially if he adds to thoſe qualifications a vigorous induſtry, a conſtant attention to the characters and wants of men, to the conjunctures of times, and continually-varying genius of affairs; and a ſteady intrepid honeſty, that will neither yield to the allurements, nor be over-awed with the terrors, of that corrupt and corrupting ſcene in which we live. We have ſometimes heard indeed of other ways and means, as fraud, diſſimulation, ſervility, and proſtitution, and the like ignoble arts, by which the men of the world (as they are called, ſhrewd politicians, and men of addreſs!) amaſs wealth, and procure power: but as we want rather to form a man of virtue, an honeſt, contented, happy man, we leave to the men of the world their own ways, and permit them, unenvied and unimitated by us, to reap the fruit of their doings.

The next ſpecies of objects in the ſcale of good, are 107 Good of the intellect.
the goods of the *intellect,* as *knowledge, memory, judgment, taſte, ſagacity, docility,* and whatever elſe we call *intellectual* virtues. Let us conſider them a little, and the *means* as well as *obligations* to improve them.

As *man* is a *rational* creature, capable of knowing 108 Their moment.
the differences of things and actions;—as he not only ſees

sees and feels what is present, but remembers what is past, and often foresees what is future;—as he advances from small beginnings, by slow degrees, and with much labour and difficulty, to knowledge and experience:—as his opinions sway his passions,—as his passions influence his conduct,—and as his conduct draws consequences after it, which extend not only to the present, but to the future time, and therefore is the principal source of his happiness or misery; it is evident, that he is formed for intellectual improvements, and that it must be of the utmost consequence for him to improve and cultivate his intellectual powers, on which those opinions, those passions, and that conduct depend*.

* *Philos. Sinic. Confuc.* lib. I. § 3, 4, *&c.*

109 The pleasures they give.

But, besides the future consequences and moment of improving our *intellectual* powers, their immediate exercise on their proper objects yields the most rational and refined pleasures.

110 Knowledge and taste.

Knowledge, and a right taste in the arts of *imitation* and *design*, as *poetry*, *painting*, *sculpture*, *music*, *architecture*, afford not only an innocent, but a most sensible and sublime entertainment. By these the understanding is instructed in ancient and modern life, the history of men and things, the energies and effects of the passions, the consequences of virtue and vice; by these the imagination is at once entertained and nourished with the beauties of nature and art, lighted up and spread out with the novelty, grandeur, and harmony of the universe; and, in fine, the passions are agreeably roused, and suitably engaged, by the greatest and most interesting objects that can fill the human mind. He who has a taste formed to these ingenious delights, and plenty of materials to gratify it, can never want the most agreeable exercise and entertainment, nor once have reason to make that fashionable complaint of the tediousness of time. Nor can he want a proper subject for the discipline and improvement of his heart. For, being daily conversant with *beauty*, *order*, and *design*, in inferior subjects, he bids fair for growing in due time an admirer of what is fair and well-proportioned in the conduct of life and the order of society, which is only *order* and *design* exerted in their highest subject. He will learn to transfer the numbers of poetry to the harmony of the mind and of well-governed passions; and, from admiring the virtues of others in moral paintings, come to approve and imitate them himself. Therefore to cultivate a *true* and *correct taste*, must be both our *interest* and our *duty*, when the circumstances of our station give leasure and opportunity for it, and when the doing it is not inconsistent with our higher obligations or engagements to society and mankind.

111 How attained.

It is best attained by reading the best books, where *good sense* has more the ascendant than *learning*, and which pertain more to *practice* than to *speculation*; by studying the best models, *i. e.* those which profess to imitate nature most, and approach the nearest to it, and by conversing with men of the most refined taste, and the greatest experience in life.

112 Moment of intellectual goods.

As to the other intellectual goods, what a fund of entertainment must it be to investigate the truth and various relations of things, to trace the operations of nature to general laws, to explain by these its manifold phænomena, to understand that order by which the universe is upheld, and that œconomy by which it is governed; to be acquainted with the human mind, the connections, subordinations, and uses of its powers, and to mark their energy in life! how agreeable to the ingenious inquirer, to observe the manifold relations and combinations of individual minds in society, to discern the causes why they flourish or decay; and from thence to ascend, through the vast scale of beings, to that general mind which presides over all, and operates unseen in every system and in every age, through the whole compass and progression of nature! devoted to such entertainments as these, the contemplative have abandoned every other pleasure, retired from the body, so to speak, and sequestered themselves from social intercourse; for these, the *busy* have often preferred to the hurry and din of life the calm retreats of contemplation; for these, when once they came to taste them, even the *gay* and *voluptuous* have thrown up the lawless pursuits of sense and appetite, and acknowledged these mentual enjoyments to be the most *refined*, and indeed the *only* luxury. Besides, by a just and large knowledge of nature, we recognize the perfections of its author; and thus piety, and all those pious affections which depend on just sentiments of his character, are awakened and confirmed; and a thousand superstitious fears, that arise from partial views of his nature and works, will of course be excluded. An extensive prospect of human life, and of the periods and revolutions of human things, will conduce much to the giving a certain greatness of mind, and a noble contempt to those little competitions about power, honour, and wealth, which disturb and divide the bulk of mankind; and promote a calm indurance of those inconveniencies and ills that are the common appendages of humanity. Add to all, that a just knowledge of human nature, and of those hinges upon which the business and fortunes of men turn, will prevent our thinking either too highly or too meanly of our fellow-creatures, give no small scope to the exercise of friendship, confidence, and good-will, and at the same time brace the mind with a proper caution and distrust, those nerves of prudence, and give a greater mastery in the conduct of private as well as public life. Therefore, by cultivating our intellectual abilities, we shall best promote and secure our interest, and be qualified for acting our part in society with more honour to ourselves, as well as advantage to mankind. Consequently, to improve them to the utmost of our power is our duty; they are talents committed to us by the almighty Head of society, and we are accountable to him for the use of them.

The intellectual virtues are best improved by accurate and impartial observation, extensive reading, and unconfined converse with men of all characters, especially with those who, to private study, have joined the widest acquaintance with the world, and greatest praictce in affairs; but, above all, by being much in the world, and having large dealings with mankind. Such opportunities contribute much to divest one of prejudices and a servile attachment to crude systems, to open one's views, and to give that experience on which the most useful, because the most practical knowledge is built, and from which the surest maxims for the conduct of life are deduced. 113 How attained.

The highest goods which enter into the composition 114 Moral of goods.

of human happineſs are *moral* goods of the mind, directly and ultimately regarding ourſelves; as *command of the appetites and paſſions, prudence and caution, magnanimity, fortitude, humility, love of virtue, love of God, reſignation*, and the like. Theſe ſublime goods are goods by way of eminence, goods recommended and enforced by the moſt intimate and awful ſenſe and conſciouſneſs of our nature; goods that conſtitute the quinteſſence, the very temper of happineſs, that form and complection of ſoul which renders us approvable and lovely in the ſight of God; goods, in fine, which are the elements of all our future perfection and felicity.

115 Their moment.

Moſt of the other goods we have conſidered depend partly on ourſelves, and partly on accidents which we can neither foreſee nor prevent, and reſult from cauſes which we cannot influence or alter. They are ſuch goods as we may poſſeſs to-day and loſe to-morrow, and which require a felicity of conſtitution, and talents to attain them in full vigour and perfection, and a felicity of conjunctures to ſecure the poſſeſſion of them. Therefore, did our happineſs depend altogether or chiefly on ſuch tranſitory and precarious poſſeſſions, it were itſelf moſt precarious, and the higheſt folly to be anxious about it.——But though creatures, conſtituted as we are, cannot be indifferent about ſuch goods, and muſt ſuffer in ſome degree, and conſequently have our happineſs incomplete without them, yet they weigh but little in the ſcale when compared with moral goods. By the benevolent conſtitution of our nature theſe are placed within the ſphere of our activity, ſo that no man can be deſtitute of them unleſs he is firſt wanting to himſelf. Some of the wiſeſt and beſt of mankind have wanted moſt of the former goods, and all the external kind, and felt moſt of the oppoſite ills, ſuch at leaſt as ariſe from without; yet by poſſeſſing the latter, *viz.* the moral goods, have declared they were happy; and to the conviction of the moſt impartial obſervers have appeared happy. The worſt of men have been ſurrounded with every outward good and advantage of fortune, and have poſſeſſed great parts; yet, for want of moral rectitude, have been, and have confeſſed themſelves, notoriouſly and exquiſitely miſerable. The exerciſe of virtue has ſupported its votaries, and made them exult in the midſt of tortures almoſt intolerable; nay, how often has ſome falſe form or ſhadow of it ſuſtained even the greateſt * villains and bigots under the ſame preſſures! But no external goods, no goods of fortune, have been able to alleviate the agonies or expel the fears of a guilty mind, conſcious of the deſerved hatred and reproach of mankind, and the juſt diſpleaſure of Almighty God.

116 The mixed condition of human life requires particular virtues.

As the preſent condition of human life is wonderfully chequered with good and ill, and as no height of ſtation, no affluence of fortune, can abſolutely inſure the good, or ſecure againſt the ill, it is evident that a great part of the comfort and ſerenity of life muſt lie in having our minds duly affected with regard to both, *i. e.* rightly attempered to the loſs of one and the ſufferance of the other. For it is certain that outward calamities derive their chief malignity and preſſure from the inward diſpoſitions with which we receive them. By managing theſe right, we may greatly abate that malignity and preſſure, and conſequently diminiſh the number, and weaken the moment, of the ills of life, if we ſhould not have it in our power to obtain a large ſhare of its goods. There are particularly three virtues which go to the forming this right temper towards ill, and which are of ſingular efficacy, if not totally to remove, yet wonderfully to alleviate, the calamities of life. Theſe are *fortitude*, or *patience*, *humility*, and *reſignation*.

117 Fortitude.

Fortitude is that calm and ſteady habit of mind which either moderates our fears, and enables us bravely to encounter the proſpect of ill, or renders the mind ſerene and invincible under its immediate preſſure. It lies equally diſtant from raſhneſs and cowardice; and though it does not hinder us from feeling, yet prevents our complaining or ſhrinking under the ſtroke. It always includes a generous contempt of, or at leaſt a noble ſuperiority to, thoſe precarious goods of which we can inſure neither the poſſeſſion nor continuance. The man therefore who poſſeſſes this virtue in this ample ſenſe of it, ſtands upon an eminence, and ſees human things below him; the tempeſt indeed may reach him, but he ſtands ſecure and collected againſt it upon the baſis of conſcious virtue, which the ſevereſt ſtorms can ſeldom ſhake, and never overthrow.

118 Humility.

Humility is another virtue of high rank and dignity, though often miſtaken by proud mortals for meanneſs and puſillanimity. It is oppoſed to *pride*, which commonly includes in it a falſe or over-rated eſtimation of our own merit, an aſcription of it to ourſelves as its only and original cauſe, an undue compariſon of ourſelves with others, and, in conſequence of that ſuppoſed ſuperiority, an arrogant preference of ourſelves, and a ſupercilious contempt of them. *Humility*, on the other hand, ſeems to denote that modeſt and ingenuous temper of mind, which ariſes from a juſt and equal eſtimate of our own advantages compared with thoſe of others, and from a ſenſe of our deriving all originally from the Author of our being. Its ordinary attendants are mildneſs, a gentle forbearance, and an eaſy unaſſuming humanity with regard to the imperfections and faults of others; virtues rare indeed, but of the faireſt complection, the proper offspring of ſo lovely a parent, the beſt ornaments of ſuch imperfect creatures as we are, precious in the ſight of God, and which ſweetly allure the hearts of men.

119 Reſignation

Reſignation is that mild and heroic temper of mind which ariſes from a ſenſe of an infinitely wiſe and good providence, and enables one to acquieſce with a cordial affection in its juſt appointments. This virtue has ſomething very peculiar in its nature, and ſublime in its efficacy. For it teaches us to bear ill not only with patience, and as being unavoidable, but it transforms, as it were, ill into good, by leading us to conſider it, and every event that has the leaſt appearance of ill, as a divine diſpenſation, a wiſe and benevolent temperament of things, ſubſervient to univerſal good, and, of courſe, including that of every individual, eſpecially of ſuch as calmly ſtoop to it. In this light, the

* As Ravilliac, who aſſaſſinated Henry the fourth of France; and Balthaſar Geraerd, who murdered William the Firſt, prince of Orange.

the adminiſtration itſelf, nay every act of it, becomes an object of affection, the evil diſappears, or is converted into a balm which both heals and nouriſheth the mind. For, though the firſt unexpected acceſs of ill may ſurpriſe the ſoul into grief, yet that grief, when the mind calmly reviews its object, changes into contentment, and is by degrees exalted into veneration and a divine compoſure. Our private will is loſt in that of the Almighty, and our ſecurity againſt every real ill reſts on the ſame bottom as the throne of him who lives and reigns for ever.

120 *Chief good, objective and formal.* Before we finiſh this ſection, it may be fit to obſerve, that as the Deity is the ſupreme and inexhauſted ſource of good, on whom the happineſs of the whole creation depends; as he is the higheſt object in nature, and the only object who is fully proportioned to the *intellectual* and *moral* powers of the mind, in whom they ultimately reſt, and find their moſt perfect exerciſe and completion, he is therefore termed the *Chief good of man, objectively* conſidered. And *virtue*, or the proportioned and vigorous exerciſe of the ſeveral powers and affections on their reſpective objects, as above deſcribed, is, in the ſchools, termed the *chief good, formally* conſidered, or its *formal* idea, being the inward temper and native conſtitution of human happineſs.

From the detail we have gone through, the following corollaries may be deduced.

121 Corollaries. *Firſt*, It is evident, that the happineſs of ſuch a *progreſſive* creature as man can never be at a ſtand, or continue a fixed invariable thing. His finite nature, let it riſe ever ſo high, admits ſtill higher degrees of improvement and perfection. And his progreſſion in improvement or virtue always makes way for a progreſſion in happineſs. So that no poſſible point can be aſſigned in any period of his exiſtence in which he is perfectly happy, that is, ſo happy as to exclude higher degrees of happineſs. All his perfection is only comparative. 2. It appears that many things muſt conſpire to complete the happineſs of ſo *various* a creature as man, ſubject to ſo many wants, and ſuſceptible of ſuch different pleaſures. 3. As his capacities of pleaſure cannot be all gratified at the ſame time, and muſt often interfere with each other in ſuch a precarious and fleeting ſtate as human life, or be frequently diſappointed, perfect happineſs, *i. e.* the undiſturbed enjoyment of the ſeveral pleaſures of which we are capable, is unattainable in our preſent ſtate. 4. That ſtate is moſt to be ſought after, in which the feweſt competitions and diſappointments can happen, which leaſt of all impairs any ſenſe of pleaſure, and opens an inexhauſted ſource of the moſt refined and laſting enjoyments. 5. That ſtate which is attended with all thoſe advantages, is a ſtate or courſe of virtue. 6. *Therefore*, a ſtate of *virtue*, in which the moral goods of the mind are attained, is the *happieſt ſtate*.

CHAP. III.

Duties to SOCIETY.

SECT. I. *Filial and Fraternal Duty.*

As we have followed the order of nature in tracing the hiſtory of man, and thoſe duties which he owes to himſelf, it ſeems reaſonable to take the ſame method with thoſe he owes to ſociety, which conſtitute the *ſecond* claſs of his *obligations*.

122 Connection of parents. His parents are among the earlieſt objects of his attention; he becomes ſooneſt acquainted with them, repoſes a peculiar confidence in them, and ſeems to regard them with a fond affection, the early prognoſtics of his future *piety* and *gratitude*. Thus does nature dictate the firſt lines of filial duty, even before a juſt ſenſe of the connection is formed. But when the child is grown up, and has attained to ſuch a degree of underſtanding, as to comprehend the *moral tie*, and be ſenſible of the obligations he is under to his parents; when he looks back on their tender and diſintereſted affection, their inceſſant cares and labours in nurſing, educating, and providing for him, during that ſtate in which he had neither prudence nor ſtrength to care and provide for himſelf, he muſt be conſcious that he owes to them theſe peculiar duties.

123 Duties to parents. To reverence and honour them, as the inſtruments of nature in introducing him to life, and to that ſtate of comfort and happineſs which he enjoys; and therefore to eſteem and imitate their good qualities, to alleviate and bear with, and ſpread, as much as poſſible, a decent veil over their faults and weakneſſes.

2. To be highly grateful to them, for thoſe favours which it can hardly ever be in his power fully to repay; to ſhew this gratitude by a ſtrict attention to their wants, and a ſollicitous care to ſupply them; by a ſubmiſſive deference to their authority and advice, eſpecially by paying great regard to it in the choice of a wife, and of an occupation; by yielding to, rather than peeviſhly contending with, their humours, as remembering how oft they have been perſecuted by his; and, in fine, by ſoothing their cares, lightening their ſorrows, ſupporting the infirmities of age, and making the remainder of their life as comfortable and joyful as poſſible.

124 Duties to brethren and ſiſters. As his brethren and ſiſters are the next with whom the creature forms a *ſocial* and *moral* connection, to them he owes a *fraternal* regard; and with them ought he to enter into a ſtrict league of friendſhip, mutual ſympathy, advice, aſſiſtance, and a generous intercourſe of kind offices, remembering their relation to common parents, and that brotherhood of nature which unites them into a cloſer community of intereſt and affection.

SECT. II. *Concerning Marriage.*

125 Connection with the other ſex. WHEN man arrives to a certain age, he becomes ſenſible of a peculiar ſympathy and tenderneſs towards the other ſex; the charms of beauty engage his attention, and call forth new and ſofter diſpoſitions than he has yet felt. The many amiable qualities exhibited by a fair outſide, or by the mild allurement of female manners, or which the prejudiced ſpectator without much reaſoning ſuppoſes thoſe to include, with ſeveral other circumſtances both natural and accidental, point his view and affection to a particular object, and of courſe contract that general rambling regard, which was loſt and uſeleſs among the undiſtinguiſhed crowd, into a peculiar and permanent attachment to one woman, which ordinarily terminates in the moſt important, venerable, and delightful connection in life.

126 The grounds of this connection.

The ſtate of the brute creation is very different from that of human creatures. The former are cloathed and generally armed by their ſtructure, eaſily find what is neceſſary to their ſubſiſtence, and ſoon attain their vigour and maturity; ſo that they need the care and aid of their parents but for a ſhort while; and therefore we ſee that nature has aſſigned to them vagrant and tranſient amours. The connection being purely *natural*, and merely for propagating and rearing their offspring, no ſooner is that end anſwered, than the connection diſſolves of courſe. But the human race are of a more tender and defenceleſs conſtitution; their infancy and non-age continue longer; they advance ſlowly to ſtrength of body, and maturity of reaſon; they need conſtant attention, and a long ſeries of cares and labours, to train them up to decency, virtue, and the various arts of life. Nature has, therefore, provided them with the moſt affectionate and anxious tutors, to aid their weakneſs, to ſupply their wants, and to accompliſh them in thoſe neceſſary arts, even their own parents, on whom ſhe has devolved this mighty charge, rendered agreeable by the moſt alluring and powerful of all ties, parental affection. But unleſs both concur in this grateful taſk, and continue their joint labours, till they have reared up and planted out their young colony, it muſt become a prey to every rude invader, and the purpoſe of nature in the original union of the human pair be defeated. Therefore our ſtructure as well as condition is an evident indication, that the human ſexes are deſtined for a more intimate, for a moral and laſting union. It appears likewiſe, that the principal end of marriage is not to propagate and nurſe up an offspring, but to educate and form minds for the great duties and extenſive deſtinations of life. Society muſt be ſupplied from this original nurſery with uſeful members, and its faireſt ornaments and ſupports.

127 [128] Moral ends of marriage.

The mind is apt to be diſſipated in its views and acts of friendſhip and humanity; unleſs the *former* be directed to a particular object, and the *latter* employed in a particular province. When men once indulge to this diſſipation, there is no ſtopping their career, they grow inſenſible to moral attractions, and, by obſtructing or impairing the decent and regular exerciſe of the tender and generous feelings of the human heart, they in time become unqualified for, or averſe to, the forming a moral union of ſouls, which is the cement of ſociety, and the ſource of the pureſt domeſtic joys. Whereas a rational, undepraved *love*, and its fair companion, *marriage*, collect a man's views, guide his heart to its proper object, and, by confining his affection to that object, do really enlarge its influence and uſe. Beſides, it is but too evident from the conduct of mankind, that the common ties of humanity are too feeble to engage and intereſt the paſſions of the generality in the affairs of ſociety. The connections of neighbourhood, acquaintance, and general intercourſe, are too wide a field of action for many, and thoſe of a *public* or *community* are ſo for more; and in which they *either care not, or know not how* to exert themſelves. Therefore nature, ever wiſe and benevolent, by implanting that ſtrong ſympathy which reigns between the individuals of each ſex, and by urging them to form a particular moral connection, the ſpring of many domeſtic endearments, has meaſured out to each pair a particular *ſphere of action*, proportioned to their views, and adapted to their reſpective capacities. Beſides, by intereſting them deeply in the concerns of their own little circle, ſhe has connected them more cloſely with ſociety, which is compoſed of particular families, and bound them down to their good behaviour in that particular community to which they belong. This *moral connection* is *marriage*, and this *ſphere of action* is a *family*.

129 Duties of marriage.

Of the *conjugal* alliance the following are the *natural laws*. Firſt, mutual fidelity to the marriage-bed. Diſloyalty defeats the very end of marriage, diſſolves the natural cement of the relation, weakens the moral tie, the chief ſtrength of which lies in the reciprocation of affection; and, by making the offspring uncertain, diminiſhes the care and attachment neceſſary to their education.

2. A conſpiration of counſels and endeavours to promote the common intereſt of the family, and to educate their common offspring. In order to obſerve theſe laws, it is neceſſary to cultivate, both before and during the married ſtate, the ſtricteſt decency and chaſtity of manners, and a juſt ſenſe of what becomes their reſpective characters.

3. The union muſt be inviolable, and for life. The nature of friendſhip, and particularly of this ſpecies of it, the education of their offspring, and the order of ſociety and of ſucceſſions, which would otherwiſe be extremely perplexed, do all ſeem to require it. To preſerve this union, and render the matrimonial ſtate more harmonious and comfortable, a mutual eſteem and tenderneſs, a mutual deference and forbearance, a communication of advice, and aſſiſtance and authority, are abſolutely neceſſary. If either party keep within their proper departments, there need be no diſputes about power or ſuperiority, and there will be none. They have no *oppoſite*, no *ſeparate* intereſts, and therefore there can be no juſt ground for oppoſition of conduct.

130 [131] Polygamy.

From this detail, and the preſent ſtate of things, in which there is pretty near a parity of numbers of both ſexes, it is evident that *polygamy* is an *unnatural* ſtate; and though it ſhould be granted to be more fruitful of children, which however it is not found to be, yet it is by no means ſo fit for rearing minds, which ſeems to be as much, if not more, the intention of nature than the propagation of bodies.

Sect. III. *Of Parental Duty.*

132 Connection of parents and children.

The connection of parents with their children is a natural conſequence of the matrimonial connection; and the duties which they owe them reſult as naturally from that connection. The feeble ſtate of children, ſubject to ſo many wants and dangers, requires their inceſſant care and attention; their ignorant and uncultivated minds demand their continual inſtruction and culture. Had human creatures come into the world with the full ſtrength of *men* and the weakneſs of reaſon and vehemence of paſſions which prevail in *children*, they would have been too ſtrong or too ſtubborn to have ſubmitted to the government and inſtruction of their parents. But as they were deſigned for a progreſſion in knowledge and virtue, it was proper that

that the growth of their bodies ſhould keep pace with that of their minds, leſt the purpoſes of that progreſſion ſhould have been defeated. Among other admirable purpoſes which this gradual expanſion of their outward as well as inward ſtructure ſerves, this is one, that it affords ample ſcope to the exerciſe of many tender and generous affections, which fill up the domeſtic life with a beautiful variety of duties and enjoyments; and are of courſe a noble diſcipline for the heart, and an hardy kind of education for the more honourable and important duties of *public* life.

133 The authority founded on that connection. The above mentioned weak and ignorant ſtate of children, ſeems plainly to inveſt their parents with ſuch authority and power as is neceſſary to their ſupport, protection, and education; but that authority and power can be conſtrued to extend no farther than is neceſſary to anſwer thoſe ends, and to laſt no longer than that weakneſs and ignorance continue; wherefore, the foundation or reaſon of the authority and power ceaſing, they ceaſe of courſe. Whatever power or authority then it may be neceſſary or lawful for parents to exerciſe during the non-age of their children, to aſſume or uſurp the ſame when they have attained the maturity or full exerciſe of their ſtrength and reaſon would be tyrrannical and unjuſt. From hence it is evident, that parents have no right to puniſh the perſons of their children more ſeverely than the nature of their wardſhip requires, much leſs to invade their lives, to encroach upon their liberty, or transfer them as their property to any maſter whatſoever.

134 Duties of parents. The firſt claſs of duties which parents owe their children reſpect their natural life; and theſe comprehend protection, nurture, proviſion, introducing them into the world in a manner ſuitable to their rank and fortune, and the like.

135 Education. The ſecond order of duties regards the *intellectual* and *moral* life of their children, or their education in ſuch arts and accompliſhments as are neceſſary to qualify them for performing the duties they owe to themſelves and to others. As this was found to be the principal deſign of the matrimonial alliance, ſo the fulfilling that deſign is the moſt important and dignified of all the parental duties. In order therefore to fit the child for acting his part wiſely and worthily as a *man*, as a *citizen*, and a *creature of God*, both parents ought to combine their joint wiſdom, authority, and power, and each apart to employ thoſe talents which are the peculiar excellency and ornament of their reſpective ſex. The father ought to *lay out* and *ſuperintend* their education, the mother to execute and manage the detail of which ſhe is capable. The *former* ſhould direct the manly exertion of the intellectual and moral powers of his child. His imagination, and the manner of thoſe exertions, are the peculiar province of the *latter*. The *former* ſhould adviſe, protect, command, and, by his experience, maſculine vigour, and that ſuperior authority which is commonly aſcribed to his ſex, brace and ſtrengthen his pupil for *active* life, for gravity, integrity, and firmneſs in ſuffering. The buſineſs of the *latter* is to bend and ſoften her *male* pupil, by the charms of her converſation, and the ſoftneſs and decency of her manners for *ſocial* life, for politeneſs of taſte, and the elegant decorums and enjoyments of humanity; and to improve and refine the tenderneſs and modeſty of her *female* pupil, and form her to all thoſe mild domeſtic virtues which are the peculiar characteriſtics and ornaments of her ſex. To conduct the opening minds of their ſweet charge through the ſeveral periods of their progreſs, to aſſiſt them in each period, in throwing out the latent ſeeds of reaſon and ingenuity, and in gaining freſh acceſſions of light and virtue; and at length, with all theſe advantages, to produce the young adventurers upon the great theatre of human life, to play their ſeveral parts in the ſight of their friends, of ſociety, and mankind!

SECT. IV. *Herile and Servile Duty.*

In the natural courſe of human affairs it muſt neceſſarily happen, that ſome of mankind will live in plenty and opulence, and others be reduced to a ſtate of indigence and poverty. The former need the labours of the latter, and the latter the proviſion and ſupport of the former. This mutual neceſſity is the foundation of that connection, whether we call it *moral* or *civil*, which ſubſiſts between maſters and ſervants. 136 The ground of this connection.

He who feeds another has a right to ſome equivalent, the labour of him whom he maintains, and the fruits of it. And he who labours for another has a right to expect that he ſhould ſupport him. But as the labours of a man of ordinary ſtrength are certainly of greater value than mere food and cloathing; becauſe they would actually produce more, even the maintenance of a family, were the labourer to employ them in his own behalf; therefore he has an undoubted right to rate and diſpoſe of his ſervice for certain wages above mere maintenance; and if he has incautiouſly diſpoſed of it for the latter only, yet the contract being of the *onerous* kind, he may equitably claim a ſupply of that deficiency. If the ſervice be ſpecified, the ſervice is bound to that only; if not, then he is to be conſtrued as bound only to ſuch ſervices as are conſiſtent with the laws of juſtice and humanity. By the voluntary ſervitude to which he ſubjects himſelf, he forfeits no rights by ſuch as are neceſſarily included in that ſervitude, and is obnoxious to no puniſhment but ſuch as a voluntary failure in the ſervice may be ſuppoſed reaſonably to require. *The offſpring of ſuch ſervants* have a right to that liberty which neither they nor their parents have forfeited. 137 The conditions of ſervice.

As to thoſe who, becauſe of ſome heinous offence, or for ſome notorious damage, for which they cannot otherwiſe compenſate, are condemned to perpetual ſervice, they do not, on that account, forfeit all the rights of men; but thoſe, the loſs of which is neceſſary to ſecure ſociety againſt the like offences for the future, or to repair the damage they have done. 138 The caſe of great offenders.

With regard to captives taken in war, it is barbarous and inhuman to make perpetual ſlaves of them, unleſs ſome peculiar and aggravated circumſtances of guilt have attended their hoſtility. The bulk of the ſubjects of any government engaged in war may be fairly eſteemed innocent enemies; and therefore they have a right to that clemency which is conſiſtent with the common ſafety of mankind, and the particular ſecurity of that ſociety againſt which they are engaged. 139 The caſe of captives.

Though ordinary captives have a grant of their lives, yet to pay their liberty as an equivalent is much too high a price. There are other ways of acknowledging or returning the favour, than by ſurrendering what is far dearer than life itſelf*. To thoſe who, under pretext of the neceſſities of commerce, drive the unnatural trade of bargaining for human fleſh, and conſigning their innocent but unfortunate fellow creatures to eternal ſervitude and miſery, we may addreſs the words of a fine writer; "Let avarice defend it as it "will, there is an honeſt reluctance in humanity a-"gainſt buying and ſelling, and regarding thoſe of "our own ſpecies as our wealth and poſſeſſions."

* *Hutcheſ. Mor. Inſt. Phil.* lib. 3. c. 3.

Sect. V. *Social Duties of the private Kind.*

Hitherto we have conſidered only the *domeſtic œconomical* duties, becauſe theſe are firſt in the progreſs of nature. But as man paſſes beyond the little circle of a family, he forms connections with relations, friends, neighbours, and others; from whence reſults a new train of duties of the more private ſocial kind, as *friendſhip, chaſtity, courteſy, good-neigbourhood, charity, forgiveneſs, hoſpitality.*

140 Man's aptitude for ſociety.

Man is admirably formed for particular ſocial attachments and duties. There is a peculiar and ſtrong propenſity in his nature to be affected with the ſentiments and diſpoſitions of others. Men, like certain muſical inſtruments, are ſet to each other, ſo that the vibrations or notes excited in one raiſe correſpondent notes and vibrations in the others. The impulſes of *pleaſure* or *pain, joy* or *ſorrow,* made on one mind, are by an inſtantaneous ſympathy of nature communicated in ſome degree to all; eſpecially when hearts are (as an humane writer expreſſes it) in *uniſon* of kindneſs; the joy that vibrates in one communicates to the other alſo. We may add, that though joy thus imparted ſwells the harmony, yet grief vibrated to the heart of a friend, and rebounding from thence in ſympathetic notes, melts as it were, and almoſt dies away. All the paſſions, but eſpecially thoſe of the ſocial kind, are contagious; and when the paſſions of one man mingle with thoſe of another, they increaſe and multiply prodigiouſly. There is a moſt moving eloquence in the human countenance, air, voice, and geſture, wonderfully expreſſive of the moſt latent feelings and paſſions of the ſoul, which darts them like a ſubtle flame into the hearts of others, and raiſes correſpondent feelings there: friendſhip, love, good-humour, joy, ſpread through every feature, and particularly ſhoot from the eyes their ſofter and fiercer fires with an irreſiſtible energy. And in like manner the oppoſite paſſions of hatred, enmity, ill-humour, melancholy, diffuſe a ſullen and ſaddening air over the face, and, flaſhing from eye to eye, kindle a train of ſimilar paſſions. By theſe, and other admirable pieces of machinery, men are formed for ſociety and the delightful interchange of friendly ſentiments and duties, to increaſe the happineſs of others by participation, and their own by rebound; and to diminiſh, by dividing the common ſtock of their miſery.

141 Duties ariſing from private relation.

The firſt emanations of the *ſocial* principle beyond the bounds of a family lead us to form a nearer conjunction of friendſhip or good-will with thoſe who are any wiſe connected with us by *blood*, or *domeſtic alliance*. To them our affection does commonly exert itſelf in a greater or leſs degree, according to the nearneſs or diſtance of the relation. And this proportion is admirably ſuited to the extent of our powers and the indigence of our ſtate; for it is only within thoſe leſſer circles of conſanguinity or alliance that the generality of mankind are able to diſplay their abilities or benevolence, and conſequently to uphold their connection with ſociety and ſubſerviency, to a public intereſt. Therefore it is our duty to regard theſe cloſer connections as the next department to that of a family, in which nature has marked out for us a ſphere of activity and uſefulneſs; and to cultivate the kind affections which are the cement of thoſe endearing alliances.

142 Ingredients of friendſhip.

Frequently the view of diſtinguiſhing moral qualities in ſome of our acquaintance may give birth to that more noble connection we call friendship, which is far ſuperior to the alliances of conſanguinity. For theſe are of a ſuperficial, and often of a tranſitory nature, of which, as they hold more of *inſtinct* than of *reaſon*, we cannot give ſuch a rational account. But *friendſhip* derives all its ſtrength and beauty, and the only exiſtence which is durable, from the qualities of the heart, or from virtuous and lovely diſpoſitions. Or, ſhould theſe be wanting, they or ſome ſhadow of them muſt be ſuppoſed preſent. Therefore *friendſhip* may be deſcribed to be, "The "union of two ſouls by means of *virtue*, the common "object and cement of their mutual affection." Without virtue, or the ſuppoſition of it, friendſhip is only a *mercenary* league, and alliance of intereſt, which muſt diſſolve of courſe when that intereſt decays or ſubſiſts no longer. It is not ſo much any particular paſſion, as a compoſition of ſome of the nobleſt feelings and paſſions of the mind. *Good ſenſe*, a *juſt taſte* and *love of virtue*, a *thorough candour* and *benignity of heart*, or what we uſually call a *good temper*, and a generous ſympathy of ſentiments and affections, are the neceſſary ingredients of this virtuous connection. When it is grafted on eſteem ſtrengthened by habit, and mellowed by time, it yields infinite pleaſure, ever new and ever growing, is a noble ſupport amidſt the various trials and viciſſitudes of life, and an high ſeaſoning to moſt of our other enjoyments. To form and cultivate virtuous friendſhip, muſt be very improving to the temper, as its principal *object* is *virtue*, ſet off with all the allurement of countenance, air, and manners, ſhining forth in the native graces of manly honeſt ſentiments and affections, and rendered *viſible* as it were to the friendly ſpectator in a conduct unaffectedly great and good; and as its principal exerciſes are the very energies of virtue, or its effect and emanations. So that wherever this amiable attachment prevails, it will exalt our admiration and attachment to virtue, and, unleſs impeded in its courſe by unnatural prejudices, run out into a friendſhip to the human race. For as no one can merit, and none ought to uſurp, the ſacred name of friend, who hates mankind; ſo whoever truly loves *them*, poſſeſſes the moſt eſſential quality of a true friend.

143 Its duties.

The duties of friendſhip are a mutual eſteem of each other, unbribed by intereſt, and independent of it, a generous

generous confidence as far distant from ſuſpicion as from reſerve, an inviolable harmony of ſentiments and diſpoſitions of deſigns and intereſts, a fidelity unſhaken by the changes of fortune, a conſtancy unalterable by diſtance of time or place, a reſignation of one's perſonal intereſt to thoſe of one's friend, and a reciprocal, unenvious, unreſerved exchange of kind offices.—But, amidſt all the exertions of this moral connection, humane and generous as it is, we muſt remember that it operates within a narrow ſphere, and its immediate operations reſpect only the individual; and therefore its particular impulſes muſt ſtill be ſubordinate to a more public intereſt, or be always directed and controlled by the more extenſive connections of our nature.

144 Love and chaſtity.

When our friendſhip terminates on any of the other ſex, in whom beauty or agreeableneſs of perſon and external gracefulneſs of manners conſpire to expreſs and heighten the moral charm of a tender honeſt heart, and ſweet, ingenuous modeſt temper, lighted up by good ſenſe; it generally grows into a more ſoft and endearing attachment. When this attachment is improved by a growing acquaintance with the worth of its object, is conducted by diſcretion, and iſſues at length, as it ought to do, in the moral connection formerly mentioned*, it becomes the ſource of many amiable duties, of a communication of paſſions and intereſts, of the moſt refined decencies, and of a thouſand nameleſs deep-felt joys of reciprocal tenderneſs and love, flowing from every look, word, and action. Here friendſhip acts with double energy, and the *natural* conſpires with the *moral* charms to ſtrengthen and ſecure the love of virtue. As the delicate nature of female honour and decorum, and the inexpreſſible grace of a chaſte and modeſt behaviour, are the ſureſt and indeed the only means of kindling at firſt, and ever after of keeping alive, this tender and elegant flame, and of accompliſhing the excellent ends deſigned by it; to attempt by fraud to violate one, or, under pretence of paſſion, to ſully and corrupt the other, and, by ſo doing, to expoſe the too often credulous and unguarded object, with a wanton cruelty, to the hatred of her own ſex and the ſcorn of ours, and to the loweſt infamy of both is a conduct not only baſe and criminal, but inconſiſtent with that truly rational and refined enjoyment, the ſpirit and quinteſſence of which is derived from the baſhful and ſacred charms of virtue kept untainted, and therefore ever alluring to the lover's heart.

* See Sect. iii. of this chapter.

145 Courteſy, good-neighbourhood, *&c.*

Courteſy, *good-neighbourhood*, *affability*, and the like duties, which are founded on our private ſocial connections, are no leſs neceſſary and obligatory to creatures united in ſociety, and ſupporting and ſupported by each other in a chain of mutual want and dependence. They do not conſiſt in a ſmooth addreſs, an artificial or obſequious air, fawning adulations, or a polite ſervility of manners; but in a juſt and modeſt ſenſe of our own dignity and that of others, and of the reverence due to mankind, eſpecially to thoſe who hold the higher links of the ſocial chain; in a diſcreet and manly accommodation of ourſelves to the foibles and humours of others; in a ſtrict obſervance of the rules of decorum and civility; but, above all, in a frank obliging carriage, and generous interchange of good deeds rather than words. Such a conduct is of great uſe and advantage, as it is an excellent ſecurity againſt injury, and the beſt claim and recommendation to the eſteem, civility, and univerſal reſpect of mankind. This inferior order of virtues unite the particular members of ſociety more cloſely, and forms the leſſer pillars of the civil fabric; which, in many inſtances, ſupply the unavoidable defects of laws, and maintain the harmony and decorum of ſocial intercourſe, where the more important and eſſential lines of virtue are wanting.

136 Charity, forgiveneſs.

Charity and *forgiveneſs* are truly amiable and uſeful duties of the ſocial kind. There is a twofold diſtinction of rights commonly taken notice of by moral writers, *viz. perfect* and *imperfect*. To fulfil the former, is neceſſary to the being and ſupport of ſociety; to fulfil the latter, is a duty equally ſacred and obligatory, and tends to the improvement and proſperity of ſociety; but as the violation of them is not equally prejudicial to the public good, the fulfilling them is not ſubjected to the cognizance of law, but left to the candour, humanity, and gratitude of individuals. And by this means ample ſcope is given to exerciſe all the generoſity, and diſplay the genuine merit and luſtre, of virtue. Thus the wants and misfortunes of others call for our charitable aſſiſtance and ſeaſonable ſupplies. And the good man, unconſtrained by law, and uncontrolled by human authority, will chearfully acknowledge and generouſly ſatisfy this mournful and moving claim; a claim ſupported by the ſanction of heaven, of whoſe bounties he is honoured to be the grateful truſtee. If his own *perfect* rights are invaded by the injuſtice of others, he will not therefore reject their *imperfect* right to pity and forgiveneſs, unleſs his grant of theſe ſhould be inconſiſtent with the more extenſive rights of ſociety, or the public good. In that caſe he will have recourſe to public juſtice and the laws, and even then he will proſecute the injury with no unneceſſary ſeverity, but rather with mildneſs and humanity. When the injury is merely perſonal, and of ſuch a nature as to admit of alleviations, and the forgiveneſs of which would be attended with no worſe conſequences, eſpecially of a public kind, the good man will generouſly forgive his offending brother. And it is his duty to do ſo, and not to take private revenge, or retaliate evil for evil. For though reſentment of injury is a natural paſſion, and implanted, as was obſerved † above, for wiſe and good ends; yet, conſidering the manifold partialities which moſt men have for themſelves, was every one to act as judge in his own cauſe, and to execute the ſentence dictated by his own reſentment, it is but too evident that mankind would paſs all bounds in their fury, and the laſt ſufferer be provoked in his turn to make full repriſals. So that evil, thus encountering with evil, would produce one continued ſeries of violence and miſery, and render ſociety intolerable, if not impracticable. Therefore, where the ſecurity of the individual, or the good of the public, does not require a proportionable retaliation, it is agreeable to the general law of benevolence, and to the particular end of the paſſion (which is to prevent injury and the miſery occaſioned by it) to forgive perſonal injuries, or not to return evil for evil. This duty is one of the noble refinements

† See Part I. chap. ii. and iv.

finements which *Chriſtianity* has made upon the general maxims and practice of mankind, and enforced, with a peculiar ſtrength and beauty, by ſanctions no leſs alluring than awful. And indeed the practice of it is generally its own reward; by expelling from the mind the moſt dreadful intruders upon its repoſe, thoſe rancorous paſſions which are begot and nurſed by reſentment, and, by diſarming, and even ſubduing, every enemy one has, except ſuch as have nothing left of men but the outward form.

147 Hoſpitality. The moſt enlarged and humane connection of the private kind ſeems to be the hoſpitable alliance, from which flow the amiable and diſintereſted duties we owe to ſtrangers. If the exerciſe of paſſions of the moſt private and inſtinctive kind is beheld with moral approbation and delight, how lovely and venerable muſt thoſe appear which reſult from a calm philanthropy, are founded in the common rights and connections of ſociety, and embrace men, not of a particular ſect, party, or nation, but all in general without diſtinction, and without any of the little partialities of ſelf-love.

SECT. VI. *Social duties of the* COMMERCIAL *kind.*

148 Commercial duties. THE next order of connections are thoſe which ariſe from the wants and weakneſs of mankind, and from the various circumſtances in which their different ſituations place them. Theſe we may call *commercial* connections, and the duties which reſult from them *commercial* duties, as *juſtice, fair-dealing, ſincerity, fidelity to compacts,* and the like.

149 Their foundation. Though nature is perfect in all her works, yet ſhe has obſerved a manifeſt and eminent diſtinction among them. To all ſuch as lie beyond the reach of human ſkill and power, and are properly of her own department, ſhe has given the finiſhing hand. Theſe man may deſign after and imitate, but he can never rival them, nor add to their beauty or perfection. Such are the forms and ſtructure of vegetables, animals, and many of their productions, as the honey-comb, the ſpider's web, and the like. There are others of her works which ſhe has of deſign left unfiniſhed, as it were, in order to exerciſe the ingenuity and power of man. She has preſented to him a rich profuſion of materials of every kind for his conveniency and uſe; but they are rude and unpoliſhed, or not to be come at without art and labour. Theſe therefore he muſt apply, in order to adapt them to his uſe, and to enjoy them in perfection. Thus nature has given him an infinite variety of herbs, grain, foſſils, minerals, wood, water, earth, air, and a thouſand other crude materials, to ſupply his numerous wants. But he muſt ſow, plant, dig, refine, poliſh, build, and, in ſhort, manufacture the various produce of nature, in order to obtain even the neceſſaries, and much more the conveniencies and elegancies of life. Theſe then are the price of his labour and induſtry, and, without that, nature will ſell him nothing. But as the wants of mankind are many, and the ſingle ſtrength of individuals ſmall, they could hardly find the neceſſaries, and much leſs the conveniencies of life, without uniting their ingenuity and ſtrength in acquiring theſe, and without a mutual intercourſe of good offices. Some men are better formed for ſome kinds of ingenuity and labour, and others for other kinds; and different ſoils and climates are enriched with different productions; ſo that men, by exchanging the produce of their reſpective labours, and ſupplying the wants of one country with the ſuperfluities of another, do, in effect, diminiſh the labours of each, and increaſe the abundance of all. This is the foundation of all commerce, or exchange of commodities and goods one with another; in order to facilitate which, men have contrived different ſpecies of coin, or money, as a common ſtandard by which to eſtimate the comparative values of their reſpective goods. But to render commerce ſure and effectual, *juſtice, fair-dealing, ſincerity,* and *fidelity to compacts,* are abſolutely neceſſary.

Juſtice or *fair-dealing;* or, in other words, a diſ- 150 Juſtice, *&c.*
poſition to treat others as we would be treated by them, is a virtue of the firſt importance, and inſeparable from the virtuous character. It is the cement of ſociety, or that pervading ſpirit which connects its members, inſpires its various relations, and maintains the order and ſubordination of each part to the whole. Without it, ſociety would become a den of thieves and banditti, hating and hated, devouring and devoured, by one another.

Sincerity, or *veracity,* in our words and actions, 151 Sincerity.
is another virtue or duty of great importance to ſociety, being one of the great bands of mutual intercourſe, and the foundation of mutual truſt. Without it, ſociety would be the dominion of miſtruſt, jealouſy, and fraud, and converſation a traffic of lies and diſſimulation. It includes in it a conformity of our words with our ſentiments, a correſpondence between our actions and diſpoſitions, a ſtrict regard to truth, and an irreconcileable abhorrence of falſehood. It does not indeed require, that we expoſe our ſentiments indiſcreetly, or tell all the truth in every caſe; but certainly it does not and cannot admit the leaſt violation of truth, or contradiction to our ſentiments. For if theſe bounds are once paſſed, no poſſible limit an be aſſigned where the violation ſhall ſtop; and no pretence of private or public good can poſſibly counterbalance the ill conſequences of ſuch a violation.

Fidelity to promiſes, compacts, and *engagements,* is 152 Fidelity to compacts, promiſes, *&c.*
likewiſe a duty of ſuch importance to the ſecurity of commerce and interchange of benevolence among mankind, that ſociety would ſoon grow intolerable without the ſtrict obſervance of it. *Hobbes,* and others who follow the ſame track, have taken a wonderful deal of pains to puzzle this ſubject, and to make all the virtues of this ſort merely *artificial,* and not at all *obligatory,* antecedent to human conventions. No doubt, compacts ſuppoſe people who make them; and promiſes, perſons to whom they are made; and therefore both ſuppoſe ſome ſociety, more or leſs, between thoſe who enter into theſe mutual engagements. But is not a compact or promiſe binding, till men have agreed that they ſhall be binding? or are they only binding, becauſe it is our intereſt to be bound by them, or to fulfil them? Do not we highly approve the man who fulfils them, even though they ſhould prove to be againſt his intereſt? and do not we condemn him as a knave who violates them on that account? a pro-

miſe is a voluntary declaration, by words, or by an action equally ſignificant, of our reſolution to do ſomething in behalf of another, or for his ſervice. When it is made, the perſon who makes it is by all ſuppoſed under an obligation to perform it. And he to whom it is made may demand the performance as his right. That perception of *obligation* is a ſimple idea, and is on the ſame footing as our other moral perceptions, which may be deſcribed by inſtances, but cannot be defined. Whether we have a perception of ſuch obligation quite diſtinct from the intereſt, either public or private, that may accompany the fulfilment of it, muſt be referred to the conſcience of every individual. And whether the mere ſenſe of that obligation, apart from its concomitants, is not a ſufficient inducement or motive to keep one's promiſe, without having recourſe to any ſelfiſh principle of our nature, muſt be likewiſe appealed to the conſcience of every honeſt man. *Fair-dealing* and *fidelity to compacts* require that we take no advantage of the ignorance, paſſion, or incapacity of others, from whatever cauſe that incapacity ariſes;—that we may be explicit and candid in making bargains, juſt and faithful in fulfilling our part of them. And if the other party violates his engagements, redreſs is to be ſought from the laws, or from thoſe who are intruſted with the execution of them. In fine, the *commercial* virtues and duties require that we not only do not evade, but maintain the rights of others;—that we be fair and impartial in transferring, bartering, or exchanging property, whether in goods or ſervice; and be inviolably faithful to our word and our engagements, where the matter of them is not criminal, and where they are not extorted by force.

Sect. VII. *Social Duties of the* Political *Kind.*

We are now arrived at the laſt and higheſt order of duties reſpecting ſociety, which reſult from the exerciſe of the moſt generous and heroic affections, and
152 are founded on our moſt enlarged connections.

Political connections.

The *ſocial* principle in man is of ſuch an expanſive nature, that it cannot be confined within the circuit of a family, of friends, or a neighbourhood; it ſpreads into wider ſyſtems, and draws men into larger confederacies, communities, and commonwealths. It is in theſe only that the higher powers of our nature attain the higheſt improvement and perfection of which they are capable. Theſe principles hardly find objects in the ſolitary ſtate of nature. *There* the principle of action riſes no higher at fartheſt than *natural affection* towards one's offspring. There perſonal or family wants intirely engroſs the creature's attention and labour, and allow no leiſure, or, if they did, no exerciſe for views and affections of a more enlarged kind. In *ſolitude* all are employed in the ſame way, in providing for the *animal* life. And even after their utmoſt labour and care, ſingle and unaided by the induſtry of others, they find but a ſorry ſupply of their wants, and a feeble, precarious ſecurity againſt dangers from wild beaſts; from inclement ſkies and ſeaſons; from the miſtakes or petulant paſſions of their fellow-creatures; from their preference of themſelves to their neighbours; and from all the little exorbitances of ſelf-love. But in *ſociety*, the mutual aids which men give and receive ſhorten the labours of each, and the combined ſtrength and reaſon of individuals give ſecurity and protection to the whole body. There is both a variety and ſubordination of genius among mankind. Some are formed to lead and direct others, to contrive plans of happineſs for individuals, and of government for communities, to take in a public intereſt, invent laws and arts, and ſuperintend their execution, and, in ſhort, to refine and civilize human life. Others, who have not ſuch good heads, may have as honeſt hearts, a truly public ſpirit, love of liberty, hatred of corruption and tyranny, a generous ſubmiſſion to laws, order, and public inſtitutions, and an extenſive philanthrophy. And others, who have none of thoſe capacities either of heart or head, may be well formed for manual exerciſes, and bodily labour. The former of theſe principles have no ſcope in ſolitude, where a man's thoughts and concerns do all either centre in himſelf, or extend no farther than a family; into which little circle all the duty and virtue of the ſolitary mortal is crowded. But ſociety finds proper objects and exerciſes for every genius, and the nobleſt objects and exerciſes for the nobleſt geniuſes, and for the higheſt principles in the human conſtitution; particularly for that warmeſt and moſt divine paſſion which God hath kindled in our boſoms, the inclination of doing good, and reverencing our nature; which may find here both employment, and the moſt exquiſite ſatisfaction. In ſociety, a man has not only more leiſure, but better opportunities, of applying his talents with much greater perfection and ſucceſs, eſpecially as he is furniſhed with the joint advice and aſſiſtance of his fellow-creatures, who are now more cloſely united one with the other, and ſuſtain a common relation to the ſame moral ſyſtem or community. This then is an object proportioned to his moſt enlarged ſocial affections, and in ſerving it he finds ſcope for the exerciſe and refinement of his higheſt intellectual and moral powers. *Therefore ſociety, or a ſtate of civil government*, reſts on theſe two principal pillars, "That in it we find ſecurity "againſt thoſe evils which are unavoidable in ſolitude "—and obtain thoſe goods, ſome of which cannot be "obtained at all, and others not ſo well, in that ſtate "where men depend ſolely on their individual ſaga- "city and induſtry."

From this ſhort detail it appears, that *man* is a *ſocial* creature, and formed for a *ſocial* ſtate; and that *ſociety*, being adapted to the higher principles and deſtinations of his nature, muſt of neceſſity be his *natural* ſtate.

The duties ſuited to that ſtate, and reſulting from 154
Political duties.

thoſe principles and deſtinations, or, in other words, from our ſocial paſſions and ſocial connections, or relation to a public ſyſtem, are, *love of our country, reſignation and obedience to the laws, public ſpirit, love of liberty, ſacrifice of life and all to the public*, and the like.

Love of our country, is one of the nobleſt paſſions 155
Love of one's country.

that can warm and animate the human breaſt. It includes all the limited and particular affections to our parents, friends, neighbours, fellow-citizens, countrymen. It ought to direct and limit their more confined and partial actions within their proper and natural bounds, and never let them incroach on thoſe ſacred and

and first regards we owe to the great public to which we belong. Were we solitary creatures, detached from the rest of mankind, and without any capacity of comprehending a *public interest*, or without affections leading us to desire and pursue it, it would not be our duty to mind it, nor criminal to neglect it. But as we are PARTS of the *public system*, and are not only capable of taking in large views of its interests, but by the strongest affections connected with it, and prompted to take a share of its concerns, we are under the most sacred ties to prosecute its security and welfare with the utmost ardour, especially in times of public trial. This *love of our country* does not import an attachment to any particular soil, climate, or spot of earth, where perhaps we first drew our breath, though those *natural* ideas are often associated with the *moral* ones; and, like external signs or symbols, help to ascertain and bind them; but it imports an affection to that *moral system*, or *community*, which is governed by the same laws and magistrates, and whose several parts are variously connected one with the other, and all united upon the bottom of a common interest. Perhaps indeed every member of the community cannot comprehend so large an object, especially if it extends through large provinces, and over vast tracts of land; and still less can he form such an idea, if there is no *public*, *i. e.* if all are subject to the caprice and unlimited will of one man; but the preference the generality shew to their native country; the concern and longing after it which they express, when they have been long absent from it; the labours they undertake, and sufferings they endure, to save or serve it; and the peculiar attachment they have to their countrymen; evidently demonstrate that the passion is *natural*, and never fails to exert itself when it is fairly disengaged from foreign clogs, and is directed to its proper object. Wherever it prevails in its genuine vigour and extent, it swallows up all sordid and selfish regards, it conquers the love of *ease*, *power*, *pleasure*, and *wealth*; nay, when the amiable partialities of *friendship*, *gratitude*, *private affection*, or *regards to a family*, come in competition with it, it will teach us bravely to sacrifice all, in order to maintain the rights, and *promote* or *defend* the honour and happiness of our country.

156 Resignation and obedience to the laws, &c.

Resignation and *obedience to the laws* and *orders* of the society to which we belong, are *political* duties necessary to its very being and security, without which it must soon degenerate into a state of licence and anarchy. The welfare, nay, the nature of civil society, requires, that there should be a subordination of orders, or diversity of ranks and conditions in it;—that certain men, or orders of men, be appointed to superintend and manage such affairs as concern the public safety and happiness;—that all have their particular provinces assigned them;—that such a subordination be settled among them as none of them may interfere with another; and finally, that certain *rules* or *common measures of action* be agreed on, by which each is to discharge his respective duty to govern or be governed, and all may concur in securing the order, and promoting the felicity, of the whole political body. Those *rules of action* are the *laws* of the community, and those different *orders* are the several officers or magistrates appointed by the public to explain them, and superintend or assist in their execution. In consequence of this settlement of things, it is the duty of each individual to obey the laws enacted, to submit to the executors of them with all due deference and homage, according to their respective ranks and dignity, as to the keepers of the public peace, and the guardians of public liberty; to maintain his own rank, and perform the functions of his own station, with diligence, fidelity, and incorruption. The superiority of the *higher* orders, or the authority with which the state has invested them, intitle them, especially if they employ their authority well, to the obedience and submission of the *lower*, and to a proportionable honour and respect from all. The subordination of the lower ranks claims protection, defence, and security from the higher. And the laws, being superior to all, require the obedience and submission of all, being the last resort, beyond which there is no decision or appeal.

157 Foundation of public spirit, love of liberty, &c.

Public spirit, *heroic zeal*, *love of liberty*, and the other *political* duties, do, above all others, recommend those who practise them to the admiration and homage of mankind; because, as they are the offspring of the noblest minds, so *are they* the parents of the greatest blessing to society. Yet, exalted as they are, it is only in equal and free governments where they can be exercised and have their due effect. For there only does a true *public spirit* prevail, and there only is the *public good* made the standard of the civil constitution. As the end of society is the *common interest* and *welfare* of the people associated, this end must of necessity be the *supreme law* or *common standard*, by which the particular rules of action of the several members of the society towards each other are to be regulated. But a *common interest* can be no other than that which is the result of the *common reason* or *common feelings* of all. Private men, or a particular order of men, have interests and feelings peculiar to themselves, and of which they may be good judges; but these may be separate from, and often contrary to, the interests and feelings of the rest of the society; and therefore they can have no right to make, and much less to impose, laws on their fellow-citizens, inconsistent with, and opposite to, those interests and those feelings. Therefore, a *society*, a *government*, or *real public*, truly worthy the name, and not a confederacy of banditti, a clan of lawless savages, or a band of slaves under the whip of a master, must be such a one as consists of freemen, chusing or consenting to laws themselves; or, since it often happens that they cannot assemble and act in a *collective* body, delegating a sufficient number of *representatives*, *i. e.* such a number as shall most fully comprehend, and most equally represent, their *common feelings* and *common interests*, to digest and vote laws for the conduct and control of the whole body, the most agreeable to those common feelings and common interests.

158 Political duties of every citizen.

A society thus constituted by *common reason*, and formed on the plan of a *common interest*, becomes immediately an object of public attention, public veneration, public obedience, a public and inviolable attachment, which ought neither to be seduced by bribes, nor

nor awed by terrors; an object, in fine, of all thoſe extenſive and important duties which ariſe from ſo glorious a confederacy. To watch over ſuch a ſyſtem; to contribute all he can to promote its good by his reaſon, his ingenuity, his ſtrength, and every other ability, whether natural or acquired; to reſiſt, and, to the utmoſt of his power, defeat every incroachment upon it, whether carried on by a ſecret corruption, or open violence; and to ſacrifice his eaſe, his wealth, his power, nay life itſelf, and, what is dearer ſtill, his family and friends, to defend or ſave it, is the duty, the honour, the intereſt, and the happineſs of every citizen; it will make him venerable and beloved while he lives, be lamented and honoured if he falls in ſo glorious a cauſe, and tranſmit his name with immortal
159, [160] renown to the lateſt poſterity.

Of the people. As the PEOPLE are the fountain of power and authority, the original ſeat of majeſty, the authors of laws, and the creators of officers to execute them; if they ſhall find the power they have conferred abuſed by their truſtees, their majeſty violated by tyranny or by uſurpation, their authority proſtituted to ſupport violence or ſcreen corruption, the laws grown pernicious through accidents unforeſeen or unavoidable, or rendered ineffectual through the infidelity and corruption of the executors of them; then it is their right, and what is their right is their duty, to reſume that delegated power, and call their truſtees to an account; to reſiſt the uſurpation, and extirpate the tyranny; to reſtore their ſullied majeſty and proſtituted authority; to ſuſpend, alter, or abrogate thoſe laws, and puniſh their unfaithful and corrupt officers. Nor is it the duty only of the united body; but every member of it ought, according to his reſpective rank, power, and weight in the community, to concur in advancing and ſupporting thoſe glorious deſigns.

CHAP. IV.

Duty to GOD.

161 Divine connections. OF all the *relations* which the human mind ſuſtains, that which ſubſiſts between the *Creator* and his *creatures*, the ſupreme *Lawgiver* and his *ſubjects*, is the higheſt and the beſt. This relation ariſes from the *nature* of a *creature* in general, and the *conſtitution* of the *human mind* in particular; the nobleſt powers and affections of which point to an *univerſal* mind, and would be imperfect and abortive without ſuch a direction. How lame then muſt that ſyſtem of morals be, which leaves a *Deity* out of the queſtion! How
162 diſconſolate, and how deſtitute of its firmeſt ſupport!

Exiſtence of God. It does not appear, from any true hiſtory, or experience of the mind's progreſs, that any man, by any formal deduction of his diſcurſive power, ever reaſoned himſelf into the belief of a God. Whether ſuch a belief is only ſome *natural anticipation* of ſoul, or is derived from father to ſon, and from one man to another, in the way of *tradition*, or is ſuggeſted to us in conſequence of an *immutable law of our nature*, on beholding the auguſt aſpect and beautiful order of the univerſe, we will not pretend to determine. What ſeems moſt agreeable to experience is, that a *ſenſe* of its *beauty* and *grandeur*, and the *admirable fitneſs* of one thing to another in its vaſt apparatus, leads the mind *neceſſarily* and *unavoidably* to a perception of *deſign*, or of a *deſigning cauſe*, the origin of all, by a progreſs as ſimple and natural as that by which *a beautiful picture*, or a *fine building*, ſuggeſts to us the idea of an *excellent artiſt*. For it ſeems to hold univerſally true, that wherever we diſcern a *tendency*, or *co-operation of things towards a certain end*, or producing a common effect, there, by a neceſſary *law of aſſociation*, we apprehend *deſign*, a *deſigning energy* or *cauſe*. No matter whether the objects are *natural* or *artificial*, ſtill that ſuggeſtion is unavoidable, and the *connection* between the *effect* and its *adequate cauſe* obtrudes itſelf on the mind, and it requires no nice ſearch or elaborate deduction of reaſon, to trace or prove that connection. We are particularly ſatisfied of its truth in the ſubject before us by a kind of direct intuition, and we do not ſeem to attend to the maxim we learn in ſchools, "That there cannot be an *infinite ſeries of* "*cauſes* and *effects* producing and produced by one "another." Nor do we feel a great acceſſion of light and conviction after we have learned it. We are conſcious of our *exiſtence*, of *thought*, *ſentiment*, and *paſſion*, and ſenſible withal that theſe came not of ourſelves; therefore we immediately recogniſe a *parent-mind*, an *original intelligence*, from whom we borrowed thoſe little portions of thought and activity. And while we not only feel *kind* affections in ourſelves, and diſcover them in others, but likewiſe behold round us ſuch a number and variety of creatures, endued with natures nicely adjuſted to their ſeveral ſtations and œconomies, ſupporting and ſupported by each other, and all ſuſtained by a *common order* of things, and ſharing different degrees of happineſs according to their reſpective capacities, we are naturally and neceſſarily led up to the Father of ſuch a numerous offſpring, the fountain of ſuch wide-ſpread happineſs. As we conceive this Being before all, above all, and greater than all, we naturally, and without reaſoning, aſcribe to him every kind of perfection, *wiſdom*, *power*, and *goodneſs without bounds*, exiſting through all 163
time, and pervading all ſpace. We apply to him His relation to the human mind.
thoſe glorious epithets of our *Creator*, *Preſerver*, *Benefactor*, the *ſupreme Lord* and *Lawgiver* of the whole ſociety of rational and intelligent creatures. Not only the imperfections and wants of our being and condition, but ſome of the *nobleſt inſtincts* and *affections* of our minds, connect us with this great and univerſal nature. The mind, in its progreſs from object to object, from one character and proſpect of beauty to another, finds ſome blemiſh or deficiency in each, and ſoon exhauſts, or grows weary and diſſatisfied with its ſubject; it ſees no character of excellency among men equal to that pitch of eſteem which it is capable of exerting; no object within the compaſs of human things adequate to the ſtrength of its affection. Nor can it ſtay any where in this ſelf-expanſive progreſs, or find repoſe after its higheſt flights, till it arrives at a Being of unbounded greatneſs and worth, on whom it may employ its ſublimeſt powers without exhauſting the ſubject, and give ſcope to the utmoſt force and fulneſs of its love without ſatiety or diſguſt. So that the nature of this Being correſponds to the nature of man; nor can his intelligent and moral powers obtain their entire end, but on the ſuppoſition of ſuch a Being, and without a real ſympathy and communication with him.

The native propenſity of the mind to reverence whatever is *great* and *wonderful* in nature, finds a proper object of homage in him who ſpread out the heavens and the earth, and who ſuſtains and governs the whole of things. The *admiration* of *beauty*, the *love* of *order*, and the *complacency* we feel in *goodneſs*, muſt riſe to the higheſt pitch, and attain the full vigour and joy of their operations, when they unite in him who is the ſum and ſource of all perfection.

164 Immorality of impiety. It is evident from the ſlighteſt ſurvey of morals, that how punctual ſoever one may be in performing the duties which reſult from our relations to mankind, yet to be quite deficient in performing thoſe which ariſe from our *relation* to the *Almighty*, muſt argue a ſtrange perverſion of *reaſon* or depravity of *heart*. If imperfect degrees of worth attract our veneration, and if the want of it would imply an inſenſibility, or, which is worſe, an averſion to merit, what lameneſs of affection or immorality of character muſt it be to be unaffected with, and much more to be ill-affected to, a Being of ſuperlative worth! To love ſociety, or particular members of it, and yet to have no ſenſe of our connection with its Head, no affection to our common Parent and Benefactor; to be concerned about the approbation or cenſure of our fellow-creatures, and yet to feel nothing of this kind towards him who ſees and weighs our actions with unerring wiſdom and juſtice, and can fully reward or puniſh them, betrays equal madneſs and partiality of mind. It is plain therefore beyond all doubt, that ſome regards are due to the great Father of all, in whom every lovely and adorable quality combines to inſpire veneration and homage.

165 Right opinions of God. As it has been obſerved already, that our *affections* depend on our *opinions* of their objects, and generally keep pace with them, it muſt be of the higheſt importance, and ſeems to be among the firſt duties we owe to the Author of our being, "to form the leaſt "imperfect, ſince we cannot form perfect, conceptions of his *character* and *adminiſtration*." For ſuch *conceptions*, thoroughly imbibed, will render our *religion* rational, and our *diſpoſitions* refined. If our *opinions* are diminutive and diſtorted, our religion will be ſuperſtitious, and our temper abject. Thus, if we aſcribe to the Deity that falſe majeſty which conſiſts in the unbenevolent and ſullen exerciſe of mere *will* or *power*, or ſuppoſe him to delight in the proſtrations of ſervile fear, or as ſervile praiſe, he will be worſhipped with mean adulation, and a profuſion of compliments. Farther, if he be looked upon as a ſtern and implacable Being, delighting in vengeance, he will be adored with pompous offerings, ſacrifices, or whatever elſe may be thought proper to ſoothe and mollify him. But if we believe *perfect goodneſs* to be the character of the ſupreme Being, and that he loves thoſe moſt who reſemble him moſt, the worſhip paid him will be rational and ſublime, and his worſhippers will ſeek to pleaſe him by imitating that goodneſs which they adore.

166 Rational faith. The foundation then of all true religion is a *rational faith*. And of a rational faith theſe ſeem to be the chief articles, to believe, "that "an infinite all-perfect Mind exiſts, who has no oppoſite nor any ſeparate intereſt from that of his "creatures;—that he ſuperintends and governs all "creatures and things;—that his goodneſs extends to "all his creatures, in different degrees indeed, according to their reſpective natures, but without any "partiality or envy;—that he does every thing for "the beſt, or in a ſubſerviency to the perfection and "happineſs of the whole;—particularly, that he directs and governs the affairs of men,—inſpects their "actions,—diſtinguiſhes the *good* from the *bad*,—loves "and befriends the former,—is diſpleaſed with, and "pities the latter in *this* world,—and will, according "to their reſpective deſerts, reward one and puniſh "the other in the *next*;—that, in fine, he is always "carrying on a ſcheme of virtue and happineſs "through an unlimited duration,—and is ever guiding the univerſe, through its ſucceſſive ſtages and "periods, to higher degrees of perfection and felicity." This is true *Theiſm*, the glorious ſcheme of divine faith; a ſcheme exhibited in all the works of God, and executed through his whole adminiſtration.

167 Morality of theiſm. This faith, well founded and deeply felt, is nearly connected with a *true moral taſte*, and hath a powerful efficacy on the temper and manners of the theiſt. He who admires goodneſs in others, and delights in the practice of it, muſt be conſcious of a reigning order within, a rectitude and candour of heart, which diſpoſes him to entertain favourable apprehenſions of men, and, from an impartial ſurvey of things, to preſume that *good order* and *good meaning* prevail in the univerſe; and if good meaning and good order, then an *ordering*, an *intending mind*, who is no enemy, no tyrant to his creatures, but a *friend*, a *benefactor*, an *indulgent ſovereign*.

168 Immorality of atheiſm. On the other hand, a bad man, having nothing goodly or generous *to contemplate within*, no right intentions, nor honeſty of heart, ſuſpects every perſon and every thing, and, beholding nature through the gloom of a ſelfiſh and guilty mind, is either averſe to the belief of a reigning order, or, if he cannot ſuppreſs the unconquerable anticipations of a governing mind, he is prone to tarniſh the beauty of nature, and to impute malevolence, or blindneſs and impotence at leaſt, to the Sovereign Ruler. He turns the univerſe into a forlorn and horrid waſte, and transfers his own character to the Deity, by aſcribing to him that uncommunicative grandeur, that arbitrary or revengeful ſpirit, which he affects or admires in himſelf. As ſuch a temper of mind naturally leads to *atheiſm*, or to a *ſuperſtition* full as bad; therefore, as far as that temper depends on the unhappy creature in whom it prevails, the propenſity to atheiſm or ſuperſtition conſequent thereto muſt be *immoral*. Farther, if it be true that the belief or ſenſe of a Deity is natural to the mind, and the evidence of his exiſtence reflected from his works ſo full as to ſtrike even the moſt ſuperficial obſerver with conviction, then the ſupplanting or corrupting that ſenſe, or the want of due attention to that evidence, and, in conſequence of both, a *ſupine* ignorance or *affected* unbelief of a Deity, muſt argue a bad temper, or an immoral turn of mind. In the caſe of invincible ignorance, or a very bad education, though nothing can be concluded directly againſt the character; yet whenever ill paſſions and habits pervert the judgment, and by perverting the judgment terminate in atheiſm, then the caſe becomes plainly criminal.

But

169 *The connection of theiſm and virtue.* But let caſuiſts determine this as they will, a true faith in the divine character and adminiſtration is generally the conſequence of a virtuous ſtate of mind. The man who is truly and habitually good feels the *love of order*, of *beauty*, and *goodneſs*, in the ſtrongeſt degree; and therefore cannot be inſenſible to thoſe emanations of them which appear in all the works of God, nor help loving their ſupreme ſource and model. He cannot but think, that he who has poured ſuch beauty and goodneſs over all his works, muſt himſelf delight in beauty and goodneſs, and what he delights in muſt be both amiable and happy. Some indeed there are, and it is pity there ſhould be any ſuch, who, through the unhappy influence of a wrong education, have entertained dark and unfriendly thoughts of a Deity and his adminiſtration, though otherwiſe of a virtuous temper themſelves. However, it muſt be acknowledged, that ſuch ſentiments have, for the moſt part, a bad effect on the temper; and when they have not, it is becauſe the undepraved affections of an honeſt *heart* are more powerful in their operation than the ſpeculative opinions of an informed *head*.

170 *Duties of gratitude, love, &c.* But wherever right conceptions of the Deity and his providence prevail, when he is conſidered as the inexhauſted ſource of light and lov, and joy, as acting in the joint character of a *Father* and *Governor*, imparting an endleſs variety of capacities to his creatures, and ſupplying them with every thing neceſſary to their full completion and happineſs, what veneration and gratitude muſt ſuch conceptions, thoroughly believed, excite in the mind? How natural and delightful muſt it be to one whoſe heart is open to the perception of truth, and of every thing *fair, great*, and *wonderful* in nature, to contemplate and adore him who is the firſt *fair*, the firſt *great*, and firſt *wonderful*; in whom *wiſdom, power*, and *goodneſs* dwell vitally, eſſentially, originally, and act in perfect concert? What *grandeur* is here to fill the moſt enlarged capacity, what *beauty* to engage the moſt ardent love, what a maſs of *wonders* in ſuch exuberance of perfection to aſtoniſh and delight the human mind through an unfailing duration!

171 *Other affections.* If the *Deity* is conſidered as our ſupreme *Guardian* and *Benefactor*, as the *Father of Mercies*, who loves his creatures with infinite tenderneſs, and in a particular manner all good men, nay, all who delight in goodneſs, even in its moſt imperfect degrees; what reſignation, what dependence, what generous confidence, what hope in God and his all-wiſe providence, muſt ariſe in the ſoul that is poſſeſſed of ſuch amiable views of him? All thoſe exerciſes of piety, and above all a ſuperlative eſteem and love, are directed to God as to their *natural*, their *ultimate*, and indeed their only *adequate* object; and though the immenſe obligations we have received from him may excite in us more lively feelings of divine goodneſs than a general and abſtracted contemplation of it, yet the affections of *gratitude* and *love* are of themſelves of the generous diſintereſted kind, not the reſult of ſelf-intereſt, or views of reward. A perfect character, in which we always ſuppoſe infinite goodneſs, guided by unerring wiſdom, and ſupported by Almighty power is the proper object of perfect love; and though that character ſuſtains to us the relation of a *Benefactor*, yet the mind, deeply ſtruck with that perfection, is quite loſt amidſt ſuch a blaze of beauty, and grows as it were inſenſible to thoſe minuter irradiations of it upon itſelf. To talk therefore of a *mercenary* love of God, or which has *fear* for its principal ingredient, is equally impious and abſurd. If we do not love the lovelieſt object in the univerſe for his own ſake, no proſpect of good or fear of ill can ever bribe our eſteem, or captivate our love. Theſe affections are too noble to be bought or ſold, or bartered in the way of *gain*; *worth*, or *merit*, is their object, and their reward is ſomething ſimilar in kind. Whoever indulges ſuch ſentiments and affections towards the Deity, muſt be confirmed in the love of virtue, in a deſire to imitate its all-perfect pattern, and in a chearful ſecurity that all his great concerns, thoſe of his friends, and of the univerſe, ſhall be abſolutely ſafe under the conduct of unerring wiſdom and unbounded goodneſs. It is in his care and providence alone that the good man, who is anxious for the happineſs of all, finds perfect ſerenity, a ſerenity neither ruffled by partial ill, nor ſoured by private diſappointment.

172 *Repentance, &c.* When we conſider the unſtained purity and abſolute perfection of the *divine* nature, and reflect withal on the imperfection and various blemiſhes of our own, we muſt ſink, or be convinced we ought to ſink, into the deepeſt humility and proſtration of ſoul before him, who is ſo wonderfully great and holy. When further, we call to mind what low and languid feelings we have of the divine preſence and majeſty, what inſenſibility of his fatherly and univerſal goodneſs, nay, what ungrateful returns we have made to it, how far we come ſhort of the perfection of his law, and the dignity of our own nature, how much we have indulged to the ſelfiſh paſſions, and how little to the benevolent ones; we muſt be conſcions that it is our duty to repent of a temper and conduct ſo unworthy our nature, and unbecoming our obligations to its Author, and to reſolve and endeavour to act a wiſer and better part for the future.

173 *Hopes of pardon.* Neverthelеſs, from the character which his works exhibit of him, from thoſe delays or alleviations of puniſhment which offenders often experience, and from the merciful tenor of his adminiſtration in many other inſtances, the ſincere penitent may entertain good hopes that his Parent and Judge will not be ſtrict to mark iniquity, but will be propitious and favourable to him, if he honeſtly endeavours to avoid his former practices, and ſubdue his former habits, and to live in a greater conformity to the divine will for the future. If any doubts or fears ſhould ſtill remain, how far it may be conſiſtent with the rectitude and equity of the divine government to let his iniquities paſs unpuniſhed, yet he cannot think it unſuitable to his paternal clemency and wiſdom to contrive a method of retrieving the penitent offender, that ſhall unite and reconcile the majeſty and mercy of his government. If reaſon cannot of itſelf ſuggeſt ſuch a ſcheme, it gives at leaſt ſome ground to expect it. But though *natural religion* cannot let in more light and aſſurance on ſo intereſting a ſubject, yet it will teach the humble theiſt to wait with great ſubmiſſion for any farther intimations it may pleaſe the ſupreme Governor to give of his will; to examine with candour and impartiality whatever

ever evidence ſhall be propoſed to him of a *divine revelation*, whether that evidence is *natural* or *ſupernatural*; to embrace it with veneration and cheerfulneſs, if the evidence is clear and convincing; and finally, if it bring to light any *new relations* or *connections*, *natural religion* will perſuade its ſincere votary faithfully to comply with the *obligations*, and perform the *duties* which reſult from thoſe relations and connections. This is *theiſm*, *piety*, the *completion of morality!*

174 Worſhip, praiſe, thankſgiving. We muſt farther obſerve, that all thoſe affections which we ſuppoſed to regard the Deity as their *immediate* and *primary* object, are vital energies of the ſoul, and conſequently exert themſelves into act, and, like all other energies, gain ſtrength or greater activity by that exertion. It is therefore our *duty* as well as higheſt *intereſt*, often at ſtated times, and by decent and ſolemn acts, to contemplate and adore the great Original of our exiſtence, the Parent of all beauty, and of all good; to expreſs our veneration and love by an awful and devout recognition of his perfections, and to evidence our gratitude by celebrating his goodneſs, and thankfully acknowledging all his benefits. It is likewiſe our duty, by proper exerciſes of ſorrow and humiliation, to confeſs our ingratitude and folly; to ſignify our dependence on God, and our confidence in his goodneſs, by imploring his bleſſing and gracious concurrence in aſſiſting the weakneſs, and curing the corruptions of our nature; and finally, to teſtify our ſenſe of his authority, and our faith in his government, by devoting ourſelves to do his will, and reſigning ourſelves to his diſpoſal. Theſe duties are not therefore obligatory, becauſe the Deity needs not, or can be profited by them; but as they are apparently *decent* and *moral*, ſuitable to the relations he ſuſtains of our *Creator*, *Benefactor*, *Lawgiver*, and *Judge*, expreſſive of our ſtate and obligations; and improving to our tempers, by making us more rational, ſocial, godlike, and conſequently more happy.

175 External worſhip. We have now conſidered INTERNAL piety, or the *worſhip of the mind*, that which is in ſpirit and in truth; we ſhall conclude the ſection with a ſhort account of that which is EXTERNAL. *External* worſhip is founded on the ſame principles as *internal*, and of as ſtrict moral obligation. It is either *private* or *public*. *Devotion* that is *inward*, or *purely intellectual*, is too ſpiritual and abſtracted an operation for the bulk of mankind. The operations of their minds, ſuch eſpecially as are employed on the moſt ſublime, immaterial objects, muſt be aſſiſted by their outward organs, or by ſome help from the imagination; otherwiſe they will ſoon be diſſipated by ſenſible impreſſions, or grow tireſome if too long continued. Ideas are ſuch fleeting things, that they muſt be fixed; and ſo ſubtle, that they muſt be expreſſed and delineated, as it were, by ſenſible marks and images; otherwiſe we cannot attend to them, nor be much affected by them. *Therefore verbal adoration*, *prayer*, *praiſe*, *thankſgiving*, and *confeſſion*, are admirable aids to *inward* devotion, fix our attention, compoſe and enliven our thoughts, impreſs us more deeply with a ſenſe of the awful preſence in which we are, and, by a natural and mechanical ſort of influence, tend to heighten thoſe devout feelings and affections which we ought to entertain, and after this manner reduce into formal and explicit act. 176

This holds true in an higher degree in the caſe of *public* worſhip, where the preſence of our fellow-creatures, and the powerful contagion of the *ſocial* affections, conſpire to kindle and ſpread the devout flame with greater warmth and energy. To conclude: As *God* is the *parent* and *head* of the *ſocial ſyſtem*, as he has formed us for a *ſocial ſtate*, as by *one* we find the beſt ſecurity againſt the ills of life, and in the *other* enjoy its greateſt comforts, and as, by means of *both*, our nature attains its higheſt improvement and perfection; and moreover, as there are *public bleſſings* and *crimes* in which we all ſhare in ſome degree, and *public wants* and *dangers* to which all are expoſed, it is therefore evident, that the various and ſolemn offices of *public religion* are duties of indiſpenſable moral obligation, among the beſt cements of ſociety, the firmeſt prop of government, and the faireſt ornament of both. Public worſhip.

PART III.

CHAP. I.

Of PRACTICAL ETHICS, *or the* CULTURE *of the* MIND.

177 Dignity and importance of the ſubject. WE have now gone through a particular detail of the ſeveral duties we owe to OURSELVES, to SOCIETY, and to GOD. In conſidering the *firſt order* of duties, we juſt touched on the methods of acquiring the different kinds of goods which we are led by nature to purſue; only we left the conſideration of the method of acquiring the *moral* goods of the mind to a chapter by itſelf, becauſe of its ſingular importance. This chapter then will contain a brief enumeration of the arts of acquiring *virtuous habits*, and of eradicating *vicious ones*, as far as is conſiſtent with the brevity of ſuch a work; a ſubject of the utmoſt difficulty as well as importance in morals; to which, nevertheleſs, the leaſt attention has been generally given by *moral* writers. This will properly follow a detail of duty, as it will direct us to ſuch *means* or *helps* as are moſt neceſſary and conducive to the practice of it. 178

In the firſt part of this inquiry we traced the order in which the paſſions ſhoot up in the different periods of human life. That order is not accidental, or dependent on the caprice of men, or the influence of cuſtom and education; but ariſes from the original conſtitution and laws of our nature; of which this is one, *viz.* "That ſenſible objects make the firſt and "ſtrongeſt impreſſions on the mind." Theſe, by means of our outward organs, being conveyed to the mind, become objects of its attention, on which it reflects when the outward objects are no longer preſent, or, in other words, when the impreſſions upon the outward organs ceaſe. Theſe objects of the mind's reflection are called *ideas* or *images*. Towards theſe, by another law of our nature, we are not altogether indifferent; Senſible ideas and ſenſible taſte.

indifferent; but correſpondent movements of *deſire* or *averſion*, *love* or *hatred* ariſe, according as the objects, of which they are images or copies, made an agreeable or diſagreeable impreſſion on our organs. Thoſe *ideas* and *affections* which we experience in the *firſt* period of life, we refer to the *body*, or to *ſenſe*; and the *taſte* which is formed towards them, we call a *ſenſible*, or a merely *natural taſte*; and the objects correſponding to them we in general call *good* or *pleaſant*.

179 Ideas of beauty and a fine taſte.

But as the mind moves forward in its courſe, it extends its views, and receives a new and more *complex* ſet of ideas, in which it obſerves *uniformity*, *variety*, *ſimilitude*, *ſymetry of parts*, *reference to an end*, *novelty*, *grandeur*. Theſe compoſe a vaſt train and diverſity of *imagery*, which the mind compounds, divides, and moulds into a thouſand forms, in the abſence of thoſe objects which firſt introduced it. And this more complicated imagery ſuggeſts a new train of *deſires* and *affections*, full as ſprightly and engaging as any which have yet appeared. This whole claſs of *perceptions* or *impreſſions* is referred to the *imagination*, and forms an higher taſte than the *ſenſible*, and which has an immediate and mighty influence on the *finer* paſſions of our nature, and is commonly termed a *fine taſte*.

The objects which correſpond to this taſte we uſe to call *beautiful*, *great*, *harmonious*, or *wonderful*, or, in general, by the name of *beauty*.

180 Moral ideas and a moral taſte.

The mind, ſtill puſhing onwards and increaſing its ſtock of ideas, aſcends from thoſe to an higher ſpecies of objects, *viz.* the *order* and *mutual relations* of *minds* to each other, their reciprocal *affections*, *characters*, *actions*, and various *aſpects*. In theſe it diſcovers a *beauty*, a *grandeur*, a *decorum*, more intereſting and alluring than in any of the former kinds. Theſe objects, or the images of them paſſing in review before the mind, do, by a neceſſary law of our nature, call forth another and nobler ſet of affections, as *admiration*, *eſteem*, *love*, *honour*, *gratitude*, *benevolence*, and others of the like tribe. This claſs of *perfections*, and their correſpondent *affections*, we refer, becauſe of their objects *(manners)*, to a *moral* ſenſe, and call the *taſte* or *temper* they excite, *moral*. And the objects which are agreeable to this *taſte* or *temper* we denominate by the general name of *moral beauty*, in order to diſtinguiſh it from the other, which is termed *natural*.

181 Sources of aſſociation.

Theſe different ſets of *ideas* or *images* are the materials about which the mind employs itſelf, which it blends, ranges, and diverſifies ten thouſand different ways. It feels a ſtrong propenſion to connect and aſſociate thoſe ideas among which it obſerves any *ſimilitude* or any *aptitude*, whether *original* and *natural*, or *cuſtomary* and *artificial*, to ſuggeſt each other. See METAPHYSICS.

182 Laws of aſſociation.

But whatever the reaſons are, whether *ſimilitude*, *co-exiſtence*, *cauſality*, or any other *aptitude* or *relation*, why any two or more ideas are connected by the mind at firſt, it is an eſtabliſhed law of our nature, "that when two or more ideas have often "ſtarted in company, they form ſo ſtrong an union, "that it is very difficult ever after to ſeparate them." Thus the *lover* cannot ſeparate the idea of *merit* from his *miſtreſs*; the *courtier* that of *dignity* from his *title* or *ribbon*; the *miſer* that of *happineſs* from his *bags*. It is theſe aſſociations of *worth* or *happineſs* with any of the different ſets of *objects* or *images* before ſpecified, that form our *taſte*, or *complex idea* of *good*. By another law of our nature, "our *affections* follow and "are governed by this *taſte*. And to theſe *affections* "our *character* and *conduct* are ſimilar and proportioned, on the general tenor of which our *happineſs* principally depends."

183 Leading paſſions follow taſte.

As all our *leading* paſſions then depend on the direction which our *taſte* takes, and as it is always of the ſame ſtrain with our *leading* aſſociations, it is worth while to enquire a little more particularly how theſe are formed, in order to detect the ſecret ſources from whence our paſſions derive their principal ſtrength, their various riſes and falls. For this will give us the true key to their management, and let us into the right method of correcting the *bad*, and improving the *good*.

184 The impor[illegible]nd uſe of the imagination.

No kind of objects make ſo powerful an impreſſion on us as thoſe which are immediately impreſſed on our *ſenſes*, or ſtrongly painted on our *imaginations*. Whatever is purely *intellectual*, as abſtracted or ſcientific truths, the ſubtle relations and differences of things, has a fainter ſort of exiſtence in the mind; and, though it may exerciſe and whet the *memory*, the *judgment*, or the *reaſoning power*, gives hardly any impulſe at all to the *active* powers, the *paſſions*, which are the main ſprings of motion. On the other hand, were the mind intirely under the direction of *ſenſe*, and impreſſible only by ſuch objects as are preſent, and ſtrike ſome of the outward organs, we ſhould then be preciſely in the ſtate of the brute creation, and be governed ſolely by *inſtinct* or *appetite*, and have no power to controul whatever impreſſions are made upon us: Nature has therefore endued us with a *middle faculty*, wonderfully adapted to our *mixed* ſtate, which holds partly of *ſenſe* and partly of *reaſon*, being ſtrongly allied to the *former*, and the common receptacle in which all the notices that come from that quarter are treaſured up; and yet greatly ſubſervient and miniſterial to the *latter*, by giving a body, a coherence, and beauty to its conceptions. This *middle* faculty is called the *imagination*, one of the moſt buſy and fruitful powers of the mind. Into this common ſtorehouſe are likewiſe carried all thoſe *moral images* or *forms* which are derived from our *moral faculties* of perception; and there they often undergo new changes and appearances, by being mixed and wrought up with the images and forms of *ſenſible* or *natural* things. By this coalition of imagery, *natural beauty* is dignified and heightened by *moral qualities* and *perfections*, and *moral qualities* are at once exhibited and ſet off by *natural beauty*. The *ſenſible* beauty, or good, is refined from its droſs by partaking of the *moral*; and the *moral* receives a ſtamp, a viſible character and currency, from the *ſenſible*.

185 Its energy in various inſtances in heightening ſenſible pleaſures.

As we are firſt of all accuſtomed to *ſenſible* impreſſions and *ſenſible* enjoyments, we contract early a *ſenſual reliſh*, or *love of pleaſure*, in the lower ſenſe of the word. In order however to juſtify this reliſh, the mind, as it becomes open to *higher* perceptions of *beauty* and *good*, borrows from thence a noble ſet of *images*, as *fine taſte*, *generoſity*, *ſocial affections*, *friendſhip*,

ſhip, good fellowſhip, and the like; and, by dreſſing out the old purſuits with theſe new ornaments, gives them an additional dignity and luſtre. By theſe ways the *deſire of a table, love of finery, intrigue*, and *pleaſure*, are vaſtly increaſed beyond their natural pitch, having an impulſe combined of the force of the *natural* appetites, and of the ſuperadded ſtrength of thoſe *paſſions* which tend to the *moral* ſpecies.

186 In heightening the pleaſures of beauty, harmony, &c.

When the mind becomes more ſenſible to thoſe objects or appearances in which it perceives *beauty, uniformity, grandeur*, and *harmony*, as fine cloaths, elegant furniture, plate, pictures, gardens, houſes, equipage, the beauty of animals, and particularly the attractions of the ſex; to theſe objects the mind is led by *nature*, or taught by *cuſtom*, the *opinion* and example of others, to annex certain ideas of *moral character, dignity, decorum, honour, liberality, tenderneſs*, and *active* or *ſocial enjoyment*. The conſequence of this aſſociation is, that the objects to which theſe are annexed muſt riſe in their value, and be purſued with proportionable ardour. The *enjoyment* of them is often attended with *pleaſure*; and the mere *poſſeſſion* of them, where that is wanting, frequently draws reſpect from one's fellow-creatures: This *reſpect* is, by many, thought equivalent to the pleaſure of *enjoyment*. Hence it happens that the idea of *happineſs* is connected with the mere *poſſeſſion*, which is therefore eagerly ſought after, without any regard to the *generous uſe* or *honourable enjoyment*. Thus the paſſion, reſting on the *means*, not the *end*, i. e. loſing ſight of its *natural* object, becomes wild and extravagant.

187 In raiſing the value of external ſymbols, &c.

In fine, any *object*, or *external denomination*, a *ſtaff*, a *garter*, a *cup*, a *crown*, a *title*, may become a *moral* badge or emblem of *merit, magnificence*, or *honour*, according as theſe have been found or thought, by the poſſeſſors or admirers of them, to accompany them; yet, by the deception formerly mentioned, the *merit* or the *conduct* which intitled, or ſhould intitle, to thoſe marks of diſtinction, ſhall be forgot or neglected, and the *badges* themſelves be paſſionately affected or purſued, as including every excellency. If theſe are attained by any means, all the concomitants which *nature, cuſtom*, or *accidents* have joined to them, will be ſuppoſed to follow of courſe. Thus, *moral ends*, with which the unhappy admirer is apt to colour over his paſſion and views, will, in his opinion, juſtify the moſt *immoral means*, as *proſtitution, adulation, fraud, treachery*, and every ſpecies of *knavery*, whether more open or more diſguiſed.

188 In heightening the value of wealth, power, &c.

When men are once engaged in *active* life, and find that *wealth* and *power*, generally called INTEREST, are the great avenues to every kind of enjoyment, they are apt to throw in many engaging *moral forms* to the object of their purſuit, in order to juſtify their paſſion, and varniſh over the meaſures they take to gratify it, as *independency on the vices* or *paſſions* of others, *proviſion* and *ſecurity to themſelves* and *friends, prudent œconomy*, or *well-placed charity, ſocial communication, ſuperiority to their enemies*, who are all villains, *honourable ſervice*, and many other ingredients of *merit*. To attain ſuch capacities of *uſefulneſs* or *enjoyment*, what arts, nay, what meanneſſes, can be thought blameable by thoſe cool purſuers of intereſt?—Nor have they whom the gay world is pleaſed to indulge with the title of *men of pleaſure* their imaginations leſs pregnant with *moral images*, with which they never fail to ennoble, or, if they cannot do that, to palliate their groſs purſuits. Thus *admiration of wit*, of *ſentiments* and *merit, friendſhip, love, generous ſympathy, mutual confidence, giving* and *receiving pleaſure*, are the ordinary ingredients with which they ſeaſon their gallantry and pleaſurable entertainments; and by which they impoſe on themſelves, and endeavour to impoſe on others, that *their amours* are the joint iſſue of good ſenſe and virtue.

189 Its influence on all the paſſions.

Theſe *aſſociations*, variouſly combined and proportioned by the *imagination*, form the chief *private* paſſions, which govern the lives of the generality, as the *love of action*, of *pleaſure, pow r, wealth*, and *fame*; they influence the *defenſive*, and affect the *public paſſions*, and raiſe *joy* or *ſorrow* as they are gratified or diſappointed. So that in effect theſe aſſociations of *good* and *evil, beauty* and *deformity*, and the paſſions they raiſe, are the main *hinges of life* and *manners*, and the great *ſources* of our *happineſs* or *miſery*. It is evident, therefore, that the whole of *moral culture* muſt depend on giving a right direction to the *leading paſſions*, and duly proportioning them to the *value* of the *objects* or *goods* purſued, under what name ſoever they may appear.

190 Moral culture, by correcting our taſte or imagination.

Now, in order to give them this *right direction* and *due proportion*, it appears, from the foregoing detail, that thoſe *aſſociations* of ideas, upon which the paſſions depend, muſt be *duly* regulated; that is to ſay, as an exorbitant paſſion for *wealth, pleaſure*, or *power*, flows from an *aſſociation* or *opinion* that more *beauty* and *good*, whether *natural* or *moral*, enters into the enjoyment or poſſeſſion of them, than really belongs to either; *therefore*, in reſtoring thoſe paſſions to their juſt proportion, we muſt begin with correcting the *opinion*, or breaking the *falſe aſſociation*, or, in other words, we muſt decompound the *complex phantom* of *happineſs* or *good*, which we fondly admire; diſunite thoſe ideas that have no natural alliance; and ſeparate the *original* idea of *wealth, power*, or *pleaſure*, from the foreign mixtures incorporated with it, which enhance its value, or give it its chief power to enchant and ſeduce the mind. For inſtance, let it be conſidered how poor and inconſiderable a thing *wealth* is, if it be disjoined from *real uſe*, or from ideas of *capacity* in the poſſeſſor *to do good*, from *independency, generoſity, proviſion for a family* or *friends*, and *ſocial communication* with others. By this *ſtandard* let its true value be fixed; let its miſapplication, or unbenevolent enjoyment, be accounted ſordid and infamous; and nothing worthy or eſtimable be aſcribed to the *mere poſſeſſion* of it, which is not borrowed from its *generous uſe*.

191 By ſelf-denial, and a counter-proceſs.

If that *complex* form of *good* which is called *pleaſure* engage us, let it be analyſed into its conſtituent principles, or thoſe allurements it draws from the *heart* and *imagination*, in order to heighten the low part of the indulgence; let the *ſeparate* and *comparative* moment of each be diſtinctly aſcertained and deduced from that groſs part, and this remainder of the accumulated enjoyment will dwindle down into a poor, inſipid, tranſitory thing. In proportion as the *opinion* of the *good* purſued abates, the *admiration* muſt decay, and

and the *paſſions* loſe ſtrength of courſe. One effectual way to lower the *opinion*, and conſequently to weaken the habit founded on it, is to practiſe leſſer pieces of ſelf-denial, or to abſtain, to a certain pitch, from the purſuit or enjoyment of the favourite object; and, that this may be the more eaſily accompliſhed, one muſt avoid thoſe occaſions, that company, thoſe places, and the other circumſtances, that enflamed *one* and endeared the *other*. And, as a *counter-proceſs*, let *higher* or even *different* enjoyments be brought in view, other paſſions played upon the former, different places frequented, other exerciſes tried, company kept with perſons of a different or more correct way of thinking, both in *natural* and *moral* ſubjects.

192 By a ſound and natural education.

As much depends on our ſetting out well in life, let the *youthful* fancy, which is apt to be very florid and luxuriant, be early accuſtomed by *inſtruction*, *example*, and ſignificant *moral exerciſes*, nay, by looks, geſtures, and every other teſtimony of juſt approbation or blame, to annex ideas of *merit*, *honour*, and *happineſs*; not to *birth*, *dreſs*, *rank*, *beauty*, *fortune*, *power*, *popularity*, and the like *outward* things, but to *moral* and *truly virtuous qualities*, and to thoſe *enjoyments* which ſpring from a well-informed judgment and a regular conduct of the affections, eſpecially thoſe of the *ſocial* and *diſintereſted* kind. Such dignified forms of *beauty* and *good*, often ſuggeſted, and, by moving pictures and examples, warmly recommended to the *imagination*, enforced by the authority of *conſcience*, and demonſtrated by *reaſon* to be the ſureſt means of enjoyment, and the only independent, undeprivable, and durable goods, will be the beſt counterbalance to meaner paſſions, and the firmeſt foundation and ſecurity to virtue.

193 By rightly ſtudying human nature.

It is of great importance to the forming a *juſt taſte*, or pure and large conceptions of happineſs, to ſtudy and underſtand *human nature* well, to remember what a complicated ſyſtem it is, particularly to have deeply imprinted on our mind that GRADATION of *ſenſes*, *faculties*, and *powers of enjoyment* formerly mentioned, and the *ſub-ordination* of *goods* reſulting from thence, which nature points out, and the experience of mankind confirms; who, when they think ſeriouſly, and are not under the immediate influence of ſome violent prejudice or paſſion, prefer not the pleaſures of *action*, *contemplation*, *ſociety*, and moſt *exerciſes* and *joys* of the *moral* kind, as *friendſhip*, *natural affection*, and the like, to all *ſenſual* gratifications whatſoever? where the different ſpecies of pleaſure are blended into *one complex form*, let them be accurately diſtinguiſhed, and be referred each to its proper *faculty* and *ſenſe*, and examined apart what they have peculiar, what common with others, and what foreign and adventitious.

194 By comparing the moment and abatements of different goods.

Let *wealth*, *grandeur*, *luxury*, *love*, *fame*, and the like, be tried to this teſt, and their true alloy will be found out.—Let it be farther conſidered, whether the mind may not be eaſy and enjoy itſelf greatly, though it want many of thoſe elegancies and ſuperfluities of life which ſome poſſeſs, or that load of wealth and power which others eagerly purſue, and under which they groan. Let the difficulty of attaining, the precariouſneſs of poſſeſſing, and the many abatements in enjoying, overgrown wealth and envied greatneſs, of which the weary poſſeſſors ſo frequently complain, as the hurry of buſineſs, the burden of company, of paying attendance to the *few*, and giving it to the *many*, the cares of keeping, the fears of loſing, and the deſires of increaſing what they have, and the other troubles which accompany this pityful drudgery and pompous ſervitude; let theſe and the like circumſtances be often conſidered, that are conducive to the removing or leſſening the *opinion* of ſuch goods, and the attendant *paſſion* or *ſet of paſſions* will decay of courſe.

195 By obſerving our own bent and character, &c.

Let the peculiar bent of our nature and character be obſerved, whether we are moſt inclined to form aſſociations and reliſh objects of the *ſenſible*, *intellectual*, or *moral* kind. Let that which has the aſcendant be particularly watched, let it be directed to right objects, be improved by proportioned exerciſes, and guarded by proper checks from an oppoſite quarter. Thus the *ſenſible* turn may be exalted by the *intellectual*, and a taſte for the beauty of the *fine arts*, and both may be made ſubſervient to convey and rivet ſentiments highly *moral* and *public-ſpirited*. This inward ſurvey muſt extend to the *ſtrenth* and *weakneſſes* of one's *nature*, one's *conditions*, *connections*, *habitudes*, *fortune*, *ſtudies*, *acquaintance*, and the other circumſtances of one's life, from which every man will form the juſteſt eſtimate of his own diſpoſitions and character, and the beſt rules for correcting and improving them. And in order to do this with more advantage, let thoſe *times* or *critical ſeaſons* be watched when the mind is beſt diſpoſed towards a change; and let them be improved by rigorous *reſolutions*, *promiſes*, or whatever elſe will engage the mind to perſevere in virtue. Let the *conduct*, in fine, be often reviewed, and the *cauſes* of its *corruption* or *improvement* be carefully obſerved.

196 By frequent moral exerciſes.

It will greatly conduce to refine the *moral taſte*, and ſtrengthen the *virtuous temper*, to accuſtom the mind to the frequent exerciſe of *moral ſentiments* and *determinations*, by reading *hiſtory*, *poetry*, particularly of the *pictureſque* and *dramatic* kind, the ſtudy of the *fine arts*; by converſing with the moſt eminent for good ſenſe and virtue; but, above all, by frequent and repeated acts of *humanity*, *compaſſions*, *friendſhip*, *politeneſs*, and *hoſpitality*. It is exerciſe gives health and ſtrength. He that reaſons moſt frequently becomes the wiſeſt, and moſt enjoys the pleaſures of wiſdom. He who is moſt often affected by objects of compaſſions in *poetry*, *hiſtory*, or *real life*, will have his ſoul moſt open to pity, and its delightful pains and duties. So he alſo who practiſes moſt diligently the offices of kindneſs and charity, will by it cultivate that diſpoſition from whence all his pretenſions to perſonal merit muſt ariſe, his preſent and his future happineſs.

197 By an honeſt employment.

An uſeful and honourable employment in life will adminiſter a thouſand opportunities of this kind, and greatly ſtrengthen a ſenſe of virtue and good affections, which muſt be nouriſhed by right training, as well as our underſtandings. For ſuch an employment, by enlarging one's experience, giving an habit of attention and caution, or obliging one, from neceſſity or intereſt, to keep a guard over the paſſions, and ſtudy the outward decencies and appearances of virtue, will by degrees produce good habit, and at length inſinuate

ſinuate the love of virtue and honeſty for its own ſake.

198 By viewing men and manners in a fair light.

It is a great inducement to the exerciſe of benevolence to view *human nature* in a favourable light, to obſerve the characters and circumſtances of mankind on the *faireſt* ſides, to put the beſt conſtructions on their actions they will bear, and to conſider them as the reſult of *partial* and *miſtaken*, rather than *ill* affections, or, at worſt, as the exceſſes of a pardonable ſelf-love, ſeldom or never the effect of pure malice.

199 By conſideration and pious exerciſes.

Above all, the *nature* and *conſequences* of *virtue* and *vice*, their conſequences being the law of our nature and will of heaven; the light in which they appear to our ſupreme *Parent* and *Lawgiver*, and the reception they will meet with from him, muſt be often attended to. The exerciſes of *piety*, as *adoration*, and *praiſe* of the *divine* excellency, *invocation* of and *dependence* on his aid, *confeſſion*, *thankſgiving*, and *reſignation*, are habitually to be indulged, and frequently performed, not only as *medicinal*, but highly *improving* to the temper.

200 By juſt views of human life and its connection with a future.

To conclude: it will be of admirable efficacy towards eradicating *bad* habits, and implanting *good* ones, frequently to contemplate *human life* as the great *nurſery* of our *future* and *immortal exiſtence*, as that *ſtate* of *probation* in which we are to be *educated* for a *divine life*. To remember, that our *virtues* or *vices* will be *immortal* as ourſelves, and influence our *future* as well as our *preſent* happineſs,—and therefore, that every diſpoſition and action is to be regarded as pointing beyond the *preſent* to an *immortal* duration. An habitual attention to this wide and important *connection* will give a vaſt compaſs and dignity to our ſentiments and actions, a noble ſuperiority to the pleaſures and pains of life, and a generous ambition to make our *virtue* as *immortal* as our *being*.

CHAP. II.

Motives to VIRTUE *from Perſonal* HAPPINESS.

201 Motives from perſonal happineſs.

WE have already conſidered our *obligations* to the practice of *virtue*, ariſing from the *conſtitution* of our nature, by which we are led to *approve* a certain *order* and *œconomy* of *affections*, and a certain *courſe of action* correſpondent to it*.—But, beſides this, there are ſeveral motives which ſtrengthen and ſecure virtue, though not themſelves of a *moral* kind. Theſe are, its *tendency to perſonal happineſs*, and the *contrary tendency of vice*. "Perſonal happineſs ariſes "either from the ſtate of a man's own mind, or from "the ſtate and diſpoſition of external cauſes towards "him."

* *Vide*. Part I. chap. i. ii. *&c.*

202 Happineſs of virtue from within.

We ſhall firſt examine the "tendency of virtue to "happineſs with reſpect to the ſtate of a man's own "mind."—This is a point of the utmoſt conſequence in morals, becauſe, unleſs we can convince ourſelves, or ſhew to others, that, by doing our *duty*, or fulfilling our *moral obligations*, we conſult the greateſt ſatisfaction of our own mind, or our higheſt intereſt on the whole, it will raiſe ſtrong and often unſurmountable prejudices againſt the practice of virtue, eſpecially whenever there ariſes any appearances of *oppoſition* between our *duty* and our *ſatisfaction* or *intereſt*. To creatures ſo deſirous of happineſs, and averſe to miſery, as we are, and often ſo odly ſituated amidſt contending paſſions and intereſts, it is neceſſary that virtue appear not only an *honourable*, but a *pleaſing* and *beneficent* form. And in order to juſtify our choice to ourſelves as well as before others, we muſt ourſelves feel and be able to avow in the face of the whole world, that *her* ways are ways of pleaſantneſs, and her paths the paths of peace. This will ſhew, beyond all contradiction, that we not only approve, but can give a ſufficient reaſon for what we do.

203 Influence of vice on the temper of the mind.

Let any man, in a cool hour, when he is diſengaged from buſineſs, and undiſturbed by paſſion (as ſuch cool hours will ſometimes happen) ſit down, and ſeriouſly reflect with himſelf what ſtate or temper of mind he would chuſe to feel and indulge, in order to be eaſy and to enjoy himſelf. Would he chuſe, for that purpoſe, to be in a conſtant diſſipation and hurry of thought; to be diſturbed in the exerciſe of his reaſon; to have various and often interfering phantoms of good playing before his imagination, ſoliciting and diſtracting him by turns, now ſoothing him with amuſing hopes, then torturing him with anxious fears; and to approve this minute what he ſhall condemn the next? Would he chuſe to have a ſtrong and painful ſenſe of every petty injury; quick apprehenſions of every impending evil; inceſſant and inſatiable deſires of power, wealth, honour, pleaſure; an irreconcileable antipathy againſt all competitors and rivals; inſolent and tyrannical diſpoſitions to all below him; fawning, and at the ſame time envious, diſpoſitions to all above him; with dark ſuſpicions and jealouſies of every mortal? Would he chuſe neither to love nor be beloved of any; to have no friend in whom to confide, or with whom to interchange his ſentiments or deſigns; no favourite, on whom to beſtow his kindneſs, or vent his paſſions; in fine, to be conſcious of no merit with mankind, no eſteem from any creature, no good affection to his Maker, no concern for, nor hopes of, his approbation; but, inſtead of all theſe, to hate, and know that he is hated, to condemn, and know that he is condemned by all; by the good, becauſe he is ſo unlike; and by the bad, becauſe he is ſo like themſelves; to hate or to dread the very Being that made him; and, in ſhort, to have his breaſt the ſeat of pride and paſſion, petulance and revenge, deep melancholy, cool malignity, and all the other furies that ever poſſeſſed and tortured mankind?—Would our calm inquirer after happineſs pitch on ſuch a ſtate, and ſuch a temper of mind, as the moſt likely means to put him in poſſeſſion of his deſired eaſe and ſelf-enjoyment?

204 [207.] Influence of virtue on the temper.

Or would he rather chuſe a ſerene and eaſy flow of thought; a reaſon clear and compoſed; a judgment unbiaſſed by prejudice, and undiſtracted by paſſion; a ſober and well-governed fancy, which preſents the images of things true, and unmixed with deluſive and unnatural charms, and therefore adminiſters no improper or dangerous fuel to the paſſions, but leaves the mind free to chuſe or reject, as becomes a reaſonable creature; a ſweet and ſedate temper, not eaſily ruffled by hopes or fears, prone neither to ſuſpicion nor revenge, apt to view men and things in the faireſt lights, and to bend gently to the humours of others rather than obſtinately to contend with them? Would he

he choose such moderation and continence of mind, as neither to be ambitious of *power*, fond of *honours*, covetous of *wealth*, nor a slave to *pleasure*; a mind of course neither elated with success, nor dejected with disappointment; such a modest and noble spirit as supports power without insolence, wears honour without pride, uses wealth without profusion or parsimony; and rejoices more in giving than in receiving pleasure; such fortitude and equanimity as rises above misfortunes, or turns them into blessings; such integrity and greatness of mind, as neither flatters the vices, nor triumphs over the follies of men; as equally spurns servitude and tyranny, and will neither engage in low designs, nor abet them in others? Would he choose, in fine, such mildness and benignity of heart as takes part in all the joys, and refuses none of the sorrows of others; stands well-affected to all mankind; is conscious of meriting the esteem of all, and of being beloved by the best; a mind which delights in doing good without any shew, and yet arrogates nothing on that account; rejoices in loving and being beloved by its Maker, acts ever under his eye, resigns itself to his providence, and triumphs in his approbation?—Which of these dispositions would be his choice, in order to be contented, serene, and happy?—The *former* temper is VICE, the *latter* VIRTUE. Where *one* prevails, there MISERY prevails, and by the generality is acknowledged to prevail. Where the *other* reigns, there HAPPINESS reigns, and by the confession of mankind is acknowledged to reign. The *perfection* of either temper is *misery* or *happiness in perfection*.—THEREFORE, every *approach* to *either extreme* is an *approach* to *misery*, or to *happiness*; *i. e.* every *degree* of *vice* or *virtue* is accompanied with a *proportionable degree* of *misery* or *happiness*.

208 The alleviations of his ills.

The principal alleviations of a virtuous man's calamities are these:—That though some of them may have been the effect of his imprudence or weakness, yet few of them are sharpened by a sense of guilt, and none of them by a consciousness of wickedness, which surely is their keenest sting;—that they are common to him with the best of men;—that they seldom or never attack him quite unprepared, but rather guarded with a consciousness of his own sincerity and virtue, with a faith and trust in providence, and a firm resignation to its perfect orders;—that they may be improved as means of correction, or materials to give scope and stability to his virtues;—and, to name no more, they are considerably lessened, and often sweetened to him, by the general sympathy of the wise and good.

209 His enjoyments.

His enjoyments are more numerous; or, if less numerous, yet more intense than those of the bad man; for he shares in the joys of others by rebound; and every increase of *general* or *particular* happiness is a real addition to his own. It is true, his friendly *sympathy* with others subjects him to some pains which the hard-hearted wretch does not feel; yet to give a loose to it, is a kind of agreeable discharge. It is such a sorrow as he loves to indulge; a sort of pleasing anguish that sweetly melts the mind, and terminates in a self-approving joy. Though the good man may want means to execute, or be disappointed in the success of, his benevolent purposes; yet, as was formerly * observed, he is still conscious of good affection, and that consciousness is an enjoyment of a more delightful favour than the greatest triumphs of successful vice. If the *ambitious*, *covetous*, or *voluptuous*, are disappointed, their passions recoil upon them with a fury proportioned to their opinion of the value of what they pursue, and their hope of success; while they have nothing within to balance the disappointment, unless it is an useless fund of pride, which, however, *frequently* turns mere accidents into mortifying affronts, and exalts grief into rage and frenzy.—Whereas the meek, humble, and benevolent temper is its own reward, is satisfied from within; and, as it magnifies greatly the pleasure of success, so it wonderfully alleviates, and in a manner annihilates, all pain for the want of it.

* See Part II. chap. ii.

210 From merited esteem and sympathy.

As the good man is conscious of loving and wishing well to all mankind, he must be sensible of his deserving the esteem and good-will of all; and this supposed reciprocation of social feelings is, by the very frame of our nature, made a source of very intense and enlivening joys. By this sympathy of affections and interests, he feels himself intimately united with the human race; and, being sensibly *alive* over the whole system, his heart receives and becomes responsive to every touch given to any part. So that, as an eminent *philosopher* § finely expresses it, he gathers contentment and delight from the pleased and happy states of those around him, from accounts and relations of such happiness, from the very countenances, gestures, voices, and sounds even of creatures foreign to our kind, whose signs of joy and contentment he can any way discern.

§ *Vide* Shaftsb. *Inq. into Virtue*, Book II.

211 Do not interfere with other joys.

Nor do those generous affections stop any other natural source of joy whatever, or deaden his sense of any innocent gratification. They rather keep the several *senses* and *powers of enjoyment* open and disengaged, intense and uncorrupted by riot or abuse; as is evident to any one who considers the dissipated, unfeeling state of men of *pleasure*, *ambition*, or *interest*, and compares it with the serene and gentle state of a mind at peace with itself, and friendly to all mankind, unruffled by any violent emotion, and sensible to every good-natured and alluring joy.

212 The misery of excess in the private passions.

It were easy, by going through the different sets of affections mentioned formerly ‡, to shew, that it is only by maintaining the proportion settled there that the mind arrives at true repose and satisfaction. If *fear* exceeds *that* proportion, it sinks into melancholy and dejection. If *anger* passes just bounds, it ferments into rage and revenge, or subsides into a sullen corroding gloom, which embitters every good, and renders one exquisitely sensible to every ill. The *private* passions, the *love of honour* especially, whose impulses are more generous, as its effects are more diffusive, are instruments of private pleasure; but if they are disproportioned to our *wants*, or to the *value* of their several objects, or to the *balance* of other passions equally necessary and more amiable, they become instruments of intense pain and misery. For, being now destitute of that counterpoise which held them at a due pitch, they grow turbulent, peevish, and revengeful, the cause of constant restlessness and torment, sometimes flying out into a wild delirious joy, at other times settling in a deep splenetic grief. The concert between reason and passion is then broke: all is dissonance and distraction within. The mind is out of

‡ See Part I. chap. i. ii.

of frame, and feels an agony proportioned to the violence of the reigning paſſion.

213 In the public affections.
The caſe is much the ſame, or rather worſe, when any of the particular *kind* affections are out of their natural order and proportion; as happens in the caſe of *effeminate pity*, *exorbitant love*, *parental dotage*, or any *party-paſſion*, where the juſt regards to ſociety are ſupplanted. The more *ſocial* and *diſintereſted* the paſſion is, it breaks out into the wilder exceſſes, and makes the more dreadful havoc both within and abroad; as is but too apparent in thoſe caſes where a falſe ſpecies of *religion*, *honour*, *zeal*, or *party-rage*, has ſeized on the natural enthuſiaſm of the mind, and worked it up to madneſs. It breaks through all ties *natural* and *civil*, contracts the moſt ſacred and ſolemn obligations, ſilences every other affection whether *public* or *private*, and transforms the moſt gentle natures into the moſt ſavage and inhuman.

214 Happineſs of well proportioned paſſions.
Whereas the man who keeps the *balance* of *affection* even, is eaſy and ſerene in his motions; mild, and yet affectionate; uniform and conſiſtent with himſelf; is not liable to diſagreeable colliſions of intereſts and paſſions; gives always place to the moſt friendly and humane affections, and never to diſpoſitions or acts of reſentment, but on high occaſions, when the *ſecurity* of the *private*, or *welfare* of the *public* ſyſtem, or the *great intereſts* of mankind, neceſſarily require a noble indignation; and even then he obſerves a juſt meaſure in wrath: and laſt of all, he proportions every paſſion to the value of the object he affects, or to the importance of the end he purſues.

215 Sum of the argument.
To ſum up this part of the argument, the *honeſt* and *good* man has eminently the advantage of the *knaviſh* and *ſelfiſh* wretch in every reſpect. The pleaſures which the *laſt* enjoys flow chiefly from external advantages and gratifications; are ſuperficial and tranſitory; daſhed with long intervals of ſatiety, and frequent returns of remorſe and fear; dependent on favourable accidents and conjunctures; and ſubjected to the humours of men. But the *good* man is ſatisfied from himſelf; his principal poſſeſſions lie within, and therefore beyond the reach of the caprice of men or fortune; his enjoyments are exquiſite and permanent; accompanied with no inward checks to damp them, and always with ideas of dignity and ſelf-approbation; may be taſted at any time, and in any place. The gratifications of *vice* are turbulent and unnatural, generally ariſing from the relief of paſſions in themſelves intolerable, and iſſuing in tormenting reflection; often irritated by diſappointment, always inflamed by enjoyment, and yet ever cloyed with repetition. The pleaſures of *virtue* are calm and natural; flowing from the exerciſe of kind affections, or delightful reflections in conſequence of them; not only agreeable in the proſpect, but in the preſent feeling; they never ſatiate, nor loſe their reliſh; nay, rather the admiration of virtue grows ſtronger every day; and not only is the deſire but the enjoyment heightened by every new gratification; and, unlike to moſt others, it is increaſed, not diminiſhed, by ſympathy and communication.—In fine, the ſatisfactions of *virtue* may be purchaſed without a bribe, and poſſeſſed in the humbleſt as well as the moſt triumphant fortune; they can bear the ſtricteſt review, do not change with circumſtances, nor grow old with time. Force cannot rob, nor fraud cheat us of them; and, to crown all, inſtead of abating, they enhance every other pleaſure.

216 External effects of virtue.
But the happy conſequences of *virtue* are ſeen not only in the internal enjoyments it affords a man, but "in the favourable diſpoſition of external cauſes towards him, to which it contributes."

217 On the body.
As *virtue* gives the ſober poſſeſſion of one's ſelf, and the command of one's paſſions, the conſequence muſt be heart's eaſe, and a fine natural flow of ſpirits, which conduce more than any thing elſe to health and long life. Violent paſſions, and the exceſſes they occaſion, gradually impair and wear down the machine. But the calm placid ſtate of a temperate mind, and the healthful exerciſes in which *virtue* engages her faithful votaries, preſerve the natural functions in full vigour and harmony, and exhilarate the ſpirits, which are the chief inſtruments of action.

218 On one's fortune, intereſt, &c.
It may by ſome be thought odd to aſſert, that *virtue* is no enemy to a man's *fortune* in the preſent ſtate of things.—But if by *fortune* be meant a moderate or competent ſhare of *wealth*, *power*, or *credit*, not overgrown degrees of them; what ſhould hinder the virtuous man from obtaining that? He cannot cringe or fawn, it is true, but he can be civil and obliging as well as the knave; and ſurely his civility is more alluring, becauſe it has more manlineſs and grace in it than the mean adulation of the other: he cannot cheat or undermine; but he may be cautious, provident, watchfull of occaſions, and equally prompt with the rogue in improving them: he ſcorns to proſtitute himſelf as a pander to the paſſions, or as a tool to the vices, of mankind; but he may have as ſound an underſtanding and as good capacities for promoting their real intereſts as the verieſt court-ſlave: and then he is more faithful and true to thoſe who employ him. In the common courſe of buſineſs, he has the ſame chances with the knave of acquiring a fortune, and riſing in the world. He may have equal abilities, equal induſtry, equal attention to buſineſs; and in other reſpects he has greatly the advantage of him. People love better to deal with him; they can truſt him more; they know he will not impoſe on them, nor take advantage of them, and can depend more on his word than on the oath or ſtrongeſt ſecurities of others. Whereas what is commonly called *cunning*, which is the *offſpring* of *ignorance*, and conſtant *companion* of *knavery*, is not only a mean-ſpirited, but a very ſhort-ſighted talent, and a fundamental obſtacle in the road of buſineſs. It may procure indeed immediate and petty gains; but it is attended with dreadful abatements, which do more than overbalance them, both as it ſinks a man's credit when diſcovered, and cramps that largeneſs of mind which extends to the remoteſt as well as the neareſt intereſt, and takes in the moſt durable equally with the moſt tranſient gains. It is therefore eaſy to ſee how much a man's *credit* and *reputation*, and conſequently his ſucceſs, depend on his honeſty and virtue.

219 On one's peace and ſecurity.
With regard to *ſecurity* and *peace* with his neighbours, it may be thought, perhaps, that the man of a quiet forgiving temper, and a flowing benevolence and courteſy, is much expoſed to injury and affronts from every proud or peeviſh mortal, who has the power or will to do miſchief. If we ſuppoſe, indeed this *quietneſs* and *gentleneſs* of nature accompanied with *cowardice*

dice and *puſillanimity*, this may often be the caſe; but in reality the good man is bold as a lion, and ſo much the bolder for being the calmer. Such a perſon will hardly be a butt to mankind. The ill-natured will be afraid to provoke him, and the good-natured will not incline to do it. Beſides, *true virtue*, which is conducted by reaſon, and exerted gracefully and without parade, is a moſt inſinuating and commanding thing; if it cannot diſarm malice and reſentment at once, it will wear them out by degrees, and ſubdue them at length. How many have, by favours and prudently yielding, triumphed over an enemy, who would have been inflamed into tenfold rage by the fierceſt oppoſition! In fine, *goodneſs* is the moſt univerſally popular thing that can be.

220 On one's family. To conclude; the good man may have ſome enemies, but he will have more friends; and, having given ſo many marks of private friendſhip or public virtue, he can hardly be deſtitute of a patron to protect, or a ſanctuary to entertain him, or to protect or entertain his children when he is gone. Though he ſhould have little elſe to leave them, he bequeaths them the faireſt, and generally the moſt unenvied, inheritance of a *good name*, which, like good ſeed ſown in the field of futurity, will often raiſe up unſolicited friends, and yield a benevolent harveſt of unexpected charities. But ſhould the fragrance of the parent's virtue prove offenſive to a perverſe or envious age, or even draw perſecution on the friendleſs orphans, there is *one* in heaven who will be more than a father to them, and recompenſe their parent's virtues by ſhowering down bleſſings on them.

CHAP. III.

Motives to VIRTUE *from the* BEING *and* PROVIDENCE *of* GOD.

221 Two external motives to virtue. BESIDES the intereſting motive mentioned in the laſt *chapter*, there are two great motives to *virtue*, ſtrictly connected with *human life*, and reſulting from the very *conſtitution* of the *human mind*. The firſt is the BEING and PROVIDENCE of GOD; the ſecond is the IMMORTALITY of the SOUL, with *future rewards* and *puniſhments*.

222 Their importance. It appears from Chap iv. of Part II. that *man*, by the *conſtitution* of his nature, is deſigned to be a RELIGIOUS CREATURE. He is intimately connected with the *Deity*, and neceſſarily dependent on him. From that *connection* and neceſſary *dependence* reſult various *obligations* and *duties*, without fulfilling which, ſome of his ſublimeſt powers and affections would be incomplete and abortive. If he be likewiſe an IMMORTAL creature, and if his *preſent conduct* ſhall affect his *future happineſs* in *another* ſtate as well as in the *preſent*; it is evident that we take only a *partial view* of the *creature* if we leave out this important property of his nature, and make a *partial eſtimate of human life*; if we ſtrike out of the account, or overlook, that part of his duration which runs out into eternity.

223 Piety. It is evident from the above-mentioned *chapter*, that "to have a reſpect to the *Deity* in our temper and "conduct, to *venerate* and *love* his *character*, to *adore* "his *goodneſs*, to *depend upon* and *reſign* ourſelves to "his *providence*, to *ſeek* his *approbation*, and *act* un-"der a *ſenſe* of his *authority*, is a *fundamental part* of "*moral virtue*, and the *completion* of the *higheſt de-"ſtination* of *our nature*."

But as *piety* is an eſſential part of virtue, ſo likewiſe it is a *great ſupport* and *enforcement* to the practice of it. To contemplate and admire a Being of ſuch tranſcendent dignity and perfection as GOD, muſt naturally and neceſſarily open and enlarge the mind, give a freedom and ampleneſs to its powers, and a grandeur and elevation to its aims. For, as an excellent *divine* obſerves, "the greatneſs of an object, and the ex-"cellency of the act of any AGENT about a tran-"ſcendent object, doth mightily tend to the enlarge-"ment and improvement of his faculties." Little objects, mean company, mean cares, and mean buſineſs, cramp the mind, contract its views, and give it a creeping air and deportment. But when it ſoars above mortal cares and mortal purſuits into the regions of divinity, and converſes with the greateſt and beſt of Beings, it ſpreads itſelf into a wider compaſs, takes higher flights in reaſon and goodneſs, becomes godlike in its air and manners. *Virtue* is, if one may ſay ſo, both the *effect* and *cauſe* of largeneſs of mind. It requires that one think freely, and act nobly. Now what can conduce more to freedom of thought and dignity of action, than to conceive worthily of GOD, to reverence and adore his unrivalled excellency, to imitate and tranſcribe that excellency into our own nature, to remember our relation to him, and that we are the image and repreſentatives of his glory to the reſt of the creation? Such feelings and exerciſes muſt and will make us ſcorn all actions that are baſe, unhandſome, or unworthy our ſtate; and the relation we ſtand in to GOD will irradiate the mind with the light of wiſdom, and ennoble it with the liberty and dominion of virtue. 224 A ſupport to virtue.

The influence and efficacy of *religion* may be conſidered in another light. We all know that the preſence of a friend, a neighbour, or any number of ſpectators, but eſpecially an auguſt aſſembly of them, uſes to be a conſiderable check upon the conduct of one who is not loſt to all ſenſe of honour and ſhame, and contributes to reſtrain many irregular ſallies of paſſion. In the ſame manner we may imagine, that the awe of ſome ſuperior mind, who is ſuppoſed privy to our ſecret conduct, and armed with full power to reward or puniſh it, will impoſe a reſtraint on us in ſuch actions as fall not under the controul or animadverſion of others. If we go ſtill higher, and ſuppoſe our inmoſt thoughts and darkeſt deſigns, as well as our moſt ſecret actions, to lie open to the notice of the ſupreme and univerſal mind, who is both the *ſpectator* and *judge* of human actions, it is evident that the belief of ſo auguſt a preſence, and ſuch awful inſpection, muſt carry a reſtraint and weight with it proportioned to the ſtrengh of that belief, and be an additional motive to the practice of many duties which would not have been performed without it. 225 A guard and enforcement to virtue.

It may be obſerved farther, that "to live under "an habitual ſenſe of the *Deity* and his great *admi-"niſtration*, is to be converſant with *wiſdom*, *order*, "and *beauty*, in the higheſt ſubjects, and to receive "the delightful reflections and benign feelings which "theſe excite while they irradiate upon him from every "ſcene of nature and providence." How improving muſt ſuch views be to the mind, in dilating and exalt- 226 Exerciſes of piety improving to virtue.

ing it above thoſe puny intereſts and competitions which agitate and inflame the bulk of mankind againſt each other!

Chap. IV.

Motive to Virtue *from the Immortality of the* Soul, *&c.*

217 Metaphyſical arguments for its immortality.

The other motive mentioned was the *immortality* of the ſoul, with *future rewards* and *puniſhments*. The *metaphyſical* proofs of the ſoul's immortality are commonly drawn from—its *ſimple*, *uncompounded*, and *indiviſible* nature; from whence it is concluded, that it cannot be corrupted or extinguiſhed by a diſſolution or deſtruction of its parts:—from its having a *beginning* of *motion* within itſelf; whence it is inferred, that it cannot diſcontinue and loſe its motion:—from the different properties of *matter* and *mind*, the *ſluggiſhneſs* and *inactivity of one*, and the immenſe *activity* of the *other;* its prodigious flight of *thought* and *imagination;* its *penetration*, *memory*, *foreſight*, and *anticipations* of *futurity:* from whence it is concluded, that a being of ſo divine a nature cannot be extinguiſhed. But as theſe metaphyſical proofs depend on intricate reaſonings concerning the *nature*, *properties*, and *diſtinctions* of *body* and *mind*, with which we are not very well acquainted, they are not obvious to ordinary underſtandings, and are ſeldom ſo convincing even to thoſe of higher reach, as not to leave ſome doubts behind them. Therefore perhaps it is not ſo ſafe to reſt the proof of ſuch an important article on what many may call the ſubtilties of ſchool-learning. Thoſe proofs which are brought from *analogy*, from the *moral conſtitution* and *phænomena* of the *human mind*, the *moral attributes* of God, and the *preſent courſe of things*, and which therefore are called the *moral* arguments, are the plaineſt, and generally the moſt ſatisfying. We ſhall ſelect only one or two from the reſt.

218 Moral proof from analogy.

In tracing the *nature* and *deſtination* of any being, we form the ſureſt judgment from his *powers* of *action*, and the ſcope and *limits* of theſe, compared with his *ſtate*, or with that *field* in which they are exerciſed. If this being paſſes through different ſtates, or fields of action, and we find a *ſucceſſion* of powers adapted to the different periods of his progreſs, we conclude that he was deſtined for thoſe ſucceſſive ſtates, and reckon his nature *progreſſive*. If, beſides the immediate ſet of powers which fit him for action in his preſent ſtate, we obſerve another ſet which appear ſuperfluous if he were to be confined to it, and which point to another or higher one, we naturally conclude, that he is not deſigned to remain in his preſent ſtate, but to advance to that for which thoſe ſupernumerary powers are adapted. Thus we argue, that the *inſect*, which has wings forming or formed, and all the apparatus proper for flight, is not deſtined always to creep on the ground, or to continue in the torpid ſtate of adhering to a wall, but is deſigned in its ſeaſon to take its flight in air. Without this farther deſtination, the admirable mechaniſm of wings and the other apparatus would be uſeleſs and abſurd. The ſame kind of reaſoning may be applied to man, while he lives only a ſort of *vegetative* life in the womb. He is furniſhed even there with a beautiful apparatus of organs, eyes, ears, and other delicate ſenſes, which receive nouriſhment indeed, but are in a manner folded up, and have no proper exerciſe or uſe in their preſent confinement *. Let us ſuppoſe ſome intelligent ſpectator, who never had any connection with man, nor the leaſt acquaintance with human affairs, to ſee this odd phenomenon, a creature formed after ſuch a manner, and placed in a ſituation apparently unſuitable to ſuch various machinery: muſt he not be ſtrangely puzzled about the uſe of his complicated ſtructure, and reckon ſuch a profuſion of art and admirable workmanſhip loſt on the ſubject; or reaſon by way of anticipation, that a creature endued with ſuch various yet unexerted capacities, was deſtined for a more enlarged ſphere of action, in which thoſe latent capacities ſhall have full play? The vaſt variety and yet beautiful ſymmetry and proportions of the ſeveral parts and organs with which the creature is endued, and their apt coheſion with and dependence on the curious receptacle of their life and nouriſhment, would forbid his concluding the whole to be the birth of chance, or the bungling effort of an unſkilful artiſt; at leaſt would make him demur a while at ſo harſh a ſentence. But if, while he is in this ſtate of uncertainty, we ſuppoſe him to ſee the babe, after a few ſucceſsful ſtruggles, throwing off his fetters, breaking looſe from his little dark priſon, and emerging into open day, then unfolding his recluſe and dormant powers, breathing in air, gazing at light, admitting colours, ſounds, and all the *fair variety* of nature; immediately his doubts clear up, the propriety and excellency of the workmanſhip dawn upon him with full luſtre, and the whole myſtery of the firſt period is unravelled by the opening of this new ſcene. Though in this *ſecond* period the creature lives chiefly a kind of *animal*-life, i. e. of *ſenſe* and *appetite*, yet by various trials and obſervations he gains experience, and by the gradual evolution of the powers of *imagination* he ripens apace for an *higher* life, for exerciſing the arts of *deſign* and *imitation*, and of thoſe in which ſtrength or dexterity are more requiſite than acuteneſs or reach of judgment. In the ſucceeding *rational* or *intellectual* period, his *underſtanding*, which formerly crept in a lower, mounts into an higher ſphere, canvaſſes the natures, judges of the relations of things, forms ſchemes, deduces conſequences from what is paſt, and from preſent as well as paſt collects future events. By this ſucceſſion of ſtates, and of correſpondent culture, he grows up at length into a *moral*, a *ſocial*, and a *political* creature. This is the laſt period at which we perceive him to arrive in this his mortal career. Each *period* is introductory to the next ſucceeding one; each *life* is a field of exerciſe and improvement for the next higher one; the life of the *fœtus* for that of the *infant*, the life of the *infant* for that of the *child*, and all the lower for the higheſt and beſt *.—But is this the laſt period of nature's progreſſion? Is this the utmoſt extent of her plot, where ſhe winds up the drama, and diſmiſſes the actor into eternal oblivion? Or does he appear to be inveſted with ſupernumerary powers, which have not full exerciſe and ſcope even in the laſt ſcene, and reach not that maturity or perfection of which they are capable; and therefore point to ſome higher ſcene where he is to ſuſtain another and more important character than he has yet ſuſtained? If any ſuch there are, may we not conclude by analogy, or in the ſame way of anticipation

* *Vide* Ludov. Viv. *de Relig. Chriſt.* Lib. II. *de Vita Uteri, &c.*

* *See* Butler's *Analogy*, Part I.

tion as before, that he is deftined for that after-part, and is to be produced upon a more auguft and folemn ftage, where his fublimer powers fhall have proportioned action, and its nature attain its completion?

229 Powers in man which point to an after-life. If we attend to that *curiofity*, or prodigious *thirft* of *knowledge*, which is natural to the mind in every period of its progrefs, and confider withal the endlefs round of bufinefs and care, and the various hardfhips to

230 Intellectual. which the bulk of mankind are chained down; it is evident, that in this prefent ftate it is impoffible to expect the gratification of an appetite at once fo infatiable and fo noble. Our *fenfes*, the ordinary organs by which knowledge is let into the mind, are always imperfect, and often fallacious; the advantages of affifting or correcting them are poffeffed by few; the difficulties of finding out truth amidft the various and contradictory opinions, interefts, and paffions of mankind, are many; and the wants of the creature, and of thofe with whom he is connected, numerous and urgent: fo that it may be faid of moft men, that their *intellectual* organs are as much fhut up and fecluded from proper nourifhment and exercife in that little circle to which they are confined, as the bodily organs are in the womb. Nay, thofe who to an afpiring genius have added all the affiftances of art, leifure, and the moft liberal education, what narrow profpects can even they take of this unbounded fcene of things from that little eminence on which they ftand? and how eagerly do they ftill grafp at new difcoveries, without any fatisfaction or limit to their ambition?

231 Moral powers. But fhould it be faid, that man is made for *action*, and not for *fpeculation*, or fruitlefs fearches after knowledge, we afk, For what kind of action? Is it only for bodily exercifes, or for *moral*, *political*, and *religious* ones? Of all thefe he is capable; yet, by the unavoidable circumftances of his lot, he is tied down to the *former*, and has hardly any leifure to think of the *latter*, or, if he has, wants the proper inftruments of exerting them. The *love of virtue*, *of one's friends* and *country*, the *generous fympathy with mankind*, and *heroic zeal of doing good*, which are all fo *natural* to great and good minds, and fome traces of which are found in the loweft, are feldom united with proportioned means or opportunities of exercifing them: fo that the *moral* fpring, the noble energies and impulfes of the mind, can hardly find proper fcope even in the moft fortunate condition; but are much depreffed in fome, and almoft entirely reftrained in the generality, by the numerous clogs of an indigent, fickly, or embarraffed life. Were fuch mighty powers, fuch godlike affections, planted in the human breaft to be folded up in the narrow womb of our prefent exiftence, never to be produced into a more *perfect* life, nor to expatiate in the ample career of immortality?

232 Unfatisfied defires of exiftence and happinefs. Let it be confidered, at the fame time, that no poffeffion, no enjoyment within the round of mortal things, is commenfurate to the defires, or adequate to the capacities, of the mind. The moft exalted condition has its abatements; the happieft conjuncture of fortune leaves many wifhes behind; and, after the higheft gratifications, the mind is carried forward in purfuit of new ones without end. Add to all, the fond *defire* of *immortality*, the fecret *dread* of *nonexiftence*, and the high unremitting *pulfe* of the foul beating for *perfection*, joined to the improbability or the impoffibility of attaining it *here*; and then judge whether this elaborate ftructure, this magnificent apparatus of inward powers and organs, does not plainly point out an *hereafter*, *and intimate eternity to man*? Does nature give the finifhing touches to the leffer and ignobler inftances of her fkill, and raife every other creature to the maturity and perfection of his being; and fhall fhe leave her principal workmanfhip unfinifhed? Does fhe carry the *vegetative* and *animal* life in *man* to their full vigour and higheft deftination; and fhall fhe fuffer his *intellectual*, his *moral*, his *divine* life to fade away, and be for ever extinguifhed? Would fuch abortions in the *moral* world be congruous to that *perfection of wifdom and goodnefs* which upholds and adorns the *natural*?

We muft therefore conclude from this detail, that the *prefent ftate*, even at its beft, is only the WOMB of man's being, in which the nobleft principles of his nature are in a manner fettered, or fecluded from a correfpondent fphere of action; and therefore deftined for a future and unbounded ftate, where they fhall emancipate themfelves, and exert the fulnefs of their ftrength. The moft accomplifhed mortal, in this low and dark apartment of nature, is only the *rudiments* of what he fhall be when he takes his ethereal flight, and puts on immortality. Without a reference to that ftate, *man* were a mere abortion, a rude unfinifhed embryo, a monfter in nature. But this being once fuppofed, he ftill maintains his rank of the mafterpiece of the creation; his latent powers are all fuitable to the *harmony* and *progreffion* of nature; his noble afpirations, and the pains of his diffolution, are his efforts towards a *fecond* birth, the pangs of his delivery into light, liberty, and perfection; and *death*, his difcharge from goal, his feparation from his fellow-prifoners, and introduction into the affembly of thofe heroic fpirits who are gone before him, and of their great eternal Parent. The fetters of his mortal coil being loofened, and his prifon-walls broke down, he will be bare and open on every fide to the admiffion of *truth* and *virtue*, and their fair attendant *happinefs*; every *vital* and *intellectual* fpring will evolve itfelf with a divine elafticity in the free air of heaven. He will not then peep at the univerfe and its glorious Author through a dark grate or a grofs medium, nor receive the reflections of his glory through the ftrait openings of fenfible organs; but will be *all eye*, *all ear*, *all ethereal and divine feeling* *. Let one part, however, of the analogy be attended to: That as in the womb we receive our original conftitution, form, and the effential *ftamina* of our being, which we carry along with us into the light, and which greatly affect the fucceeding periods of our life; fo our temper and condition in the *future* life will depend on the conduct we have obferved, and the character we have formed, in the *prefent* life. We are *here* in *miniature* what we fhall be at *full length hereafter*. The firft *rude fketch* or *out-lines* of *reafon* and *virtue* muft be drawn at prefent, to be afterwards enlarged to the *ftature* and *beauty* of angels.

233 Therefore man immortal.

* *Vide* Religion of Nature, § 9.

This, if duly attended to, muft prove not only a *guard*, but an admirable *incentive* to virtue. For he who faithfully and ardently follows the lights of knowledge, and pants after higher improvements in virtue, 234 Immortality a guard and incentive to virtue.

will

will be wonderfully animated and inflamed in that purſuit by a full conviction that the ſcene does not cloſe with life—that his ſtruggles, ariſing from the weakneſs of nature and the ſtrength of habit, will be turned into triumphs—that his career in the tract of wiſdom and goodneſs will be both ſwifter and ſmoother—and thoſe generous ardours with which he glows towards *heaven*, *i. e.* the *perfection* and *immortality of virtue*, will find their adequate object and exerciſe in a ſphere proportionably enlarged, incorruptible, immortal. On the other hand, what an inexpreſſible damp muſt it be to the good man, to dread the total extinction of that *light* and *virtue*, without which *life*, nay, *immortality* itſelf, were not worth a ſingle wiſh?

235 Proof from the inequality of preſent diſtributions.

Many writers draw their proofs of the immortality of the ſoul, and of a future ſtate of rewards and puniſhments, from the unequal diſtribution of theſe here. It cannot be diſſembled that wicked men often eſcape the *outward* puniſhment due to their crimes, and do not feel the *inward* in that meaſure their demerit ſeems to require, partly from the callouſneſs induced upon their nature by the habits of vice, and partly from the diſſipation of their minds abroad by pleaſure or buſineſs—and ſometimes good men do not reap all the natural and genuine fruits of their virtue, through the many unforeſeen or unavoidable calamities in which they are involved. This, no doubt, upon the ſuppoſition of an all-wiſe and good Providence, were an argument, and a ſtrong one too, for a future ſtate, in which thoſe inequalities ſhall be corrected. But unleſs we ſuppoſe a *prepollent good order* in the preſent ſcene of things, we weaken the proof of the *divine* adminiſtration, and the preſumption of any better order in any future period of it.

236 Belief of immortality, &c. a great ſupport amidſt trials.

Virtue has preſent rewards, and *vice* preſent puniſhments, annexed to it; ſuch rewards and puniſhments as make *virtue*, in moſt caſes that happen, far more eligible than *vice:* but, in the infinite variety of human contingencies, it may ſometimes fall out, that the inflexible practice of virtue ſhall deprive a man of conſiderable advantages to himſelf, his family, or friends, which he might gain by a well-timed piece of roguery; ſuppoſe by betraying his truſt, voting againſt his conſcience, ſelling his country, or any other crime, where the ſecurity againſt diſcovery ſhall heighten the temptation. Or, it may happen, that a ſtrict adherence to his honour, to his religion, to the cauſe of liberty and virtue, ſhall expoſe him, or his family, to the loſs of every thing, nay, to poverty, ſlavery, death itſelf, or to torments far more intolerable. Now what ſhall ſecure a man's virtue in circumſtances of ſuch trial? What ſhall enforce the obligations of conſcience againſt the allurements of ſo many intereſts, the dread of ſo many and ſo terrible evils, and the almoſt unſurmountable averſion of human nature to exceſſive pain! The conflict is the greater, when the circumſtances of the crime are ſuch as eaſily admit a variety of alleviations from *neceſſity*, *natural affection*, *love to one's family* or *friends*, perhaps in indigence: theſe will give it even the air of virtue. Add to all, that the crime may be thought to have few bad conſequences,—may be eaſily concealed,—or imagined poſſible to be retrieved in a good meaſure by future good conduct. It is obvious to which ſide moſt men will lean in ſuch a caſe; and how much need there is of a balance in the oppoſite ſcale, from the conſideration of a *God*, of a *Providence*, and of an *immortal ſtate* of *retribution*, to keep the mind firm and uncorrupt in thoſe or like inſtances of ſingular trial or diſtreſs.

237 In the general courſe of life.

But without ſuppoſing ſuch peculiar inſtances, a ſenſe of a governing Mind, and a perſuaſion that virtue is not only befriended by him here, but will be crowned by him hereafter with rewards ſuitable to its nature, vaſt in themſelves, and immortal in their duration, muſt be not only a mighty ſupport and incentive to the practice of virtue, but a ſtrong barrier againſt vice. The thoughts of an Almighty Judge, and of an impartial future reckoning, are often alarming, inexpreſſibly ſo, even to the ſtouteſt offenders. On the other hand, how ſupporting muſt it be to the good man, to think that he acts under the eye of his friend, as well as judge! How improving, to conſider the *preſent ſtate* as connected with a *future* one, and every relation in which he ſtands as a *ſchool* of *diſcipline* for his *affections;* every *trial* as the *exerciſe* of ſome *virtue;* and the virtuous deeds which reſult from both, as introductory to higher ſcenes of *action* and *enjoyment!* Finally, how tranſporting is it to view *death* as his *diſcharge* from the *warfare* of *mortality*, and a triumphant *entry* into a ſtate of freedom, ſecurity, and perfection, in which knowledge and wiſdom ſhall break upon him from every quarter; where each faculty ſhall have its proper object; and his virtue, which was often damped or defeated here, ſhall be enthroned in undiſturbed and eternal empire!

238 Advantages of the Chriſtian ſcheme, and its connection with natural religion or morality.

On reviewing this ſhort *ſyſtem* of *morals*, and the *motives* which ſupport and enforce it, and comparing both with the Christian *ſcheme*, what *light* and *vigour* do they borrow from thence! How clearly and fully does Christianity lay open the *connections* of our nature, both *material* and *immaterial*, and *future* as well as *preſent!* What an ample and beautiful detail does it preſent of the *duties* we owe to *God*, to *ſociety*, and *ourſelves*, promulgated in the moſt ſimple, intelligible, and popular manner; diveſted of every partiality of ſect or nation; and adapted to the general ſtate of mankind! With what bright and alluring *examples* does it illuſtrate and recommend the practice of thoſe duties; and with what mighty *ſanctions* does it enforce that practice! How ſtrongly does it deſcribe the *corruptions* of our nature; the *deviations* of our life from the *rule* of *duty*, and the *cauſes* of both! How marvellous and benevolent a plan of *redemption* does it unfold, by which thoſe corruptions may be remedied, and our *nature* reſtored from its *deviations* to tranſcendent heights of *virtue* and *piety!* Finally, what a fair and comprehenſive proſpect does it give us of the *adminiſtration* of *God*, of which it repreſents the *preſent ſtate* only as a *ſmall period*, and a *period* of *warfare* and *trial!* How ſolemn and unbounded are the ſcenes which it opens beyond it! the *reſurrection* of the *dead*, the *general judgment*, the *equal diſtribution* of *rewards* and *puniſhments* to the *good* and the *bad;* and the full *completion* of *divine wiſdom* and *goodneſs* in the *final eſtabliſhment* of *order*, *perfection*, and *happineſs!* How glorious then is that Scheme of Religion, and how worthy of *affection* as well as of *admiration*, which, by making ſuch *diſcoveries*, and affording ſuch *aſſiſtances*, has diſcloſed the unfading fruits and triumphs of virtue, and ſecured its intereſts beyond the power of time and chance!

MORAL *Sense*, that whereby we perceive what is good, virtuous, and beautiful, in actions, manners, and characters. See MORAL *Philosophy*.

MORALITY. See MORAL *Philosophy*.

MORASS, a low and moist land, which receives the waters from the higher grounds without having any descent to carry them off.

MORATA (Olympia Fulvia), an Italian lady, distinguished for her learning, was born at Ferrara, in 1526. Her father, after teaching the belles lettres in several cities of Italy, was made preceptor to the two young princes of Ferrara, the sons of Alphonsus I. The uncommon abilities he discovered in his daughter determined him to give her a very extraordinary education. Meanwhile the princess of Ferrara studying polite literature, it was judged expedient that she should have a companion in the same pursuit; and Morata being called, she was heard by the astonished courtiers to declaim in Latin, to speak Greek, and to explain the paradoxes of Cicero. Her father dying, she was obliged to return home, to take upon her the management of family-affairs, and the education of her brother and three sisters; both which she executed with the greatest diligence and success. In the mean time Andrew Grunthler, a young German, who had studied physic, and taken his doctor's degree at Ferrara, fell in love with her, and married her. She now went with her husband to Germany, taking her little brother with her, whom she instructed in the Latin and Greek tongues; and after staying a short time at Augsburg, went to Schweinfort in Franconia, where her husband was born: but they had not been there long before that town was unhappily besieged and burnt; however, escaping the flames, they fled in the utmost distress to Hammelburg. This place they were also obliged to quit, and were reduced to the last extremities, when the elector palatine invited Grunthler to be professor of physic at Heidelberg, and he entered on his new office in 1554; but they no sooner began to taste the sweets of repose, than a disease, occasioned by the distresses and hardships they had suffered, seized upon Morata, who died in 1555, in the 29th year of her age; and her husband and brother did not long survive her. She composed several works, great part of which were burnt with the town of Schweinfort; the remainder, which consist of orations, dialogues, letters, and translations, were collected and published under the title of *Olympiæ Fulviæ Moratæ, fœminæ doctissimæ, et plane divinæ, opera omnia quæ hactenus invenire potuerint; quibus Cœlii secundi curionis epistolæ ac orationes accesserunt;* which has had several editions in octavo.

MORAVIA, a marquisate of Germany, derives the name of *Mahern*, as it is called by the Germans, and of *Morawa*, as it is called by the natives, from the river of that name which rises in the mountains of the county of Glatz, and passes through the middle of it. It is bounded to the south by Austria, to the north by Glatz and Silesia, to the west by Bohemia, and to the east by Silesia and Hungary; being about 120 miles in length, and 100 in breadth.

A great part of this country is over-run with woods and mountains, where the air is very cold, but much wholesomer than in the low grounds, which are full of bogs and lakes. The mountains, in general, are barren; but the more champaign parts tolerably fertile, yielding corn, with plenty of hemp and flax, good saffron, and pasture. Nor is it altogether destitute of wine, red and white, fruits, and garden-stuff. Moravia also abounds in horses, black cattle, sheep, and goats. In the woods and about the lakes there is plenty of wild fowl, game, venison, bees, honey, hares, foxes, wolves, beavers, &c. In this country are likewise quarries of marble, bastard diamonds, amethysts, alum, iron, sulphur, salt-petre, and vitriol, with wholesome mineral-waters, and warm springs; but salt is imported. Its rivers, of which the March, Morawa, or Morau, are the chief, abound with trout, crayfish, barbels, eels, perch, and many other sorts of fish.

The language of the inhabitants is a dialect of the Sclavonic, differing little from the Bohemian; but the nobility and citizens speak German and French.

Moravia was anciently inhabited by the Quadi, who were driven out by the Sclavi. Its kings, who were once powerful and independent, afterwards became dependent on, and tributary to, the German emperors and kings. At last, in the year 908, the Moravian kingdom was parcelled out among the Germans, Poles, and Hungarians. In 1086, that part of it properly called *Moravia* was declared a marquisate by the German king Henry IV. and united with Bohemia, to whose dukes and kings it hath ever since been subject. Though it is not very populous, it contains about 42 greater or walled towns, 17 smaller or open towns, and 198 market-towns, besides villages, &c. The states of the country consist of the clergy, lords, knights, and burgesses; and the diets, when summoned by the regency, are held at Brunn. The marquisate is still governed by its own peculiar constitutions, under the *directorium in publicis & cameralibus*, and the supreme judicatory at Vienna. It is divided into six circles, each of which has its captain, and contributes to its sovereign about one-third of what is exacted of Bohemia. Towards the expences of the military establishment of the whole Austrian hereditary countries, its yearly quota is 1,856,490 florins. Seven regiments of foot, one of cuirassiers, and one of dragoons, are usually quartered in it.

Christianity was planted in this country in the 9th century; and the inhabitants continued attached to the church of Rome till the 15th, when they espoused the doctrine of John Huss, and threw off popery: but after the defeat of the elector Palatine, whom they had chosen king, as well as the Bohemians, the emperor Ferdinand II. re-established popery. However, there are still some Protestants in Moravia; and here it was that the *Hernhutters*, or *Moravian Brethren*, first made their appearance. See MORAVIANS. The bishop of Olmutz, who stands immediately under the pope, is at the head of the ecclesiastics in this country. The supreme ecclesiastical jurisdiction, under the bishop, is vested in a consistory.

The commerce of this country is inconsiderable. Of what they have, Brunn enjoys the principal part. At Iglau and Trebitx are manufactures of cloth, paper, gun-powder, &c. There are also some iron-works and glass-houses in the country.

The inhabitants of Moravia in general are open-hearted, not easy to be provoked or pacified, obedient to their masters, and true to their promises; but credu-

lous.

lous of old prophecies, and much addicted to drinking, though neither fuch fots or bigots as they are reprefented by fome geographers. The boors, indeed, upon the river Hanak, are faid to be a thievifh, unpolifhed, brutal race. The fciences now begin to lift up their heads a little among the Moravians, the univerfity of Olmutz having been put on a better footing; and a riding academy, with a learned fociety, have been lately eftablifhed there.

MORAVIANS, a fect of Proteftants, who have been fettled for a confiderable time paft at Hernhuth in Moravia, and have of late years fpread themfelves over moft of our American colonies, as well as in feveral parts of England, where they are permitted to fettle, by a late act of parliament. They have a kind of church-government peculiar to themfelves; and are commonly known by the name of *Unitas Fratrum*, or *The Brethren*. They profefs the utmoft veneration for our bleffed Saviour, whom they confider as their immediate head and director; enjoin the moft implicit obedience to the rulers of their church; and are faid to practife much brotherly love amongft one another; but from many of their tenets, it would appear, that obfcenity makes no fmall part of their devotion. See ZINZENDORFF.

MORBID, among phyficians, fignifies "difeafed or corrupt;" a term applied either to an unfound conftitution, or to thofe parts or humours that are affected by a difeafe.

MORBUS SACER, in medicine, the fame with HIERANOSOS. See MEDICINE, p. 4787. col. 2.

MORBUS *Regius*, the fame with the JAUNDICE. See MEDICINE, n° 453.

MORBUS, or *Difeafe*, in botany. See VARIETAS.

MORDAUNT (Charles), earl of Peterborough, a celebrated commander both by fea and land, was the fon of John Lord Mordaunt, vifcount Avalon, and was born about the year 1658. In 1675 he fucceeded his father in his honours and eftate. While young he ferved under the admirals Torrington and Narborough in the Mediterranean, againft the Algerines; and in 1680 embarked for Africa with the earl of Plymouth, and diftinguifhed himfelf at Tangier when it was befieged by the Moors.

In the reign of James II. he voted againft the repeal of the teft-act; and difliking the meafures of the court, obtained leave to go to Holland to accept the command of a Dutch fquadron in the Weft Indies. He afterwards accompanied the prince of Orange into this kingdom; and upon his advancement to the throne, was fworn of the privy-council, made one of the lords of the bedchamber to his majefty, alfo firft commiffioner of the treafury, and advanced to the dignity of earl of Monmouth. But, in November 1690, he was difmiffed from his poft in the treafury. On the death of his uncle Henry earl of Peterborough in 1697, he fucceeded to that title; and, upon the acceffion of queen Anne, was invefted with the commiffion of captain-general and governor of Jamaica. In 1705 he was fworn of the privy-council; and the fame year declared general and commander in chief of the forces fent to Spain, and joint admiral of the fleet with Sir Cloudfley Shovel, of which the year following he had the fole command. His taking Barcelona with a handful of men, and afterwards relieving it when greatly diftreffed by the enemy; his driving out of Spain the duke of Anjou, and the French army, which confifted of 25,000 men, though his own troops never amounted to 10,000; his gaining poffeffion of Catalonia, of the kingdoms of Valencia, Arragon, and the ifle of Majorca, with part of Murcia and Caftile, and thereby giving the earl of Galway an opportunity of advancing to Madrid without a blow; are aftonifhing inftances of his bravery and conduct. For thefe important fervices his Lordfhip was declared general in Spain by Charles III. afterwards emperor of Germany; and on his return to England he received the thanks of the Houfe of Lords. His Lordfhip was afterwards employed in feveral embaffies to foreign courts, inftalled knight of the garter, and made governor of Minorca. In the reign of George I. he was general of all the marine forces in Great Britain, in which poft he was continued by king George II. He died in his paffage to Lifbon, where he was going for the recovery of his health, in 1735.

His Lordfhip was diftinguifhed by his poffeffing various fhining qualities: for, to the greateft perfonal courage and refolution, he added all the arts and addrefs of a general; a lively and penetrating genius; and a great extent of knowledge upon almoft every fubject of importance within the compafs of ancient and modern literature; hence his familiar letters, inferted among thofe of his friend Mr Pope, are an ornament to that excellent collection.

MORDELLA, in zoology, a genus of the coleoptera clafs of infects. The antennæ are thread-fhaped and ferrated; the head is deflected under the neck; the pappi are clavated, compreffed, and obliquely blunted; and the elytra are bent backwards near the apex. There are fix fpecies, all natives of different parts of Europe.

MORE (Sir Thomas), lord high chancellor of England, the fon of Sir John More, knight, one of the judges of the king's-bench, was born in the year 1480, in Milk-ftreet, London. He was firft fent to a fchool at St Anthony's in Threadneedle-ftreet; and afterwards introduced into the family of cardinal Moreton, who, in 1497, fent him to Canterbury college in Oxford. During his refidence at the univerfity he conftantly attended the lectures of Linacre and Grocinus, on the Greek and Latin languages. Having in the fpace of about two years made confiderable proficiency in academical learning, he came to New-inn in London, in order to ftudy the law; whence, after fome time, he removed to Lincoln's-inn, of which his father was a member. Notwithftanding his application to the law, however, being now about 20 years old, he was fo bigotted to monkifh difcipline, that he wore a hair-fhirt next his fkin, frequently fafted, and often flept on a bare plank. In the year 1503, being then a burgefs in parliament, he diftinguifhed himfelf in the houfe, in oppofition to the motion for granting a fubfidy and three fifteenths for the marriage of Hen. VII.'s eldeft daughter, Margaret, to the king of Scotland. The motion was rejected; and the king was fo highly offended at this oppofition from a beardlefs boy, that he revenged himfelf on Mr More's father, by fending him on a frivolous pretence to the Tower, and obliging him to pay 100l. for his liberty. Being now called to the bar, he was appointed law-reader at Furnival's

 val's inn, which place he held about three years; but about this time, he alfo read a public lecture in the church of St Lawrence, Old Jewry, upon St Auftin's treatife *De civitate Dei*, with great applaufe. He had indeed formed a defign of becoming a Francifcan friar, but was diffuaded from it; and, by the advice of Dr Colet, married Jane, the eldeft daughter of John Colt, Efq; of Newhall in Effex. In 1508 he was appointed judge of the fheriff's court in the city of London, was made a juftice of the peace, and became very eminent at the bar. In 1516 he went to Flanders in the retinue of bifhop Tonftal and Dr Knight, who were fent by king Henry VIII. to renew the alliance with the archduke of Auftria, afterwards Charles V. On his return, cardinal Wolfey would have engaged Mr More in the fervice of the crown, and offered him a penfion, which he refufed. Neverthelefs, it was not long before he accepted the place of mafter of the requefts, was created a knight, admitted of the privy-council, and in 1520 made treafurer of the exchequer. About this time he built a houfe on the bank of the Thames, at Chelfea, and married a fecond wife. This wife, whofe name was *Middleton*, and a widow, was old, ill-tempered, and covetous; neverthelefs Erafmus fays he was as fond of her as if fhe were a young maid.

In the 14th year of Henry VIII. Sir Thomas More was made fpeaker of the houfe of commons: in which capacity he had the refolution to oppofe the then powerful minifter, Wolfey, in his demand of an oppreffive fubfidy; notwithftanding which, it was not long before he was made chancellor of the duchy of Lancafter, and was treated by the king with fingular familiarity. The king having once dined with Sir Thomas at Chelfea, walked with him near an hour in the garden, with his arm round his neck. After he was gone, Mr Roper, Sir Thomas's fon-in-law, obferved how happy he was to be fo familiarly treated by the king: to which Sir Thomas replied, "I thank our lord, fon Roper, I find his grace my very good lord indeed, and believe he doth as fingularly favour me as any fubject within this realm: howbeit, I muft tell thee, I have no caufe to be proud thereof; for, if my head would win him a caftle in France, it would not fail to go off." From this anecdote it appears, that Sir Thomas knew his grace to be a villain.

In 1526 he was fent, with cardinal Wolfey and others, on a joint embaffy to France, and in 1529 with bifhop Tonftal to Cambray. The king, it feems, was fo well fatisfied with his fervices on thefe occafions, that in the following year, Wolfey being difgraced, he made him chancellor; which feems the more extraordinary, when we are told that Sir Thomas had repeatedly declared his difapprobation of the king's divorce, on which the great *defenfor fidei* was fo pofitively bent. Having executed the office of chancellor about three years, with equal wifdom and integrity, he refigned the feals in 1533, probably to avoid the danger of his refufing to confirm the king's divorce. He now retired to his houfe at Chelfea; difmiffed many of his fervants; fent his children with their refpective families to their own houfes, (for hitherto he had, it feems, maintained all his children, with their families, in his own houfe, in the true ftyle of an ancient patriarch); and fpent his time in ftudy and devotion: but the capricious tyrant would not fuffer him to enjoy this tranquillity. Though now reduced to a private ftation, and even to indigence, his opinion of the legality of the king's marriage with Anne Boleyn, was deemed of fo much importance, that various means were tried to procure his approbation; but all perfuafion proving ineffectual, he was, with fome others, attainted in the houfe of lords of mifprifion of treafon, for encouraging Eliz. Barton, the nun of Kent, in her treafonable practices. His innocence in this affair appeared fo clearly, that they were obliged to ftrike his name out of the bill. He was then accufed of other crimes, but with the fame effect; till, refufing to take the oath enjoined by the act of fupremacy, he was committed to the Tower, and, after 15 months imprifonment, was tried at the bar of the king's-bench, for high treafon, in denying the king's fupremacy. The proof refted on the fole evidence of Rich the folicitor-general, whom Sir Thomas, in his defence, fufficiently difcredited: neverthelefs the jury brought him in guilty, and he was condemned to fuffer as a traitor. The merciful Harry however indulged him with fimple decollation; and he was accordingly beheaded on Tower-hill, on the 5th of July 1535. His body, which was firft interred in the Tower, was begged by his daughter Margaret, and depofited in the chancel of the church at Chelfea, where a monument, with an infcription written by himfelf, had been fome time before erected. This monument with the infcription is ftill to be feen in that church. The fame daughter, Margaret, alfo procured his head after it had remained 14 days upon London-bridge, and placed it in a vault belonging to the Roper's family, under a chapel adjoining to St Dunftan's church in Canterbury. Sir Thomas More was a man of fome learning, and an upright judge; a very prieft in religion, yet cheerful, and even affectedly witty (A). He wanted not fagacity, where religion was out of the queftion; but in that his faculties were fo enveloped, as to render him a weak and credulous enthufiaft. He left one fon and three daughters; Margaret, the eldeft of which, was very remarkable for her knowledge of the Greek and Latin languages. She married a Mr Roper of Well-hall in Kent, whofe Life of Sir Thomas More was publifhed by Mr Hearne at Oxford, in 1716. Mrs Roper died in 1544; and was buried in the vault of St Dunftan's in Canterbury, with her father's head in her arms.

Sir Thomas was the author of various works, tho' his *Utopia* is the only performance that has furvived in the efteem of the world; owing to the reft being chiefly of a polemic nature: his anfwer to Luther has only gained him the credit of having the beft knack of any man in Europe, at calling bad names in good Latin. His

(A) This laft difpofition, we are told, he could not reftrain even at his execution. The day being come, he afcended the fcaffold, which feemed fo weak, that it was ready to fall; whereupon, "I pray (faid he) fee me fafe up, and for my coming down let me fhift for myfelf." His prayers being ended, he turned to the executioner, and with a cheerful countenance faid, "Pluck up thy fpirits, man, and be not afraid to do thy office; my neck is very fhort, take heed therefore thou ftrike not awry for faving thy honefty." Then laying his head upon the block, he bid him ftay until he had put afide his beard, faying, "That had never committed any treafon."

His Englifh works were collected and publifhed by order of queen Mary, in 1557; his Latin, at Bafil in 1563, and at Louvain in 1566.

More (Henry), an eminent Englifh divine and philofopher, in the 17th century, was educated at Eton fchool, and in Chrift-college in Cambridge, of which he became a fellow, and fpent his life in a retired way, publifhing a great number of excellent works. He refufed bifhoprics both in Ireland and England. He was an open-hearted, fincere Chriftian philofopher, who ftudied to eftablifh men in the belief of providence againft atheifm. Mr Hobbes was ufed to fay, that if his own philofophy was not true, there was none that he fhould fooner like than our philofopher's. His writings have been publifhed together in Latin and Englifh, folio.

MOREA, formerly called the *Peloponnefus*, is a peninfula to the fouth of Greece, to which it is joined by the ifthmus of Corinth. Its form refembles a mulberry-leaf, and its name is derived from the great number of mulberry-trees which grow there. It is about 180 miles in length, and 130 in breadth. The air is temperate, and the land fertile, except in the middle, where it is full of mountains, and is watered by a great number of rivers. It is divided into three provinces; Scania, Belvedera, and Brazzo-di-Maina. It was taken from the Turks by the Venetians in 1687; but they loft it again in 1715. The fangiac of the Morea refides at Modon. See Greece and Peloponnesus.

MOREAU (James), an eminent French phyfician, born at Chalons-fur-Saone, was the difciple and friend of the famous Guy Patin. He drew upon himfelf the jealoufy and hatred of the old phyficians by the public thefes he maintained, and afterwards vindicated in his writings. He died in a very advanced age, in 1729. He wrote in French, 1. Confultations on the Rheumatifm. 2. A chemical treatife on Fevers. 3. A phyfical differtation on the Dropfy; and other works which are efteemed.

MOREL, the name of feveral celebrated printers to the kings of France, who, like the Stephens's, were alfo men of great learning. William Morel died at Paris in 1564. Frederic Morel, who was alfo interpreter in the Greek and Latin tongues, as well as printer to the king, died in 1583. He left a fon of his own name, who became more famous than his father; and who had fo ftrong an attachment to ftudy, that when he was informed of his wife's being at the point of death he would not lay down his pen till he had finifhed what he was upon; and when fhe was dead, as fhe was before they could prevail upon him to ftir, he was only heard to reply coldly; "I am very forry; fhe was a good woman." This Frederic Morel died in June 1630, aged 38 years, after having printed a great number of authors in fuch a manner as fhew him to have been a very learned and ingenious man. His fons and grandfons trode in his fteps; they diftinguifhed themfelves in literature, and maintained alfo the reputation which he had acquired by printing.

Morel (Andreas), a very eminent antiquary, born at Berne in Switzerland. Having a ftrong paffion for the ftudy of medals, he travelled through feveral countries, and made large collections: in 1683 he publifhed at Paris in 8vo, *Specimen univerfæ rei nummariæ antiquæ;* and the great work of which this was the fpecimen, was to be a complete collection of all ancient medals, of which he had at that time 20,000 exactly defigned. Soon after this effay appeared, Lewis XIV. gave him a place in his cabinet of antiques, in which capacity he brought himfelf into great danger by fpeaking too freely of M. Louvois on account of the neglect in paying his falary, or on fome other private account; as he was committed to the Baftile, where he lay for three years: nor was he releafed until the death of Louvois, nor till the canton of Berne had interceded in his favour. He afterward accepted an invitation from the count of Schwartzburg at Arnftadt in Germany, with whom he lived in the capacity of antiquary, and was furnifhed with every thing neceffary for carrying on his grand work. In 1703 he died; and in 1734 came out at Amfterdam part of this collection, in 2 vols folio, under the title of *Thefaurus Morellianus, five familiarum Romanorum numifmata omnia, diligentiffime undique conquifita*, &c. *Nunc primum edidit & commentario perpetuo illuftravit Sigibertus Havercampus.* Thefe volumes contain an explication of 3539 medals, engraved, with their reverfes.

MORENA, (anc. geog.), a diftrict or divifion of Myfia, in the Hither Afia. A part of which was occupied by Cleon, formerly at the head of a band of robbers; but afterwards prieft of Jupiter Abrettenus, and enriched with poffeffions, firft by Antony, and then by Cæfar.

MORRERI (Lewis), author of the Hiftorical Dictionary, was born at Bargemont in Provence 1643. He learned rhetoric and philofophy at Aix, and divinity at Lyons. At 18 years of age he wrote a fmall piece, intitled *Le Pays d'Amour;* and a collection of the fineft French poems, intitled *Doux plaifirs de la Poefie.* He learned Spanifh and Italian; and tranflated out of Spanifh into French, the book intitled *La Perfection Chretienne de Rodriguez.* He then refined the Saints Lives to the purity of the French tongue. Being ordained prieft, he preached at Lyons; and undertook, when he was but 30 years of age, a new Hiftorical Dictionary, printed at Lyons in one vol. folio, 1673. But his continual labour impaired his health; fo that he died in 1680, aged 37. His fecond volume was publifhed after his death; and four more volumes have fince been added. He left fome other works behind him.

MORESK, or Morisco, is a kind of painting, carving, &c. done after the manner of the Moors; confifting of feveral grotefque pieces and compartments, promifcuoufly mingled, not containing any perfect figure of a man, or other animal; but a wild refemblance of birds, beafts, trees, &c.

MORGAGNI (John Baptift), doctor of medicine, firft profeffor of anatomy in the univerfity of Padua, and member of feveral of the moft eminent focieties of learned men in Europe, was born in the year 1682, at Forli, a town in the diftrict of *La Romagna* in Italy. His parents, who were in eafy circumftances, allowed him to follow that courfe in life his genius dictated. He began his ftudies at the place of his nativity; but foon after removed to Bologna, where he obtained the degree of Doctor of Medicine, when he had but juft reached the 16th year of his age. Here his peculiar tafte for anatomy found an able preceptor in Valfalva, who beftowed on him the utmoft attention; and, fuch was the

Morgagni.

the progreſs he made under this excellent maſter, that at the age of 20 he himſelf taught anatomy with high reputation. Soon, however, the fame of his prelections, and the number of his pupils, excited the jealouſy of the public profeſſors, and gave riſe to invidious perſecutions. But his abilities and prudence gained him a complete triumph over his enemies; and all oppoſition to him was finally terminated from his being appointed by the ſenate of Bologna to fill a medical chair, which ſoon became vacant. But the duties of this office, although important, neither occupied the whole of his time, nor ſatisfied his anxious deſire to afford inſtruction. He ſtill continued to labour in ſecret on his favourite ſubject, and ſoon after communicated the fruits of theſe labours to the public in his *Adverſaria Anatomica*, the firſt of which was publiſhed in the year 1706, the ſecond and third in 1717, and the three others in 1719. The publication of this excellent work ſpread the fame of Morgagni far beyond the limits of the ſtate of Bologna. Such was his reputation, that the wiſe republic of Venice had no heſitation in making him an offer of the ſecond chair of the theory of medicine in the univerſity of Padua, then vacant by the death of Mr Molinetti; and, to enſure his acceptance, they doubled the emoluments of that appointment. While he was in this department, he publiſhed his treatiſe, entitled *Nova inſtitutionum medicarum idea*, which firſt appeared at Padua in the year 1712. From this work his former reputation ſuffered no diminution. And ſoon after he roſe, by different ſteps, to be firſt profeſſor of anatomy in that celebrated univerſity. Although Morgagni was thus finally ſettled at Padua, yet he gave evident proofs of his gratitude and attachment to Bologna, which he conſidered as his native country with reſpect to the ſciences. He exerted his utmoſt efforts in eſtabliſhing the academy of Bologna, of which he was one of the firſt aſſociates; and he enriched their publications with ſeveral valuable and curious papers. Soon after this, the royal ſocieties of London and Paris received him among their number. Not long after the publication of his *Adverſaria Anatomica*, he began, much upon the ſame plan, his *Epiſtolæ Anatomicæ*, the firſt of which is dated at Padua in the beginning of April 1726. The works of Morgagni which have already been mentioned, are to be conſidered, in a great meaſure, as ſtrictly anatomical; but he was not more eminent as an anatomiſt, than as a learned and ſucceſsful phyſician. In the year 1760, when he was not far diſtant from the 80th year of his age, he publiſhed his large and valuable work *De cauſis et ſedibus morborum per anatomen indagatis*. This laſt and moſt important of all his productions will afford convincing evidence of his induſtry and abilities to lateſt poſterity. Beſides theſe works, he publiſhed, at different periods of his life, ſeveral miſcellaneous pieces, which were afterwards collected into one volume, and printed under his own eye at Padua, in the year 1765. It does not appear that he had in view any future publications; but he intended to have favoured the world with a complete edition of all his works, which would probably have been augmented with many new obſervations. In this he was engaged, when, on the 5th of December 1771, after he had nearly arrived at the 90th year of his age, death put a period to his long and glorious career in the learned world.

Morhoff || Morin.

MORHOFF (Daniel George), a very learned German, born at Wiſmar in the duchy of Mecklenburgh, in 1639. The duke of Holſtein, when he founded an univerſity at Kiel, made him profeſſor of eloquence and poetry there in 1665; to which was afterwards added the profeſſorſhip of hiſtory, and in 1680 the office of librarian to the univerſity. He was the author of many works of a ſmall kind; as orations, diſſertations, theſes, and poems: but his chief work was his *Polyhiſtor, ſive de notitia auctorum & rerum commentarii;* firſt publiſhed at Lubec in 1688; which has been greatly enlarged ſince his death in 1691, and gone through ſeveral ſucceſſive editions.

MORIAH, one of the eminences of Jeruſalem; on which Abraham went to offer his ſon, and David wanted to build the temple, which was afterwards executed by Solomon: The threſhing-floor of Araunah; originally narrow, ſo as ſcarce to contain the temple, but enlarged by means of ramparts; and ſurrounded with a triple wall, ſo as to add great ſtrength to the temple, (Joſephus). It may be conſidered as a part of Mount Sion, to which it was joined by a bridge and gallery, (*Id.*).

MORIN (John Baptiſt), phyſician and regius profeſſor of mathematics at Paris, was born at Villefranche in Beaufolois, in 1583. After commencing doctor at Avignon, he went to Paris, and lived with Claude Dormi biſhop of Boulogne, who ſent him to examine the mines of Hungary; and thereby gave occaſion to his *Mundus ſublunaris anatomia*, which was his firſt production, and publiſhed in 1619. Upon his return to his patron the biſhop, he contracted an attachment to judicial aſtrology, concerning which he furniſhed the world with many ridiculous ſtories, and wrote a great number of books not worth enumerating. He died in 1656, before he had finiſhed the favourite labour of life, which was his *Aſtrologia Gallica*. Louiſa Maria de Gonzaga queen of Poland gave 2000 crowns to carry on the edition, at the recommendation of one of her ſecretaries, who was a lover of aſtrology; and it appeared at the Hague in 1661, in one vol. folio, with two dedications, one to Jeſus Chriſt, and another to the queen of Poland.

MORIN (John), a very learned Frenchman, born at Blois, of Proteſtant parents, in 1591; but converted by cardinal du Perron to the catholic religion. He publiſhed, in 1626, ſome Exercitations upon the original of patriarchs and primates, and the ancient uſage of eccleſiaſtical cenſures; dedicated to pope Urban VIII. In 1628 he undertook the edition of the Septuagint Bible, with Nobilius's verſion; and placed a preface before it, in which he treats of the authority of the Septuagint, and prefers the verſion in the edition made at Rome by order of Sixtus V. to the preſent Hebrew text, which he affirms has been corrupted by the Jews. About the ſame time he gave a French hiſtory of the deliverance of the church by the emperor Conſtantine; and of the temporal greatneſs conferred on the Roman church by the kings of France. He afterwards publiſhed Exercitations upon the Samaritan Pentateuch; and took the care of the Samaritan Pentateuch, for the Polyglot then preparing at Paris. He was greatly careſſed at Rome; where, after living nine years, at the invitation of cardinal Bar-

barini, he was recalled by cardinal Richlieu, and died at Paris in 1659. His works are very numerous; and fome of them as much valued by Proteftants as Papifts for the oriental learning they contain.

MORINUS (Stephen), a learned French Proteftant, born at Caen in 1625. He became minifter of two churches near Caen, and in 1664 was chofen minifter of Caen; but on the revocation of the edict of Nantz, was obliged to take refuge in Holland. He was foon called to be profeffor of the oriental tongues at Amfterdam, to which employment was afterwards joined that of minifter in ordinary: he died in 1700. He was the author of feveral works: and his fondnefs for the Hebrew language made him run into fome extravagancies concerning it; for in his *Lettre fur l'origine de la langue Hebraïque*, he endeavours to prove that language as old as the creation, and that God himfelf infpired it into Adam. This was anfwered by Huet.

MORISON (Robert), phyfician and profeffor of botany at Oxford, was born at Aberdeen in 1620, bred at the univerfity there, and taught philofophy for fome time in it; but having a ftrong inclination to botany, made great progrefs in it. The civil wars obliged him to leave his country; which, however, he did not do till he had firft fignalized his zeal for the intereft of the king, and his courage, in a battle fought between the inhabitants of Aberdeen and the Prefbyterian troops on the bridge of Aberdeen, in which he received a dangerous wound on the head. As foon as he was cured of it, he went into France; and fixing at Paris, he applied affiduoufly to botany and anatomy. He was introduced to the duke of Orleans, who gave him the direction of the royal gardens at Blois. He exercifed the office till the death of that prince, and afterwards went over to England in 1660. Charles II. to whom the duke of Orleans had prefented him at Blois, fent for him to London, and gave him the title of his *phyfician*, and that of *profeffor royal of botany*, with a penfion of 200l. *per annum*. The *Præludium Botanicum*, which he publifhed in 1669, procured him fo much reputation, that the univerfity of Oxford invited him to the profefforfhip of botany in 1669; which he accepted, and acquitted himfelf in it with great ability. He died at London in 1683, aged 63. He publifhed a fecond and third part of his Hiftory of Plants, in 2 vols, folio; with this title *Plantarum Hiftoria Oxonienfis Univerfalis*. The firft part of this excellent work has not been printed; and it is not known what has become of it.

MORLACHIA, a mountainous country of Dalmatia. The inhabitants are called *Morlacks* or *Morlacchi;* and inhabit the pleafant valleys of Koter, along the rivers Kerha, Cettina, Narenta, and among the inland mountains of Dalmatia. The inhabitants are by fome faid to be of Walachian extraction, as (according to thefe authors), is indicated even by their name; Morlachia being a contraction of *Mauro-Walachia*, that is, *black Walahica:* and the Walachians are faid to be defcendents of the ancient Roman colonies planted in thefe countries. This however is denied by the abbe Fortis, who hath publifhed a volume of travels into that country. He informs us, that the origin of the Morlacchi is involved in the darknefs of barbarous ages, together with that of many other nations, refembling them fo much in cuftoms and language, that they may be taken for one people, difperfed in the vaft tracks from the Adriatic fea to the frozen ocean. The emigrations of the various tribes of the Slavi, who, under the names of *Scythians*, *Geti*, *Goths*, *Hunns*, *Slavini*, *Croats*, *Avari*, and *Vandals*, invaded the Roman empire, and particularly the Illyrian provinces during the decline of the empire, muft have ftrangely perplexed the genealogies of the nations which inhabited it, and which perhaps removed thither in the fame manner as at more remote periods of time. The remainder of the Ardiæi, Autariati, and other Illyrian people anciently fettled in Dalmatia, who probably could not reconcile themfelves to a dependence on the Romans, might neverthelefs naturally enough form an union with foreign invaders not unlike themfelves in dialect and cuftoms; and, according to our author, it feems no ill-founded conjecture, that many families, driven out of Hungary by the irruption of the Moguls under Jenghiz Khan and his fucceffors, might people the deferted valleys between the mountains of Dalmatia. This conjecture is alfo fomewhat confirmed by the traces of the Calmuck Tartars, which are ftill to be found in a part of that country called *Zara*.

With regard to the etymology of the name, the abbe obferves, that the Morlacchi generally call themfelves, in their own language, *Vlaffi;* a national term, of which no veftige is found in the records of Dalmatia till the 13th century. It fignifies *powerful men*, or *men of authority*, and the denomination of *Moro-Vlaffi*, corruptly *Morlacchi*, as they are now called, may perhaps point out the original of the nation. This word may poffibly fignify the *conquerors that came from the fea; Moor*, in all the dialects of the Sclavonian language, fignifying the *fea*.

The Morlacchi are fo different from the inhabitants of the fea-coafts in dialect, drefs, difpofitions, and cuftoms, that they feem clearly to be of a different original, or at leaft the colonies muft have fettled at fuch diftant periods from each other, that they have had time to alter in a great meafure their national character. There is alfo a remarkable diverfity among the Morlacchi themfelves in feveral diftricts, probably on account of the different countries from whence they came.

With regard to the character of thefe people, we are informed that they are much injured by their maritime neighbours. The inhabitants of the fea-coaft of Dalmatia tell many frightful ftories of their avarice and cruelty: but thefe, in our author's opinion, are all either of an ancient date; or if any have happened in latter times, they ought rather to be afcribed to the corruption of a few individuals, than to the bad difpofition of the nation in general; and though thievifh tricks are frequent among them, he informs us, that a ftranger may travel fecurely through their country, where he is faithfully efcorted, and hofpitably treated. The greateft danger is from the *Haiduks* or *Banditti*, of whom their are great numbers among the woods and caves of thefe dreadful mountains on the confines. There, fays our author, a man ought to get himfelf efcorted by a couple of thefe "honeft fellows;" for they are not capable of betraying him, although a banditti; and their fituation is commonly more apt to raife compaffion than diffidence. They lead their life among

Morlachia. among the wolves, wandering from one precipice to another, expofed to the feverity of the feafons, and frequently languifh in want of the neceffaries of life, in the moft hideous and folitary caverns. Yet they very feldom difturb the tranquillity of others, and prove always faithful guides to travellers; the chief objects of their rapine being fheep and oxen, to fupply themfelves with food and fhoes. Sometimes it happens, that, in their extreme neceffity, the Haiduks go in parties to the fhepherds cottages, and rudely demand fomething to eat; which they do not fail to take immediately by force if the leaft hefitation is made. It is feldom indeed that they meet with a refufal, or with refiftance, as their refolution and fury are well known to be equal to the favage life they lead. Four Haiduks are not afraid to affualt a caravan of 15 or 20 Turks, and generally plunder and put them to flight. The greateft part of the Haiduks look upon it as a meritorious action to fhed the blood of the Turks; to which cruelty they are eafily led by their natural ferocity, inflamed by a miftaken zeal for religion, and the difcourfes of their fanatic priefts.

As to the Morlacchi themfelves, they are reprefented as open and fincere to fuch a degree, that they would be taken for fimpletons in any other country; and by means of this quality they have been fo often duped by the Italians, that *the faith of an Italian*, and *the faith of a dog*, are fynonimous among the Morlacchi. They are very hofpitable to ftrangers, and their hofpitality is equally confpicuous among the rich and poor. The rich prepares a roafted lamb or fheep, and the poor with equal cordiality offers whatever he has; nor is this generofity confined to ftrangers, but generally extends itfelf to all who are in want. When a Morlack is on a journey, and comes to lodge at a friend's houfe, the eldeft daughter of the family, or the new-married bride if there happens to be one, receives and kiffes him when he alights from his horfe or at the door of the houfe: but a foregner is rarely favoured with thefe female civilities; on the contrary, the women, if they are young, hide themfelves, and keep out of his way.

The Morlacchi in general have little notion of domeftic œconomy, and readily confume in a week as much as would be fufficient for feveral months, whenever any occafion of merriment prefents itfelf. A marriage, the holiday of the faint, protector of the family, the arrival of relations or friends, or any other joyful incident, confumes of courfe all that there is to eat and to drink in the houfe. Yet the Morlack is a great œconomift in the ufe of his wearing-apparel; for, rather than fpoil his new cap, he takes it off, let it rain ever fo hard, and goes bareheaded in the ftorm. In the fame manner he treats his fhoes, if the road is dirty and they are not very old. Nothing but an abfolute impoffibility hinders a Morlack from being punctual; and if he cannot repay the money he borrowed at the appointed time, he carries a fmall prefent to his creditor, and requefts a longer term. Thus it happens fometimes, that, from term to term, and prefent to prefent, he pays double what he owed, without reflecting on it.

Friendfhip, that among us is fo fubject to change on the flighteft motives, is lafting among the Morlacchi. They have even made it a kind of religious point, and tie the facred bond at the foot of the altar. The Sclavonian ritual contains a particular benediction for the folemn union of two male or two female friends in the prefence of the congregation. The male friends thus united are called *Pobratimi*, and the female *Pofeftreme*, which mean half-brothers and half-fifters. Friendfhips between thofe of different fexes are not at this day bound with fo much folemnity, though perhaps in more ancient and innocent ages it was alfo the cuftom. Morlachia.

From thefe confecrated friendfhips among the Morlacchi and other nations of the fame origin, it fhould feem that the *fworn brothers* arofe, a denomination frequent enough among the common people of Italy, and in many parts of Europe. The difference between thefe and the Pobratimi of Morlacchia confifts not only in the want of the ritual ceremony, but in the defign of the union itfelf. For, among the Morlacchi, the fole view is reciprocal fervice and advantage; but fuch a brotherhood among the Italians, is generally commenced by bad men, to enable them the more to hurt and difturb fociety. The duties of the Pobratimi are, to affift each other in every cafe of need or danger, to revenge mutual wrongs, and fuch like. The enthufiafm is often carried fo far as to rifk and even to lofe their life for the Pobratimi, although thefe favage friends are not celebrated like a Pylades. If difcord happens to arife between two friends, it is talked of over all the country as a fcandalous novelty; and there has been fome examples of it of late years, to the great affliction of the old Morlacchi, who attribute the depravation of their countrymen to their intercourfe with the Italians. Wine and ftrong liquors, of which the nation is beginning to make daily abufe, will of courfe produce the fame bad effects as among others.

But as the friendfhips of the Morlacchi are ftrong and facred, fo their quarrels are commonly unextinguifhable. They pafs from father to fon; and the mothers fail not to put their children in mind of their duty to revenge their father if he has had the misfortune to be killed, and to fhew them often the bloody fkirt and arms of the deed. And fo deeply is revenge rooted in the minds of this nation, that all the miffionaries in the world would not be able to eradicate it. A Morlack is naturally inclined to do good to his fellow-creatures, and is full of gratitude for the fmalleft benefit; but implacable if injured or infulted.

A Morlack who has killed another of a powerful family, is commonly obliged to fave himfelf by flight, and to keep out of the way for feveral years. If during that time he has been fortunate enough to efcape the fearch of his purfuers, and has got a fmall fum of money, he endeavours to obtain pardon and peace; and, that he may treat about the conditions in perfon, he afks and obtains a fafe conduct, which is faithfully maintained, through only verbally granted. Then he finds mediators; and, on an appointed day, the relations of the two hoftile families are affembled, and the criminal is introduced, dragging himfelf along on his hands and feet, the mufket, piftol, or cutlafs, with which he committed the murder, hung about his neck; and while he continues in that humble pofture, one or more of the relations recites a panegyric on the

Morlachia. the dead, which fometimes rekindles the flames of revenge, and puts the poor proftrate in no fmall danger. It is the cuftom in fome places for the offended party to threaten the criminal, holding all kind of arms to his throat, and, after much intreaty, to confent at leaft to accept of his ranfom. Thefe pacifications coft dear in Albania; but the Morlacchi make up matters fometimes at a fmall expence; and every-where the bufinefs is concluded with a feaft at the offender's charge.

The Morlacks, whether they happen to be of the Roman or of the Greek church, have very fingular ideas about religion; and the ignorance of their teachers daily augments this monftrous evil. They are as firmly perfuaded of the reality of witches, fairies, enchantments, nocturnal apparitions, and fortileges, as if they had feen a thoufand examples of them. Nor do they make the leaft doubt about the exiftence of vampires; and attribute to them, as in Tranfylvania, the fucking the blood of infants. Therefore, when a man dies fufpected of becoming a vampire, or *vukodlak*, as they call it, they cut his hams, and prick his whole body with pins; pretending, that after this operation he cannot walk about. There are even inftances of Morlacchi, who, imagining that they may poffibly thirft for childrens blood after death, intreat their heirs, and fometimes oblige them, to promife to treat them as vampires when they die.

The boldeft Haiduk would fly trembling from the apparition of a fpectre, ghoft, phantom, or fuch like goblins as the heated imaginations of credulous and prepoffeffed people never fail to fee. Nor are they afhamed, when ridiculed for this terror; but anfwer, much in the words of Pindar: "Fear that proceeds from fpirits, caufes even the fons of the gods to fly." The women, as may be naturally fuppofed, are a hundred times more timorous and vifionary than the men; and fome of them, by frequently hearing themfelves called *witches*, actually believe they are fo.

A moft perfect difcord reigns in Morlachia, as it generally does in other parts, between the Latin and Greek communion, which their refpective priefts fail not to foment, and tell a thoufand little fcandalous ftories of each other. The churches of the Latins are poor, but not very dirty: thofe of the Greeks are equally poor, and fhamefully ill kept. Our author has feen the curate of a Morlack village fitting on the ground in the church-yard, to hear the confeffion of women on their knees by his fide: a ftrange pofture indeed! but a proof of the innocent manners of thofe good people, who have the moft profound veneration for their fpiritual paftors, and a total dependence upon them; who, on their part, frequently make ufe of a difcipline rather military, and correct the bodies of their offending flock with the cudgel. Perhaps this particular is carried to an abufe as well as that of public penance, which they pretend to inflict after the manner of the ancient church. They moreover, thro' the filly credulity of thofe poor mountaineers, draw illicit profits, by felling certain fuperftitious fcrolls and other fcandalous merchandife of that kind. They write in a capricious manner, on the fcrolls called *zapiz*, facred names which ought not to be trifled with, and fometimes adding others very improperly joined. The virtues attributed to thefe zapiz are much of the fame nature as thofe which the Bafilians attributed to their monftruoufly cut ftones. The Morlacchi ufe to carry them fewed to their caps, to cure or to prevent difeafes; and they alfo tie them for the fame purpofe to the horns of their oxen. The compofers of this trumpery take every method to maintain the credit of their profitable trade, in fpite of its abfurdity, and the frequent proofs of its inutility. And fo great has their fuccefs been, that not only the Morlacchi, but even the Turks near the borders, provide themfelves plentifully with zapiz from the Chriftian priefts, which not a little increafes their income, as well as the reputation of the commodity. The Morlacchi have alfo much devotion, and many of the ignorant people in Italy have little lefs, to certain copper and filver coins of the low empire; or to Venetian cotemporary pieces, which pafs among them for medals of St Helen; and they think they cure the epilepfy and fuch like. They are equally fond of an Hungarian coin called *petizza*, which has the virgin and child on the reverfe; and one of thefe is a moft acceptable prefent to a Morlack. Morlachia.

The bordering Turks not only keep with devotion the fuperftitious zapiz, but frequently bring prefents and caufe maffes to be celebrated to the images of the Virgin; which is doubtlefs in contradiction to the alcoran; yet when faluted, in the ufual manner in that country, by the name of *Jefus*, they do not anfwer. Hence, when the Morlacchi, or other travellers, meet them on the confines, they do not fay, *Huaglian Iffus*, "Jefus be praifed;" but, *Huaglian Bog*, "God be praifed."

Innocence, and the natural liberty of paftoral ages, are ftill preferved among the Morlacchi, or at leaft many traces of them remain in the places fartheft diftant from our fettlements. Pure cordiality of fenti ment is not there reftrained by other regards, and difplays itfelf without any diftinction of circumftances. A young handfome Morlack girl, who meets a man of her diftrict on the road, kiffes him affectionately, without the leaft malice or immodeft thought; and our author has feen all the women and girls, all the young men and old, kiffing one another as they came into the church-yard on a holiday; fo that they looked as if they had been all belonging to one family. He hath often obferved the fame thing on the road, and at the fairs in the maritime towns, where the Morlacchi came to fell their commodities. In times of feafting and merriment, befides the kiffes, fome other little liberties are taken with the hands, which we would not reckon decent, but are not minded among them; and when they are told of it, they anfwer, it is only toying, and means nothing. From this toying, however, their amours often take their beginning, and frequently end ferioufly when the two lovers are once agreed. For it very rarely happens, in places far diftant from the coaft, that a Morlacco carries off a girl againft her will, or difhonours her: and were fuch attempts made, the young woman would, no doubt, be able to defend herfelf; the women in that country being generally very little lefs robuft than the men. But the cuftom is for the woman herfelf to appoint the time and place of being carried off; and fhe does fo in order to extricate herfelf from other fuitors, from whom fhe may have received fome love-token, fuch as a brafs ring, a little

little knife, or fuch like trifles. The Morlack women keep themfelves fomewhat neat till they get a hufband; but after marriage they abandon themfelves totally to a loathfome dirtinefs, as if they intended to juftify the contempt with which they are treated. Indeed it cannot be faid that even the young women have a grateful odour, as they are ufed to anoint their hair with butter, which foon becoming rancid exhales no agreeable effluvia.

The drefs of the unmarried women is the moft complex and whimfical, in refpect to the ornaments of the head; for when married they are not allowed to wear any thing elfe but a handkerchief, either white or coloured, tied about it. The girls ufe a fcarlet cap, to which they commonly hang a veil falling down on the fhoulders, as a mark of their virginity. The better fort adorn their caps with ftrings of filver coins, among which are frequently feen very ancient and valuable ones; they have moreover ear-rings of very curious work, and fmall filver chains with the figures of half moons faftened to the ends of them. But the poor are forced to content themfelves with plain caps; or if they have any ornaments, they confift only of fmall exotic fhells, round glafs beads, or bits of tin. The principal merit of thefe caps, which conftitute the good tafte as well as vanity of the Morlack young ladies, is to attract and fix the eyes of all who are near them by the multitude of ornaments, and the noife they make on the leaft motion of their heads. Hence half-moons of filver, or of tin, little chains and hearts, falfe ftones and fhells, together with all kind of fplendid trumpery, are readily admitted into their head-drefs. In fome diftricts, they fix tufts of various coloured feathers, refembling two horns on their caps; in others, tremulous plumes of glafs; and in others, artificial flowers, which they purchafe in the fea-port towns; and in the variety of thofe capricious and barbarous ornaments, fometimes a fancy not inelegant is difplayed. Their holiday-fhifts are embroidered with red filk, and fometimes with gold, which they work themfelves while they attend their flocks; and it is furprifing to fee how nicely this work is executed. Both old and young women wear about their necks large ftrings of round glafs-beads of various fize and colour; and many rings of brafs, tin, or filver, on their fingers. Their bracelets are of leather covered with wrought tin or filver; and they embroider their ftomachers, or adorn them with beads or fhells. But the ufe of ftays is unknown, nor do they put whalebone or iron in the ftomacher. A broad woollen girdle furrounds their petticoat, which is commonly decked with fhells, and of blue colour, and therefore called *modrina*. Their gown, as well as petticoat, is of a kind of ferge; and both reach near to the ankle: the gown is bordered with fcarlet, and called *fadak*. They ufe no modrina in fummer, and only wear the fadak without fleeves over a linen petticoat or fhift. The girls always wear red ftockings; and their fhoes are like thofe of the men, called *opanke*. The fole is of undreffed ox-hide, and the upper part of fheeps-fkin thongs knotted, which they call *apute;* and thefe they faften above the ankles, fomething like the ancient coturnus.

The unmarried women, even of the richeft females, are not permitted to wear any other fort of fhoes; tho' after marriage they may, if they will, lay afide the opanke, and ufe the Turkifh flippers. The girls keep their hair treffed under their caps, but when married they let it fall difhevelled on the breaft; fometimes they tie it under the chin; and always have medals, beads, or bored coins, in the Tartar or American mode, twifted amongft it. An unmarried woman, who falls under the imputation of want of chaftity, runs the rifk of having her red cap torn off her head publicly in church by the curate, and her hair cut by fome relation, in token of infamy. Hence, if any of them happen to have fallen into an illicit amour, they commonly of their own accord lay afide the badge of virginity, and remove into another part of the country.

Nothing is more common among the Morlacchi than marriages concluded between the old people of the refpective families, efpecially when the parties live at a great diftance, and neither fee nor know each other; and the ordinary motive of thefe alliances is the ambition of being related to a numerous and powerful family, famous for having produced valiant men. The father of the future bridegroom, or fome other near relation of mature age, goes to afk the young woman, or rather a young woman of fuch a family, not having commonly any determinate choice. Upon this, all the girls of the houfe are fhewn to him, and he choofes which pleafes him beft, though generally refpecting the right of feniority. A denial in fuch cafes is very rare, nor does the father of the maid inquire much into the circumftances of the family that afks her. Sometimes a daughter of the mafter is given in marriage to the fervant or tenant, as was ufual in patriarchal times; fo little are the women regarded in this country. On thefe occafions, however, the Morlacchi girls enjoy a privilege which ours would alfo wifh to have, as in juftice they certainly ought. For he who acts by proxy, having obtained his fuit, is obliged to go and bring the bridegroom; and if, on feeing each other, the young people are reciprocally content, the marriage is concluded, but not otherwife. In fome parts it is the cuftom for the bride to go to fee the houfe and family of the propofed hufband, before fhe gives a definitive anfwer; and if the place or perfons are difagreeable to her, fhe is at liberty to annul the contract. But if fhe is contented, fhe returns to her father's houfe, efcorted by the bridegroom and neareft relations. There the marriage-day is appointed; on which the bridegroom comes to the bride's houfe, attended by all his friends of greateft note, who on this occafion are called *fvati*, and are all armed, and on horfeback, in their holiday-cloaths, with a peacock's feather in their cap, which is the diftinctive ornament ufed by thofe who are invited to weddings. The company goes armed, to repulfe any attack or ambufh that might be intended to difturb the feaft: for in old times thefe encounters were not unfrequent, according to the records of many national heroic fongs.

The bride is conducted to a church, veiled, and furrounded by the fvati on horfeback; and the facred ceremony is performed amidft the noife of mufkets, piftols, barbaric fhouts and acclamations, which continue till fhe returns to her father's houfe, or to that of her hufband if not far off. Each of the fvati has his parti-

Morlachia. particular inſpection, as well during the cavalcade, as at the marriage feaſt, which begins immediately on their return from church. The parvinaz precedes all the reſt, ſinging ſuch ſongs as he thinks ſuitable to the occaſion. The bariactar brandiſhes a lance with a ſilken banner faſtened to it, and an apple ſtuck on the point; there are two bariactars, and ſometimes four, at the more noble marriages. The ſtari-ſvat is the principal perſonage of the brigade, and the moſt reſpectable relation is commonly inveſted with this dignity. The ſtacheo's duty is to receive and obey the orders of the ſtari-ſvat. The two diveri, who ought to be the bridegroom's brothers when he has any, are appointed to ſerve the bride. The knum correſponds to our ſponſors; and the komorgia, or ſekſana is deputed to receive and guard the dowery. A ciaous carries the mace, and attends to the order of the march, as maſter of the ceremonies; he goes ſinging aloud, *Breberi*, *Davori*, *Dobraſrichia*, *Jara*, *Pico*, names of ancient propitious deities. Buklia is the cup-bearer of the company, as well on the march as at table; and all theſe offices are doubled, and ſometimes tripled, in proportion to the number of the company.

The firſt day's entertainment is ſometimes made at the bride's houſe, but generally at the bridegroom's, whither the ſvati haſten immediately after the nuptial benediction; and at the ſame time, three or four men run on foot to tell the good news; the firſt who gets to the houſe has a kind of towel, embroidered at the ends, as a premium. The domachin, or head of the houſe, comes out to meet his daughter-in-law; and a child is handed to her, before ſhe alights, to careſs it; and if there happens to be none in the houſe, the child is borrowed from one of the neighbours. When ſhe alights, ſhe kneels down, and kiſſes the threſhold. Then the mother-in-law, or, in her place, ſome other female relation, preſents a corn-ſieve, full of different kinds of grain, nuts, almonds, and other ſmall fruit, which the bride ſcatters upon the ſvati, by handfuls behind her back. The bride does not ſit at the great table the firſt day, but has one apart for herſelf, the two diveri, and the ſtacheo. The bridegroom ſits at table with the ſvati; but in all that day, conſecrated to the matrimonial union, he muſt neither unlooſen or cut any thing whatever. The knum carves his meat, and cuts his bread. It is the domachin's buſineſs to give the toaſts; and the ſtari-ſvat is the firſt who pledges him. Generally the bukkara, a very large wooden cup, goes round, firſt to the ſaint protector of the family; next to the proſperity of the holy faith; and ſometimes to a name the moſt ſublime and venerable. The moſt extravagant abundance reigns at theſe feaſts; and each of the ſvati contributes, by ſending a ſhare of proviſions. The dinner begins with fruit and cheeſe; and the ſoup comes laſt, juſt contrary to our cuſtom. All ſorts of domeſtic fowls, kid, lamb, and ſometimes veniſon, are heaped in prodigal quantities upon their tables; but very rarely a Morlacco eats veal, and perhaps never, unleſs he has been perſuaded to do it out of his own country. This abhorrence to calves fleſh is very ancient among the Morlacchi. St Jerom, againſt Jovinian, takes notice of it; and Tomeo Marnavich, a Boſnian writer, who lived in the beginning of the laſt age, ſays, that the Dalmatians, uncorrupted by the vices of ſtrangers, abſtained from eating calves-fleſh, as an unclean food, even to his days. The women-relations, if they are invited, never dine at table with the men, it being an eſtabliſhed cuſtom for them to dine by themſelves. After dinner, they paſs the reſt of the day in dancing, ſinging ancient ſongs, and in games of dexterity, or of wit and fancy; and in the evening, at a convenient hour after ſupper, the three ritual healths having firſt gone round, the knum accompanies the bridegroom to the matrimonial apartment, which commonly is the cellar or the ſtable, whither the bride is alſo conducted by the diveri and the ſtacheo; but the three laſt are obliged to retire, and the knum remains alone with the new-married couple. If there happens to be any bed prepared better than ſtraw, he leads them to it; and having untied the bride's girdle, he cauſes them both to undreſs each other reciprocally. It is not long ſince the knum was obliged to undreſs the bride entirely; but that cuſtom is now out of uſe; and, inſtead of it, he has the privilege of kiſſing her as often as he pleaſes, wherever he meets her; which privilege may poſſibly be agreeable for the firſt months, but muſt ſoon become very diſguſtful. When they are both undreſſed, the knum retires, and ſtands liſtening at the door, if there be a door. It is his buſineſs to announce the conſummation of the marriage, which he does by diſcharging a piſtol, and is anſwered by many of the company. The next day, the bride, without her veil and virginal cap, dines at table with the ſvati, and is forced to hear the coarſe equivocal jeſts of her indelicate, and ſometimes intoxicated, company. Morlachia.

Theſe nuptial-feaſts, called *ſdrave* by the ancient Huns, are by our Morlacchi called *ſdravize*, from whence our Italian word *ſtravizzo* is undoubtedly derived. They continue three, ſix, eight, or more days, according to the ability or prodigal diſpoſition of the family where they are held. The new-married wife gets no inconſiderable profit in theſe days of joy. And it uſually amounts to much more than all the portion ſhe brings with her, which often conſiſts of nothing but her own cloaths, and perhaps a cow; nay, it happens ſometimes that the parents, inſtead of giving money with their daughter, get ſomething from the bridegroom by way of price. The bride carries water every morning, to waſh the hands of her gueſts, as long as the feaſting laſts; and each of them throws a ſmall piece of money into the baſon, after performing that function, which is a very rare one among them excepting on ſuch occaſions. The brides are alſo permitted to raiſe other little contributions among the ſvati, by hiding their ſhoes, caps, knives, or ſome other neceſſary part of their equipage, which they are obliged to ranſom by a piece of money, according as the company rates it. And, beſides all theſe voluntary or extorted contributions already mentioned, each gueſt muſt give ſome preſent to the new married wife at taking leave the laſt day of the ſdravize; and then ſhe alſo diſtributes ſome trifles in return, which commonly conſiſt in ſhirts, caps, handkerchiefs, and ſuch like.

The nuptial-rites are almoſt preciſely the ſame thro' all the vaſt country inhabited by the Morlacchi; and thoſe in uſe among the peaſants and common people of the ſea-coaſt of Dalmatia, Iſtria, and the iſlands, differ

Morlacchi. differ but little from them. Yet among these particular varieties, there is one of the island Zlarine, near Sebenico, remarkable enough; for there the starisvat (who may naturally be supposed drunk at that hour) must, at one blow, with his naked broad sword, strike the bride's crown of flowers off her head, when she is ready to go to bed. And in the island of Pago, in the village of Novoglia, (probably the Gissa of ancient geographers), there is a custom more comical, and less dangerous, but equally savage and brutal. After the marriage-contract is settled, and the bridegroom comes to conduct his bride to church; her father or mother, in delivering her over to him, makes an exaggerated enumeration of her ill qualities: "Know, since thou wilt have her, that she is good for nothing, ill-natured, obstinate, &c." On which the bridegroom, affecting an angry look, turns to the young woman, with an, "Ah! since it is so, I will teach you to behave better;" and at the same time regales her with a blow or a kick, or some piece of similar gallantry, which is by no means figurative. And it seems in general, that the Morlack women, and perhaps the greatest part of the Dalmatians, the inhabitants of the cities excepted, do not dislike a beating, either from their husbands or lovers.

In the neighbourhood of Dernish, the women are obliged, during the first year after marriage, to kiss all their national acquaintances who come to the house; but after the first year they are dispensed from that compliment; and indeed they become so intolerably nasty, that they are no longer fit to practise it. Perhaps the mortifying manner in which they are treated by their husbands and relations, is, at the same time, both the cause and effect of this shameful neglect of their persons. When a Morlack husband mentions his wife, he always premises, by your leave, or begging your pardon. And when the husband has a bedstead, the wife must sleep on the floor near it. Our author often lodged in Morlack houses, and observed that the female sex is universally treated with contempt: it is true, that the women are by no means amiable in that country; they even deform and spoil the gifts of nature.

The pregnancy and births of those women would be thought very extraordinary among us, where the ladies suffer so much, notwithstanding all the care and circumspection used before and after labour. On the contrary, a Morlack woman neither changes her food nor interrupts her daily fatigue, on account of her pregnancy; and is frequently delivered in the fields, or on the road, by herself; and takes the infant, washes it in the first water she finds, carries it home, and returns the day after to her usual labour, or to feed her flock.

The little creatures, thus carelessly treated in their tenderest moments, are afterwards wrapt in miserable rags, where they remain three or four months, under the same ungentle management; and when that term is elapsed, they are set at liberty, and left to crawl about the cottage and before the door, till they learn to walk upright by themselves; and at the same time acquire that singular degree of strength and health with which the Morlacchi are endowed, and are able, without the least inconvenience, to expose their naked breasts to the severest frost and snow. The infants are allowed to suck their mother's milk while she has any, or till she is with child again; and if that should not happen for three, four, or six years, they continue all that time to receive nourishment from the breast. The prodigious length of the breasts of the Morlacchian women is somewhat extraordinary; for it is very certain, that they can give the teat to their children over their shoulders, or under their arms. They let the boys run about, without breeches, in a shirt that reaches only to the knee, till the age of 13 or 14, following the custom of Bossina, subject to the Porte, where no haraz or capitation-tax is paid for the boys till they wear breeches, they being considered before that time as children, not capable of labouring, or of earning their bread. On the occasion of births, and especially of the first, all the relations and friends send presents of eatables to the woman in childbed, or rather to the woman delivered; and the family makes a supper of all those presents together. The women do not enter the church till 40 days after child-birth.

The Morlacchi pass their youth in the woods, attending their flocks and herds, and in that life of quiet and leisure they often become dexterous in carving with a simple knife; they make wooden cups, and whistles adorned with fanciful basse-reliefs, which are not void of merit, and at least shew the genius of the people.

Morley. MORLEY (George), bishop of Winchester, was the son of Francis Morley, Esq; and was born at London in 1597. He was educated at Christ-church, Oxford, of which he had the canonry in 1641, and the next year was made doctor of divinity. He had also several church-preferments, of which he was deprived by the parliament visitors in the beginning of the year 1648. After this, king Charles I. sent for him to assist at the treaty of the Isle of Wight. After the king's death he attended the lord Capel at his execution, and then retired to Charles II. at the Hague, on whom he constantly waited till his majesty went to Scotland, when he retired to Antwerp, where he read the service of the church of England, as he afterwards did at Breda. At the Restoration he was first made dean of Christ-church, and in 1660 was consecrated bishop of Worcester, and soon after was made dean of the royal chapel. In 1662 he was translated to the bishopric of Winchester, when he bestowed considerable sums on that see, in repairing Farnham-castle and his palace at Westminster, and in purchasing Winchester-house at Chelsea. He died at Farnham-castle in 1684. He was a Calvinist, and before the wars was thought a friend to the Puritans; but after his promotion, he took care to free himself from all suspicions of that kind. He was a pious and charitable man, of a very exemplary life, but extremely passionate. He published, 1. *Epistola apologetica et parænetica ad theologum quendam Belgam scripta*, in 4to. 2. The sum of a short conference between Father Darcey a Jesuit, and Dr Morley at Brussels. 3. An argument drawn from the evidence and certainty of sense against the doctrine of Transubstantiation. 4. A letter to Anne duchess of York. 5. Several sermons, and other pieces.

Mornay. MORNAY (Philip de), lord of Plessis-Marly, governor of Saumur, and one of the best Protestant generals of France, was born of a noble family at Buhy in

in 1549. He became well ſkilled in polite literature, divinity, and the learned languages. Having embraced the Proteſtant religion, he travelled to Italy, Germany, the Netherlands, and to England; and at length engaged himſelf in the intereſt of the king of Navarre, who was afterwards Henry the Great. That prince relied greatly on his judgment, and in 1590 made him counſellor of ſtate. De Pleſſis performed the moſt important ſervices for him, and was one of the lords who contributed moſt to his aſcending the throne. He was in a manner the head and ſoul of the Proteſtants: he had their entire confidence, and acquired great reputation amongſt them on account of his learning, valour, and probity; which occaſioned his being called the *Pope of the Huguenots*. He oppoſed king Henry IV.'s embracing the Romiſh religion to the utmoſt of his power; and ſoon after that event retired from court, and laboured at his famous work on the Euchariſt. He continued to ſupport the Calviniſts party by his writings; and Lewis XIII. taking from him the government of Saumur in 1621, he retired to his barony at Forét-ſur-Seure in Poitou, where he died in 1623, aged 74. He alſo wrote, 1. A treatiſe on the truth of the Chriſtian religion. 2. The myſtery of iniquity; and other works.

MORNING, the beginning of the day, the firſt appearance of light, or the time from midnight till noon.

MOROCCO, an empire of Africa, comprehending a conſiderable part of the ancient Mauritania, is bounded on the weſt by the Atlantic Ocean; on the eaſt by the river Mulvya, which ſeparates it from Algiers; on the north by the Mediterranean; and on the ſouth by mount Atlas, or rather by the river Sus, which divides it from the kingdom of Tafilet. Its greateſt length is from the north-eaſt to the ſouth-weſt, amounting to above 590 miles; its breadth is not above 260 where broadeſt, and in the moſt narrow places is not above half that breadth.

The ancient hiſtory of Morocco hath been already given under the article MAURITANIA. It continued under the dominion of the Romans upwards of 400 years. On the decline of that empire it fell under the Goths, who held it till about the year 600, when the Goths were driven out by the Vandals, the Vandals by the Greeks, and they in their turn by the Saracens, who conquered not only this empire, but we may ſay the whole continent of Africa; at leaſt their religion, one way or other, is to be found in all parts of it. The Saracen empire did not continue long united under one head, and many princes ſet up for themſelves in Africa as well as elſewhere, through whoſe diſſentions the Almoravides were at length raiſed to the ſovereignty, as related under the article ALGIERS, n° 2. Yuſef, or Joſeph, the ſecond monarch of that line, built the city of Morocco, conquered the kingdom of Fez, and the Mooriſh dominions in Spain; all which were loſt by his grandſon Abu Hali, who was defeated and killed by the Spaniards. On this prince's death the crown paſſed to the Mohedians, or Almohedes, with whom it had not continued above three generations, when Mohammed the ſon of Al Manſur loſt the famous battle of Sierra Morena, in which 200,000 Moors were ſlain, and in conſequence of which Alphonſo X. retook a great many of the Mooriſh conqueſts immediately after.

Mohammed died ſoon after this diſgrace, and left ſeveral ſons, between whom a civil war enſued, during which the viceroys of Fez, Tunis, and Tremeſen, found means to eſtabliſh themſelves as independent princes. At length one of the princes of the royal blood of Tremeſen having defeated the Almohedes, made himſelf maſter of the kingdoms of Morocco and Fez, and entailed them on his own family. In a ſhort time, however, this family was expelled by the Merini, the Merini by the Oatazes, and theſe by the Sharifs of Haſcen, who have kept the government ever ſince.

This happened about the year 1516; and ſince that time the hiſtory of the empire affords nothing remarkable. What we have under that name is indeed nothing elſe than a catalogue of the enormous vices and and exceſſes of the emperors and people. Nothing indeed can be conceived more unjuſt and deſpotic than the government of Morocco, and nothing more degenerate than the characters of the people. The emperor is allowed to have not only an uncontrolable power over the lives and fortunes of his ſubjects, but in a great meaſure over their conſciences, ſuch as they are; in as much as he is the only perſon who, as the ſucceſſor of the prophet, hath a right to interpret the Koran; and appoints all the judges under him, of whom thoſe of Morocco and Fez are the chief, whoſe buſineſs it is to explain and diſpenſe all matters relating to their religion; and, being his creatures and dependents, dare not ſteer otherwiſe than as he directs. Whenever therefore the laws are enacted by him, and proclaimed by his governors in all the provinces, as is commonly done, that none may plead ignorance, they are everywhere received with an implicit and religious ſubmiſſion. On the other hand, the ſubjects are bred up with a notion, that thoſe who die in the execution of his command are entitled to an immediate admittance into paradiſe, and thoſe who have the honour to die by his hand to a ſtill greater degree of happineſs in it. After this we need not wonder at finding ſo much cruelty, oppreſſion, and tyranny on the one ſide, and ſo much ſubmiſſion, paſſiveneſs, and miſery on the other.

This latter, however, extends no farther than the Moors: for as to the Arabs, the ſubjection and tribute they pay to thoſe tyrants was always involuntary, and altogether forced; and as for the negroes, their zeal and attachment is owing merely to the great ſway and power which they have gained in the government, both on account of their being better ſoldiers than the Moors, and from a particular regard which Muley Iſhmael a late emperor had for them on account of his mother being a negro; ſo that, being now grown in a manner too ſtrong to be ſuppreſſed, their loyalty and affection to thoſe monarchs, whom they ſtrive to imitate in all their vices, muſt be ſuppoſed to riſe and fall according to the favour and encouragement they receive from them. And they are now the only ones to whom thoſe tyrants entruſt their perſons, their treaſure, and their concubines; whom they raiſe to the higheſt poſts of authority and truſt; and whom they ſuffer, not to ſay encourage by their

Morocco. their own example, to tyrannize and oppress their native, as well as their most faithful and submissive subjects.

These negroes, ever since their adhering so closely to Muley Ishmael, have been in high request with his successors, and make the main branch of the soldiery both of horse and foot. They are brought so young out of Guinea, that they quickly lose the memory of it; and having no relations or friends, nor dependence but on the emperor's favour, are the more ready to obey his orders in all things. They are at first brought up to be foot-soldiers; and after so many years service in it, or sooner if their behaviour deserve it, are advanced to the cavalry, which is a great honour in that country. They are taught little else except the exercise of arms, and to obey the emperor's orders; and, by the readiest compliance with his views, politics, and inclination, advance themselves to the highest posts under him.

But we shall perhaps find less reason to wonder at this connivance, if we consider, that, sooner or later, all the extortions of those blood-suckers come in course into their own treasury, either by the heavy fines they impose upon them upon any complaint preferred against them, or upon any other, whether real or pretended, mal-administrations, or by seizing on all their ill-gotten wealth at their deaths. For the emperors here have found means to establish another branch of despotism, which renders them still more powerful and formidable to their subjects; viz. their making themselves their sole heirs, and, in virtue of that, seizing upon all their effects, and making only such provision for their families as they think proper; and often, on some frivolous pretence, leaving them destitute of any, according to the liking or dislike they bear to the deceased: so that, upon the whole, they are the only makers, judges, and interpreters, and in many instances likewise the executioners, of their own laws, which have no other limits than their own arbitrary will. To preserve, however, some specious shew or shadow of justice, they allow their mufti a kind of superiority in spirituals, and a sort of liberty to the meanest subject to summon them before his tribunal. But the danger which such an atttempt would bring upon a plaintiff, perhaps no less than death and destruction, is of itself sufficient to deter any man from it; especially considering the little probability there is that the judges of it would run the risk of declaring themselves against a monarch whose creatures they are, and on whom their lives and fortunes so absolutely depend.

The titles which the emperors of Morocco assume, are those of *Most glorious, mighty, and noble emperor of Afric, king of Fez and Morocco, Taphilet, Suz, Darha, and all the Algarbe, and its territories in Afric; grand Sharif* (or, as others write it, *Xarif*, that is, "successor, or vicegerent,") *of the great prophet Mohammed, &c.*

The judges or magistrates that act immediately under him, are either spiritual or temporal, or rather ecclesiastic and military. The mufti and the kadis are judges of all religious and civil affairs; and the bashas, governors, alcaides, and other military officers, of those that concern the state or the army. All of them the most obsequious creatures and slaves of their prince, and no less the rapacious tyrants of his subjects, and from whom neither justice nor favour can be obtained but by mere dint of money, and extortionate bribery, from the highest to the lowest. Neither can it indeed be otherwise in such an arbitrary government, where the highest posts must not only be bought of the prince at a most extravagant price, and kept only by as exorbitant a tribute, which is yearly paid to him, but where no one is sure to continue longer than he can bribe some of the courtiers to insinuate to the monarch that he pays to the utmost of his power, and much beyond what was expected from him. Add to this, that those bashas, governors, &c. are obliged to keep their agents and spies in constant pay at court, to prevent their being supplanted by higher bidders, slanderers, or other artful underminers.

From what hath been said under this head, it may be reasonably concluded that this branch of the imperial revenue must be very considerable, though there is no possibility to make any other conjecture of its real amount, than that it must be an immense one. Another considerable branch is the piratical trade, which brings the greater income into his treasury, as he is not at any expence either for fitting of corsair vessels out, or maintaining their men: and yet hath the tenth of all the cargo, and of all the captives; besides which, he appropriates to himself all the rest of them, by paying the captors 50 crowns *per* head; by which means he engrosses all the slaves to his own service and advantage. This article is indeed a very considerable addition to his revenue, not only as he sells their ransom at a very high rate, but likewise as he hath the profit of all their labour, without allowing them any other maintenance than a little bread and oil, nor any other assistance when sick than what medicines a Spanish convent, which he tolerates there, gives them gratis; and which, nevertheless, is forced to pay him an annual present for that toleration, besides furnishing the court with medicines, and the slaves with lodging and diet when they are not able to work. Another branch of his revenue consists in the tenth part of all cattle, corn, fruits, honey, wax, hides, rice, and other products of the earth, which is exacted of the Arabs and Berebers, as well as of the natives; and these are levied, or rather farmed, by the bashas, governors, alcaides, &c. with all possible severity. The Jews and Christians likewise pay an income or capitation, the former of six crowns *per* head on all males from 15 years and upwards, besides other arbitrary imposts, fines, &c. That on the Christians, for the liberty of trading in his dominions, rises and falls according to their number, and the commerce they drive; but which, whatever it may bring yearly into his coffers, is yet detrimental to trade in general, seeing it discourages great numbers from settling there, notwithstanding the artful invitations which the emperors and their ministers make use of to invite them to it; for, besides those arbitrary exactions, there is still another great hardship attending them, viz. that they cannot leave the country without forfeiting all their debts and effects to the crown. The duties on all imports and exports is another branch of his income, the amount of which, *communibus annis*, no author hath yet given us any account of; only consul Hatfield hath computed the whole yearly revenue,

venue, including ordinaries and extraordinaries, to amount to 500 quintals of ſilver, each quintal, or 100 lb. weight, valued at ſomewhat above 330l. Sterling; ſo that the whole amounts to no more, according to him, than 165,000l.; a ſmall revenue indeed for ſo large an empire, if the calculation may be depended upon. But St Olan, though he doth not pretend ſo much as to gueſs at the yearly amount of it, doth in general repreſent it as ſo conſiderable, that Muley Iſhmael was reckoned to have amaſſed out of it a treaſure in gold and ſilver of about 50 effective millions; but whether of crowns or livres he doth not tell us, nor how he came by his knowledge of it; becauſe that politic prince, even by his own confeſſion, not only cauſed all his riches to be buried in ſundry places under-ground, his gold and ſilver to be melted into great lumps, and laid in the ſame privacy underground, but likewiſe all thoſe whom he entruſted with the ſecret to be as privately murdered. However that be, we ſhall, upon the whole, have the leſs cauſe to wonder at theſe exorbitant exactions which he extorts from Chriſtian princes and ſtates, whenever they are obliged either to ſeek his alliance, or to obtain ſome redreſs in favour of their trading ſubjects; much leſs at the ſhameful delays, inſults, extortions, indignities, and injuſtice, which their ambaſſadors muſt be content to put up with, to obtain the leaſt favour from their rapacious miniſters.

The air of this country, though hot and dry, is pleaſant and healthy, the winds from the ſea and mount Atlas refreſhing the inhabitants in the hotteſt ſeaſon.

As to the ſoil, it is neither ſo mountainous, ſandy, or barren, as many other parts of Africa; but produces, or would produce if duly cultivated, vaſt quantities of corn, wine, and oil. No country affords better wheat, barley, or rice: both the French and Spaniards fetch theſe from the Barbary coaſt, when they have a ſcarcity at home; and our garriſons of Gibraltar and Port-Mahon are often ſupplied with proviſions from thence. The plains of Fez and Morocco are well planted with olives: and there are no better grapes for making wine in the world, as the Jews at Tetuan experience; though the cultivation of vines is not encouraged among the Mahommedans, in conſequence of the precept in the Koran, forbidding the drinking of wine. Here are alſo other fruits, as dates, figs, raiſins, almonds, apples, pears, cherries, plums, citrons, lemons, oranges, pomegranates, with plenty of roots and herbs, hemp, flax, ſugar, honey, and wax: but they have not many foreſt-trees, and ſcarce any good timber; poſſibly their ſoil is not proper for timber, or they take no care to preſerve it, having little occaſion for any.

The animals of this part of Africa, whether wild or tame, are much the ſame we meet with to the ſouthward; except the elk, the elephant, and the rhinoceros, which no travellers pretend to meet with in the empire of Morocco: and as they want theſe, ſo they have ſome others not to be found in the ſouth of Africa, particularly camels, dromedaries, and that fine breed of horſes called *barbs*, which for their beauty and ſwiftneſs can ſcarce be paralleled in the world. Nor are their horſes to be admired only for their beauty and ſpeed, but their uſe in war, being extremely ready to obey their riders upon the leaſt ſign, in charging, wheeling, or retiring; ſo that the trooper has his hands very much at liberty, and can make the beſt uſe of his arms.

As to mountains, the chief are that chain which goes under the name of *Mount Atlas*, and runs the whole length of Barbary from eaſt to weſt, paſſing through Morocco, and abutting upon that ocean which ſeparates the eaſtern from the weſtern continent, and is from this mountain called the *Atlantic Ocean*. This mountain, as the poets feigned, ſuſtained the univerſe; hence we ſee Atlas repreſented with the world upon his ſhoulders, and deſcriptions of the globe or ſets of maps dignified with the name of *Atlas*. Dr Shaw, however, aſſures us, that this chain cannot ſtand in competition either with the Alps or Appennines for height. Near the Straits ſtands the mountain anciently called *Abyla*, and now, if we are not miſtaken, by our countrymen ſtyled the *Apes-hill*.

The principal rivers, beſides the Malva or Mulvia above-mentioned, which riſes in the deſarts, and running from ſouth to north divides Morocco from the kingdom of Algiers, are the Suz, Ommirabih, Rabbatta, Larache, Darodt, Sebon, Gueron, and Tenſift, which riſe in Mount Atlas, and fall into the Atlantic Ocean.

The chief capes are Cape Threeforks on the Miditerranean, Cape Spartel at the enterance of the ſtraits, Cape Cantin, Cape None, and Cape Rajador, on the Atlantic Ocean.

Of the bays the moſt conſiderable are, the bay of Tetuan in the Mediterranean, and the bay of Tangier in the ſtraits of Gibraltar.

There are ſome mines of very fine copper in this empire; but if there are any of gold and ſilver, as ſome writers tell us, they have never been opened, as far as we can find.

The traffic of the empire by land is either with Arabia or Negroland: to Mecca they ſend caravans, conſiſting of ſeveral thouſand camels, horſes, and mules, twice every year, partly for traffic, and partly upon a religious account; for numbers of pilgrims take that opportunity of paying their devotions to their great prophet. The goods they carry to the eaſt are woollen manufactures, very fine Morocco ſkins, indigo, cochineal, and oſtrich feathers; and they bring back from thence, ſilk, muſlins, and drugs. By their caravans to Negroland, they ſend ſalt, ſilk, and woollen manufactures, and bring back gold and ivory in return, but chiefly negroes: for from hence it is that their emperor chiefly recruits his black cavalry, though there are alſo great numbers born in the country; for they bring thoſe of both ſexes very young from Negroland, the females for breeders, and the males for ſoldiers. As they grow up, they firſt carry a muſket, and ſerve on foot, and after ſome time are preferred to be cavaliers: and as they have no other hopes or dependence but the favour of the emperor, they prove much the moſt dutiful and obſequious of all his ſubjects, and indeed ſupport his tyranny over the reſt. The caravans always go ſtrong enough to defend themſelves againſt the wild Arabs in the deſarts of Africa and Aſia; though, notwithſtanding all their vigilance, ſome of the ſtragglers and baggage often

fall

Morocco. fall into their hands: they are alfo forced to load one half of their camels with water, to prevent their perifhing with drought and thirft in thofe inhofpitable defarts. And there is ftill a more dangerous enemy, and that is the fand itfelf: when the winds rife, the caravan is perfectly blinded with duft; and there have been inftances both in Africa and Afia, where whole caravans, and even armies, have been buried alive in the fands. There is no doubt alfo, but both men and cattle are fometimes furprifed by wild beafts, as well as robbers, in thofe vaft defarts; the hot winds alfo, blowing over a long tract of burning fand, are equal almoft to the heat of an oven, and deftroy abundance of merchants and pilgrims. If it was not for devotion, and in expectation of very great gains, no man would undertake a journey in thefe defarts; great are the hazards and fatigues they muft of neceffity undergo; but thofe that go to Mecca affure themfelves of paradife if they die, and have uncommon honours paid them at home if they furvive. People crowd to be taken into the eaftern caravans; and the gold that is found in the fouth, make them no lefs eager to undertake that journey.

The natives have hardly any trading veffels, but are feldom without fome corfairs. Thefe, and European merchant-fhips, bring them whatever they want from abroad; as linen and woollen cloth, ftuffs, iron wrought and unwrought, arms, gunpowder, lead, and the like: for which they take in return, copper, wax, hides, Morocco leather, wool, (which is very fine) gums, foap, dates, almonds, and other fruits.

The coins of this empire are a fluce, a blanquil, and ducat. The fluce is a fmall copper coin, twenty whereof make a blanquil, of the value of two-pence Sterling. The blanquil is of filver, and the ducat of gold, not unlike that of Hungary, and worth about nine fhillings. Both thefe pieces are fo liable to be clipped and filed by the Jews, that the Moors always carry fcales in their pockets to weigh them; and when they are found to be much diminifhed in their weight, they are recoined by the Jews, who are mafters of the mint, by which they gain a confiderable profit; as they do alfo by exchanging the light pieces for thofe that are full weight. Merchants accouuts are kept in ounces, ten of which make a ducat; but in payments to the government, it is faid they will reckon feventeen one-half for a ducat.

With refpect to religion, the inhabitants of Morocco are Mohammedans, of the fect of Ali; and have a mufti, or high-prieft, who is alfo the fupreme civil magiftrate, and the laft refort in all caufes ecclefiaftical and civil. They have a great veneration for their hermits, and for idiots and madmen; as well as for thofe who by their tricks have got the reputation of wizzards: all whom they look upon as infpired perfons, and not only honour as faints while they live, but build tombs and chapels over them when dead; which places are not only devoutly vifi ed by their devotees far and near, but are efteemed inviolable fanctuaries for all forts of criminals, except in cafes of treafon.

Notwithftanding the natives are zealous Mohammedans, they allow foreigners the free and open profeffion of their religion, and their very flaves have their priefts and chapels in the capital city, though it muft be owned that the Chriftian flaves are here treated with the utmoft cruelty. Here, as in all other Mohammedan countries, the alcoran and their comments upon it are their only written laws; and though in fome inftances their cadis, and other civil magiftrates, are controlled by the arbitrary determinations of their princes, bafhaws, generals, and military officers, yet the latter have generally a very great deference and regard for their laws. Murder, theft, and adultery, are commonly punifhed with death: and their punifhments for other crimes, particularly thofe againft the ftate, are very cruel; as impaling, dragging the prifoner through the ftreets at a mule's heels, till all his flefh is torn off; throwing him from a high tower upon iron hooks; hanging him upon hooks till he die; crucifying him againft a wall; and, indeed, the punifhment and condemnation of criminals is in a manner arbitrary. The emperor, or his bafhaws, frequently turn executioners; fhoot the offender, or cut him to pieces with their own hands, or command others to do it in their prefence. Morocco.

In regard to the character of the Moors, they are faid to be a covetous inhofpitable people, intent upon nothing but heaping up riches, to obtain which they will be guilty of the meaneft things, and ftick at no manner of fraud. The Arabs alfo, who are almoft as numerous as the Moors, have always had the character of a pilfering generation. The people who inhabit the hills, and who have the leaft to do with the court and with traffic, are much the honefteft people among them, and ftill retain a good fhare of liberty, the government ufing them rather as allies than fubjects, left they fhould entirely difown their authority. The Moors, however, with all their bad qualities, are obferved to be very dutiful to their parents, their princes, and fuperiors. A plurality of wives is allowed here, as in other Mohammedan countries; nor do they confine themfelves to women, but keep boys, as they do in Turkey. The woman who commits adultery is punifhed with death; but it is not difficult for them to obtain a divorce, if ill ufed.

The dead are carried to the grave in their ufual drefs, the priefts finging before them, *La illa All illa, Mahomet Refoul Alla*; i. e. God is a great God, and Mahomet his prophet.

The Moors, or natives of the country, are of much the fame complexion as the Spaniards on the oppofite fhore; but fuch multitudes of negroes have been brought from Guinea, that you fee almoft as many black as white people, efpecially about Mequinez, where the court refides. The habit of a Moor is a linen frock or fhirt next his fkin, a veft of filk or cloth tied with a fafh, a pair of drawers, a loofe coat, his arms bare to the elbow, as well as his legs, fandals or flippers on his feet, and fometimes people of condition wear bufkins: they fhave their heads, and wear a turban, which is never pulled off before their fuperiors, or in their temples; they exprefs their reverence both to God and man by pulling off their flippers, which they leave at the door of the mofque or palace; and, when they attend their prince in the city, they run bare-foot after him, if the ftreets are ever fo dirty. Their turbans are of fine filk, or fine linen. The habit of the women is not very different from

from that of the men, except that they wear a fine linen cloth or caul on their heads, inftead of a turban, and their drawers are much larger and longer than the mens. The women alfo, when they go abroad, have a linen cloth over their faces, with holes in it for their eyes, like a mafk.

Morocco, the capital city of the kingdom of Morocco, in Barbary; feated in a very large plain, 250 miles fouth by weft of Fez, 125 north-weft of Suez, and 15 from Mount Atlas. It was furrounded by a ftrong wall, fortified with towers and fome bulwarks, and encompaffed with deep ditches. The number of houfes were reckoned formerly to be 100,000, all with flat roofs; but they are now greatly diminifhed, infomuch that the greateft part of the city is unpeopled. The irruptions and robberies of the Arabs hinder them from cultivating the lands about it, infomuch that there is nothing but vines, date-trees, and fome other fruits. There were three temples or mofques in this place, of a prodigious fize; and the emperor's palace was fo large, and took up fo much ground, that it refembled a fmall city. A late traveller affirms, that the inhabitants now are not above 25,000, and that the houfes go to ruin every day, without being rebuilt. This may happen partly from the removal of the court, which is now at Mequinez. W. Long. 6. 45. N. Lat. 30. 32.

Morocco, or *Turkey-leather*. See Leather.

MOROCHTHUS, in natural hiftory, an indurated clay called by us *French chalk*; ferving taylors and others to mark with. The ancients efteemed it as an aftringent, prefcribing it in the colic, hæmorrhages, and other fluxes.

MORON, a town of Spain, in Andalufia, feated in a pleafant fertile plain, and in the neighbourhood is a mine of precious ftones. It is 30 miles fouth-eaft of Seville. W. Long. 5. 20. N. Lat. 37. 0.

MORPETH, a handfome town of Northumberland, which fends two members to parliament. The moft remarkable particular concerning it is a ftory of its being reduced to afhes by its own inhabitants on the approach of king John in 1215, out of pure hatred to their monarch, that he might find no fhelter there.

MORPHEUS, in fabulous hiftory, the god of fleep, or, according to others, one of the minifters of Somnus. He caufed fleepinefs, and reprefented the forms of dreams. Ovid ftyles him the kindeft of the deities; and he is ufually defcribed in a recumbent pofture, and crowned with poppies.

MORSE, in zoology. See Trichecus.

MORTALITY, or *Bills of* Mortality, properly denote lifts of the perfons who die in any place. See Annuities.

Brief *of* MORTANCESTRY, in Scots law; anciently the ground of an action at the inftance of an heir, in the fpecial cafe where he had been excluded from the poffeffion of his anceftor's eftate by the fuperior, or other perfon pretending right.

MORTAR, a preparation of lime and fand mixed with water, which ferves as a cement, and is ufed by mafons and bricklayers in building walls of ftone and brick.

Under the article Cement, we have already given the theory of mortar, as delivered by Mr Anderfon; which hath now received a farther confirmation by a recent difcovery, that if the lime is flaked, and the mortar made up with lime-water inftead of common water, the mortar will be much better. The reafon of this is, that in common water, efpecially fuch as is drawn from wells, there is always a confiderable quantity of fixed air, which, mingling with the mortar previous to its being ufed, fpoils it by reducing the quicklime in part to an inert calcareous earth like chalk; but when it is built up in a perfectly cauftic ftate, it attracts the air fo flowly, that it hardens into a kind of ftony matter as hard as was the rock from whence the limeftone was taken.

Mortar, a chemical inftrument very ufeful for the divifion of bodies, partly by percuffion, and partly by grinding. Mortars have the form of an inverted bell. The matter intended to be pounded is to be put into them, and there it is to be ftruck and bruifed by a long inftrument called a *peftle*. The motion given to the peftle ought to vary according to the nature of the fubftances to be pounded. Thofe which are eafily broken, or which are apt to fly out of the mortar, or which are hardened by the ftroke of the peftle, require that this inftrument fhould be moved circularly, rather by grinding or bruifing, than by ftriking. Thofe fubftances which are foftened by the heat occafioned by rubbing and percuffion, require to be pounded very flowly. Laftly, thofe which are very hard, and which are not capable of being foftened, are eafily pounded by repeated ftrokes of the peftle. They require no bruifing but when they are brought to a certain degree of finenefs. But thefe things are better learnt by habit and practice than by any directions.

As mortars are inftruments which are conftantly ufed in chemiftry, they ought to be kept of all fizes and materials; as of marble, copper, glafs, iron, grittftone, and agate. The nature of the fubftance to be pounded determines the choice of the kind of mortar. The hardnefs and diffolving power of that fubftance are particularly to be attended to. As copper is a foft metal, foluble by almoft all menftruums, and hurtful to health, good artifts have fome time ago profcribed the ufe of this metal.

One of the principal inconveniencies of pulverifation in a mortar proceeds from the fine powder which rifes abundantly from fome fubftances during the operation. If thefe fubftances be precious, the lofs will be confiderable; and if they be injurious to health, they may hurt the operator. Thefe inconveniencies may be remedied, either by covering the mortar with a fkin, in the middle of which is a hole, thro' which the peftle paffes; or by moiftening the matter with a little water, when this addition does not injure it; or, laftly, by covering the mouth and nofe of the operator with a fine cloth, to exclude this powder. Some fubftances, as corrofive fublimate, arfenic, calxes of lead, cantharides, euphorbium, &c. are fo noxious, that all thefe precautions ought to be ufed, particularly when a large quantity of them is pounded.

Large mortars ought to be fixed upon a block of wood, fo high, that the mortar fhall be level with the middle of the operator. When the peftle is large and heavy, it ought to be fufpended by a cord or chain fixed to a moveable pole, placed horizontally above the mortar: this pole confiderably relieves the

the operator, becaufe its elafticity affifts the raifing of the peftle.

MORTAR-PIECE. See GUN, par. ult. GUNNERY, n° 50, 52, 55. and Plate CXLI. and CXLIII. fig. 20.

MORTGAGE, in law, (*mortuum vadium*, or dead-pledge,) is where a man borrows of another a fpecific fum (*e. g.* 200 l.) and grants him an eftate in fee, on condition that if he, the mortgagor, fhall pay the mortgagee the faid fum of 200 l. on a certain day mentioned in the deed, that then the mortgagor may re-enter on the eftate fo granted in pledge; or, as is now the more ufual way, that the mortgagee fhall reconvey the eftate to the mortgagor: in this cafe the land which is fo put in pledge, is by law, in cafe of nonpayment at the time limited, for ever dead and gone from the mortgagor; and the mortgagee's eftate in the lands is then no longer conditional, but abfolute. But, fo long as it continues conditional, that is, between the time of lending the money, and the time allotted for payment, the mortgagee is called *tenant in mortgage*. But as it was formerly a doubt, whether, by taking fuch eftate in fee, it did not become liable to the wife's dower, and other incumbrances, of the mortgagee, (though that doubt has been long ago over-ruled by our courts of equity), it therefore became ufual to grant only a long term of years, by way of mortgage; with condition to be void on repayment of the mortgage-money: which courfe has been fince continued, principally becaufe on the death of the mortgagee fuch term becomes vefted in his perfonal reprefentatives, who alone are entitled in equity to receive the money lent, of whatever nature the mortgage may happen to be.

As foon as the eftate is created, the mortgagee may immediately enter on the lands; but is liable to be difpoffeffed, upon performance of the condition by payment of the mortgage-money at the day limited. And therefore the ufual way is to agree that the mortgagor fhall hold the land till the day affigned for payment; when, in cafe of failure, whereby the eftate becomes abfolute, the mortgagee may enter upon it and take poffeffion, without any poffibility at law of being afterwards evicted by the mortgagor, to whom the land is now for ever dead. But here again the courts of equity interpofe; and though a mortgage be thus forfeited, and the eftate abfolutely vefted in the mortgagee at the common law, yet they will confider the real value of the tenements compared with the fum borrowed. And if the eftate be of greater value than the fum lent thereon, they will allow the mortgagor at any reafonable time to re-call or redeem his eftate; paying to the mortgagee his principal, intereft, and expenfes: for otherwife, in ftrictnefs of law, an eftate worth 1000 l. might be forfeited for non-payment of 100 l. or a lefs fum. This reafonable advantage, allowed to mortgagors, is called the *equity of redemption*; and this enables a mortgagor to call on the mortgagee, who has poffeffion of his eftate, to deliver it back, and account for the rents and profits received, on payment of his whole debt and intereft; thereby turning the *mortuum* into a kind of *vivum vadium*; (fee VADIUM). But, on the other hand, the mortgagee may either compel the fale of the eftate, in order to get the whole of his money immediately; or elfe call upon the mortgagor to redeem his eftate prefently, or, in default thereof, to be for ever foreclofed from redeeming the fame; that is, to lofe his equity of redemption without poffibility of recall. And alfo, in fome cafes of fraudulent mortgages, the fraudulent mortgagor forfeits all equity of redemption whatfoever. It is not, however, ufual for mortgagees to take poffeffion of the mortgaged eftate, unlefs where the fecurity is precarious, or fmall; or where the mortgagor neglects even the payment of intereft: when the mortgagee is frequently obliged to bring an ejectment, and take the land into his own hands, in the nature of a pledge, or the *pignus* of the Roman law: whereas, while it remains in the hands of the mortgagor, it more refembles their hypotheca, which was where the poffeffion of the thing pledged remained with the debtor. But, by ftatute 7 Geo. II. c. 20. after payment or tender by the mortgagor of principal, intereft, and cofts, the mortgagee can maintain no ejectment; but may be compelled to re-affign his fecurities. In Glanvil's time, when the univerfal method of conveyance was by livery of feifin or corporal tradition of the lands, no gage or pledge of lands was good unlefs poffeffion was alfo delivered to the creditor; *fi non fequatur ipfius vadii traditio, curia domini regis hujufmodi privatas conventiones tueri non folet*: for which the reafon given is, to prevent fubfequent and fraudulent pledges of the fame land; *cum in tali cafu poffit eadem res pluribus aliis creditoribus tum prius tum pofterius invadiari*. And the frauds which have arifen, fince the exchange of thefe public and notorious conveyances for more private and fecret bargains, have well evinced the wifdom of our ancient law.

MORTIER, an enfign of dignity, borne by the chancellor and grand prefidents of the parliament of France. That borne by the chancellor is a piece of cloth of gold, edged and turned up with ermine; and that of the firft prefident is a piece of black velvet edged with a double row of gold lace, while that of the other prefidents is only edged with a fingle row. This they formerly carried on their heads, as they ftill do in grand ceremonies, fuch as the entry of the king; but ordinarily they carry them in the hand.

MORTISE, or MORTOISE, in carpentry, &c. a kind of joint wherein a hole of a certain depth is made in a piece of timber, which is to receive another piece called a *tenon*.

MORTMAIN, or ALIENATION *in Mortmain*, (*in mortua manu*), is an alienation of lands or tenements to any corporation, fole or aggregate, ecclefiaftical or temporal *: but thefe purchafes having been chiefly made by religious houfes, in confequence whereof the lands became perpetually inherent in one dead hand, this hath occafioned the general appellation of *mortmain* to be applied to fuch alienations, and the religious houfes themfelves to be principally confidered in forming the ftatutes of mortmain: in deducing the hiftory of which ftatutes, it will be matter of curiofity to obferve the great addrefs and fubtile contrivance of the ecclefiaftics in eluding from time to time the laws in being, and the zeal with which fucceffive parliaments have purfued them through all their fineffes: how new remedies were ftill the parents of new evafions; till the legiflature at laft, though with difficulty, hath

* See *Corporation*.

Mortmain. hath obtained a decifive victory.

By the common law any man might difpofe of his lands to any other private man at his own difcretion, efpecially when the feodal reftraints of alienation were worn away. Yet in confequence of thefe it was always, and is ftill neceffary, for corporations to have a licence of mortmain from the crown, to enable them to purchafe lands: for as the king is the ultimate lord of every fee, he ought not, unlefs by his own confent, to lofe his privilege of efcheats and other feodal profits, by the vefting of lands in tenants that can never be attainted or die. And fuch licences of mortmain feem to have been neceffary among the Saxons, above 60 years before the Norman conqueft. But, befides this general licence from the king as lord paramount of the kingdom, it was alfo requifite, whenever there was a mefne or intermediate lord between the king and the alienor, to obtain his licence alfo (upon the fame feodal principles) for the alienation of the fpecific land. And if no fuch licence was obtained, the king or other lord might refpectively enter on the lands fo alienated in mortmain, as a forfeiture. The neceffity of this licence from the crown was acknowledged by the conftitutions of Clarendon, in refpect of advowfons, which the monks always greatly coveted, as being the groundwork of fubfequent appropriations. Yet fuch were the influence and ingenuity of the clergy, that (notwithftanding this fundamental principle) we find that the largeft and moft confiderable dotations of religious houfes happened within lefs than two centuries after the conqueft. And (when a licence could not be obtained) their contrivance feems to have been this: That as the forfeiture for fuch alienations accrued in the firft place to the immediate lord of the fee, the tenant who meant to alienate firft conveyed his lands to the religious houfe, and inftantly took them back again to hold as tenant to the monaftery; which kind of inftantaneous feifin was probably held not to occafion any forfeiture: and then, by pretext of fome other forfeiture, furrender, or efcheat, the fociety entered into thofe lands in right of fuch their newly acquired figniory, as immediate lords of the fee. But when thefe donations began to grow numerous, it was obferved that the feodal fervices, ordained for the defence of the kingdom, were every day vifibly withdrawn; that the circulation of landed property from man to man began to ftagnate; and that the lords were curtailed of the fruits of their figniories, their efcheats, wardfhips, reliefs, and the like: and therefore, in order to prevent this, it was ordained by the fecond of king Henry III.'s great charters, and afterwards by that printed in our common ftatute-books, that all fuch attempts fhould be void, and the land forfeited to the lord of the fee.

Blackft. Comment.

But as this prohibition extended only to religious houfes, bifhops and other fole corporations were not included therein; and the aggregate ecclefiaftical bodies (who, Sir Edward Coke obferves, in this were to be commended, that they ever had of their counfel the beft learned men that they could get) found many means to creep out of this ftatute, by buying in lands that were *bona fide* holden of themfelves as lords of the fee, and thereby evading the forfeiture; or by taking long leafes for years, which firft introduced thofe extenfive terms, for a thoufand or more years, which are now fo frequent in conveyances. This produced the ftatute *de religiofis*, 7 Edward I.; which provided, that no perfon, religious or other whatfoever, fhould buy, or fell, or receive, under pretence of a gift, or term of years, or any other title whatfoever, nor fhould by any art or ingenuity appropriate to himfelf any lands or tenements in mortmain; upon pain that the immediate lord of the fee, or, on his default for one year, the lords paramount, and, in default of all of them, the king, might enter thereon as a forfeiture. Mortmain.

This feemed to be a fufficient fecurity againft all alienations in mortmain: but as thefe ftatutes extended only to gifts and conveyances between the parties, the religious houfes now began to fet up a fictitious title to the land, which it was intended they fhould have, and to bring an action to recover it againft the tenant; who, by fraud and collufion, made no defence, and thereby judgment was given for the religious houfe, which then recovered the land by a fentence of law upon a fuppofed prior title. And thus they had the honour of inventing thofe fictitious adjudications of right, which are fince become the great affurance of the kingdom, under the name of *common* RECOVERIES. But upon this the ftatute of Weftminfter the fecond, 13 Edw. I. c. 32. enacted, that in fuch cafes a jury fhall try the true right of the demandants or plaintiffs to the land; and if the religious houfe or corporation be found to have it, they fhall ftill recover feifin; otherwife it fhall be forfeited to the immediate lord of the fee, or elfe to the next lord, and finally to the king, upon the immediate or other lord's default. And the like provifion was made by the fucceeding chapter, in cafe the tenants fet up croffes upon their lands (the badges of knights templars and hofpitallers) in order to protect them from the feodal demands of their lords, by virtue of the privileges of thofe religious and military orders. And fo careful was this provident prince to prevent any future evafions, that when the ftatute of *quia emptores*, 18 Edward I. abolifhed all fub-infeudations, and gave liberty for all men to alienate their lands to be holden of their next immediate lord, a provifo was inferted that this fhould not extend to authorife any kind of alienation in mortmain. And when afterwards the method of obtaining the king's licence by writ of *ad quod damnum* was marked out, by the ftatute 27 Edward I. ft. 2. it was farther provided by ftatute 34 Edward I. ft. 3. that no fuch licence fhould be effectual without the confent of the mefne or intermediate lords.

Yet ftill it was found difficult to fet bounds to ecclefiaftical ingenuity: for when they were driven out of all their former holds, they devifed a new method of conveyance, by which the lands were granted, not to themfelves directly, but to nominal feoffees to the ufe of the religious houfes; thus diftinguifhing between the poffeffion and the ufe, and receiving the actual profits, while the feifin of the land remained in the nominal feoffee; who was held by the courts of equity (then under the direction of the clergy) to be bound in confcience to account to his *ceftuy que ufe* for the rents and emoluments of the eftate. And it is to thefe inventions that our practifers are indebted for the introduction of ufes and trufts, the foundation of modern conveyancing. But, unfortunately for the inventors themfelves, they did not long enjoy

Mortmain. enjoy the advantage of their new device; for the ftatute 15 Richard II. c. 5. enacts, that the lands which had been fo purchafed to ufes fhould be amortifed by licence from the crown, or elfe be fold to private perfons; and that for the future ufes fhall be fubject to the ftatutes of mortmain, and forfeitable like the lands themfelves. And whereas the ftatutes had been eluded by purchafing large tracts of land adjoining to churches, and confecrating them by the name of *church-yards*, fuch fubtile imagination is alfo declared to be within the compafs of the ftatutes of mortmain. And civil or lay corporations, as well as ecclefiaftical, are alfo declared to be within the mifchief, and of courfe within the remedy provided by thofe falutary laws. And, laftly, as during the times of popery lands were frequently given to fuperftitious ufes, though not to any corporate bodies; or were made liable in the hands of heirs and devifees to the charge of obits, chauntries, and the like, which were equally pernicious in a well-governed ftate as actual alienations in mortmain; therefore at the dawn of the Reformation, the ftatute 23 Hen. VIII. c. 10. declares, that all future grants of lands for any of the purpofes aforefaid, if granted for any longer term than 20 years, fhall be void.

But, during all this time, it was in the power of the crown, by granting a licence of mortmain, to remit the forfeiture, fo far as related to its own rights; and to enable any fpiritual or other coporation to purchafe and hold any lands or tenements in perpetuity: which prerogative is declared and confirmed by the ftatute 18 Edw. III. ft. 3. c. 3. But as doubts were conceived at the time of the Revolution how far fuch licence was valid, fince the king had no power to difpenfe with the ftatutes of mortmain by a claufe of *non obftante*, which was the ufual courfe, though it feems to have been unneceffary; and as, by the gradual declenfion of mefne figniories through the long operation of the ftatute of *quia emptores*, the rights of intermediate lords were reduced to a very fmall compafs; it was therefore provided by the ftatute 7 & 8 W. III. c. 37. that the crown for the future at its own difcretion may grant licences to aliene or take in mortmain, of whomfoever the tenements may be holden.

After the diffolution of monafteries under H. VIII. though the policy of the next popifh fucceffor affected to grant a fecurity to the poffeffors of abbey-lands, yet, in order to regain fo much of them as either the zeal or timidity of their owners might induce them to part with, the ftatutes of mortmain were fufpended for 20 years by the ftatute 1 & 2 P. & M. c. 8. and during that time any lands or tenements were allowed to be granted to any fpiritual corporation without any licence whatfoever. And long afterwards, for a much better purpofe, the augmentation of poor livings, it was enacted by the ftatute 17 Car. II. c. 3. that appropriators may annex the great tithes to the vicarages; and that all benefices under 100 l. *per annum*, may be augmented by the purchafe of lands, without licence of mortmain in either cafe: and the like provifion hath been fince made, in favour of the governors of queen Anne's bounty. It hath alfo been held, that the ftatute 23 Hen. VIII. before-mentioned did not extend to any thing but fuperftitious ufes; and that therefore a man may give lands for the maintenance of a fchool, an hofpital, or any other charitable ufes. But as it was apprehended from recent experience, that perfons on their deathbeds might make large and improvident difpofitions even for thefe good purpofes, and defeat the political ends of the ftatutes of mortmain; it is therefore enacted by the ftatute 9 Geo. II. c. 36. that no lands or tenements, or money to be laid out thereon, fhall be given for or charged with any charitable ufes whatfoever, unlefs by deed indented, executed in the prefence of two witneffes 12 kalendar months before the death of the donor, and enrolled in the court of chancery within fix months after its execution, (except ftocks in the public funds, which may be transferred within fix months previous to the donor's death), and unlefs fuch gift be made to take effect immediately, and be without power of revocation: and that all other gifts fhall be void. The two univerfities, their colleges, and the fcholars upon the foundation of the colleges of Eton, Winchefter, and Weftminfter, are excepted out of this act: but fuch exemption was granted with this provifo, that no college fhall be at liberty to purchafe more advowfons than are equal in number to one moiety of the fellows or ftudents upon the refpective foundations.

Morton. Mortuary.

MORTON (Thomas), a learned Englifh bifhop in the 17th century, was bred at St John's college Cambridge, and was logic-lecturer of the univerfity. After feveral preferments he was advanced to the fee of Chefter in 1615, and tranflated to that of Litchfield and Coventry in 1618: at which time he became acquainted with Antonio de Dominis archbifhop of Spalatro, whom he endeavoured to diffuade from returning to Rome. While he was bifhop of Litchfield and Coventry, in which fee he fat 14 years, he educated, ordained, and prefented to a living, a youth of excellent parts and memory, who was born blind; and detected the impofture of the famous boy of Bilfon in Staffordfhire, who pretended to be poffeffed with a devil. In 1632 he was tranflated to the fee of Durham, in which he fat with great reputation till the opening of the long parliament, which met in 1640; when he received great infults from the common people, and was committed twice to cuftody. The parliament, upon the diffolution of bifhoprics, voted him 800l. *per annum*, of which he received but a fmall part. He died in 1659, in the 95th year of his age and 44th of his epifcopal confecration. He publifhed *Apologia Catholica*, and feveral other works; and was a man of extenfive learning, great piety, and temperance.

MORTUARY, in law, is a fort of ecclefiaftical heriot *, being a cuftomary gift claimed by and due to the minifter in very many parifhes on the death of his parifhioners. They feem originally to have been only a voluntary bequeft to the church; being intended, as Lyndewode informs us from a conftitution of archbifhop Langham, as a kind of expiation and amends to the clergy for the perfonal tithes, and other ecclefiaftical duties, which the laity in their life-time might have neglected or forgotten to pay. For this purpofe, after the lord's heriot or beft good was taken out, the fecond beft chattel was referved to the church as a mortuary. And therefore in the laws of king Canute this mortuary is called *foul-fcot*, or *fymbolum animæ*. And, in purfuance of the fame principle, by the laws of Venice, where no perfonal tithes have been paid du-

* See *Heriot* in Append.

ring the life of the party, they are paid at his death out of his merchandife, jewels, and other moveables. So alfo, by a fimilar policy, in France, every man that died without bequeathing a part of his eftate to the church, which was called *dying without confeffion*, was formerly deprived of Chriftian burial: or, if he died inteftate, the relations of the deceafed, jointly with the bifhop, named proper arbitrators to determine what he ought to have given to the church, in cafe he had made a will. But the parliament, in 1409, redreffed this grievance.

It was anciently ufual in England to bring the mortuary to church along with the corpfe when it came to be buried; and thence it is fometimes called a *corfe-prefent:* a term which befpeaks it to have been once a voluntary donation. However, in Bracton's time, fo early as Henry III. we find it rivetted into an eftablifhed cuftom: infomuch that the bequefts of heriots and mortuaries were held to be neceffary ingredients in every teftament of chattels. *Imprimis autem debet quilibet, qui teftamentum fecerit, dominum fuum de meliori re quam habuerit recognofcere; et poftea ecclefiam de alia meliori:* the lord muft have the beft good left him as an heriot; and the church the fecond beft as a mortuary. But yet this cuftom was different in different places: *in quibufdam locis habet ecclefia melius animal de confuetudine; in quibufdam fecundum, vel tertium melius; et in quibufdam nihil: et ideo confideranda eft confuetudo loci.* This cuftom ftill varies in different places, not only as to the mortuary to be paid, but the perfon to whom it is payable. In Wales a mortuary or corfe-prefent was due upon the death of every clergyman to the bifhop of the diocefe; till abolifhed, upon a recompence given to the bifhop, by the ftatute 12 Ann. ft. 2. c. 6. And in the archdeaconry of Chefter a cuftom alfo prevailed, that the bifhop, who is alfo archdeacon, fhould have, at the death of every clergyman dying therein, his beft horfe or mare, bridle, faddle, and fpurs, his beft gown or cloak, hat, upper garment under his gown, and tippet, and alfo his beft fignet or ring. But by ftatute 28 Geo. II. c. 6. this mortuary is directed to ceafe, and the act has fettled upon the bifhop an equivalent in its room. The king's claim to many goods, on the death of all prelates in England, feems to be of the fame nature; though Sir Edward Coke apprehends, that this is a duty upon death, and not a mortuary: a diftinction which feems to be without a difference. For not only the king's ecclefiaftical character, as fupreme ordinary, but alfo the fpecies of the goods claimed, which bear fo near a refemblance to thofe in the archdeaconry of Chefter, which was an acknowledged mortuary, puts the matter out of difpute. The king, according to the record vouched by Sir Edward Coke, is entitled to fix things; the bifhop's beft horfe or palfrey, with his furniture; his cloak or gown, and tippet; his cup and cover; his bafon and ewer; his gold ring; and laftly, his *muta canum*, his mew or kennel of hounds.

This variety of cuftoms with regard to mortuaries, giving frequently a handle to exactions on the one fide, and frauds or expenfive litigations on the other, it was thought proper by ftatute 21 Henry VIII. c. 6. to reduce them to fome kind of certainty. For this purpofe it is enacted, that all mortuaries, or corfe-prefents to parfons of any parifh, fhall be taken in the following manner, unlefs where by cuftom lefs or none at all is due: *viz.* for every perfon who does not leave goods to the value of ten marks, nothing: for every perfon who leaves goods to the value of ten marks and under 30 pounds, 3*s.* 4*d.* if above 30 pounds, and under 40 pounds, 6*s.* 8*d.* if above 40 pounds, of what value foever they may be, 10*s.* and no more. And no mortuary fhall throughout the kingdom be paid for the death of any feme covert; nor for any child; nor for any one of full age, that is not a houfekeeper; nor for any wayfaring man; but fuch wayfaring man's mortuary fhall be paid in the parifh to which he belongs. And upon this ftatute ftands the law of mortuaries to this day.

MORUS, the MULBERRY-TREE; a genus of the tetrandria order, belonging to the monœcia clafs of plants. The moft remarkable fpecies are,

1. The *nigra*, or common black-fruited mulberry-tree. It rifes with an upright, large, rough trunk, dividing into a large, branchy, and very fpreading head, rifing 20 feet high, or more; large, heart-fhaped, rough leaves, and monœcious flowers; fucceeded in the females by large fucculent black-berries. There is a variety with jagged leaves and fmaller fruit. This fpecies is the proper mulberry-tree for general cultivation in this country for its fruit; the tree being a plentiful bearer, and the fruit ripen in good perfection in Auguft and September.

2. The *alba*, or white mulberry-tree, rifes with an upright trunk, branching 20 or 30 feet high; garnifhed with large, oblique, heart-fhaped, fmooth, light-green, fhining leaves, and monœcious flowers, fucceeded by pale-whitifh fruit. There is a variety with purplifh fruit.

3. The *papyrifera*, or paper mulberry-tree of Japan, grows 20 or 30 feet high, with large palmated leaves, fome trilobate, others quinquelobed, and monœcious flowers, fucceeded by fmall black fruit. In the countries where this tree grows naturally, the inhabitants make paper of the bark.

4. The *rubra*, or red Virginia mulberry-tree, grows 30 feet high, with very large, heart-fhaped, rough leaves, hairy underneath, and monœcious flowers, fucceeded by large reddifh berries.

All thefe trees are very hardy, and fucceed in any common foil and fituation. The black mulberry is the only fort proper to cultivate as a fruit-tree for its fruit; the others are principally employed here to form variety in our ornamental plantations, of which the white and paper mulberry are the moft common, the red fort being very fcarce in the Englifh gardens; the black and the white-fruited kinds are alfo eminent for their leaves to feed filk-worms, they being the principal food of thefe valuable infects; but the white mulberry-leaves are in the moft efteem for this purpofe; and abroad, in France, Italy, &c. vaft plantations of the trees are made folely for their leaves to feed filk-worms, which amply reward the poffeffors with the annual fupply of filk they fpin from their bowels: plantations of the fame trees has formerly been recommended in this country for the purpofe of filk-worms, to introduce the manufacturing of raw filk, fince it is obfervable that where the trees thrive, the filk-worms will alfo profper; all recommendations, however, have proved fruitlefs, although it

it in time might probably turn to a national advantage.

The leaves of these trees are generally late before they begin to come out, the buds seldom beginning to open till the middle or towards the latter end of May, according to the temperature of the season; and when these trees in particular begin to expand their foliage, it is a good sign of the near approach of fine warm settled weather; the white mulberry, however, is generally forwarder in leafing than the black.

The flowers and fruit come out soon after the leaves; the males in *amentums*, and the females in small roundish heads; neither of which are very conspicuous, nor possess any beauty, but for observation; the female or fruitful flowers always rise on the extremity of the young shoots, on short spurs; and with this singularity, the calixes of the flowers become the fruit; which is of the berry kind, and being composed of many tuberances, each of these furnish one seed. The fruit ripens here gradually from about the middle of August until the middle of September; which in dry warm seasons ripen in great perfection; but when it proves very wet weather they ripen but indifferently, and prove devoid of flavour.

Considered as fruit-trees, the black-fruited kind is the only proper sort to cultivate, the trees being not only the most plentiful bearers in this country, but the fruit are larger and much finer-flavoured than the white kind, which is the only sort, besides the black mulberry, that bears fruit in this country.

MOSAIC, or Mosaic-work, an assemblage of little pieces of glass, marble, precious stones, &c. of various colours, cut square, and cemented on a ground of stucco, in such a manner as to imitate the colours and gradations of painting. The critics are divided as to the origin and reason of the name. Some derive it from *mosaicum*, a corruption of *musaicum*, as that is of *musivum*, as it was called among the Romans. Scaliger derives it from the Greek μῦσα, and imagines the name was given to this sort of works as being very fine and ingenious. Nebricensis is of opinion it was so called, because *ex illis picturis ornabantur musea.*

1. Method of performing Mosaic-work of *glass* is this: They provide little pieces of glass, of as many different colours and sizes as possible.

Now, in order to apply these several pieces, and out of them to form a picture, they in the first place procure a cartoon or design to be drawn; this is transferred to the ground or plaster by calking, as in painting in fresco. See Fresco.

As this plaster is to be laid thick on the wall, and therefore will continue fresh and soft a considerable time, so there may be enough prepared at once to serve for as much work as will take up three or four days.

This plaster is composed of lime, made of hard stone, with brick-dust very fine, gum tragacanth, and whites of eggs: when this plaster has been thus prepared and laid on the wall, and made the design of what is to be represented, they take out the little pieces of glass with a pair of plyers, and range them one after another, still keeping strictly to the light, shadow, different teints, and colours, represented in the design before; pressing or flatting them down with a ruler, which serves both to sink them within the ground, and to render the surface even.

Thus in a long time, and with a great deal of labour, they finish the work, which is still the more beautiful, as the pieces of glass are more uniform, and ranged at an even height.

Some of these pieces of mosaic-work are performed with that exactness, that they appear as smooth as a table of marble, and as finished and masterly as a painting in fresco; with this advantage, that they have a fine lustre, and will last ages.

The finest works of this kind that have remained till our time, and those by whom the moderns have retrieved the art, which was in a manner lost, are those in the church of St Agnes, formerly the temple of Bacchus, at Rome; and some at Pisa, Florence, and other cities of Italy. The most esteemed among the works of the moderns are those of Joseph Pine and the Chevalier Lanfranc, in the church of St Peter at Rome: there are also very good ones at Venice.

2. Method of performing Mosaic-work of *marble* and *precious stones* is this: The ground of Mosaic-works, wholly marble, is usually a massive marble, either white or black. On this ground the design is cut with a chisel, after it has been first calked. After it has been cut of a considerable depth, *i. e.* an inch or more, the cavities are filled up with marble of a proper colour, first fashioned according to the design, and reduced to the thickness of the indentures with various instruments. To make the piece thus inserted into the indentures cleave fast, whose several colours are to imitate those of the design, they use a stucco, composed of lime and marble-dust; or a kind of mastic, which is prepared by each workman, after a different manner peculiar to himself.

The figures being marked out, the painter or sculptor himself draws with a pencil the colours of the figures not determined by the ground, and in the same manner makes strokes or hatchings in the place where shadows are to be: and after he has engraven with the chisel all the strokes thus drawn, he fills them up with a black mastic, composed partly of Burgundy-pitch poured on hot; taking off afterwards what is superfluous with a piece of soft stone or brick, which, together with water and beaten cement, takes away the mastic, polishes the marble, and renders the whole so even that one would imagine it only consisted of one piece.

This is the kind of Mosaic-work that is seen in the pompous church of the invalids at Paris, and the fine chapel at Versailles, with which some entire apartments of that palace are incrustated.

As for Mosaic-work of precious stones, other and finer instruments are required than those used in marble; as drills, wheels, &c. used by lapidaries and engravers on stone. As none but the richest marbles and stones enter this work, to make them go the farther, they are sawn into the thinnest leaves imaginable, scarce exceeding half a line in thickness; the block to be sawn is fastened firmly with cords on the bench, and only raised a little on a piece of wood, one or two inches high. Two iron pins, which are on one side the block, and which serve to fasten it, are put into a vice contrived

contrived for the purpofe; and with a kind of faw or bow, made of fine brafs-wire, bent on a piece of fpongy wood, together with emery fteeped in water, the leaf is gradually fafhioned by following the ftroke of the defign, made on paper, and glued on the piece. When there are pieces enough faftened to form an entire flower, or fome other part of the defign, they are applied to the ground.

The ground which fupports this Mofaic-work is ufually of free-ftone. The matter with which the ftones are joined together, is a maftic, or kind of ftucco, laid very thin on the leaves as they are fafhioned; and this being done, the leaves are applied with plyers.

If any contour, or fide of a leaf, be not either fquared or rounded fufficiently, fo as to fit the place exactly into which it is to be inferted, when it is too large, it is to be brought down with a brafs file or rafp; and if it be too little, it is managed with a drill and other inftruments ufed by lapidaries.

Mofaic-work of marble is ufed in large works, as in pavements of churches, bafilics, and palaces; and in the incruftation and vaneering of the walls of the fame edifices.

As for that of precious ftones, it is only ufed in fmall works, as ornaments for altar-pieces, tables for rich cabinets, precious ftones being fo very dear.

3. Manner of performing Mofaic-work of *gypfum*. Of this ftone calcined in a kiln, beaten in a mortar, and fifted, the French workmen make a fort of artificial marbles, imitating precious ftones; and of thefe they compofe a kind of Mofaic-work, which does not come far fhort either of the durablenefs or the vivacity of the natural ftones; and which befides has this advantage, that it admits of continued pieces or paintings of entire compartiments without any vifible joining.

Some make the ground of plafter of Paris, others of free ftone. If it be of plafter of Paris, they fpread it in a wooden frame, of the length and breadth of the work intended, and in thicknefs about an inch and a half. This frame is fo contrived, that the tenons being only joined to the mortifes by fingle pins, they may be taken afunder, and the frame be difmounted, when the plafter is dry. The frame is covered on one fide with a ftrong linen-cloth, nailed all round, which being placed horizontally with the linen at the bottom, is filled with plafter paffed through a wide fieve. When the plafter is half dry, the frame is fet up perpendicularly, and left till it is quite dry; then it is taken out, by taking the frame to pieces.

In this mofaic, the ground is the moft important part. Now in order to the preparation of this fifted gypfum, which is to be applied on this ground, it is diffolved and boiled in the beft Englifh glue, and mixed with the colour that it is to be of; then the whole is worked up together into the ufual confiftence of plafter, and then is taken and fpread on the ground five or fix inches thick. If the work be fuch, as that mouldings are required, they are formed with gouges and other inftruments.

It is on this plafter, thus coloured like marble or precious ftone, and which is to ferve as a ground to a work, either of lapis, agate, alabafter, or the like, that the defign to be reprefented is drawn; having been firft pounced or calqued. To hollow or imprefs the defign, they ufe the fame inftruments that fculptors do; the ground whereon they are to work not being much lefs hard than the marble itfelf. The cavities being thus made in the ground, are filled with the fame gypfum boiled in glue, only differently coloured, and thus are the different colours of the original reprefented. In order that the neceffary colours and teints may be ready at hand, the quantities of the gypfum are tempered with the feveral colours in pots.

After the defign has been thus filled and rendered vifible, by half-polifhing it with brick and foft ftone, they go over it again, cutting fuch plates as are either to be weaker or more fhadowed, and filling them with gypfum; which work they repeat, till all the colours being added one after the other, reprefent the original to the life.

When the work is finifhed, they fcour it with foft ftone, fand, and water; after that, with a pumice-ftone; and in the laft place polifh it with a wooden mullet and emery. Then, laftly, they gave it a luftre, by fmearing it over with oil, and rubbing it a long time with the palm of the hand, which gives it a luftre no ways inferior to that of natural marble.

MOSAMBIQUE, a kingdom of Africa, lying fouth of Quiloa, and taking its name from the chief town, which is fituated on an ifland, at the mouth of a river of the fame name, in 15° S. Lat. The ifland is thirty miles in circumference, and very populous, though the air is faid to be very hot, and the foil in general dry, fandy, and barren; yet they have moft of the tropical fruits, with black cattle, hogs, and fheep. There is a kind of fowl here, both the feathers and flefh of which are black, infomuch that, when they are boiled, the broth looks like ink; and yet their flefh is very delicate, and good food. The town of Mofambique is regularly fortified, and has a good harbour, defended by a citadel, with feveral churches and monafteries. The Portuguefe fhipping to and from India touch here for refrefhments. As the ifland abounds in cattle, the Portuguefe flaughter and falt up a great deal of beef, which they afterwards fend to the Brafils, or fell to the European fhipping. They alfo barter European goods with the natives for gold, elephants teeth, and flaves. There is another town, called *Mongale*, fituated alfo on an ifland, and garrifoned by the Portuguefe, being their chief magazine for European goods. The gold they receive from the natives is found near the furface of the earth, or in the fands of rivers; no gold-mines, or at leaft very few, being at prefent wrought in Africa.

MOSCHUS, a Grecian poet of antiquity, ufually coupled with Bion; and they were both of them cotemporaries with Theocritus. In the time of the latter Grecians, all the ancient Idylliums were collected and attributed to Theocritus; but the claims of Mofchus and Bion have been admitted to fome few little pieces; and this is fufficient to make us inquifitive about their characters and ftory; yet all that can be known about them muft be collected from their own remains. Mofchus, by compofing his delicate elegy on Bion, has given the beft memorials of Bion's life. See Bion. Mofchus and Theocritus have by fome critics been fuppofed the fame perfon; but there are irrefragable evidences againft it: others will have him

Moschus. as well as Bion to have lived later than Theocritus, upon the authority of Suidas; while others again suppose him to have been the scholar of Bion, and probably his successor in governing the poetic school; which, from the elegy of Moschus, does not seem unlikely. Their remains are to be found in all the editions of the Poetæ minores.

Moschus, in zoology, a genus of quadrupeds of the order of pecora, having no horns; the canine teeth of the upper jaw are solitary and exserted. There are three species.

Plate CLXXXII. fig. 2. 1. The moschiferus, or musk animal, hath been considered by some authors as a stag, a roebuck, a goat; and by others as a large cherrotain, a species of antelope; but M. Buffon hath determined it to be an ambiguous animal, participating of the nature of all these, but differing effectually from every one of them, and from all other animals. It is of the size of a small roebuck, but has no horns; it has long coarse hair, a sharp muzzle, and tusks like those of the hog. From the nose to the tail, the animal is about a yard and half a foot long; the head above half a foot; the neck is a quarter of a yard, the fore-head three inches broad; the nose end scarce three-fourths of an inch, being very sharp, like that of a gre-hound. The ears are like those of a rabbit, about three inches long, and erect; as is also the tail, which exceeds not two inches; the fore-legs are a foot and two inches long, taking in the foot and thigh. The foot is deeply cloven; with two fore-hoofs, an inch and a quarter long, each a quarter of an inch over; and two heels almost as big, and therefore conspicuous. The hair on the head and legs is about half an inch long, and rateably small; on the belly it is an inch and an half in length, and somewhat thicker; on the back and buttocks it is three inches long, thicker in proportion than in any other animal, excepting perhaps some of the deer-kind, viz. three or four times as thick as hog's bristles; consisting of brown and white portions alternately from the root to the top. On the head and legs it is brown; on the belly, and under the tail, whitish, and as it were frizzled, especially on the back and belly, by a kind of undulation. The hair of the musk is softer than in most animals, and exceeding light and rare; for, being split, they appear to be made up of little bladders, like those in the plume or stalk of a quill; so that it is something betwixt a common hair and a quill. On each side of his lower chop, almost under the corner of his mouth, there is a peculiar tuft, (about three-fourths of an inch long), of short, thick, and hard hairs, or rather bristles, of equal length, as in a scrubbing-brush. The musk-bladder or bag which holds the perfume, is on the belly near the navel. It is about three inches long, and two over; standing out from the belly one and a half, and before the groin as much. The creature hath 26 teeth, 16 in the lower chop; of which there are eight little cutters before; behind four grinders on each side, rugged and continuous, with as many grinders in the upper jaw. About an inch and an half from the nose end in the same jaw, is on each side a tusk two inches and an half long, hooked downward and backward, and ending in a point. This tusk is not round, but flat; the breadth of half an inch; thin, and having a sharp edge behind; so that it hath a considerable resemblance of a scythe.—From the testimony of a number of travellers it appears that the perfume is produced only in the body of the male. The female hath indeed a pouch of the same kind near the navel, but the humour secreted in it has not the same odour; and this tumour of the male is not filled with musk except in the rutting season; at other times the quantity of this humour is smaller, and its odour weaker. See Musk.

Moschus, Moscow.

2. The grimmia, grimm, or Guinea antelope, is a most beautiful animal, with strait black horns, slender and sharp-pointed, not three inches long, and slightly annulated at the base. Its height is about 18 inches; the ears are large, and the eyes dusky; below the eyes is a large cavity, into which exudes a strong-scented oily liquid; between the horns is a tuft of black hairs. The colour of the neck and body is brown, mixed with an ash-colour, and a tinge of yellow; the belly is white; the tail short, white beneath, and black above. M. Vosmaer tells us, that these animals are extremely timid, and easily frightened with any noise, particularly thunder; when surprised, they express their fear by blowing suddenly and with great force through their noses. He describes one which was kept in the menagerie of the prince of Orange. "This one (says he) was at first wild, but afterwards became pretty tame. It listens when called by its name *Tetje;* and when gently approached with a piece of bread in the hand, it allows its head and neck to be stroaked. It is so cleanly, that it suffers not the smallest particle of dirt to remain on any part of its body; and for this purpose it often scratches itself with one of its hind-feet. This is the reason why it has received the appellation of *tetje*, from *tettig*, which signifies neat or clean. However, if a person continues for some time to rub its body, a white powder adheres to his fingers like that which proceeds from horses when they are curried. This animal is extremely agile; and, when reposing, it frequently keeps one of its fore-feet in an elevated and bended position, which gives it a very agreeable appearance. It is fed with bread, rye, and carrots: it likewise spontaneously eats potatoes: it is a ruminating animal, and discharges its excrements in small balls, the size of which is considerable in proportion to the magnitude of the creature."—Dr Herman Grimm tells us, that the fat, viscid, yellow humour, which is secreted in the cavities above the eyes of this animal, has an odour that participates of musk and castoreum; but M. Vosmaer remarks, that in his live subject this viscid matter has no odour of any kind.

3. The pygmæus has feet narrower than a man's finger, and is found in Africa and Asia.

MOSCOW, the chief province of the empire of Russia, deriving its name from the river Muscova, or Moska, on which the capital is situated. It was from this duchy that the czars of old took the title of *dukes of Muscovy*. The province is bounded on the north by the duchies of Twere, Rostow, Susdal, and Wolodimer; on the south by Rezan, from which it is separated by the river Occa; on the east by the principality of Cachine, and the same river Occa parting it from Nisi-novogorod; and on the west by the duchies of Rzeva, Biela, and Smolensko. It extends about 200 miles in length, and about 100 in breadth; and

Mofcow. is watered by the Mofka, Occa, and Clefma, which fall into the Wolga: neverthelefs, the foil is not very fertile. The air, however, though fharp, is falubrious; and this confideration, with the advantage of its being fituated in the midft of the beft provinces in the empire, induced the czars to make it their chief refidence. In the weftern part of Mofcow is a large foreft, from whence flows the celebrated river Nieper, or Boryfthenes, which, traverfing the duchy of Smolenfko, winds in a ferpentine courfe to Ukrania, Lithuania, and Poland. The capital, Mofcow, or Mofkova, is the metropolis and largeft city of the Ruffian empire, fituated in a fpacious plain on the banks of the river Mufkova; over which the prince Gafifchin built a ftately bridge, confifting of 12 arches of prodigious height, breadth, and folidity, becaufe the river is fo apt to overflow its banks: it was defigned by a Polifh monk, and is the only ftone-bridge in all Ruffia. Mofcow is feated on a wholefome gravelly foil, and divided into four quarters, each furrounded with a diftinct wall. Thefe diftricts are known by the names of *Cataigorod*, *Czarogorod*, *Skorodum*, and *Strelitze-flaboda*. The Cataigorod, furrounded with a brick-wall, is the middle of the city; in which ftands the citadel, about two miles in circuit, fortified with a triple wall, flanked with towers and a foffe. It contains two imperial palaces, the one of timber and the other of ftone, built after the Italian architecture; the patriarchal palace, which is a large ancient edifice; the exchequer, chancery, and other offices; two noble monafteries; five large churches, including that of St Michael, famous for its fabric and ornaments, as well as for the monuments of the grand dukes and czars who have been here interred; the grand magazine, and many other ftately buildings. Without the citadel-gate ftands that noble edifice the church of Jerufalem, finifhed by the czar John Bafilides, who ordered the architect to be deprived of his eye-fight, that he might never contrive, or at leaft behold, its equal. In the great market that fronts the citadel we fee the ftupendous bell, fuppofed to be the largeft in the whole world. It was hung in a tower built for the purpofe, which tower was confumed by fire in the beginning of the prefent century. The weight of the bell amounts to 336,000 pounds. It is in height 19 feet, in diameter 23, in circumference 70, and the fides are two feet in thicknefs. One hundred men were employed in moving this monftrous machine, which was only rung on extraordinary occafions: for example, when the Czar condefcended to fhew himfelf to his people, and when he converfed with his wife, that the fubjects mights know when to petition heaven that a male child fhould be the iffue of the conjugal embrace. This diftrict is watered by the rivers Negliga and Mofka; and is called *Cataigorod*, from *catai*, the Ruffian name for China, becaufe here the merchandifes of that empire are chiefly fold. The Czarogorod, or ducal city, encompaffed the Cataigorod, and is itfelf fortified with a white-ftone wall, called *Bielaftena;* whence it has acquired the appellation of *Bielagorod*, or the *white city*. The moft remarkable building in this divifion is the great arfenal. The Skorodum quarter ftands to the north-weft of the Czarogorod; and is chiefly inhabited by timber-merchants and carpenters, who fell wooden houfes ready made. It is furrounded with a mud-wall, and diftinguifhed by the name of *Scorodum*, which fignifies *done in hafte;* becaufe, on an alarm from the Tartars, it was finifhed in four days, tho' it is 15 miles in circuit, and the earth is every where fupported by planks and beams of timber. It is abfolutely neceffary that there fhould be fuch a magazine of houfes ready made, to fupply the lofs of thofe that perifh almoft every day by conflagrations, owing to the careleffnefs, rage, and intoxication, of the inhabitants. On the eaft and fouth-eaft fides of the Cataigorod and citadel ftands the Strelitze-flabodo, fo called from the guards of that name, who were formerly lodged in this quarter, which is fortified with wooden ramparts, and divided from the other parts of the city by the river Mofka. The houfes of the commonalty are no better than mean paultry wooden huts, without neatnefs and furniture: but the merchants fecure their commodities in vaults of ftone or brick, which are proof againft the accidents of fire. There are 3000 ftone or brick houfes in the city of Mofcow; but they ftand at fuch diftances from one another, are fo intermingled with rows of wooden houfes, and fuch a number of them ftand detached from, and as it were behind the ftreets, furrounded with high walls, that the effect of them is almoft loft in the general profpect. The ftreets, inftead of being paved with ftones, are boarded with fir-planks; fo that in conflagrations the ground feems to burn, and it becomes impoffible to approach the fcene of difafter. Among the churches and chapels of this city, which are faid to amount in number to 1500, that in the Krimelin, or palace of the citadel, is a very ancient and remarkable edifice. On the right-hand fide of the altar is the Czar's throne, and on the left is that of the patriarch. The body of the church is lighted by a filver chandelier of immenfe weight and value. The jewels and ornaments belonging to an image of the Virgin Mary are valued at half a tun weight in gold: but ineftimable is the value of an infinite number of chalices, pixes, patens, ftatues, and other church-utenfils of gold and filver, curioufly wrought and enriched with precious ftones, a prodigious number of rich prieftly veftments, befides innumerable donatives, and prefents offered to the relics of three eminent Ruffian faints interred in this place. In a word, the treafure contained in this church is faid to equal, at leaft, that of any cathedral in Europe. Hard by the church of St Michael, which we have mentioned above, is the ftately abbey of nuns, called *tzudoff-monafter:* here the bodies of the princeffes of the blood are interred; and in a feparate chapel we fee the tombs of thofe princes who never afcended the throne. Nothing can be more rich and magnificent than the palls with which their coffins are covered on holidays. Of the feveral monafteries that appear in Mofcow and its neighbourhood, the moft remarkable is the Dewitze-monafter, about a mile from the city, where Peter confined his ambitious fifter the princefs Sophia, who had hatched fo many confpiracies againft his government. This monaftery, which is fituated in an extenfive plain, contains 300 nuns, who are kept under fevere reftrictions, contrary to the freedom with which other Mufcovite nuns are indulged. The only liberty thefe enjoy is in holiday-time, when they are permitted to walk on the terraces of the garden, which over-

look

look the adjacent plain.

Peter the Great founded at Moſcow three colleges, and ſelected for them able profeſſors. In the firſt they taught humanity, rhetoric, and philoſophy; in the ſecond, mathematics; and in the third, navigation and aſtronomy. To theſe colleges he added a diſpenſatory, which is one of the nobleſt ſtructures in Moſcow, completely furniſhed with all ſorts of drugs and medicines, under the care of ſome Germans well ſkilled in the art of pharmacy and chemiſtry. The yearly revenue of this diſpenſatory amounts to 2000 rubles, allotted for freſh ſupplies of the *materia medica;* and from hence not only the army, but likewiſe all the chief cities of the empire, are furniſhed.

The courts of judicature, cuſtom-houſe, goals, and other public edifices, are built of ſtone, large, ſtrong, and maſſy. The city of Moſcow was founded in the year 1334, and in proceſs of time gradually enlarged itſelf to ſuch a degree, that it is ſaid to have contained 80,000 houſes: but in the ſequel it ſuffered greatly, both from the enemy and ſucceſſive conflagrations. Nevertheleſs, in the reign of Charles II. of England, while lord Carliſle was ambaſſador at that court, the city was 12 miles in compaſs, and the number of houſes computed at 40,000. Notwithſtanding the ſeverity and vigilance of the magiſtracy in Moſcow, the city ſwarms with ſturdy-beggars and vagabonds, who render it very unſafe to walk through the ſtreets in the dark. Some of theſe, being armed with ſhort truncheons, lurk in obſcure corners, from whence they throw their weapons at the heads of paſſengers with ſuch dexterity that they ſeldom fail to knock them down: then they rob and murder them, and make off with the booty. The body of the perſon thus murdered is expoſed in public for a certain time; and, if not owned, the magiſtrates order it to be thrown into a large deep pit, dug on purpoſe for the interment of all thoſe who loſe their lives in this manner: thither ſome prieſts repair on Whitſuntide-holidays, to ſay maſs for the ſouls of the deceaſed. The ancient ſplendour and opulence of Moſcow was greatly diminiſhed by the building of Peterſburg, and the removal of the court to that city. Nevertheleſs the place is ſtill populous; and there is plenty of all kinds of proviſion, extremely good, and ſurpriſingly cheap; except the article of fiſh, for which there is a very great demand, occaſioned by the four great lents and weekly faſts obſerved by the Ruſſians. The canal between Moſcow and Peterſburg is one of the moſt ſtupendous works of the czar Peter: it begins at the Nieva, and is continued from lake to lake, and river to river, for near 100 leagues, until it reaches Moſcow. What is properly deemed the artificial canal, commences at the city of Novogorod, and is carried on with incredible labour and expence through the territories of Brognitz, Chriſtitz, Chilolova, Witſchora, Voloſcha, Torſchock, the province of Twere, and the diſtrict of Kiln. The city of Moſcow ſtands about 650 miles from Caffa, the capital of Crim-Tartary; 950 miles from Conſtantinople; 720 from Cracow in Poland; 660 from Stockholm; and 1320 from London; in 55 degrees 42 minutes of north latitude.

MOSELLE, a river of Germany, which riſes in the mountains of Vauge in Lorrain, and, running thro' that duchy and the electorate of Triers, falls into the Rhine at Coblentz.

MOSES, the great prophet and lawgiver of the Jews, ſon of Amram, was born *anno mundi* 2433, and died without ſickneſs, *anno mundi* 2553, aged 120.— He wrote the Pentateuch, and the book of Job is attributed to him.

MOSKITO COUNTRY, is ſituated in North America, between 85 and 88 degrees of weſt longitude, and between 13 and 15 degrees of north latitude; having the north ſea on the north and eaſt; Nicaragua on the ſouth; and Honduras on the weſt; and indeed the Spaniards eſteem it a part of the principality of Honduras, though they have no colonies in the Moſkito country. When the Spaniards firſt invaded this part of Mexico, they maſſacred the greateſt part of the natives, which gave thoſe that eſcaped into the inacceſſible part of the country an unſuperable averſion to them; and they have always appeared ready to join any Europeans that come upon their coaſts againſt the Spaniards, and particularly the Engliſh, who frequently come hither; and the Moſkito-men being excellent markſmen, the Engliſh employ them in ſtriking the maratee fiſh, &c. and many of the Moſkito Indians come to Jamaica, and ſail with the Engliſh in their voyages.

Theſe people are ſo ſituated between moraſſes and inacceſſible mountains, and a coaſt full of rocks and ſhoals, that no attempts againſt them by the Spaniards, whom they mortally hate, could ever ſucceed. Nevertheleſs, they are a mild inoffenſive people, of great morality and virtue, and will never truſt a man who has once deceived them. They have ſo great a veneration towards the Engliſh, that they have ſpontaneouſly put themſelves and their lands under the protection and dominion of the crown of England. This was firſt done when the duke of Albemarle was governor of Jamaica, and the king of the Moſkitos received a commiſſion from his grace, under the ſeal of that iſland; ſince which time, they have not only been ſteady in their alliance with the Engliſh, but warm in their affections, and very uſeful to them on many occaſions.

When their king dies, the next male heir goes to Jamaica, to certify that he is next in blood, and receives a commiſſion in form from the governor of Jamaica to be king of the Moſkitos, till which he is not acknowledged as ſuch by his countrymen. So fond are theſe people of every thing that is Engliſh, that the common people are proud of every Chriſtian or ſurname given them by our ſeamen, who honour their chief men with the titles of ſome of our nobility.

MOSQUE, a temple or place of religious worſhip among the Mahometans.

All moſques are ſquare buildings, generally conſtructed of ſtone. Before the chief gate there is a ſquare court paved with white marble; and low galleries round it, whoſe roof is ſupported by marble pillars. In theſe galleries the Turks waſh themſelves before they go into the moſque. In each moſque there is a great number of lamps; and between theſe hang many cryſtal rings, oſtriches eggs, and other curioſities, which, when the lamps are lighted, make a fine ſhew. As it is not lawful to enter the moſque with ſtockings or ſhoes on, the pavements are covered with pieces of ſtuff ſewed together, each being wide enough

to

to hold a row of men kneeling, fitting, or proftrate. The women are not allowed to enter the mofque, but ftay in the porches without. About every mofque there are fix high towers, called *minarets*, each of which has three little open galleries, one above another: thefe towers, as well as the mofques, are covered with lead, and adorned with gilding and other ornaments; and from thence, inftead of a bell, the people are called to prayers by certain officers appointed for that purpofe. Moft of the mofques have a kind of hofpital belonging to them, in which travellers, of what religion foever, are entertained three days. Each mofque has alfo a place called *tarbe*, which is the burying-place of its founders; within which is a tomb fix or feven feet long, covered with green velvet or fattin; at the ends of which are two tapers, and round it feveral feats for thofe who read the koran, and pray for the fouls of the deceafed.

MOSS (Robert), dean of Ely, was bred in Bennet-college Cambridge, of which he was chofen a fellow. He acquired the reputation of one of the moft ingenious performers of any about his time, of all kinds of public exercifes, whether in claffical or academical learning. His fermons at St Mary's were much crowded. He publifhed fermons, and fome poems: and he is fuppofed to be the author of a pamphlet intitled, *A defence of my lords the bifhops, as well as the clergy of the lower houfe of Convocation; in a letter from a member of that houfe to the prolocutor, concerning the late confultations about the bifhop of Bangor's writings*. He died in 1729, aged 63.

MOSSES, in botany. See MUSCI.

Colours extracted from MOSSES. See COLOUR-*Making*, n° 38.

Moss is alfo a name given by fome to the boggy ground in many parts of England, more ufually called a *fen* and *bog*.

In many of thefe grounds, as well in England and Ireland as in other parts of the world, there are found vaft numbers of trees ftanding with their ftumps erect, and their roots piercing the ground in a natural pofture, as when growing. Many of thofe trees are broken or cut off near the roots, and lie along, and this ufually in a north-eaft direction. People who have been willing to account for this, have ufually refolved it into the effect of the deluge in the days of Noah; but this is a very wild conjecture, and is proved falfe by many unanfwerable arguments. The waters of this deluge might indeed have wafhed together a great number of trees, and buried them under loads of earth; but then they would have lain irregularly and at random; whereas they all lie lengthwife from fouth-weft to north-eaft, and the roots all ftand in their natural perpendicular pofture, as clofe as the roots of trees in a foreft.

Befide, thefe trees are not all in their natural ftate, but many of them have the evident marks of human workmanfhip upon them, fome being cut down with an ax, fome fplit, and the wedges ftill remaining in them; fome burnt in different parts, and fome bored through with holes. Thefe things are alfo proved to be of a later date than the deluge, by other matters found among them, fuch as utenfils of ancient people, and coins of the Roman emperors.

It appears from the whole, that all the trees which we find in this foffile ftate, originally grew in the very places where we now find them, and have only been thrown down and buried there, not brought from elfewhere. It may appear indeed an objection to this opinion, that moft of thefe foffil trees are of the fir kind; and that Cæfar fays exprefsly, that no firs grew in Britain in his time: but this is eafily anfwered by obferving, that thefe trees, though of the fir kind, yet are not the fpecies ufually called the *fir*, but pitch-tree; and Cæfar has no where faid that pitch-trees did not grow in England. Norway and Sweden yet abound with thefe trees; and there are at this time whole forefts of them in many parts of Scotland, and a large number of them wild upon a hill at Wareton in Staffordfhire to this day.

In Hatfield marfh, where fuch vaft numbers of the foffil trees are now found, there has evidently once been a whole foreft of them growing. The laft of thefe was found alive, and growing in that place within 70 years laft paft, and cut down for fome common ufe.

It is alfo objected by fome to the fyftem of the firs growing where they are found foffile, that thefe countries are all bogs and moors, whereas thefe forts of trees grow only in mountainous places. But this is founded on an error; for though in Norway and Sweden, and fome other cold countries, the fir-kinds all grow upon barren and dry rocky mountains, yet in warmer places they are found to thrive as well on wet plains. Such are found plentifully in Pomerania, Livonia, and Courland, &c. and in the weft parts of New England there are vaft numbers of fine ftately trees of them in low grounds. The whole truth feems to be, that thefe trees love a fandy foil; and fuch is found at the bottoms of all the moffes where thefe trees are found foffile. The roots of the fir-kind are always found fixed in thefe; and thofe of oaks, where they are found foffile in this manner, are ufually found fixed in clay: fo that each kind of tree is always found rooted in the places where they ftand in their proper foil; and there is no doubt to be made, but that they originally grew there. When we have thus found that all the foffile trees we meet with once grew in the places where they are now buried, it is plain that in thefe places there were once noble forefts, which have been deftroyed at fome time; and the queftion only remains how and by whom they were deftroyed. This we have reafon to believe, by the Roman coins found among them, was done by the people of that empire, and that at the time when they were eftablifhed, or eftablifhing, themfelves here.

Their own hiftorians tells us, that when their armies purfued the wild Britons, thefe people always fheltered themfelves in the miry woods, and low watery forefts. Cæfar exprefsly fays this; and obferves, that Caffibelan and his Britons, after their defeat, paffed the Thames, and fled into fuch low moraffes and woods, that there was no purfuing them: and we find that the Silures fecured themfelves in the fame manner when attacked by Oftorius and Agricola. The fame thing is recorded of Venutius king of the Brigantes, who fled to fecure himfelf into the boggy forefts of the midland part of this kingdom: and Herodian exprefsly fays, that in the time of the Romans pufhing their conquefts in thefe iflands, it was the cuftom

 ftom of the Britons to fecure themfelves in the thick forefts which grew in their boggy and wet places, and when opportunity offered, to iffue out thence and fall upon the Romans. The confequence of all this was the deftroying all thefe forefts; the Romans finding themfelves fo plagued with parties of the natives iffuing out upon them at times from thefe forefts, that they gave orders for the cutting down and deftroying all the forefts in Britain which grew on boggy and wet grounds. Thefe orders were punctually executed; and to this it is owing that at this day we can hardly be brought to believe that fuch forefts ever grew with us as are now found buried.

The Roman hiftories all join in telling us, that when Suetonius Paulinus conquered Anglefea, he ordered all the woods to be cut down there, in the manner of the Roman generals in England: and Galen tells us, that the Romans, after their conqueft in Britain, kept their foldiers conftantly employed in cutting down forefts, draining of marfhes, and paving of bogs. Not only the Roman foldiers were employed in this manner, but all the native Britons made captives in the wars were obliged to affift in it: and Dion Caffius tells us, that the emperor Severus loft no lefs than 50,000 men in a few years time, in cutting down the woods and draining the bogs of this ifland. It is not to be wondered at, that fuch numbers executed the immenfe deftruction which we find in thefe buried forefts. One of the greateft fubterranean treafures of wood is that near Hatfield; and it is eafy to prove, that thefe people, to whom this havock is thus attributed, were upon the fpot where thefe trees now lie buried. The common road of the Romans out of the fouth into the north, was formerly from Lindum (Lincoln) to Segelochum (Little Burrow upon Trent), and from thence to Danum (Doncafter), where they kept a ftanding garrifon of Crifpinian horfe. A little off on the eaft, and north-eaft of their road, between the two laft-named towns, lay the borders of the greateft foreft, which fwarmed with wild Britons, who were continually making their fallies out, and their retreats into it again, intercepting their provifions, taking and deftroying their carriages, killing their allies and paffengers, and difturbing their garrifons. This at length fo exafperated the Romans, that they were determined to deftroy it; and to do this fafely and effectually, they marched againft it with a great army, and encamped on a great moor not far from Finningly: this is evident from their fortifications yet remaining.

There is a fmall town in the neighbourhood called *Ofterfield;* and as the termination *field* feems to have been given only in remembrance of battles fought near the towns whofe names ended with it, it is not improbable that a battle was fought here, between all the Britons who inhabited this foreft, and the Roman troops under Oftorius. The Romans flew many of the Britons, and drove the reft back into this foreft, which at that time overfpread all this low country. On this the conquerors taking advantage of a ftrong fouth-weft wind, fet fire to the pitch-trees, of which this foreft was principally compofed; and when the greater part of the trees were thus deftroyed, the Roman foldiers and captive Britons cut down the remainder, except a few large ones which they left ftanding as remembrances of the deftruction of the reft. Thefe fingle trees, however, could not ftand long againft the winds, and thefe falling into the rivers which ran through the country, interrupted their currents; and the water then overfpreading the level country made one great lake, and gave origin to the moffes or moory bogs, which were afterwards formed there, by the workings of the waters, the precipitation of earthy matter from them, and the putrefaction of rotten boughs and branches of trees, and the vaft increafe of water-mofs and other fuch plants which grow in prodigious abundance in all thefe forts of places. Thus were thefe burnt and felled trees buried under a new-formed fpungy and watery earth, and afterwards found on the draining and digging thro' this earth again.

Hence, it is not ftrange that Roman weapons and Roman coins are found among thefe buried trees; and hence it is that among the buried trees fome are found burnt, fome chopped and hewn; and hence it is that the bodies of the trees all lie by their proper roots, and with their tops lying north-eaft, that is, in that direction in which a fouth-weft wind would have blown them down: hence alfo it is, that fome of the trees are found with their roots lying flat, thefe being not cut or burned down, but blown up by the roots afterwards when left fingle; and it is not wonderful, that fuch trees as thefe fhould have continued to grow even after their fall, and fhoot up branches from their fides which might eafily grow into high trees. Phil. Tranf. n° 275.

By this fyftem it is alfo eafily explained why the moor foil in the country is in fome places two or three yards thicker than in others, or higher than it was formerly, fince the growing up of peat-earth or bog-ground is well known, and the foil added by overflowing of waters is not a little.

As the Romans were the deftroyers of this great and noble foreft, fo they were probably alfo of the feveral other ancient forefts; the ruins of which furnifhes us with the bog-wood of Staffordfhire, Lancafhire, Yorkfhire, and other counties. But as the Romans were not much in Wales, in the Ifle of Man, or in Ireland, it is not to be fuppofed that forefts cut down by thefe people gave origin to the foffile wood found there: but though they did not cut down thefe forefts, others did; and the origin of the bog-wood is the fame with them and with us. Holingfhead informs us, that Edward I. being not able to get at the Welch becaufe of their hiding themfelves in boggy woods, gave orders at length that they fhould all be deftroyed by fire and by the ax; and doubtlefs the roots and bodies of trees found in Pembrokefhire under ground, are the remains of the execution of this order. The foffile wood in the bogs of the ifland of Man is doubtlefs of the fame origin, though we have not any accounts extant of the time or occafion of the forefts there being deftroyed; but as to the foffile trees of the bogs of Ireland, we are exprefsly told, that Henry II. when he conquered that country, ordered all the woods to be cut down that grew in the low parts of it, to fecure his conquefts, by cutting away the places of refort of rebels.

Moving-Moss. We have an account in the Philofophical Tranfactions, of a moving mofs near Church-

town in Lancafhire, which greatly alarmed the neighbourhood as miraculous. The mofs was obferved to rife to a furprifing height, and foon after funk as much below the level, and moved flowly towards the fouth.

A very furprifing inftance of a moving mofs is that of Solway in Scotland, which happened in the year 1771, after fevere rains which had produced terrible inundations of the rivers in many places. For the better underftanding of this event, we fhall give the following defcription of the fpot of ground where it happened. Along the fide of the river Efk there is a vale, about a mile broad, lefs or more in different places. It is bounded on the fouth-eaft by the river Efk, and on the north-weft by a fteep bank 30 feet in height above the level of the vale. From the top of the bank the ground rifes in an eafy afcent for about a quarter of a mile, where it is terminated by the mofs; which extends about two miles north and fouth, and about a mile and an half eaft and weft, and is bounded on the north-weft by the river Sark. It is probable that the folid ground from the top of the bank above the vale was continued in the fame direction under the mofs, before its eruption, for a confiderable fpace; for the mofs at the place where the eruption happened, was inclined towards the floping ground. From the edge of the mofs there was a gully or hollow, called by the country people *the gap*, and faid to be 30 yards deep where it entered the vale; down which ran a fmall rill of water, which was often dry in fummer, having no fupply but what filtered from the mofs. The eruption happened at the head of this gap, on Saturday November 16th 1771, about ten or eleven at night, when all the neighbouring rivers and brooks were prodigioufly fwelled by the rains. A large body of the mofs was forced, partly by the great fall of rain, and partly by fome fprings below it, into a fmall beck or burn, which runs within a few yards of its border to the fouth-eaft. By the united preffure of the water behind it, and of this beck, which was then very high, it was carried down a narrow glen between two banks about 300 feet high, into a wide and fpacious plain, over part of which it fpread with great rapidity. The mofs continued for fome time to fend off confiderable quantities; which, being borne along by the torrent on the back of the firft great body, kept it for many hours in perpetual motion, and drove it ftill farther on. This night at leaft 400 acres of fine arable land were covered with mofs from 3 to 12 or 15 feet deep. Several houfes were deftroyed, a good deal of corn loft, &c. but all the inhabitants efcaped. When the waters fubfided, the mofs alfo ceafed to flow; but two pretty confiderable ftreams continued to run from the heart of it, and carried off fome pieces of moffy matter to the place where it burft. There they joined the beck already mentioned; which, with this addition, refumed its former channel; and, with a little affiftance from the people of the neighbourhood, made its way to the Efk, through the midft of that great body of mofs which obftructed its courfe. Thus, in a great meafure drained, the new mofs fell feveral feet, when the fair weather came in the end of November, and fettled in a firmer and more folid body on the lands it had over-run. By this inundation about 800 acres of arable ground were overflowed before the mofs ftopped, and the habitations of 27 families deftroyed. Tradition has preferved the memory of a fimilar inundation in Monteith in Scotland. A mofs there altered its fituation in one night, and covered a great extent of ground.

Moss-*Troopers*, a rebellious fort of people in the north of England, that lived by robbery and rapine, not unlike the tories in Ireland, the bucaneers in Jamaica, or banditti of Italy. The counties of Northumberland and Cumberland were charged with an yearly fum, and a command of men, to be appointed by juftices of the peace, to apprehend and fupprefs them.

MOSTRA, in the Italian mufic, a mark at the end of a line or fpace, to fhew that the firft note of the next line is in that place: and if this note be accompanied with a fharp or flat, it is proper to place thefe characters along with the moftra.

MOTACILLA, in ornithology, a genus of birds of the order of pafferes; diftinguifhed by a ftraight beak of a fubulated figure, and a lacerated tongue. There are 49 fpecies belonging to this genus; the moft remarkable are,

1. The alba, or white wagtail, frequents the fides of ponds and fmall ftreams, and feeds on infects and worms. The head, back, and upper and lower fide of the neck, as far as the breaft, are black; in fome the chin is white, and the throat marked with a black crefcent: the breaft and belly are white; the quill-feathers are dufky; the coverts black, tipt and edged with white. The tail is very long, and always in motion. Mr Willoughby obferves, that this fpecies fhifts its quarters in the winter; moving from the north to the fouth of England during that feafon. In fpring and autumn it is a conftant attendant on the plough, for the fake of the worms thrown up by that inftrument.

2. The flava, or yellow wagtail, migrates in the north of England, but in Hampfhire continues the whole year. The male is a bird of great beauty: the breaft, belly, thighs, and vent-feathers, being of a moft vivid and lovely yellow: the throat is marked with fome large black fpots; above the eye is a bright yellow line: beneath that, from the bill, crofs the eye, is another of a dufky hue; and beneath the eye is a third of the fame colour: the head and upper part of the body is of an olive-green, which brightens in the coverts of the tail; the quill-feathers are dufky; the coverts of the wings olive-coloured; but the lower rows dufky, tipt with yellowifh white; the two outmoft feathers of the tail half white; the others black, as in the former. The colours of the female are far more obfcure than thofe of the male: it wants alfo thofe black fpots on the throat. It makes its neft on the ground, in corn-fields: the outfide is compofed of decayed ftems of plants, and fmall fibrous roots; the infide is lined with hair: it lays five eggs.

3. The regulus, or gold-coloured wren, is a native of Europe, and of the correfponding latitudes of Afia and America. It is the leaft of all the European birds, weighing only a fingle drachm. Its length is about four inches and an half; and the wings, when fpread out, meafure little more than fix inches. On the top of its head is a beautiful orange-coloured fpot called its *creft*, which it can hide at pleafure; the margins

Mote || Motte. margins of the crest are yellow, and it ends in a pretty broad black line; the sides of the neck are of a beautiful yellowish green; the eyes surrounded with a white circle; the neck and back of a dark green mixed with yellow; the breast of a dirty white; the tail composed of 12 feathers of a brown colour, an inch and an half long, but not forked. In America it associates with the titmice, running up and down the bark of lofty oaks with them, and collecting its food in their company, as if they were all of one brood. It feeds on insects lodged in their winter dormitories in a torpid state.

4. The sialis, or blue-bird, is a native of most parts of North America; and is about the bigness of a sparrow. The eyes are large; the head and upper part of the body, tail, and wings, are of a bright blue, excepting that the ends of the feathers are brown. The throat and breast are of a dirty red. The belly is white. It flies swiftly, having very long wings; so that the hawk generally pursues it in vain. It makes its nest in holes and trees; resembles our robin-red breast in its disposition, and feeds only on insects.

Plate CLXXXII. fig. 1. 5. The sutoria, or taylor-bird, is a native of the East-Indies. It is remarkable for the art with which it makes its nest, seemingly in order to secure itself and its young in the most perfect manner possible against all danger from voracious animals. It picks up a dead leaf, and sews it to the side of a living one: its slender bill is the needle, and its thread is formed of some fine fibres; the lining is composed of feathers, gossamer, and down: its eggs are white, the colour of the bird light-yellow; its length three inches; and its weight only three sixteenths of an ounce, so that the materials of the nest and its own size are not likely to draw down a habitation depending on so slight a tenure.

MOTE, in law-books, signifies court or convention; as a ward-mote, burgh-mote, swain-mote, &c.

Mote-*Bell*, or *Mot-Bell*, the bell so called, which was used by the English Saxons to call people together to the court. See Folkmote.

MOTH, in zoology. See Phalæna and Papilio.

MOTHE le Vayer (Francis de la). See Vayer.

MOTHER, a term of relation, denoting a woman who hath born a child.

Mother *of Pearl*. See Pearl.

MOTTE (Anthony Houdart de la), an ingenious Frenchman, greatly distinguished by his writings in prose and verse, and by his literary contests with many eminent persons, was born at Paris in 1672. He wrote with very different success, no man having been more praised or more criticised than he was: his literary paradoxes, his singular systems, in all branches of polite learning, and above all, his judgment upon the ancients, which, like those of Perrault, were thought disrespectful and detracting, raised him up formidable adversaries. Racine, Boileau, Rousseau, and Madam Dacier, were among the number of those who made it their business to avenge antiquity on a man who, with more wit than genius or learning, assumed a kind of dictatorial authority in the province of belles lettres. He became blind in the latter years of his life, and died in 1731: a complete edition of all his works was published in 11 vols, 8vo. in 1754; though, as has been said of our Swift, his reputation had been better consulted by reducing them to three or four.

Motion. MOTION, is defined to be the continued and successive change of place.

There are three general laws of motion.

1. That a body always perseveres in its state of rest, or of uniform motion in a right line, till by some external force it be made to change its state: for as body is passive in receiving its motion, and the direction of its motion; so it retains them, or perseveres in them without any change, till it be acted on by something external. From this law it appears why we inquire not, in philosophy, concerning the cause of the continuation of the motion or rest in bodies, which can be no other than their *inertia;* but if a motion begin, or if a motion already produced is either accelerated or retarded, or if the direction of the motion is altered, an inquiry into the power or cause that produces this change is a proper subject of philosophy. 2. The second general law of motion is, The change of motion is proportional to the force impressed, and is produced in the right line in which that force acts. When a fluid acts upon a body, as water or air upon the vanes of a mill, or wind upon the sails of a ship, the acceleration of the motion is not proportional to the whole force of those fluids, but to that part only which is impressed upon the vanes or sails, which depends upon the excess of the velocity of the fluid above the velocity which the vane or sail has already acquired; for if the velocity of the fluid be only equal to that of the vane or sail, it just keeps up with it, but has no effect either to advance or retard its motion. Regard must always be had to the direction in which the force is impressed, in order to determine the change of motion produced by it: thus, when the wind acts obliquely with respect to the direction of a ship, the change of her motion is first to be estimated in the direction of the force impressed; and thence, by a proper application of mechanical and geometrical principles, the change of the motion of the ship in her own direction is to be deduced. 3. The third general law of motion is, That action and re-action are equal, with opposite directions, and are to be estimated always in the same right line. Body not only never changes its state of itself, but resists by its *inertia* every action that produces a change in its motion: hence when two bodies meet, each endeavours to persevere in its state, and resists any change; the one acquires no new motion, but what the other loses in the same direction; nor does this last lose any force, but what the other acquires: and hence, though, by their collision, motion passes from the one to the other; yet the sum of their motions, estimated in a given direction, is preserved the same, and is unalterable by their mutual actions upon each other.

All motion may be considered absolutely or relatively. Absolute or real motion, says Mr Maclaurin, is when a body changes its place in absolute space; and relative motion, is when a body changes its place only with relation to other bodies.

From the observation of nature, every one knows that there is motion; that a body in motion perseveres in that state, till by the action of some power it is necessitated to change it; that it is not in relative or apparent motion in which it perseveres in consequence of its *inertia*, but in real or absolute motion. Thus the apparent diurnal motion of the sun and stars would

ceafe, without the leaft power or force acting upon them, if the motion of the earth was ftopt; and if the apparent motion of any ftar was deftroyed by a contrary motion impreffed upon it, the other celeftial bodies would ftill appear to perfevere in their courfe.

To make this matter ftill plainer, Mr Martin obferves, that fpace is nothing but an abfolute and infinite void, and that the place of a body is that part of the immenfe void which it takes up or poffeffes; and this place may be confidered abfolutely, or in itfelf, in which cafe it is called the *abfolute place of the body;* or elfe with regard to the place of fome other body, and then it is called the *relative* or *apparent place of the body.*

Now, as a motion is only the change of place in bodies, it is evident that it will come under the fame diftinction of abfolute and relative, or apparent. All motion is in itfelf abfolute, or the change of abfolute fpace; but when the motions of bodies are confidered and compared with each other, then are they relative and apparent only: they are relative, as they are compared to each other; and they are apparent only, infomuch that not their true or abfolute motion, but the fum or difference of the motions only is perceivable to us.

In comparing the motions of bodies, we may confider them as moving both the fame way, or towards contrary parts: in the firft cafe, the difference of motion is only perceived by us; in the latter, the fum of the motions. Thus, for example; fuppofe two fhips, A and B, fet fail from the fame port upon the fame rhumb, and that A fails at the rate of five miles *per* hour, and B at the rate of three; here the difference of the velocity (viz. two miles *per* hour) is that by which the fhip A will appear to go from the fhip B forwards, or the fhip B will appear at A to go with the fame velocity backwards, to a fpectator in either refpectively.

If the two fhips, A and B, move with the fame degree of velocity, then will the difference be nothing, and fo neither fhip will appear to the other to move at all. Hence it is, that though the earth is continually revolving about its axis; yet as all objects on its furface partake of the fame common motion, they appear not to move at all, but are relatively at reft.

If two fhips, A and B, with the degrees of velocity as above, meet each other, the one will appear to the other to move with the fum of both velocities, *viz.* at the rate of eight miles per hour; fo that in this cafe the apparent motion exceeds the true, as in the other it fell fhort of it. Hence the reafon why a perfon, riding againft the wind, finds the force of it much greater than it really is; whereas if he rides with it, he finds it lefs.

The reafon of all thefe phenomena of motion will be evident, if we confider that we muft be abfolutely at reft, if we would difcern the true or real motion of bodies about us. Thus a perfon on the ftrand will obferve the fhips failing with their real velocity. A perfon ftanding ftill will experience the true ftrength and velocity of the wind; and a perfon placed in the regions between the planets will view all their true motions, which he cannot otherwife do, becaufe in all other cafes the fpectator's own motion muft be added to or fubtracted from that of the moving body.

Motion is either *equable* or *accelerated.*

Equable motion is that by which a body paffes over equal fpaces in equal times.

Accelerated motion is that which is continually augmented or increafed, as retarded motion is that which continually decreafes; and if the increafe or decreafe of motion be equal in equal times, the motion is then faid to be equally accelerated or retarded.

Equable motion is generated by a fingle impetus or ftroke: thus the motion of a ball from a cannon is produced by the fingle action of the powder in the firft moment; and therefore the velocity it firft fets out with would always continue the fame, were it void of gravity, and to move in an unrefifting medium; which therefore would be always equable, or fuch as would carry it through the fame length of fpace in every equal part of time.

Hence we may determine the theorems for the expreffions of the time (T) the velocity (V) and the fpace (S) paffed over in equable or uniform motion very eafily thus:

If the time be given, or the fame, the fpace paffed over will be as the velocity, viz. S : V; that is, with twice the velocity, twice the fpace; with three times the velocity, three times the fpace, will be paffed over in the fame time; and fo on.

If the velocity be given, or remain the fame, then the fpace paffed over will be as the time, viz. S : T; that is, it will be greater or lefs, as the time is fo.

But if neither the time nor velocity be given or known, then will the fpace be in the compound ratio of both, viz. S : TV. Hence, in general, fince S : TV, we have $V : \frac{S}{T}$; that is, the velocity is always directly as the fpace, and inverfely as the time. And alfo $T : \frac{S}{V}$; that is, the time is as the fpace directly, and as the velocity inverfely; or, in other words, it increafes with the fpace, and decreafes with the velocity.

If, therefore, in any rectangle, one fide reprefent the time, and the other fide the velocity, it is evident that the area of the faid rectangle will reprefent the fpace paffed over by an uniform motion in that time, and with that velocity.

Accelerated motion is produced by a conftant impulfe or power, which keeps continually acting upon the body, as that of gravity which produces the motion of falling bodies; which fort of motion is conftantly accelerated, becaufe gravity every moment adds a new impulfe, which generates a new degree of velocity; and the velocity thus increafing, the motion muft be quickened each moment, or the body muft fall fafter and fafter the lower it falls.

In like manner a body thrown perpendicularly upward, as a ball from a cannon, will have its motion continually retarded, becaufe gravity acts conftantly upon it in a direction contrary to that given it by the powder; fo that its velocity upwards muft be continually diminifhed, and fo its motion as continually retarded, till at laft it be all deftroyed. The body has then attained its utmoft height, and is for a moment motionlefs; after which it begins to defcend with a velocity in the fame manner accelerated, till it comes to the earth's furface.

Since the momentum (M) of a body is compounded of the quantity of matter (Q), and the velocity (V), we have this general expreffion M=QV, for the force

force of any body A; and ſuppoſe the force of another body B be repreſented by the ſame letters in Italics, viz. $M=\mathcal{Q}V$.

Let the two bodies A and B in motion impinge on each other directly; if they tend both the ſame way, the ſum of their motions towards the ſame part will be $\mathrm{QV}+\mathcal{Q}V$. But if they tend towards contrary parts, or meet, then the ſum of their motions towards the ſame part will be $\mathrm{QV}-\mathcal{Q}V$; for ſince the motion of one of the bodies is contrary to what it was before, it muſt be connected by a contrary ſign. Or thus; becauſe, when the motion of B conſpires with that of A, it is added to it; ſo, when it is contrary, it is ſubducted from it, and the ſum or difference of the abſolute motions is the whole relative motion, or that which is made towards the ſame part. Again, this total motion towards the ſame parts, is the ſame both before and after the ſtroke, in caſe the two bodies A and B impinge on each other; becauſe, whatever change of motion is made in one of thoſe bodies by the ſtroke, the ſame is produced in the other body towards the ſame part; that is, as much as the motion of B is increaſed or decreaſed towards the ſame part by the action of A, juſt ſo much is the motion of A diminiſhed or augmented towards the ſame part by the equal re-action of B, by the third law of motion.

In bodies not elaſtic, let x be the velocity of the bodies after the ſtroke (for, ſince we ſuppoſe them not elaſtic, there can be nothing to ſeparate them after colliſion; they muſt therefore both go on together, or with the ſame celerity). Then the ſum of the motions after colliſion will be $\mathrm{Q}x+\mathcal{Q}x$; whence, if the bodies tend the ſame way, we have $\mathrm{QV}+\mathcal{Q}V=\mathrm{Q}x+\mathcal{Q}x$, or if they meet, $\mathrm{QV}-\mathcal{Q}V=\mathrm{Q}x+\mathcal{Q}x$; and accordingly $\frac{\mathrm{QV}+\mathcal{Q}V}{\mathrm{Q}+\mathcal{Q}}=x$, or $\frac{\mathrm{QV}-\mathcal{Q}V}{\mathrm{Q}+\mathcal{Q}}=x$.

If the body (B) be at reſt, then $V=o$, and the velocities of the bodies after the ſtroke will be $\frac{\mathrm{QV}}{\mathrm{Q}+\mathcal{Q}}=x$.

Thus if the bodies be equal (*viz.* $\mathrm{Q}=\mathcal{Q}$) and A with 10 degrees of velocity impinge on B at reſt; then $\frac{\mathrm{QV}}{\mathrm{Q}+\mathcal{Q}}=\frac{10}{2}=5=x$. If $\mathrm{Q}=\mathcal{Q}$, and $\mathrm{V}:V::10:6$ we have $\frac{\mathrm{QV}+\mathcal{Q}V}{\mathrm{Q}+\mathcal{Q}}=\frac{16}{2}=8=x$, the velocity after the ſtroke.

If the bodies are both in motion, and tend the contrary way; then when $\mathrm{Q}=\mathcal{Q}$ and $\mathrm{V}=V$, it is plain $\frac{\mathrm{QV}-\mathcal{Q}V}{\mathrm{Q}+\mathcal{Q}}=o=x$; that is, the bodies which meet with equal bulks and velocities will deſtroy each other's motion after the ſtroke, and remain at reſt. If $\mathrm{Q}=\mathcal{Q}$ but $\mathrm{V}:V::6:14$, then $\frac{\mathrm{QV}-\mathcal{Q}V}{\mathrm{Q}+\mathcal{Q}}=\frac{-8}{2}=-4=x$; which ſhews that equal bodies meeting with unequal velocities, they will, after meeting the ſtroke, both go on the ſame way which the moſt prevalent body moved before.

If the velocity $\frac{\mathrm{QV}\pm\mathcal{Q}V}{\mathrm{Q}+\mathcal{Q}}$ be multiplied by the quantities of matter Q and $\mathcal{Q}$, we ſhall have $\frac{\mathrm{Q}^2\mathrm{V}\pm\mathrm{Q}\mathcal{Q}V}{\mathrm{Q}+\mathcal{Q}}=$ the momentum of A after the ſtroke; and $\frac{\mathrm{QV}\mathcal{Q}\pm\mathcal{Q}^2V}{\mathrm{Q}+\mathcal{Q}}=$ the momentum B; therefore $\mathrm{QV}-\frac{\mathrm{Q}^2\mathrm{V}\pm\mathrm{Q}\mathcal{Q}V}{\mathrm{Q}+\mathcal{Q}}=\frac{\mathrm{Q}\mathcal{Q}\mathrm{V}\pm\mathcal{Q}\mathrm{Q}V}{\mathrm{Q}+\mathcal{Q}}=\frac{\mathrm{Q}\mathcal{Q}}{\mathrm{Q}+\mathcal{Q}}\times\overline{\mathrm{V}\pm V}=$ the quantity of the motion loſt in A after the ſtroke, and conſequently is equal to what is gained in B, as may be ſhewn in the ſame manner.

But ſince a part of this expreſſion (*viz.* $\frac{\mathrm{Q}\mathcal{Q}}{\mathrm{Q}+\mathcal{Q}}$) is conſtant, the loſs of motion will ever be proportional to the other part $\mathrm{V}\pm W$. But this loſs or change of motion iu either body is the whole effect, and ſo meaſures the magnitude or energy of the ſtroke. Whereſore any two bodies, not elaſtic, ſtrike each other with a ſtroke always proportionable to the ſum of their velocities $(\mathrm{V}+V)$ if they meet, or to the difference of their velocities $(\mathrm{V}-V)$ if they tend the ſame way.

Hence, if one body (B) be at reſt before the ſtroke, then $V=o$; and the magnitude of the ſtroke will be as V; that is, as the velocity of the moving body A; and not as the ſquare of its velocity, as many philoſophers (viz. the Dutch and Italians) maintain.

In bodies perfectly elaſtic, the reſtituent power or ſpring by which the parts diſplaced by the ſtroke reſtore themſelves to their firſt ſituation, is equal to the force impreſſed, becauſe it produces an equal effect; therefore, in this ſort of bodies, there is a power of action twice as great as in the former non-elaſtic bodies; for theſe bodies not only ſtrike each other by impulſe, but likewiſe by repulſe, they always repelling each other after the ſtroke. But we have ſhewn, that the force with which non-elaſtic bodies ſtrike each other is as $\mathrm{V}\pm V$; therefore the reaction of elaſtic bodies is the ſame; that is, the velocity with which elaſtic bodies recede from each other after the ſtroke, is equal to the velocity with which they approached each other before the ſtroke. Whence if x and y be the velocities of two bodies A and B, tending the ſame way after the ſtroke, ſince $\mathrm{V}-V=y-x$, we have $x+\overline{\mathrm{V}-V}=y$; whence the motion of A after the ſtroke will be $\mathrm{Q}x$, and that of B will be $\mathcal{Q}x+\mathcal{Q}\mathrm{V}-\mathcal{Q}V$; and the ſum of theſe motions will be equal to the ſum of the motions before the ſtroke, viz. $\mathrm{Q}x+\mathrm{Q}x+\mathcal{Q}\mathrm{V}-\mathcal{Q}V=\mathrm{QV}+\mathcal{Q}V$. Whence, by reducing the equation, it will be $\mathrm{Q}x+\mathcal{Q}x=\mathrm{QV}-\mathcal{Q}\mathrm{V}+2\mathcal{Q}V$; and $x=\frac{\mathrm{QV}-\mathcal{Q}\mathrm{V}+2\mathcal{Q}V}{\mathrm{Q}+\mathcal{Q}}=$ the velocity of the body A.

Again, the velocity of B is $x+\mathrm{V}-V=\frac{\mathrm{QV}-\mathcal{Q}\mathrm{V}+2\mathcal{Q}\mathrm{V}}{\mathrm{Q}+\mathcal{Q}}+\mathrm{V}-\mathrm{V}=\frac{2\mathrm{QV}-\mathrm{Q}V+\mathcal{Q}V}{\mathrm{Q}+\mathcal{Q}}$. Here we ſuppoſe the bodies tend the ſame way before the ſtroke; and it is evident from the equation above, that ſo long as $\mathrm{QV}+2\mathcal{Q}V$ is greater than $\mathcal{Q}\mathrm{V}$, the velocity (x) of A after the ſtroke will be affirmative, or the body A will move the ſame way after the ſtroke as before; but when $\mathcal{Q}V$ is greater than $\mathrm{QV}+2V\mathcal{Q}$, the velocity (x) will be negative, or the body A will be reflected back.

If the body B be at reſt, then $V=o$; and $x=\frac{\mathrm{QV}-\mathcal{Q}\mathrm{V}}{\mathrm{Q}+\mathcal{Q}}$, which ſhews the body A will go forwards or backwards, as QV is greater or leſſer than $\mathcal{Q}\mathrm{V}$, or A greater or leſſer than B.

If

Motion.

If $Q=3$, $\mathcal{Q}=$, $\mathrm{V}=10$, and $V=o$; then after the ſtroke the velocity of A will be $x=\frac{Q\mathrm{V}-\mathcal{Q}\mathrm{V}}{Q+\mathcal{Q}}=\frac{30-20}{5}=\frac{10}{5}=2$, and the velocity of B will be $y=\frac{2Q\mathrm{V}}{Q+\mathcal{Q}}=\frac{60}{5}=12$. If the bodies are both in motion, and $V=5$, the reſt is the ſame as before; then $\frac{Q\mathrm{V}-\mathcal{Q}\mathrm{V}+2\mathcal{Q}V}{Q+\mathcal{Q}}=6=$ velocity of A after the ſtroke, and $\frac{2Q\mathrm{V}-QV+\mathcal{Q}V}{Q+\mathcal{Q}}=11=$ velocity of B after the ſtroke.

If the bodies A and B move towards contrary parts, or meet each other, then will the relative velocity, to which the force of the ſtroke is proportional, be $V+V$; and ſo the velocities of A and B after the ſtroke will be x and $x+\mathrm{V}+V$; and ſo the motion of A will be Qx and $\mathcal{Q}x+\mathcal{Q}\mathrm{V}+\mathcal{Q}V$; the ſum of theſe motions in $Qx+\mathcal{Q}x+\mathcal{Q}\mathrm{V}+\mathcal{Q}V=Q\mathrm{V}-\mathcal{Q}V=$ the motion towards the ſame part before the ſtroke. Whence we have $x=\frac{Q\mathrm{V}-\mathcal{Q}\mathrm{V}-2\mathcal{Q}V}{Q+\mathcal{Q}}$, and therefore the velocity of B will be $\frac{Q\mathrm{V}-\mathcal{Q}\mathrm{V}-2\mathcal{Q}V}{Q+\mathcal{Q}}+\mathrm{V}+V=\frac{2Q\mathrm{V}+QV-\mathcal{Q}V}{Q+\mathcal{Q}}$.

If $Q\mathrm{V}+2\mathcal{Q}V$ be greater than $Q\mathrm{V}$, the motion of the body A will be backwards; otherwiſe it will go on forwards as before.

If $Q=3$, $\mathcal{Q}=2$, $\mathrm{V}=10$, and $V=5$; then will the velocity of A be $\frac{Q\mathrm{V}-\mathcal{Q}\mathrm{V}-2\mathcal{Q}V}{Q+\mathcal{Q}}=\frac{-10}{5}=-2$; and ſo the body A will go back with two degrees of velocity. The velocity of B, after the ſtroke, will be $\frac{2Q\mathrm{V}+QV-\mathcal{Q}V}{Q+\mathcal{Q}}=13$.

If the bodies are equal, that is, if $Q=\mathcal{Q}$, then $x=\frac{-2\mathcal{Q}V}{2N}=-V$; which ſhews, that when equal bodies meet each other, they are reflected back with interchanged velocities; for in that caſe alſo the velocity of B becomes $\frac{2Q\mathrm{V}}{2Q}=\mathrm{V}$.

If the bodies are equal, and one of them at reſt, as B, then ſince $Q=\mathcal{Q}$, and $V=o$, we have the velocity of A after the ſtroke $x=o$; or the body A will abide at reſt, and the velocity of B will be $=\mathrm{V}$, the velocity of A before the impulſe, as appears by the example in the figure referred to.

If ſeveral bodies B, C, D, E, F, are contiguous in a right line, and another equal body A ſtrike B with any given velocity, it ſhall loſe all its motion, or be quieſcent after the ſtroke; the body B which receives it will communicate it to C, and C to D, and D to E, and E to F; and becauſe action and re-action between the bodies B, C, D, E, are equal, as they were quieſcent before, they muſt continue ſo; but the body F, having no other body to re-act upon it, has nothing to obſtruct its motion; it will therefore move on with the ſame velocity which A had at firſt, becauſe it has all the motion of A, and the ſame quantity of matter by hypotheſis.

Let there be three bodies A, B, C, and let A ſtrike B at reſt; the velocity generated in B by the ſtroke will be $y=\frac{2Q\mathrm{V}}{Q+\mathcal{Q}}$, and ſo the momentum of B will be $\frac{2Q\mathrm{V}\mathcal{Q}}{Q+\mathcal{Q}}=\mathcal{Q}y$. With this momentum B will ſtrike C at reſt and contiguous to it; the velocity generated in C will be $\frac{2\mathcal{Q}y}{\mathcal{Q}+C}$; and its momentum will be $\frac{2\mathcal{Q}yC}{\mathcal{Q}+C}=\frac{2QC}{\mathcal{Q}+C}\times\frac{2Q\mathrm{V}}{Q+\mathcal{Q}}=\frac{4Q\mathrm{V}\mathcal{Q}C}{Q\mathcal{Q}+QC+\mathcal{Q}^2+\mathcal{Q}C}$.

Motion ‖ Motteux.

If now we ſuppoſe B a variable quantity, while A and C remain the ſame, we ſhall find what proportion it muſt have to each of them, in order that the momentum of C may be a maximum, or the greateſt poſſible, by putting the fluxion thereof equal to nothing; that is, $\frac{4Q^2C^2\mathrm{V}\dot{\mathcal{Q}}-4QC\mathcal{Q}^2\dot{\mathcal{Q}}}{(QC+Q\mathcal{Q}+\mathcal{Q}C+\mathcal{Q}^2)^2}=o$; whence we get $QC-\mathcal{Q}\mathcal{Q}=o$, and ſo $QC=\mathcal{Q}\mathcal{Q}$; conſequently $Q:\mathcal{Q}::\mathcal{Q}:C$, or A : B :: B : C; that is, the body B is a geometrical mean between A and C. Hence if there be any number (n) of bodies in a geometrical ratio (r) to each other, and the firſt be A, the ſecond will be rA, the third r^2A, and ſo on to the laſt, which will be r^{n-1}A.

Alſo, the velocity of the firſt being V, that of the ſecond will be $\frac{2\mathrm{V}}{1+r}$ (for $\frac{2Q\mathrm{V}}{Q+\mathcal{Q}}$ is here $=\frac{2A\mathrm{V}}{A+rA}=\frac{2\mathrm{V}}{1+r}$) that of the third $\frac{4\mathrm{V}}{\overline{1+r}^2}$, that of the fourth $\frac{8\mathrm{V}}{\overline{1+r}^3}$, and ſo on to the laſt, which will be $\left(\frac{2}{1+r}\right)^{n-1}\mathrm{V}$.

The momentum of the firſt will be AV, that of the ſecond $\frac{2r\mathrm{AV}}{1+r}$, that of the third $\frac{4r^2\mathrm{AV}}{\overline{1+r}^2}$, that of the fourth $\frac{8r^3\mathrm{AV}}{\overline{1+r}^3}$, and ſo on to the laſt, which will be $\left(\frac{2r}{1+r}\right)^{n-1}\mathrm{AV}$.

To give an example of this theorem; if $n=100$, and $r=2$, then will the firſt body A be to the laſt r^{n-1}A, as 1 to 633825300000000000000000000000, nearly; and its velocity to that of the laſt nearly as 271022000000000000 to 1: laſtly, the momentum of the firſt to that of the laſt will be nearly as 1 to 2338480000000.

If the number (n) of bodies be required, and the ratio of the momenta of the firſt and laſt be given as 1 to M, and the ratio of the ſeries r given alſo; then, putting $\frac{2r}{1+r}=\mathrm{R}$, we have the momentum of the laſt body expreſſed by $\left(\frac{2r}{1+r}\right)^{n-1}=\mathrm{M}=\mathrm{R}^{n-1}$; therefore the logarithm of M ($l.$ M) is equal to the logarithm of R ($l.$ R) multiplied by the power $n-1$; that is, $l.\,\mathrm{M}=\overline{n-1}\times l.\,\mathrm{R}$; conſequently $\frac{l.\,\mathrm{M}}{l.\,\mathrm{R}}+1=n$, the number of bodies required.

MOTTEUX (Peter), a French gentleman, born and educated at Rouen in Normandy. Coming over to England on account of the perſecution of the Proteſtants, he became a conſiderable trader in London, kept an Eaſt-India warehouſe in Leadenhall-ſtreet, and had a genteel place in the general poſt-office, relating to foreign letters, being maſter of ſeveral languages.

guages. He was a man of wit and humour; and acquired so perfect a mastery of the English language, that he not only was qualified to oblige the world with a very good translation of Don Quixote, but also wrote several songs, prologues, epilogues, &c. and what was still more extraordinary, became a very eminent dramatic writer in a language to which he was not a native. He was at last, in the year 1718, found dead in a disorderly house, on his birth-day, when he completed his 58th year.

MOTTO, in armoury, a short sentence or phrase, carried in a scroll, generally under, but sometimes over, the arms; sometimes alluding to the bearing, sometimes to the name of the bearer, and sometimes containing whatever pleases the fancy of the deviser.

MOVEABLE, in general, denotes any thing capable of being moved.

Moveable *Subject*, in Scots law, any thing that moves itself, or can be moved; in contradistinction to immoveable or heritable subjects, as lands, houses, &c.

MOVEMENT, in mechanics, a machine that is moved by clock-work. See Clock and Watch.

Perpetual Movement. Many have attempted to find a perpetual movement, but without success; and there is reason to think, from the principles of mechanics, that such a movement is impossible: for tho', in many cases of bodies acting upon one another, there is a gain of absolute motion, yet the gain is always equal in opposite directions; so that the quantity of direct motion is never increased.

To make a perpetual movement, it appears necessary that a certain system of bodies, of a determined number and quantity, should move in a certain space for ever, and in a certain way and manner; and for this there must be a series of actions returning in a circle, otherwise the movement will not be perpetual; so that any action by which the absolute quantity of force is increased, of which there are several sorts, must have its corresponding counter-action, by which the gain is destroyed, and the quantity of force restored to its first state.

Thus by these actions there will never be any gain of direct force to overcome the friction and resistance of the medium; so that every motion being diminished by these resistances, they must at length languish and cease.

MOVING plants. See Hedysarum, Tremella, and Mimosa.

MOULD, or Mold, in the mechanic arts, a cavity cut with a design to give its form or impression to some softer matter applied therein; of great use in Sculpture, Foundery, &c. See these articles.

Mould, in agriculture, a loose kind of earth, everywhere obvious on the surface of the ground, called also *natural* or *mother earth;* by some also *loam.* For an account of the nature and properties of this earth, see Agriculture, Part I.

MOULDINESS, a term applied to bodies which corrupt in the air, from some hidden principle of humidity therein; and whose corruption shews itself by a certain white down or lanugo on their surface, which, viewed through a microscope, appears like a kind of meadow, out of which arise herbs and flowers, some only in the bud, others full-blown, and others decayed; each having its root, stalk, and other parts. See Mucor.

MOULDING, any thing cast in a mould, or that seems to have been so though in reality it were cut with a chisel or the ax.

Mouldings, in architecture, projectures beyond the naked wall, column, wainscot, &c. the assemblage of which forms corniches, door-cases, and other decorations of Architecture. See that article.

MOULIN (Charles du), a celebrated civilian, and one of the most learned men of the 16th century, was born of a considerable family at Paris in 1500, and acquired great reputation by his skill in the law. He published many works, which have been collected together, and printed in five volumes folio; and are justly considered as the most excellent works that France has produced on the subject of civil law. He died at Paris in 1566.

Moulin (Peter du), a Protestant divine, believed to be of the same family with the former, was born in 1568. He taught philosophy at Leyden; and afterwards became chaplain to the princess of Navarre. At the king of England's desire he came hither in 1615, and prepared a plan for the union of the Protestant churches. The university of Leyden offered him a professorship of divinity in 1619: but he refused it, and presided at the synod held by the Calvinists at Alais in 1620. Some time after, being informed by Mr Drelincourt that the French king resolved to have him thrown into prison, he retired to Sedan, where the duke de Bouillon made him professor of divinity, and minister in ordinary. He was employed by the Calvinists in the most important affairs; and died at Sedan in 1658. His principal works are, 1. The anatomy of Arminianism. 2. A treatise on repentance, and the keys of the church. 3. The Capuchine, or the history of those monks. 4. The buckler of faith, or a defence of the reformed churches. 5. The judge of controversies and traditions. 6. The anatomy of the mass. 7. The novelty of Popery.

Peter du Moulin, his eldest son, was chaplain to Charles II. of England, and prebendary of Canterbury, where he died in 1684, aged 84. He wrote, 1. The peace of the soul, in French. 2. *Clamor regii sanguinis;* which Milton, by mistake, attributed to Alexander Morus. 3. A defence of the Protestant religion, in English.

MOULINET, is used, in mechanics, to signify a roller, which, being crossed with two levers, is usually applied to cranes, capstans, and other sorts of engines of the like nature, to draw ropes, and heave up stones, &c.

Moulinet is also a kind of turnstile, or wooden cross, which turns horizontally upon a stake fixed in the ground; usually placed in passages to keep out horses, and to oblige passengers to go and come one by one. These moulinets are often set near the outworks of fortified places at the sides of the barriers, through which people pass on foot.

MOUND, a term used for a bank or rampart, or other fence, particularly that of earth.

Mound, in heraldry, a ball or globe with a cross upon it, such as our kings are usually drawn with, holding it in their left hand, as they do the sceptre in the right.

Mount. MOUNT, an elevation of earth, called alſo *mountain*. See MOUNTAIN.

MOUNT *of Piety*, certain funds or eſtabliſhments in Italy, where money is lent out on ſome ſmall ſecurity. There were alſo mounts of piety in England, raiſed by contribution for the benefit of people ruined by the extortions of the Jews.

MOUNTAIN, a part of the earth riſing to a conſiderable height above the level of the ſurface thereof.

The origin of mountains is variouſly aſſigned by philoſophers: ſome will have them coeval with the world, and created along with it; others, among whom is Dr Burnet, will have them to take their riſe from the deluge, urging that the extreme irregularity and diſorder viſible in them, plainly ſhews they do not come immediately out of the hand of God, but are the wrecks of the old world, broken into the abyſs. See DELUGE.

Others again allege from hiſtory, that the roots of many hills being eaten away, the hills themſelves have ſubſided and ſunk into plains; whence they conclude, that where the corruption is natural, the generation is ſo too. It appears certain to many, that ſome mountains muſt have generated gradually, and have grown up in proceſs of time, from the ſea-ſhells, &c. found in them, which they ſuppoſe may be accounted for from a violent wind blowing the ſand, &c. into huge heaps, which were made into a maſs by the rain, &c. The origin of mountains, in the opinion of Mr Ray, ſeems to have been from exploſions by means of ſubterraneous fires; and he thinks it very probable, that they all have vaſt hollows beneath them: and that this might have been the means uſed at the creation to make the dry land appear, he thinks no way diſſonant to reaſon, ſince hiſtory proves that fires have raged in ſubterraneous caverns under the ſeas; and there is no natural impoſſibility in fire's ſubſiſting in ſuch caverns, even when the earth was all over covered with water, as at the firſt creation.

Mountains appear to many to be defects and blemiſhes in the earth; but they are truly of the utmoſt uſe and neceſſity to the well-being both of man and other animals. They ſerve as ſcreens to keep off the cold and nipping blaſts of the northern and eaſtern winds; they ſerve for the production of a great number of vegetables and minerals, which are not found in any other ſoil; the long ridges and chains of lofty and topping mountains, being generally found to run from eaſt to weſt, ſerve to ſtop the evagation of the vapours towards the poles, without which they would all run from the hot countries, and leave them deſtitute of rain. Mr Ray adds, that they condenſe theſe vapours, like alembic heads, into clouds; and ſo, by a kind of external diſtillation, give origin to ſprings and rivers; and by amaſſing, cooling, and conſtipating them, turn them into rain, and by that means render the fervid region of the torrid zone habitable. He farther adds, that many creatures cannot live but in particular ſituations; and even the tops of the higheſt and the coldeſt mountains are the only places where ſome creatures, as well birds as quadrupeds, will live.

M. Buffon remarks, that the higheſt mountains of the world, as well as the largeſt, are ſituated in the torrid zone; and the nearer we approach the equator, the greater are the inequalities on the earth's ſurface. "A ſhort enumeration of mountains and iſlands (ſays he) will be ſufficient to eſtabliſh this point.—In America, the Cordileras, which are the higheſt mountains in the world, lie preciſely under the equator; and they extend on both ſides a conſiderable way beyond the tropic circles. The higheſt mountains of the Moon, of Monomotapa, and the great and little Atlas in Africa, lie either under or very near the equator. In Aſia, mount Caucaſus, the chain of which, under different names, runs into China, and through this whole extent, lies nearer the equator than the poles. In Europe, the Pyrenees, the Alps, and the mountains of Greece, which form one chain, are ſtill leſs diſtant from the equator than the pole.

"Theſe chains of mountains of which we have given an enumeration, are higher and of greater extent, both in length and breadth, than thoſe of more northern countries. With regard to their direction, the Alps form a continued chain which runs acroſs the whole continent from Spain to China. They commence on the ſea-coaſt of Galicia, join the Pyrenees, traverſe France by Vivares and Auvergne, run through Italy, and ſtretch into Germany above Dalmatia, until they reach Macedonia; from thence they join the mountains of Armenia, the Caucaſus, the Taurus, the Imaus, and at laſt terminate on the coaſt of Tartary. Mount Atlas in the ſame manner traverſes the whole continent of Africa, from the kingdom of Fez to the Straits of the Red Sea. The mountains of the moon have likewiſe the ſame direction; but the mountains of America have an oppoſite direction. The vaſt chains of Cordileras, and other mountains, run more from ſouth to north than from eaſt to weſt."

This aſſertion concerning the magnitude and height of mountains, is no doubt neceſſary for the ſupport of his theory of the earth *; but it is by no means agreeable to fact. The mountains of the moon, though much nearer the equator than the Alps, are not, by all accounts, equal to them in ſize; one of the peaks of the Alps, named *Mont Blanc*, being reckoned the higheſt point of land in Europe, Aſia, or Africa. According to ſome late computations, this peak is more than 800 feet higher than mount Ætna would be with Veſuvius ſet on its top; ſo that we may reckon it little inferior to the higheſt mountains even in America. In Mr Forſter's account of the Southern Thule alſo, he tells us of an exceeding high mountain ſeen on that iſland, and which was thought to be little leſs than two miles perpendicular; and yet this iſland lies in a very conſiderable ſouth latitude: ſo that the height of mountains ſeems by no means to be in proportion to the vicinity of the equator or torrid zone.

* See *Earth*.

The moſt remarkable mountain in the world for ſhape, is that called the *needle mountain*, or the *inacceſſible mountain*, in Dauphiny.—This is a vaſt hill, placed as it were bottom upwards, or ſet on its ſummit on the earth, with its broad baſe elevated in the air; it is but about 1000 paces in circumference at bottom, and above 2000 at the top. On the centre of the plain at the top there ſtands another ſmall and very narrow, but very high hill. It obtained its name from

from the ſuppoſed impoſſibility of aſcending it, on account of its projection outwards. Some hardy perſons, however, once ventured to climb it; and found at the top a number of the chamois, animals by no means qualified for climbing, and which doubtleſs had never either aſcended or deſcended the mountain, and which muſt be ſuppoſed to have bred there for many ages; though it is very difficult to account for their coming there.

The difficulty and danger of aſcending to the tops of mountains, proceeds not from the thinneſs of the air as has been commonly reported; but the reaſon is, that they riſe with ſuch a rugged and precipitate aſcent, that they are utterly inacceſſible. In ſome places they appear like a great wall of 600 or 700 feet high; in others, there ſtick out enormous rocks, that hang upon the brow of the ſteep, and every moment threaten deſtruction to the traveller below.

In this manner almoſt all the tops of the higheſt mountains are bare and pointed. And this naturally proceeds from their being ſo continually aſſaulted by thunders and tempeſts. All the earthy ſubſtances with which they might have been once covered, have for ages been waſhed away from their ſummits; and nothing is left remaining but immenſe rocks, which no tempeſt has hitherto been able to deſtroy.

Nevertheleſs, time is every day and every hour making depredations; and huge fragments are ſeen tumbling down the precipiece, either looſened from the ſummit by the froſt or rains, or ſtruck down by lightning. Nothing can exhibit a more terrible picture than one of theſe enormous rocks, commonly larger than an houſe, falling from its height with a noiſe louder than thunder, and rolling down the ſide of the mountain. Dr Plot tells us of one in particular, which being looſened from its bed, tumbled down the precipice, and was partly ſhattered into a thouſand pieces. Notwithſtanding, one of the largeſt fragments of the ſame, ſtill preſerving its motion, travelled over the plain below, croſſed a rivulet in the midſt, and at laſt ſtopped on the other ſide of the bank! Theſe fragments, as was ſaid, are often ſtruck off by lightning, and ſometimes undermined by rains; but the moſt uſual manner in which they are diſunited from the mountain, is by froſt: the rains inſinuating between the interſtices of the mountain, continue there until there comes a froſt; and then, when converted into ice, the water ſwells with an irreſiſtible force, and produces the ſame effect as gun-powder, ſplitting the moſt ſolid rocks, and thus ſhattering the ſummits of the mountain.

But not rocks alone, but whole mountains, are, by various cauſes, diſunited from each other. We ſee, in many parts of the Alps, amazing clefts, the ſides of which ſo exactly correſpond with the oppoſite, that no doubt can be entertained of their having been once joined together. At Cajeta, in Italy, a mountain was ſplit in this manner by an earthquake; and there is a paſſage opened through it, that appears as if elaborately done by the induſtry of man. In the Andes theſe breaches are frequently ſeen. That at Thermopyle, in Greece, has been long famous. The mountain of the Troglodytes, in Arabia, has thus a paſſage through it: and that in Savoy, which nature began, and which Victor Amadeus completed, is an inſtance of the ſame kind.

We have accounts of ſome of theſe diſruptions, immdiately after their happening. "In the month of June, in the year 1714, a part of the mountain of Diableret, in the diſtrict of Valais, in France, ſuddenly fell down, between two and three o'clock in the afternoon, the weather being very calm and ſerene. It was of a conical figure, and deſtroyed 55 cottages in the fall. Fifteen perſons, together with about 100 beaſts, were alſo cruſhed beneath its ruins, which covered an extent of a good league ſquare. The duſt it occaſioned inſtantly covered all the neighbourhood in darkneſs. The heaps of rubbiſh were more than 300 feet high. They ſtopped the current of a river that ran along the plain, which now is formed into ſeveral new and deep lakes. There appeared, through the whole of this rubbiſh, none of thoſe ſubſtances that ſeemed to indicate that this diſruption had been made by means of ſubterraneous fires. Moſt probably, the baſe of this rocky mountain was rotted and decayed; and thus fell, without any extraneous violence." In the ſame manner, in the year 1618, the town of Pleurs, in France, was buried beneath a rocky mountain, at the foot of which it was ſituated.

Theſe accidents, and many more that might be enumerated of the ſame kind, have been produced by various cauſes: by earthquakes, as in the mountain at Cajeta; or by being decayed at the bottom, as at Diableret. But the moſt general way is, by the foundation of one part of the mountain being hollowed by waters, and thus wanting a ſupport, breaking from the other. Thus it generally has been found in the great chaſms in the Alps; and thus it almoſt always is known in thoſe diſruptions of hills which are known by the name of *land-ſlips*. Theſe are nothing more than the ſliding down of an higher piece of ground, diſrooted from its ſituation by ſubterraneous inundations, and ſettling itſelf upon the plain below.

There is not an appearance in all nature that ſo much aſtoniſhed our anceſtors as theſe land-ſlips. In fact, to behold a large upland, with its houſes, its corn, and cattle, at once looſened from its place, and floating as it were upon the ſubjacent water; to behold it quitting its ancient ſituation, and travelling forward like a ſhip, in queſt of new adventures; this is certainly one of the moſt extraordinary appearances that can be imagined; and, to a people ignorant of the powers of nature, might well be conſidered as a prodigy. Accordingly, we find all our old hiſtorians mentioning it as an omen of approaching calamities. In this more enlightened age, however, its cauſe is very well known; and, inſtead of exciting ominous apprehenſions in the populace, it only gives riſe to ſome very ridiculous law-ſuits among them, about whoſe the property ſhall be; whether the land which has thus ſlipt, ſhall belong to the original poſſeſſor, or to him upon whoſe grounds it has encroached and ſettled. What has been the determination of the judges is not ſo well known; but the circumſtances of the ſlips themſelves have been minutely enough and exactly deſcribed.

In the lands of Slatberg, in the kingdom of Ireland, there ſtood a declivity gradually aſcending for near half a mile. In the year 1713, and on the 10th of March, the

 the inhabitants perceived a crack on its ſide, ſomewhat like a furrow made with a plough, which they imputed to the effects of lightning, as there had been thunder the night before. However, on the evening of the ſame day, they were ſurpriſed to hear an hideous confuſed noiſe iſſuing all round from the ſide of the hill; and their curioſity being raiſed, they reſorted to the place. There, to their amazement, they found the earth for near five acres all in gentle motion, and ſliding down the hill upon the ſubjacent plain. This motion continued the remaining part of the day, and the whole night: nor did the noiſe ceaſe during the whole time; proceding, probably, from the attrition of the ground beneath. The day following, however, this ſtrange journey down the hill ceaſed entirely; and above an acre of the meadow below was found covered with what before compoſed a part of the declivity.

However, theſe ſlips, when a whole mountain's ſide ſeems to deſcend, happen but very rarely. There are ſome of another kind, however, much more common; and, as they are always ſudden, much more dangerous. Theſe are ſnow-ſlips, well known, and greatly dreaded by travellers. It often happens, that when ſnow has long been accumulated on the tops and on the ſides of mountains, it is borne down the precipice either by means of tempeſts or its own melting. At firſt, when looſened, the volume in motion is but ſmall; but it gathers as it continues to roll, and, by the time it has reached the habitable parts of the mountain, it is generally grown of enormous bulk. Wherever it rolls, it levels all things in its way; or buries them in unavoidable deſtruction. Inſtead of rolling, it ſometimes is found to ſlide along from the top; yet even thus it is generally as fatal as before. Nevertheleſs, we have had an inſtance, a few years ago, of a ſmall family in Germany that lived for above a fortnight beneath one of theſe ſnow-ſlips. Although they were buried during that whole time in utter darkneſs, and under a bed of ſome hundred feet deep, yet they were luckily taken out alive, the weight of the ſnow being ſupported by a beam that kept up the roof; and nouriſhment being ſupplied them by the milk of a ſhe-goat that was buried under the ſame ruin.

Attraction of MOUNTAINS. This is a late diſcovery, and a very conſiderable confirmation of Sir Iſaac Newton's theory of univerſal gravity. According to the Newtonian ſyſtem, an attractive power is not only exerted between thoſe large maſſes of matter which conſtitute the ſun and planets; but likewiſe between all comparatively ſmaller bodies, and even between the ſmalleſt particles of which they are compoſed. Agreeably to this hypotheſis, a heavy body, which ought to gravitate or tend toward the centre of the earth, in a direction perpendicular to its ſurface, ſuppoſing the ſaid ſurface to be perfectly even and ſpherical, ought likewiſe, though in a leſs degree, to be attracted and tend towards a mountain placed on the earth's ſurface: ſo that a plumb-line, for inſtance, of a quadrant, hanging in the neighbourhood of ſuch a mountain, ought to be drawn from a perpendicular ſituation, in conſequence of the attractive power of the quantity of matter of which it is compoſed, acting in a direction different from that exerted by the whole maſs of matter in the earth, and with a proportionably inferior degree of force.

Though Sir Iſaac Newton had long ago hinted at an experiment of this kind; and had remarked, that "a mountain of an hemiſpherical figure, three miles high and ſix broad, would not, by its attraction, draw the plumb-line two minutes out of the perpendicular (A):" yet no attempt to aſcertain this matter, by actual experiment, was made till about the year 1738; when the French academicians, particularly Meſſrs Bouguer and Condamine, who were ſent to Peru to meaſure a degree under the equator, attempted to diſcover the attractive power of Chimboraço, a mountain in the province of Quito. According to their obſervations, which were however made under circumſtances by no means favourable to an accurate ſolution of ſo nice and difficult a problem, the mountain Chimboraço exerted an attraction equal to eight ſeconds. Though this experiment was not perhaps ſufficient to prove ſatisfactorily even the reality of an attraction, much leſs the preciſe quantity of it; yet it does not appear that any ſteps had been ſince taken to repeat it.

Through the munificence of his Britannic majeſty, the royal ſociety were enabled to undertake the execution of this delicate and important experiment; the aſtronomer royal was choſen to conduct it. After various inquiries, the mountain Schehallien, ſituated nearly in the centre of Scotland, was pitched upon as the moſt proper for the purpoſe that could be found in this iſland. The obſervations were made by taking the meridian zenith diſtances of different fixed ſtars, near the zenith, by means of a zenith ſector of ten feet radius; firſt on the ſouth, and afterwards on the north ſide of the hill, the greateſt length of which extended in an eaſt and weſt direction.

It is evident, that if the maſs of matter in the hill exerted any ſenſible attraction, it would cauſe the plumb-line of the ſector, through which an obſerver viewed a ſtar in the meridian, to deviate from its perpendicular ſituation, and would attract it contrary ways at the two ſtations, thereby doubling the effect. On the ſouth ſide the plummet would be drawn to the northward, by the attractive power of the hill placed to the northward of it: and on the north ſide, a contrary and equal deflection of the plumb-line would take place, in conſequence of the attraction of the hill, now to the ſouthward of it. The apparent zenith diſtances of the ſtars would be affected contrarywiſe; thoſe being increaſed at the one ſtation which were diminiſhed at the other: and the correſpondent quantities of the deflection of the plumb-line would give the obſerver the ſum of the contrary attractions of the hill, acting on the plummet at the two ſtations; the half of which will of courſe indicate the attractive power of the hill.

The various operations requiſite for this experiment laſted about four months; and from them it appears, that the ſum of the two contrary attractions of the mountain Schehallien, in the two temporary obſervations which were ſucceſſively fixed half-way up the hill (where the effect of its attraction would be greateſt) was equal to 11″. 6.—From a rough computation, founded on the known law of gravitation, and

A By a very eaſy calculation it is found that ſuch a mountain would attract the plumb-line 1′ 18″ from the perpendicular.

and on an aſſumption that the denſity of the hill is equal to the mean denſity of the earth; it appears that the attraction of the hill ſhould amount to about the double of this quantity. From thence it was inferred, that the denſity of the hill is only about half the mean denſity of the earth. It does not appear, however, that the mountain Schehallien has ever been a volcano, or is hollow; as it is extremely ſolid and denſe, and ſeemingly compoſed of an entire rock.

The inference drawn from theſe experiments may be reduced to the following:

" 1. It appears, that the mountain Schehallien exerts a ſenſible attraction; therefore, from the rules of philoſophiſing, we are to conclude, that every mountain, and indeed every particle of the earth, is endued with the ſame property, in proportion to its quantity of matter.

" 2. The law of the variation of this force, in the inverſe ratio of the ſquares of the diſtances, as laid down by Sir Iſaac Newton, is alſo confirmed by this experiment. For if the force of attraction of the hill had been only to that of the earth as the matter in the hill to that of the earth, and had not been greatly increaſed by the near approach to its centre, the attraction thereof muſt have been wholly inſenſible. But now, by only ſuppoſing the mean denſity of the earth to be double to that of the hill, which ſeems very probable from other conſiderations, the attraction of the hill will be reconciled to the general law of the variation of attraction in the inverſe duplicate ratio of the diſtances, as deduced by Sir Iſaac Newton from the compariſon of the motion of the heavenly bodies with the force of gravity at the ſurface of the earth; and the analogy of nature will be preſerved.

" 3. We may now, therefore, be allowed to admit this law, and to acknowledge, that the mean denſity of the earth is at leaſt double of that at the ſurface; and conſequently that the denſity of the internal parts of the earth is much greater than near the ſurface. Hence alſo, the whole quantity of matter in the earth will be at leaſt as great again as if it had been all compoſed of matter of the ſame denſity with that at the ſurface; or will be about four or five times as great as if it were all compoſed of water.—This concluſion, Mr Maſkelyne adds, is totally contrary to the hypotheſis of ſome naturaliſts, who 'ſuppoſe the earth to be only a great hollow ſhell of matter; ſupporting itſelf from the property of an arch, with an immenſe vacuity in the midſt of it.' But, were that the caſe, the attraction of mountains, and even ſmaller inequalities in the earth's ſurface, would be very great, contrary to experiment, and would affect the meaſures of the degrees of the meridian much more than we find they do; and the variation of gravity, in different latitudes, in going from the equator to the poles, as found by pendulums, would not be near ſo regular as it has been found by experiment to be.

" 4. As mountains are, by theſe experiments, found capable of producing ſenſible deflections of the plumb-lines of aſtronomical inſtruments; it becomes a matter of great importance, in the menſuration of degrees in the meridian, either to chooſe places where the irregular attractions of the elevated parts may be ſmall; or where, by their ſituation, they may compenſate or counteract the effects of each other."

For meaſuring the heights of mountains, ſee the article BAROMETER, and the ſame in the APPENDIX.

MOUSE, in zoology. See MUS.

MOUSE-*Ear*, in botany. See HIERACHIUM.

MOUSE-*Tail*. See MYOSURUS.

Dor-MOUSE. See SOREX.

MOUSUL, or MOSUL, a town of Turkey in Aſia, ſeated on the weſtern bank of the river Tigris, nearly oppoſite to the place where Nineveh formerly ſtood. It is a large place, ſurrounded with high walls; but the houſes are ill-built, and in ſeveral places gone to ruin; however, it has a ſtrong caſtle and a citadel. It is a place of great trade, particularly in cloth and all ſorts of cottons and ſilks. At ſome diſtance from Mouſul is a moſque, in which they pretend the prophet Jonah lies. The inhabitants are generally Mahometans; but there are a great number of Neſtorian Chriſtians. It was beſieged in vain by the Perſians in 1743. E. Lon. 41. 45. N. Lat. 35. 30.

MOUTH, in anatomy, a part of the face, conſiſting of the lips, the gums, the inſides of the cheeks, the palate, the ſalival glands, the os hyoides, the uvula, and the tonſils; which ſee under the article ANATOMY.

Mr Derham obſerves, that the mouth in the ſeveral ſpecies of animals is nicely adapted to the uſes of ſuch a part, and well ſized and ſhaped for the formation of ſpeech, the gathering and receiving of food, the catching of prey, &c. In ſome creatures it is wide and large, in others little and narrow; in ſome it is formed with a deep inciſure into the head, for the better catching and holding of prey, and more eaſy comminution of hard, large, and troubleſome food; and in others with a ſhorter inciſure, for the gathering and holding of herbaceous food. In birds, it is neatly ſhaped for piercing the air; hard and horny, to ſupply the want of teeth; hooked, in the rapacious kind, to catch and hold their prey; long and ſlender in thoſe that have their food to grope for in mooriſh places; and broad and long in thoſe that ſearch for it in the mud. Nor is the mouth leſs remarkable in inſects: in ſome it is forcipated, to catch, hold, and tear the prey; in others aculeated, to pierce and wound animals, and ſuck their blood; in others, ſtrongly rigid, with jaws and teeth, to gnaw and ſcrape out their food, carry burdens, perforate the earth, nay the hardeſt wood, and even ſtones themſelves, for houſes and neſts for their young.

MOXA, alſo called *artemiſia Chinenſis*. *Moxa*, or *mugwort* of China. It is a ſoft lanuginous ſubſtance, prepared in Japan from the young leaves of a ſpecies of mugwort, by beating them together when thoroughly dried, and rubbing them betwixt the hands, till only the fine fibres are left.

The down on the leaves of mullein, cotton, hemp, &c. do as well as moxa.

In the Eaſtern countries it is uſed by burning it on the ſkin: a little cone of the moxa is laid upon the part, previouſly moiſtened, and ſet on fire at the top; it burns down with a temperate glowing heat, and produces a dark-coloured ſpot, the exulceration of which is promoted by applying a little garlic; the ulcer is left to diſcharge, or is ſoon healed, according to the intention in uſing the moxa. See ARTEMISIA.

MOYLE (Walter), a learned Englifh writer in the 18th century, defcended of a good family in Cornwall, where he was born in 1672. He was fent to Oxford, and thence removed to the temple; where he applied himfelf chiefly to the general, and more noble parts of the law, fuch as led him to the knowledge of the conftitution of the Englifh government. In 1697 he had a fhare with Mr Trenchard in writing a pamphlet, intitled, "An argument fhewing that a ftanding army is inconfiftent with a free government, and abfolutely deftructive to the conftitution of the Englifh monarchy." He tranflated Xenophon's difcourfe upon improving the ftate of Athens. He was for fome time member of parliament, in which he always acted an honourable part; applying himfelf to the improvement and regulation of trade, and the employment of the poor, which has fo near a connection with trade. He afterwards retired to his feat at Bake in Cornwall, where he applied himfelf with vigour to his ftudies, and died in 1721. In 1726, his works were printed at London, in 2 vols 8vo.

MUCILAGE, in pharmacy, is in general any vifcid or glutinous liquor.

Mucilage, alfo imports the liquor which principally ferves to moiften the ligaments and cartilages of the articulations; and is fupplied by the mucilaginous glands.

MUCOR, in botany, a genus of the order of fungi, belonging to the cryptogamia clafs of plants. There are 12 fpecies; the moft remarkable of which are, 1. The fpærocephalus, or grey round-headed mucor, growing upon rotten wood, and fometimes upon decayed plants and moffes. The ftalks of this are generally black; about a line in height, bearing each at the top a fpherical ball about the fize of a pin's head; its coat or rind is covered with a grey powder, and containing within a black or fufcous fpongy down. The coat burfts with a ragged, irregular margin. 2. The lichenoides, or little, black, pin headed mucor. This fpecies grows in groups near to each other, in chafms of the barks of old trees, and upon old park-pales. The ftalks are black, about two lines in height; bearing each a fingle head, fometimes a double or treble one, of the fize of muftard or poppy feeds, of a roundifh figure at firft, but when burft often flattifh or truncated, and of a black colour. The internal powdered down is black, with a tinge of green. 3. The mucedo, or common grey mould, grows on bread, fruits, plants, and other fubftances in a putrid ftate. It grows in clufters; the ftalks a quarter of an inch high, pellucid, hollow, and cylindrical; fupporting each a fingle globular head, at firft tranfparent, afterwards dark grey; which burfts with elaftic force, and ejects fmall round feeds difcoverable by the microfcope. 4. The glaucus, or grey clufter-headed mould, is found on rotten apples, melons, and other fruits; as alfo upon decayed wood, and the ftalks of wheat. Thefe are of a pellucid grey colour; the ftalks generally fingle, fupporting a fpherical ball, which, when magnified, appears to be compounded of numerous, fine, moniliform, necklace-like radii. 5. The cruftaceus, or fingered mould, is frequent upon corrupted food of various kinds. It is of a white aqueous colour; the ftalks fingle, each fupporting at the top four or five necklace-like radii, diverging from the fame point or centre. 6. The fepticus, or yellow frothy mucor, is found on the leaves of plants, fuch as ivy and beech, &c. fometimes upon dry fticks, and frequently upon the tan or bark in hot-houfes. It is of no certain fize or figure, but of a fine yellow colour, and a fubftance refembling at firft cream beat up into froth. In the fpace of 24 hours it acquires a thin filmy coat, becomes dry, and full of a footy powder adhering to downy threads. The feeds under the microfcope appear to be globular. Haller ranks it under a new genus, which he terms *fuligo;* the characters of which are, that the plants contained under it are foft, and like butter at firft, but foon change into a black footy powder.

MUCUS, a mucilaginous liquor fecreted by certain glands, and ferving to lubricate many of the internal cavities of the body. In its natural ftate it is generally limpid and colourlefs; but, from certain caufes, will often affume a thick confiftence and whitifh colour like pus. As it is fometimes of very great importance in medicine to diftinguifh thefe two fluids from each other, this was lately propofed as the fubject of a prize-difputation by the Æfculapian Society of Edinburgh. The prize was gained by Mr Charles Darwin ftudent of medicine from Litchfield. The conclufions drawn from his experiments were,

1. Pus and mucus are both foluble in the vitriolic acid, though in very different proportions, pus being by far leaft foluble.

2. The addition of water to either of thefe compounds decompofes it. The mucus thus feparated, either fwims in the mixture, or forms large flocculi in it; whereas the pus falls to the bottom, and forms, on agitation, an uniform turbid mixture.

3. Pus is diffufible through a diluted vitriolic acid, though mucus is not. The fame alfo occurs with water, or with a folution of fea falt.

4. Nitrous acid diffolves both pus and mucus. Water added to the folution of pus produces a precipitate, and the fluid above becomes clear and green, while water and the folution of mucus form a turbid dirty-coloured fluid.

5. Alkaline lixivium diffolves, though fometimes with difficulty, mucus, and generally pus.

6. Water precipitates pus from fuch a mixture, but does not mucus.

7. Where alkaline lixivium does not diffolve pus, it ftill diftinguifhes it from mucus, as it then prevents its diffufion through water.

8. Coagulable lymph is neither foluble in concentrated nor diluted vitriolic acid.

9. Water produces no change on a folution of ferum in alkaline lixivium, until after long ftanding, and then only a very flight fediment appears.

10. Corrofive fublimate coagulates mucus, but does not pus.

From the above experiments it appears, that ftrong vitriolic acid and water, diluted vitriolic acid, and cauftic alkaline lixivium and water, will ferve to diftinguifh pus from mucus; that the vitriolic acid can feparate it from coagulable lymph, and alkaline lixivium from ferum.

Hence, when a perfon has any expectorated matter, the compofition of which he wifhes to afcertain, let him diffolve it in vitriolic acid, and in cauftic alkaline

Mud.

line lixivium. And let him add pure water to both folutions. If there be a fair precipitation in each, he may be affured that fome pus is prefent. But if there be a precipitation in neither, it is a certain teft that the mixture is entirely mucus. If the matter cannot be made to diffolve in alkaline lixivium by time and trituration, we have alfo reafon to believe that it is pus.

MUD-INGUÁNA, the American name of a remarkable kind of two-footed amphibious animal found in South Carolina, firft obferved by Dr Garden of Charleftown, and afterwards defcribed by John Ellis, F.R.S. in the Phil. Tranf. p. 189.

" It is found (fays he) in fwampy and muddy places, by the fide of pools, under the trunks of old trees that hang over the water.

Plate CLXXXIV

" The leffer one B, which is preferved in fpirits, meafures about 9 inches in length; and appears to be a very young ftate of the animal, as we may obferve from the fin of the tail, and the opercula or coverings of the gills being not yet extended to their full fize. Thefe opercula, in their prefent ftate, confift each of three indented lobes, hiding the gills from view, and are placed juft above the two feet. Thefe feet appear like little arms and hands, each furnifhed with four fingers, and each finger with a claw.

" In the fpecimen A, which is 31 inches long, the head is fomething like an eel, but more compreffed; the eyes are fmall, and placed as thofe of the eel are. In this they are fcarce vifible. This fmallnefs of the eye beft fuits an animal that lives fo much in mud. The noftrils are very plainly to be diftinguifhed; thefe, with the gills, and remarkable length of the lungs, fhew it to be a true amphibious animal. The mouth is fmall in proportion to the length of the body; but its palate and infide of the lower jaw (fee fig. C.) are well provided with many rows of pointed teeth: with this provifion of nature, added to the fharp exterior bony edges of both the upper and under jaw, the animal feems capable of biting and grinding the hardeft kind of food. The fkin, which is black, and full of fmall fcales, refembles fhagreen. Thefe fcales are of different fizes and fhapes, according to their fituation; but all appear funk into its gelatinous furface: thofe along the back and belly are of an oblong oval form, and clofe fet together; in the other parts they are round, and more diftinct. Both the fides are mottled with fmall white fpots, and have two diftinct lines compofed of fmall white ftreaks continued along from the feet to the tail. The fin of the tail has no rays, and is no more than an adipofe membrane like that of the eel; this fin appears more diftinctly in the dry animal than in thofe that have been preferved in fpirits.

" The opercula, or coverings to the gills, in dry fpecimens, appear fhrivelled up; but yet we may plainly fee that they have been doubly pennated. Under thefe coverings are the openings to the gills, three on each fide, agreeable to the number of the opercula. In the plate, at fig. F. the fins are reprefented as they appear when juft taken out of the water and put into the fpirits of wine.

" The form of thefe pennated coverings approach very near to what I have fome time ago obferved in the *larva*, or aquatic ftate of our Englifh lacerta, known by the name of *eft* or *water-newt*, (fee fig. D and E), which ferve them for coverings to their gills, and for fins to fwim with during this ftate; and which they lofe, as well as the fins of their tails, when they change and become land-animals; as I have obferved by keeping them alive for fome time myfelf.

Mud, Muffle.

" Recollecting thefe obfervations on the changes of our lizard, and at the fame time the many remarkable changes in frogs, I began to fufpect whether this animal might not be the larva ftate of fome large kind of lizard; and therefore requefted the favour of Dr Solander to examine with me the lacertas in the Britifh Mufeum, that we might fee whether any of the young ones had only two feet; but after carefully going thro' many kinds, we could plainly difcover four feet perfectly formed, even in thofe that were but juft coming out of their eggs.

" During this ftate of uncertainty, I forwarded to Dr Linnæus of Upfal, at Dr Garden's requeft, his account of the largeft fpecimen, and at the fame time fent him one of the fmaller fpecimens preferved in fpirits; defiring his opinion, for my own as well as Dr Garden's fatisfaction.

" About the end of January laft I was favoured with an anfwer from the profeffor, dated Upfal, Dec. 27th 1765; wherein he fays,

" I received Dr Garden's very rare two-footed animal with gills and lungs. The animal is probably the larva of fome kind of lacerta, which I very much defire that he will particularly inquire into. If it does not undergo a change, it belongs to the order of nantes, which have both lungs and gills; and if fo, it muft be a new and very diftinct genus, and fhould moft properly have the name of *firen*. I cannot poffibly defcribe to you how much this two-footed animal has exercifed my thoughts; if it is a larva, he will no doubt find fome of them with four feet. It is not an eafy matter to reconcile it to the larva of the lizard tribe, its fingers being furnifhed with claws; all the larvas of lizards that I know are without them, (*digitis muticis*). Then, alfo the branchiæ, or gills, are not to be met with in the aquatic falamanders, which are probably the larvas of lizards. Further, the croaking noife or found it makes, does not agree with the larvas of thofe animals; nor does the fituation of the anus. So that there is no creature that ever I faw, that I long fo much to be convinced of the truth, as what this will certainly turn out to be.

" *P. S.* In a letter lately received from Dr Garden, he mentions one remarkable property of this animal, which is, that his fervant endeavouring to kill one of them by dafhing it againft the ftones, it broke into three or four pieces: he further fays, that he has had an opportunity of feeing many of them lately of a much larger fize, and that he never faw one with more than two feet; fo that he is fully convinced that it is quite a new genus of the animal-kingdom."

MUFFLE, in chemiftry, a veffel much ufed in fome metallurgic operations. In figure it reprefents an oblong arch or vault, the hinder part of which is clofed by a femicircular plane, and the lower part, or floor of which, is a rectangular plane. It is a little oven that is placed horizontally in affay and enamelling furnaces, fo that its open fide correfponds with the door of the fire-place of the furnace. Under this arched oven fmall cupels, or crucibles, are placed; and the fubftances contained are thus expofed to heat without con-

tact

tact of fuel, ſmoke, or aſhes.

MUFTI, the chief of the eccleſiaſtical order, or primate of the muſſulman religion. The authority of the mufti is very great in the Ottoman empire; for even the ſultan himſelf, if he would preſerve any appearance of religion, cannot, without hearing his opinion, put any perſon to death, or ſo much as inflict any corporal puniſhment. In all actions, eſpecially criminal ones, his opinion is required, by giving him a writing in which the caſe is ſtated under feigned names; which he ſubſcribes with the words, *He ſhall*, or, *Shall not be puniſhed.* Such outward honour is paid to the mufti, that the grand ſignior himſelf riſes up to him, and advances ſeven ſteps to meet him when he comes into his preſence. He alone has the honour of kiſſing the ſultan's left ſhoulder, whilſt the prime vizier kiſſes only the hem of his garment. When the grand ſignior addreſſes any writing to the mufti, he gives him the following titles: *To the eſad, the wiſeſt of the wiſe, inſtructed in all knowledge, the moſt excellent of excellents, abſtaining from things unlawful, the ſpring of virtue and of true ſcience, heir of the prophetic doctrines, reſolver of the problems of faith, revealer of the orthodox articles, key of the treaſures of truth, the light to the doubtful allegories, ſtrengthened with the grace of the ſupreme Legiſlator of mankind, may the Moſt High God perpetuate thy virtues!* The election of the mufti is ſolely in the grand ſignior, who preſents him with a veſt of rich ſables, &c. If he is convicted of treaſon, or any great crime, he is put into a mortar kept for that purpoſe in the Seven Towers at Conſtantinople, and pounded to death.

MUGGLETONIANS, a religious ſect which aroſe in England about the year 1657; ſo denominated from their leader Lodowick Muggleton, a journeyman-taylor, who, with his aſſociate Reeves, ſet up for great prophets, pretending, as it is ſaid, to have an abſolute power of ſaving and damning whom they pleaſed; and giving out that they were the two laſt witneſſes of God that ſhould appear before the end of the world.

MUGIL, the MULLET; in ichthyology, a genus of fiſhes belonging to the order of abdominales. The lips are membranaceous, the inferior one being carinated inwards; they have no teeth; the branchioſtege membrane has ſeven crooked rays; the opercula are ſmooth and round; and the body is of a whitiſh colour. There are two ſpecies, diſtinguiſhed by the number of rays in the back-fin.

The mullet is juſtly ranked by Ariſtotle among the *piſces littorales*, or thoſe that prefer the ſhores to the full ſea; they are found in great plenty on ſeveral of the ſandy coaſts of our iſland, and haunt in particular thoſe ſmall bays that have influxes of freſh water. They come in great ſhoals, and keep rooting like hogs in the ſand or mud, leaving their traces in form of large round holes. They are very cunning: and when ſurrounded with a net, the whole ſhoal frequently eſcapes by leaping over it; for when one takes the lead, the others are ſure to follow. This circumſtance is obſerved by Oppian; who alſo informs us, that if theſe fiſhes fail to get over at the firſt leap, they never attempt a ſecond, but lie without motion as if they reſigned themſelves to their fate. Mr Pennant ſays he is uncertain whether this laſt obſervation holds good or not: however, Oppian had good opportunity of examining thoſe fiſh, as they ſometimes ſwarm on the coaſts of the Mediterranean. Near Martegues, in the ſouth of France, abundance of mullets are taken in weres made of reeds placed in the ſhallows. Of the milts of the males, which are there called *alletants*, and of the roes of females, which are called *botar*, is made botargo. The materials are taken out entire, covered with ſalt for four or five hours, then preſſed a little between two boards or ſtones, waſhed, and at laſt dried in the ſun for 13 or 14 days.

This fiſh was ſometimes made the inſtrument of a horrible puniſhment for unfortunate gallants. It was uſed both at Athens and Rome; but it is very doubtful whether it was a legal puniſhment or not. By Horace it is mentioned in the following lines:

Diſcincta tunica fugiendum eſt, et pede nudo;
Ne nummi pereant, aut PYGA, *aut denique fama.*
Satyr. II. lib. i. 132.

The mullet is an excellent fiſh for the table, but at preſent not a faſhionable one.

MUGWORT, in botany, a ſpecies of ARTEMISIA. An infuſion of this plant in white wine, or a bath made of it, has been always eſteemed an emmenagogue, and uſeful in difficult parturition. The leaves, when young and tender, are frequently made uſe of by the Highlanders of Scotland as a pot-herb. The country-people in Sweden drink a decoction of them for the ague.

MUID, a large meaſure in uſe among the French, for things dry. The muid is no real veſſel uſed as a meaſure, but an eſtimation of ſeveral other meaſures; as the ſeptier, mine, minot, buſhel, &c.

MUID, is alſo one of the nine caſks, or regular veſſels uſed in France, to put wine and other liquors in. The muid of wine is divided into two demi-muids, four quarter muids, and eight half-quarter muids, containing 36 ſeptiers.

MULATTO, a name given in the Indies to thoſe who are begotten by a negro man on an Indian woman, or by an Indian man on a negro woman.

MULBERRY, in botany. See MORUS.

MULCT, a fine of money laid upon a man who has committed ſome fault or miſdemeanour.

MULE, in zoology, a mongrel kind of quadruped, uſually generated between an aſs and a mare, and ſometimes between a horſe and a ſhe-aſs; but the ſignification of the word is commonly extended to every kind of animal produced by a mixture of two different ſpecies. There are two kinds of theſe animals; one from the he-aſs and mare, the other from the horſe and the ſhe-aſs. We call them indifferently *mules*, but the Romans diſtinguiſhed them by proper appellations. The firſt kind are the beſt and moſt eſteemed; as being larger, ſtronger, and having leaſt of the aſs in their diſpoſition. The largeſt and ſtouteſt aſſes, and the faireſt and fineſt mares, are choſen in thoſe countries where theſe creatures are moſt in uſe; as in Spain, Italy, and Flanders. In the laſt eſpecially, they ſucceeded in having very ſtately mules from the ſize of their mares, ſome of them 16, and ſome 17 hands high, which are very ſerviceable as ſumpter-mules in the army. But, ſince the Low Countries are no longer under the dominion of Spain, they breed fewer mules. Theſe creatures are very much commended for their being ſtronger, ſurer footed, going eaſier, being more cheaply maintained,

tained, and lasting longer than horses. They are commonly of a black-brown, or quite black, with that shining list along the back and cross the shoulders, which distinguishes asses. In former times they were much more common in this country than at present; being often brought over in the days of Popery by the Italian prelates. They continued longest in the service of millers; and are yet in use among them in some places, on account of the great loads they carry on their back. As they are capable of being trained for riding, bearing burdens, and for draught, there is no doubt that they might be usefully employed in many different services. But they are commonly found to be vicious, stubborn, and obstinate to a proverb; which whether it occasions or is produced by the ill usage they meet with, is a point not easily settled. Whatever may be the case of asses, it is allowed that mules are larger, fairer, and more serviceable in mild than in warm climates. In the British American colonies, both on the continent and in the islands, but especially in the latter, they are much used and esteemed; so that they are frequently sent to them from hence, suffer less in the passage, and die much seldomer than horses, and commonly yield, when they arrive, no inconsiderable profit.

It hath commonly been asserted, that animals produced by the mixture of two heterogeneous species, are incapable of generating, and thus perpetuating the monstrous breed; but this, we are informed by M. Buffon, is now discovered to be a mistake. Aristotle, says he, tells us, that the mule engenders with the mare, and that the junction produces an animal which the Greeks call *hinnus*, or *ginnus*. He likewise remarks, that the she-mule easily conceives, but seldom brings the fœtus to perfection. But the most remarkable and well attested instance of this fact, is mentioned in a letter read by M. d'Alembert before the academy of sciences, which informed him that a she-mule in the island of St Domingo had brought forth a foal. The fact was attested by persons of the most unquestionable veracity; and other instances, though not so well authenticated, are adduced by our author. We may therefore, continues M. Buffon, consider it as an established fact, that the he-mule can generate, and the she-mule produce. Like other animals, they have a seminal liquor, and all the organs necessary to generation. But mongrel animals are always less fertile and more tardy than those of a pure species. Besides, mules have never produced in cold climates, seldom in warm regions, and still more seldom in temperate countries. Hence their barrenness, without being absolute, may be regarded as positive; since their productions are so rare, that a few examples can be only collected.

The translator of Buffon's works, in a note on the passage above-quoted, hath given a remarkable and well authenticated instance of the prolific powers of a she-mule in the north of Scotland. Having heard that a mule, belonging to Mr David Tullo farmer in Auchtertyre, in the county of Forfar, had some years ago brought forth a foal, he transmitted a few queries to be put to Mr Tullo; and requested that his answers might be legally attested before a magistrate. This request was cheerfully complied with; and the following is an exact copy of the queries, answers, and attestations.

Interrogatories to be put to Mr Tullo tenant in Auchtertyre, parish of Newtyle, and county of Forfar, with his answers thereto.

1mo, Had you ever a she-mule? At what period? Is it true that the mule had a foal? At what time was she covered; and when did she foal?

Answered by Mr Tullo: That he bought a she-mule about 20 years ago: That she was constantly in season for a horse: That, about some years thereafter, he gave her a horse; and that she thereafter gave him a foal, about the 10th of June. The mule's price was 4*l.* 5*s.* Sterling.

2do, What was the colour of the foal? Was there any thing particular in its figure?

Answer: The foal was exactly the colour of its mother, inclined to black, with a very large head, big ears, and small tail; and the declarant thinks, had its head been weighed when foaled, it would have weighed nearly as much as its body.

3tio, How long was the animal allowed to live?

Answer: The next day after the mule foaled, it was sent, with its mother, to the Loch of Lundie, in order to let the foal die, as the declarant could not want the mule's work, and the mother seemed not fond of the foal: That it was accordingly left, and next day came to Auchtertyre, about two miles distance, over a hill, with the cattle of Auchtertyre, that had been grazing near to that place, and was drowned in a ditch the day following.

4to, Was its skin preserved, or the head, or any other bones of the skeleton? Could any part thereof be still found?

Answered: Neither the skin, nor any part of the skeleton was preserved, nor can now be had; though the declarant has often regretted the not preserving the foal, as its mother always performed any work that a horse of 15*l.* value could do.

5to, Is the mother still alive? What is her age?

Answer: The mother died about eight years ago, of an epidemic cold that was raging among the horses in this country: The mule had little or no milk after foaling, and the foal got some cow's milk: And this is all that he remembers of the matter. David Tullo.

Auchtertyre, 4th February 1780.

We James Small tenant in Burmouth, and Robert Ramsay tenant in Newtyle, hereby certify, That we have often seen the mule above-described; and we know that she had a foal, as is narrated by David Tullo.

James Small. Rob. Ramsay.

Ballantyne house, 4th February 1780.

The within interrogatories were put to David Tullo tenant in Auchtertyre, anent he mule he had, and the foal she produced; to which he gave the answers subjoined to each query, and signed them; as did James Small and Robert Ramsay, attesting the truth thereof, in presence of George Watson, J. P.

The original attestation is in the possession of the translator; and he lately transmitted notorial or authenticated copies of it to the count de Buffon, and to Thomas Pennant, Esq; of Downing, in Flintshire.

MULIER, in law, signifies the lawful issue born in wedlock, though begotten before. The mulier is pre-

preferred to an elder brother born out of matrimony; as for inftance, if a man has a fon by a woman before marriage, which iffue is a baftard, and afterwards marries the mother of the baftard, and they have another fon, this fecond fon is mulier and lawful, and fhall be heir of the father; but the other can be heir to no perfon †. By the civil law, where a man has iffue by a woman, if after that he marries her, the iffue is mulier.

† See the article *Baftard.*

MULL, one of the Weftern Iflands of Scotland, about 24 Scots miles long, and as much in breadth. It is in general rocky and barren, not producing a fufficient quantity of corn for the inhabitants; but about 1800 head of cattle are annually exported. The ifland was originally part of the dominions of the Lords of the Ifles; but in after-times it became part of the poffeffions of the ancient and valiant family of Macleanes, who ftill retain one-half. The other is the litigated property of the duke of Argyle, whofe anceftor poffeffed himfelf of it in 1674, on account of a debt; but after the courts of law had made an adjudication in his favour, he was obliged to fupport their decree by force of arms.

Mull *of Cantire*, the fouth cape or promontory of the county of Cantire or Mull, in the frith of Clyde, in the weft of Scotland.

Mull *of Galloway*, the fouth cape or promontory of all Scotland, in the county of Galloway, on the Irifh Sea.

MULLER, or Regiomontanus (John), a celebrated aftronomer of the 15th century, was born at Koningfhoven in Franconia in 1436, and acquired great reputation by publifhing an abridgment of Ptolemy's Almageft, which had been begun by Purback. He went to Rome to perfect himfelf in the Greek tongue, and to fee the cardinal Baffarion; but finding fome faults in the Latin tranflations of George de Trebizond, that tranflator's fon affaffinated him in a fecond journey he made to Rome in 1476, where Pope Sixtus IV. had provided for him the archbifhopric of Ratifbon, and had fent for him to reform the calendar. Others fay that he died of the plague.

MULLERAS, a town of Germany, in the circle of Upper Saxony, and marquifate of Brandenburg, feated 38 miles fouth of Berlin, upon a canal which joins the Oder and the Spree. This canal is 15 miles in length, 10 yards in breadth, and feven feet in depth. It was eight years in making; and fince that time the cities of Hamburg and Breflaw have carried on great trade by water. E. Long. 14. 50. N. Lat. 52. 21.

MULLET, in ichthyology. See Mugil.

Mullet, or *Mollet*, in heraldry, a bearing in form of the rowel of a fpur, which it originally reprefented. See Plate CXLIV.

MULLUS, in ichthyology, a genus of fifhes belonging to the order of thoracici. The *barbatus*, or red furmullet, was highly efteemed by the Romans, and bore an exceeding high price. The capricious epicures of Horace's days valued it in proportion to its fize; not that the larger were more delicious, but that they were more difficult to be got. The price that was given for one in the time of Juvenal and Pliny, is a ftriking evidence of the luxury and extravagance of the age:

> Mullum *fex millibus emit*
> *Æquantem fane paribus feftertia libris* ‡. Juv. Sat. IV.
>
> The lavifh flave
> Six thoufand pieces for a mullet gave,
> A fefterce for each pound. Dryden.

‡ 48 *l.* 8 *s.* 9 *d.*

But Afinius Celer, a man of confular dignity, gave a ftill more unconfcionable fum; for he did not fcruple beftowing 8000 *nummi*, or 64l. 11s. 8d. for a fifh of fo fmall a fize as the mullet: for, according to Horace, a *mullus trilibris*, or one of 3 ℔. was a great rarity; fo that Juvenal's fpark muft have had a great bargain in comparifon of what Celer had.

But Seneca fays, that it was not worth a farthing except it died in the very hand of your gueft: that fuch was the luxury of the times, that there were ftews even in the eating-rooms, fo that the fifh could at once be brought from under the table, and placed on it: that they put the mullets in tranfparent vafes, that they might be entertained with the various changes of its rich colour while it lay expiring. Apicius, a wonderful genius for luxurious inventions, firft hit upon the method of fuffocating them in the exquifite Carthaginian pickle, and afterwards procured a rich fauce from their livers. This is the fame gentleman whom Pliny, in another place, honours with the title of *Nepotum omnium altiffimus gurges;* an expreffion too forcible to be rendered in our language.

Mr Pennant has heard of this fpecies being taken on the coaft of Scotland, but had no opportunity of examining it; and whether it is found in the weft of England with the other fpecies or variety, we are not at this time informed. Salvianus makes it a diftinct fpecies, and fays that it is of a purple colour, ftriped with golden lines, and that it did not commonly exceed a palm in length: no wonder then that fuch a prodigy as one of 6 ℔. fhould fo captivate the fancy of the Roman epicure.

Mr Ray eftablifhes fome other diftinctions, fuch as the firft dorfal fin having nine rays, and the colour of that fin, the tail, and the pectoral fins, being of a very pale purple.

MULTIPLE, in arithmetic, a number which comprehends fome other feveral times: thus 6 is a multiple of 2, and 12 is a multiple of 6, 4, and 3; comprehending the firft twice, the fecond thrice, &c.

Action *of* MULTIPLEPOINDING, in Scots law. See Law, n° clxxxiii. 24.

MULTIPLICAND, in arithmetic, the number to be multiplied by another. See there, n° 10.

MULTIPLICATION, in general, the act of increafing the number of any thing.

Multiplication, in arithmetic, is a rule by which any given number may be fpeedily increafed, according to any propofed number of times *.

* See *Arithmetic*, n° 10.

Multiplication, in algebra. See Algebra, n° 5.

MULTIPLICATOR, or Multiplier, in arithmetic, the number by which any other is multiplied, or the number of times it is fuppofed to be taken. See Arithmetic, n° 10.

MULTIPLICATUS flos, a luxuriant flower, whofe petals are multiplied fo as to exclude a part of the ftamina.

A multiplied luxuriant flower differs from a full one, the higheſt degree of luxuriance, in that the petals of the latter are ſo multiplied as to exclude all the ſtamina: whereas thoſe of the former are only repeated or multiplied, two, three, or four times, as to the excluſion of only a ſmall part of the eſſential organs.

MULTIPLYING-GLASS, in optics, a glaſs wherewith objects appear increaſed in number. See (the *Index* ſubjoined to) OPTICS.

MULTURE, in Scots law, the quantity of grain paid to the proprietor or tackſman of a mill, for grinding.

MULVIA, a river of Barbary in Africa, which riſes in the mountains of Atlas, and divides the empire of Morocco from that of Algiers, and then falls into the Mediterranean, to the weſtward of Marſalquiver.

MUM, a kind of malt-liquor much drank in Germany, and chiefly brought from Brunſwick, which is the place of moſt note for making it. The proceſs of brewing mum, as recorded in the town-houſe of that city, is as follows: Take 63 gallons of water that has been boiled till one-third part is conſumed, and brew it with ſeven buſhels of wheaten malt, one buſhel of oat-meal, and one buſhel of ground beans. When it is tunned, the hogſhead muſt not be filled too full at firſt: as ſoon as it begins to work, put into it three pounds of the inner rind of fir, one pound of the tops of fir and beach, three handfuls of carduus benedictus, a handful or two of the flower of roſa ſolis: add burnet, betony, marjoram, avens, pennyroyal, and wild thyme, of each an handful and an half; of elder-flowers, two handfuls or more; ſeeds of cardamom bruiſed, 30 ounces; barberries bruiſed, one ounce: when the liquor has worked a while, put the herbs and ſeeds into the veſſel; and, after they are added, let it work over as little as poſſible; then fill it up: laſtly, when it is ſtopped, put into the hogſhead ten new-laid eggs unbroken; ſtop it up cloſe, and uſe it at two years end. The brewers of this country, inſtead of the inner rind of fir, uſe cardomom, ginger, and ſaſafras; and alſo add elicampane, madder, and red ſanders. Mum, on being imported, pays for every barrel 1 l. 5 s.

MUMMY, a body embalmed or dried, in the manner uſed by the ancient Egyptians; or the compoſition with which it is embalmed. There are two kinds of bodies denominated *mummies*. The firſt are only carcaſes dried by the heat of the ſun, and by that means kept from putrefaction: theſe are frequently found in the ſands of Libya. Some imagine, that theſe are the bodies of deceaſed people buried there on purpoſe to keep them entire without embalming; others think they are the carcaſes of travellers, who have been overwhelmed by the clouds of ſand raiſed by the hurricanes frequent in thoſe deſarts. The ſecond kind of mummies are bodies taken out of the catacombs near Cairo, in which the Egyptians depoſited their dead after embalming. See EMBALMING.

We have two different ſubſtances preſerved for medicinal uſe under the name of *mummy*, though both in ſome degree of the ſame origin. The one is the dried and preſerved fleſh of human bodies, embalmed with myrrh and ſpices; the other is the liquor running from ſuch mummies, when newly prepared, or when affected by great heat or damps. The latter is ſometimes in a liquid, ſometimes of a ſolid form, as it is preſerved in vials well ſtopped, or ſuffered to dry and harden in the air. The firſt kind of mummy is brought to us in large pieces, of a lax and friable texture, light and ſpungy, of a blackiſh brown colour, and often damp and clammy on the ſurface: it is of a ſtrong but diſagreeable ſmell. The ſecond kind of mummy, in its liquid ſtate, is a thick, opaque, and viſcous fluid, of a blackiſh colour, but not diſagreeable ſmell. In its indurated ſtate, it is a dry ſolid ſubſtance, of a fine ſhining black colour, and cloſe texture, eaſily broken, and of a good ſmell; very inflammable, and yielding a ſcent of myrrh and aromatic ingredients while burning. This, if we cannot be content without medicines from our own bodies, ought to be the mummy uſed in the ſhops; but it is very ſcarce and dear; while the other is ſo cheap, that it will always be moſt in uſe.

All theſe kinds of mummies are brought from Egypt. But we are not to imagine, that any body breaks up the real Egyptian mummies, to ſell them in pieces to the druggiſts, as they make a much better market of them in Europe whole, when they can contrive to get them. What our druggiſts are ſupplied with, is the fleſh of executed criminals, or of any other bodies the Jews can get, who fill them with the common bitumen, ſo plentiful in that part of the world; and adding a little aloes, and two or three other cheap ingredients, ſend them to be baked in an oven, till the juices are exhaled, and the embalming matter has penetrated ſo thoroughly that the fleſh will keep and bear tranſporting into Europe. Mummy has been eſteemed reſolvent and balſamic: but whatever virtues have been attributed to it, ſeem to be ſuch as depend more upon the ingredients uſed in preparing the fleſh, than in the fleſh itſelf; and it would ſurely be better to give thoſe ingredients without ſo ſhocking an addition.

MUMMY, among gardeners, a kind of wax uſed in grafting and planting the roots of trees, made in the following manner: Take one pound of black pitch, and a quarter of pound of turpentine; put them together into an earthen pot, and ſet them on fire in the open air, holding ſomething in your hand to cover and quench the mixture in time, which is to be alternately lighted and quenched till all the nitrous and volatile parts be evaporated. To this a little common wax is to be added; and the compoſition is then to be ſet by for uſe.

MUMPS. See MEDICINE, n° 526.

MUNDA, an ancient town of Spain, in the kingdom of Granada, ſeated on the declivity of a hill, at the bottom of which runs a river. W. Long. 4. 13. N. Lat. 48. 15.

MUNICH, a town of Germany, capital of the whole duchy of Bavaria, and the reſidence of the elector. It ſtands on the Iſer, 70 miles ſouth of Ratiſbon, and 214 weſt of Vienna, being one of the moſt pleaſant and populous cities of Germany for its bigneſs. The number of the inhabitants is ſaid to be about 40,000. Having been built at firſt on a ſpot of ground belonging to a convent, it had from thence, in German, the name of *Munchen*, i. e. *Monk's-town*, and a monk for its arms. The elector's palace here is a very grand ſtructure, conſiſting of ſeveral courts, fur-

furniſhed and adorned in the moſt magnificent manner, with tapeſtry, gilding, ſculpture, ſtatues, and paintings. It contains an amazing collection of jewels, antiquities, and curioſities. The great hall is 118 feet long, and 52 broad; and the ſtair-caſe leading to it, from top to bottom, of marble and gold. In the hall of antiquities are 354 buſts and ſtatues of jaſper and porphyry, braſs and marble. In this palace alſo is a library, containing a vaſt collection of books, and many valuable manuſcripts, in moſt languages, ancient and modern; and a chamber of rarities, among which is the picture of a bravo, or aſſaſſin, who is ſaid to have committed 345 murders with his own hand, and to have been accomplice in, or privy to, 400 more. The treaſury in the chapel contains alſo a vaſt number of pictures, precious ſtones, medals, veſſels of gold and ſilver, &c. Among other curioſities, here is a cherry-ſtone with 140 heads diſtinctly engraved upon it. The gardens of the palace are alſo very fine, and it is ſaid a ſecret paſſage leads from it to all the churches and convents in the town. There is a great number of other fine buildings in this city, public and private, particularly the riding-houſe, town-houſe, opera-room, the Jeſuits college, the large edifice for tournaments, the churches, convents, fountains, &c. Its manufactures are thoſe of ſilk, particularly velvet, woollen cloths, and tapeſtry; and it has two annual fairs, at which great quantities of ſalt, wine, &c. are ſold. The ſtreets are broad and regular; and moſt of the houſes well built, and painted on the outſide. The market-place is extremely beautiful. Mr Keyſler ſays, the ſervant-maids at the great inns here, on holidays, wear a ſilver chain round their necks, conſiſting of three rows; and that their breaſts are likewiſe laced with two other chains of the ſame metal. He further obſerved, that it was a general cuſtom to place a green garland, on a bundle of ſtraw, before every houſe containing the corpſe of an unmarried perſon. The common ſalutation here, and in the other catholic countries of Germany, is, *Praiſed be Jeſus Chriſt;* and the anſwer returned, *For ever amen:* two popes having granted an indulgence of 100 days each time to all that uſe it. Not far from Munich are four other palaces, with fine gardens, belonging to the elector, viz. thoſe of Sleiſheim, Nymphenburg, Dauchau, and Starenberg. The firſt and laſt are about three leagues from the capital; the ſecond about half a league; and the third about two, at a market-town of the ſame name.

MUNICIPAL, in the Roman civil law, an epithet which ſignifies inveſted with the rights and privileges of Roman citizens. Thus the municipal cities were thoſe whoſe inhabitants were capable of enjoying civil offices in the city of Rome: theſe cities, however, according to Mariana, had fewer privileges than the colonies; they had no ſuffrages or votes at Rome, but were left to be governed by their own laws and magiſtrates. Some few municipal cities, however, obtained the liberty of votes.

MUNICIPAL, among us, is applied to the laws that obtain in any particular city or province. And thoſe are called *municipal officers* who are elected to defend the intereſt of cities, to maintain their rights and privileges, and to preſerve order and harmony among the citizens; ſuch as mayors, ſheriffs, conſuls, &c.

MUNITION, the proviſions with which a place is furniſhed, in order for defence; or that which follows a camp for its ſubſiſtence.

MUNITION *Ships*, are thoſe that have ſtores on board in order to ſupply a fleet of men of war at ſea. In an engagement, all the munition-ſhips and victuallers attending the fleet take their ſtation in the rear of all the reſt; they are not to engage in the fight, but to attend ſuch directions as are ſent them by the admiral.

MUNSTER (Sebaſtian), a learned writer, was born at Ingelheim, and became a cordelier; but having embraced Luther's ſentiments, he quitted that order in 1529, and retired to Heidelberg, and afterwards to Baſil, where he taught with reputation. He was a man of great candour, and void of ambition; and was ſo well ſkilled in geography, the mathematics, and the Hebrew tongue, that he was ſurnamed the *Eſdras* and the *Strabo of Germany*. His Latin tranſlation of the bible is eſteemed. He was the firſt who wrote a Chaldee grammar and lexicon: he alſo publiſhed a treatiſe on coſmography, and ſeveral other works. He died of the plague at Baſil in 1552, aged 63.

MUNSTER, in Latin *Monomia*, and in Iriſh *Moun*, the moſt ſoutherly province of Ireland; bounded on the ſouth by the Vergivian ſea, on the weſt by the Atlantic ocean, on the north by the river Shannon which parts it from Connaught, and on the eaſt by the Iriſh ſea. Its length is about 130 miles; but its breadth is very unequal, being from 68 miles to 120. The air is healthful and temperate; and the ſoil, where properly cultivated, is fruitful both in corn and graſs; but the mountains are bleak and barren. The northern parts, being the moſt level and fertile, are the beſt improved and incloſed. Vaſt numbers of cattle are fed in the province; which is alſo well ſupplied with fiſh, eſpecially cod and herrings.

MUNSTER, a territory of Germany, in the circle of Weſtphalia; bounded on the north by Embden and Oldenburg, on the ſouth by the county of Mark and duchy of Weſtphalia, on the weſt by the county of Bentheim and the United Provinces, and on the eaſt by the biſhoprics of Oſnaburg and Paderborn together with the county of Ravenſberg. It is the largeſt of all the Weſtphalian biſhoprics, being in length about 80 miles, and in breadth from 20 to 60. It is divided into 13 bailiwics; and tho' in general but a barren country, has ſome fruitful plains, with woods, and quarries of ſtone. The inhabitants, excepting a few of the nobility and gentry, are all Roman Catholics; though Lutheraniſm had once a conſiderable footing here. The biſhop, who is generally alſo elector of Cologne, has a revenue from hence of about 70,000 pounds, and can maintain 8000 men. In conſequence of an unjuſt cuſtom, unknown in the reſt of the empire, he is heir to all ſtrangers who die in the country without children. In the matricula he is rated at 30 foot, and 118 horſe; or 832 florins monthly in lieu of them. His chapter conſiſts of 40 canons, who are all noble.

MUNSTER, a city of Germany, capital of a biſhopric of the ſame name and of all Weſtphalia, ſtands at the conflux of the river Aa with the Ems, in E. Long. 7. 49. N. Lat. 52. 0. It is of a circular form,

form, large, and well fortified both by nature and art. It hath a fine citadel called the *Brille*, erected by a bishop named *Bernard van Galen* in order to awe the burghers. The dean and chapter now elect the bishop; but till the beginning of the 13th century he was nominated by the emperor. This city has been rendered famous by three remarkable transactions 1. By the peace concluded here in 1648, which put an end to a war of 30 years; occasioned by the persecuting spirit of bigotted papists, who chose rather to plunge their country into all the calamities of war than allow liberty of conscience to the Protestants. By this peace, however, they consented, much against their inclinations, to grant them a toleration. 2. By the disorders and disturbances occasioned here in 1553, by a parcel of enthusiasts called the *Munster Anabaptists*, who, headed by a taylor, called *John of Leyden*, from the place of his birth, turned out the magistrates, and took possession of the city, where they perpetrated the most horrid villanies and cruelties. 3. For the noble, though unsuccessful, efforts it made in defence of its liberties against the tyranny and usurpation of the above-mentioned turbulent and bloody-minded bishop, Bernard van Galen. In this city are a great number of convents, and other religious houses, many of them stately piles, and surrounded with beautiful gardens.

MUNYCHIA, or *Munychius Portus*, (anc. geogr.) a village and port of Athens, nearer to the city, less than and fortified in the same manner with the Piræeus, to the east of which it lay, or between it and the promontory Sunium, at the mouth of the Ilissus. Strabo says it was an eminence in form of a peninsula, at the foot of which stood three harbours, anciently encompassed with a wall, taking within its extent the Piræeus and other harbours, full of docks, with the temple of Diana Munychia, (Pausanias); taking its name from Mynichus, the founder of the temple, (Strabo, Plutarch).

MURÆNA, or Eel, in ichthyology; a genus of fishes, belonging to the order of apodes. The head is smooth; there are ten rays in the membrane of the gills; the eyes are covered with a common skin; and the body is cylindrical and slimy. There are seven species, distinguished by their fins, tail, &c. The most remarkable are,

1. The *anguilla*, or common eel, is very frequent in all our fresh waters, ponds, ditches, and rivers: according to Mr Pennant, it is the most universal of fish, yet is scarce ever found in the Danube, though very common in the lakes and rivers of Upper Austria.

The eel is very singular in many things relating to its natural history, and in some respects borders on the nature of the reptile tribe. It is known to quit its element, and during night to wander along the meadows, not only in order to change its habitation, but also for the sake of prey, feeding on snails as it passes along. During winter it beds itself deep in the mud, and continues in a state like the serpent-kind. It is very impatient of cold, and will eagerly take shelter in a wisp of straw flung into a pond in severe weather, which has sometimes been practised as a method of taking them. Albertus affirms, that he has known eels to take shelter in a hay-rick; yet all perished through excess of cold.

It has been observed in a river of England called the *Nyne*, there is a variety of small eel, with a lesser head and narrower mouth than the common kind, that is found in clusters in the bottom of the river, and is called the *bed-eel*: these are sometimes roused up by the violent floods, and are never found at that time with meat in their stomach.

There is scarce any animal the generation of which has puzzled the learned more than this. Aristotle first broached an opinion that eels were of no sex, nor did propagate their species like other animals, but were equivocally gendered of the mud; and as wild and absurd a system as this is, there have not been wanting many, even in these latter and more enlightened times, who have given into it. But there is now no room to doubt that all animals are produced by the copulation of parents like themselves; and the finding of eels in new ponds is easily accounted for from the above-mentioned circumstance of their migration. Dr Plot, and many others, have given accounts of whole droves of them leaving one ditch or pond to go to another.

Though the learned world at this time generally allows that eels are produced like other animals, by parents of their own kind, yet there remain many doubts about the manner in which the generation is performed. Some allow the eels to be, like the generality of other animals, of different sexes in the different individuals; and others affirming that they are all hermaphrodites, each having the parts of generation of both sexes. Rondeletius affirms that they are of both sexes; and Mr Allan, who has given a very curious paper concerning them in the Philosophical Transactions, is of the same opinion; and both say, that the parts of the sexes may be discovered on a careful inspection; and some are found to be males, and others females; but these parts are, in both sexes, they say, buried in a large quantity of fat; and they are of opinion, that hence proceeded the mistake of Aristotle and his followers, who, not being able to find those parts, concluded that they did not exist at all. Among those who allow the eel to be produced, like other animals, from animal-parents which have the sexes, some are of opinion that they are viviparous, and others that they are oviparous: but Mr Chartwynd seems to have determined this controversy by observing, that if the aperture under the belly of the eel, which looks red in the month of May, be cut open at that time, the young eels will be seen to come forth alive after the operation. Mr Lewenhoeck says, that he found an uterus in every eel he examined; and therefore concludes, that they are hermaphrodites: and he supposes that they have no male parts of generation like those of other animals; but that the office of these is performed by a liquor analogous to the male seed of animals, which is contained in certain glands, situated on the inside of the uterus itself.

Eels have sometimes been met with in recent ponds, made at such a distance from any other water that we cannot reasonably suppose them to have migrated thither over land. But in these cases there is reason to believe, that the ponds have been supplied with them by the aquatic fowl of prey, in the same manner as vegetation is spread by many of the land-birds, either

either by being dropped, as they carry them to feed their young, or by paffing quick through their bodies, as is the cafe with herons.

Thefe fifh are extremely voracious, and deftructive to the fry of others. No fifh lives fo long out of water as the eel; and it is extremely tenacious of life, infomuch that its parts will move a confiderable time after they are flayed and cut in pieces. They vary much in their colours, from a footy hue to a light olive green; and thofe which are called *filver eels* have their bellies white, and a remarkable clearnefs throughout.

Befides thefe, there is a variety of this fifh known in the river Thames by the name of *grigs*, and about Oxford by that of *grigs* or *gluts*. Thefe are fcarce ever feen near Oxford in the winter; but appear in fpring, and bite readily at the hook, which common eels in that neighbourhood will not. They have a larger head, a blunter nofe, thicker fkin, and lefs fat, than the common fort; neither are they fo much efteemed, nor do they often exceed three or four pounds in weight.—Common eels grow to a large fize, fometimes weighing 15 or 20 pounds; but that is extremely rare. Mr Dale indeed, in the Philofophical Tranfactions, and fome others, bring inftances of eels much exceeding that fize; but Mr Pennant fufpects them to have been congers, fince the enormous fifh they defcribe have all been taken at the mouths of the Thames or Medway. The Romans held eels very cheap, probably on account of their likenefs to fnakes. On the contrary, the luxurious Sybarites were fo fond of thefe fifh, as to exempt from tribute of every kind thofe perfons who fold them.

2. The *conger*, or conger-eel, grows to a vaft fize. Dr Borlafe informs us, that they are fometimes taken near Mount's-bay of 100 lb. weight; and Mr Pennant affures us, that he has heard of fome taken near Scarborough that were 10 feet and a half long, and 18 inches in circumference in the thickeft part.

They differ from the common eel in the following particulars: 1. Their colour in general is more dark. 2. Their eyes much larger in proportion. 3. The irides of a bright filvery colour. 4. The lower jaw is rather fhorter than the upper. 5. The fide-line is broad, whitifh, and marked with a row of fmall fpots. 6. The edges of the dorfal and anal fins are black. 7. They have more bones than the common eel, efpecially along the back quite to the head. 8. They grow to a much larger fize.

As to the diftinction that Mr Ray and other writers make of the fmall beards at the end of the nofe, Mr Pennant thinks it not to be depended on, being fometimes found in both kinds, and fometimes entirely wanting.

Probably they generate like the frefh-water fpecies. Innumerable quantities of what are fuppofed to be their fry, come up the Severn about the month of April, preceding the fhads, which it is conjectured migrate into that river to feed on them: they are called *elvers*. They fwarm during their feafon, and are taken in a kind of fieve made of hair-cloth, fixed to a long pole; the fifherman ftanding on the edge of the water during the tide, puts in his net as far as he can reach, and drawing it out again, takes multitudes at every fweep, and will take as many during one tide as will fill a bufhel. They are dreffed, and reckoned very delicate.

Congers are extremely voracious, preying on other fifh, and on crabs at the time they have loft their fhell and are in a foft ftate. They and eels in general are alfo particularly fond of carcafes of any kind, being frequently found lodged in fuch as are accidentally taken up.

Thefe fifh are an article of commerce in Cornwall; numbers are taken on that coaft, and exported to Spain and Portugal, particularly to Barcelona.

Some are taken by a fingle hook and line, but (becaufe that way is tedious, and does not anfwer the expence of time and labour) they are chiefly caught by *bulters*, which are ftrong lines 500 feet long, with 60 hooks, each eight feet afunder, baited with pilchards or mackarel; the bulters are funk to the ground by a ftone faftened to them: fometimes fuch a number of thefe are tied together as to reach a mile.

The fifhermen are very fearful of a large conger, left it fhould endanger their legs by clinging round them; they therefore kill them as foon as poffible by ftriking them on the navel.

They are afterwards cured in this manner: They are flit, and hung on a frame till they dry, having a confiderable quantity of fat, which it is neceffary fhould exude before they are fit for ufe. It is remarkable that a conger of 100 weight will wafte by drying to 24 lb.; the people therefore prefer the fmalleft, poffibly becaufe they are fooneft cured. During the procefs there is a confiderable ftench; and it is faid, that in the fifhing villages the poultry are fed with the maggots that drop from the fifh. a

The Portuguefe and Spaniards ufe thofe dried congers after they have been ground into a powder, to thicken and give a relifh to their foups. They are fold for about 40 fhillings the quintal, which weighs 126 lb.

A fifhery of congers, fays Mr Pennant, would be of great advantage to the inhabitants of the Hebrides. Perhaps they would at firft undertake it with repugnancy, from their abfurd averfion to the eel kind.

MURAL CROWN. See CROWN.

MURATORI (Lewis Anthony), a learned and celebrated Italian writer, born at Vignoles, in the territory of Bologna, in 1672. He early difcovered an extreme fondnefs for the learned languages and fciences; and this was feconded by an excellent education. After having completed his firft ftudies, he embraced the ftate of an ecclefiaftic; and applied himfelf to polite literature, philofophy, theology, civil law, antiquities, and other fciences; by which means he became in a manner univerfally learned. He was fcarce 22 years of age when he was made librarian of the Ambrofian library at Milan. In 1700 the duke of Modena, his fovereign, recalled him, and made him his librarian, and keeper of the archives of his duchy. Muratori difcharged this double employment during the reft of his life, and had no other benefice than the provoftfhip of Santa Maria del Pompófa. He acquired the efteem of the learned throughout Europe, who had recourfe to him for the lights they wanted. He became an affociate to the Academies of the Ar-

cades

Murcia, Murder.

cades of Rome, Della Crusca, and Colomberia of Florence, the Academy of Etrusca at Cortona, the Royal Society of London, and of the Imperial Academy of Olmutz; and died in 1750. He wrote a great number of learned works; the principal of which are, 1. *Anecdota*, or a collection of pieces taken from the Ambrosian library, 2 vols 4to. with learned notes and dissertations. 2. A treatise on the perfection of the Italian poetry, 2 vols, 4to. 3. *Anecdota Græca*, 3 vols 4to. 4. A genealogical history of the house of Modena, 2 vols, folio. 5. An excellent collection of the writers of the Italian history, 27 vols folio, with learned notes. 6. Another collection, under the title of *Antiquitates Italicæ*. 7. A collection of ancient inscriptions, under the title of *Novus Thesaurus*, 6 vols folio. 8. The annals of Italy, 12 vols 4to. in Italian, &c. 9. Letters, dissertations, Italian poems, &c.

MURCIA, the Pagan goddess of idleness.—The name is taken from *murcus* or *murcidus*, an obsolete word, signifying a dull, slothful, or lazy person.—The statues of this goddess were always covered with dust and moss, to express her idleness and negligence. She had a temple in Rome, at the foot of Mount Aventine.

MURCIA, a kingdom in Spain, bounded on the north by New Castile, on the east by the kingdom of Valencia, on the west by Andalusia and Granada, and on the south by the Mediterranean Sea. It is about 62 miles in length, and 58 in breadth; and its principal river is Segura. The soil is dry, because it seldom rains, and therefore it produces little corn or wine; but there is plenty of oranges, citrons, lemons, olives, almonds, mulberries, rice, pulse, and sugar. It has also a great deal of silk. It was taken from the Moors in 1265. The air is very healthful.

MURCIA, a large, handsome, and populous town of Spain, capital of a kingdom of the same name, with a bishop's see. It contains six parishes and a superb cathedral, the stairs of whose steeple are so contrived, that a man may ride up to the top, either on horseback or in a coach. It is situated in a pleasant plain, which abounds in fine gardens about the city, in which are the best fruits in Spain. It is seated on the river Segura, in W. Long. 0. 36. N. Lat. 37. 48.

MURDER, or MURTHER, in law, is thus defined, or rather described, by Sir Edward Coke: "when a person, of sound memory and discretion, unlawfully killeth any reasonable creature in being, and under the king's peace, with malice aforethought, either express or implied." The best way of examining the nature of this crime will be by considering the several branches of this definition.

1. It must be committed by a person *of sound memory and discretion:* for lunatics or infants are incapable of committing any crime; unless in such cases where they shew a consciousness of doing wrong, and of course a discretion, or discernment between good and evil.

2. Next, it happens when a person of such sound discretion *unlawfully killeth*. The unlawfulness arises from the killing without warrant or excuse: and there must also be an actual killing to constitute murder; for a bare assault, with intent to kill, is only a great misdemesnor, tho' formerly it was held to be murder.

Murder.

The killing may be by poisoning, striking, starving, drowning, and a thousand other forms of death, by which human nature may be overcome. Of these the most detestable of all is poison; because it can of all others be the least prevented, either by manhood or forethought. And therefore, by the stat. 22 Hen. VIII. c. 9. it was made treason, and a more grievous and lingering kind of death was inflicted on it than the common law allowed; namely, *boiling to death:* but this act did not live long, being repealed by 1 Edw. VI. c. 12. There was also, by the ancient common law, one species of killing held to be murder, which may be dubious at this day, as there hath not been an instance wherein it has been held to be murder for many ages past, viz. bearing false witness against another, *Black's Comment.* with an express premeditated design to take away his life, so as the innocent person be condemned and executed. The Gothic laws punished in this case both the judge, the witnesses, and the prosecutor; and, among the Romans, the *lex Cornelia de sicariis*, punished the false witness with death, as being guilty of a species of assassination. And there is no doubt but this is equally murder *in foro conscientiæ* as killing with a sword; though the modern law (to avoid the danger of deterring witnesses from giving evidence upon capital prosecutions, if it must be at the peril of their own lives) has not yet punished it as such. If a man, however, does such an act, of which the probable consequence may be, and eventually is, death; such killing may be murder, although no stroke be struck by himself, and no killing may be primarily intended: as was the case of the unnatural son who exposed his sick father to the air against his will, by reason whereof he died; and of the harlot, who laid her child under leaves in an orchard, where a kite struck it, and killed it. So too, if a man hath a beast that is used to do mischief; and he, knowing it, *suffers* it to go abroad, and it kills a man; even this is manslaughter in the owner: but if he had purposely *turned it loose*, though barely to frighten people, and make what is called *sport*, it is with us (as in the Jewish law) as much murder as if he had incited a bear or a dog to worry them. If a physician or surgeon gives his patient a potion or plaster to cure him, which, contrary to expectation, kills him, this is neither murder nor manslaughter, but mi[s]adventure; and he shall not be punished criminally, however liable he might formerly have been to a civil action for neglect or ignorance: but it hath been holden, that if it be not a *regular* physician or surgeon who administers the medicine, or performs the operation, it is manslaughter at the least. Yet Sir Matthew Hale very justly questions the law of this determination; since physic and salves were in use before licensed physicians and surgeons: wherefore he treats this doctrine as apocryphal, and fitted only to gratify and flatter licentiates and doctors in physic; though it may be of use to make people cautious and wary how they meddle too much in so dangerous an employment. In order also to make the killing murder, it is requisite that the party die within a year and a day after the stroke received, or cause of death administered; in the computation of which the whole day upon which the hurt was done shall be reckoned the first.

3. Farther: The person killed must be "*a reasonable*

 able creature in being, and under the king's peace," at the time of the killing. Therefore to kill an alien, a Jew, or an outlaw, who are all under the king's peace or protection, is as much murder as to kill the moft regular-born Englifhman; except he be an alien-enemy, in time of war. To kill a child in its mother's womb, is now no murder, but a great mifprifion: but if the child be born alive, and dieth by reafon of the potion or bruifes it received in the womb, it feems, by the better opinion, to be murder in fuch as adminiftered or gave them. As to the murder of baftard-children, fee Bastard.

4. Laftly, the killing muft be committed "*with malice aforethought,*" to make it the crime of murder. This is the grand criterion which now diftinguifhes murder from other killing: and this malice prepenfe, *malitia præcogitata*, is is not fo properly fpite or malevolence to the deceafed in particular, as any evil defign in general; the dictate of a wicked, depraved, and malignant heart; *un difpofition à faire un male chofe:* and it may be either *exprefs*, or *implied*, in law. Exprefs malice is when one, with a fedate deliberate mind and formed defign, doth kill another: which formed defign is evidenced by external circumftances difcovering that inward intention; as lying in wait, antecedent menaces, former grudges, and concerted fchemes to do him fome bodily harm. This takes in the cafe of deliberate duelling, where both parties meet avowedly with an intent to murder: thinking it their duty, as gentlemen, and claiming it as their right, to wanton with their own lives and thofe of their fellow-creatures; without any warrant or authority from any power either divine or human, but in direct contradiction to the laws both of God and man: and therefore the law has juftly fixed the crime and punifhment of murder on them, and on their feconds alfo. Yet it requires fuch a degree of paffive valour to combat the dread of even undeferved contempt, arifing from the falfe notions of honour too generally received in Europe, that the ftrongeft prohibitions and penalties of the law will never be entirely effectual to eradicate this unhappy cuftom, till a method be found out of compelling the original aggreffor to make fome other fatisfaction to the affronted party, which the world fhall efteem equally reputable as that which is now given at the hazard of the life and fortune, as well of the perfon infulted, as of him who hath given the infult. Alfo, if even upon a fudden provocation one beats another in a cruel and unufual manner, fo that he dies, tho' he did not intend his death, yet he is guilty of murder by exprefs malice; *i. e.* by an exprefs evil defign, the genuine fenfe of *malitia*. As when a park-keeper tied a boy that was ftealing wood to a horfe's tail, and dragged him along the park; when a mafter corrected his fervant with an iron bar, and a fchoolmafter ftamped on his fcholar's belly, fo that each of the fufferers died; thefe were juftly held to be murders, becaufe the correction being exceffive, and fuch as could not proceed but from a bad heart, it was equivalent to a deliberate act of flaughter. Neither fhall he be guilty of a lefs crime who kills another in confequence of fuch a wilful act as fhews him to be an enemy to all mankind in general; as going deliberately, and with an intent to do mifchief, upon a horfe ufed to ftrike, or coolly difcharging a gun among a multitude of people. So if a man refolves to kill the next man he meets, and does kill him, it is murder, although he knew him not; for this is univerfal malice. And if two or more come together to do an unlawful act againft the king's peace, of which the probable confequence might be bloodfhed; as to beat a man, to commit a riot, or to rob a park, and one of them kills a man; it is murder in them all, becaufe of the unlawful act, the *malitia præcogitata*, or evil intended beforehand.

Alfo in many cafes where no malice is expreffed, the law will imply it: as, where a man wilfully poifons another, in fuch a deliberate act the law prefumes malice, though no particular enmity can be proved. And if a man kills another fuddenly, without any, or without a confiderable provocation, the law implies malice; for no perfon, unlefs of an abandoned heart, would be guilty of fuch an act upon a flight or no apparent caufe. No affront, by words, or geftures only, is a fufficient provocation, fo as to excufe or extenuate fuch acts of violence as manifeftly endanger the life of another. But if the perfon fo provoked had unfortunately killed the other, by beating him in fuch a manner as fhewed only an intent to chaftife and not to kill him, the law fo far confiders the provocation of contumelious behaviour, as to adjudge it only manflaughter, and not murder. In like manner, if one kills an officer of juftice, either civil or criminal, in the execution of his duty, or any of his affiftants endeavouring to conferve the peace, or any private perfon endeavouring to fupprefs an affray or apprehend a felon, knowing his authority or the intention with which he interpofes, the law will imply malice, and the killer fhall be guilty of murder. And if one intends to do another felony, and undefignedly kills a man, this is alfo murder. Thus if one fhoots at A and miffes him, but kills B, this is murder; becaufe of the previous felonious intent, which the law transfers from one to the other. The fame is the cafe, where one lays poifon for A; and B, againft whom the prifoner had no malicious intent, takes it, and it kills him; this is likewife murder. So alfo, if one gives a woman with child a medicine to procure abortion, and it operates fo violently as to kill the woman, this is murder in the perfon who gave it. It were endlefs to go through all the cafes of homicide, which have been adjudged, either exprefsly or impliedly, malicious: thefe therefore may fuffice as a fpecimen; and we may take it for a general rule, that all homicide is malicious, and of courfe amounts to murder, unlefs where juftified by the command or permiffion of the law; excufed on a principle of accident or felf-prefervation; or alleviated into manflaughter, by being either the involuntary confequence of fome act, not ftrictly lawful, or (if voluntary) occafioned by fome fudden and fufficiently violent provocation. And all thefe circumftances of juftification, excufe, or alleviation, it is incumbent upon the prifoner to make out, to the fatisfaction of the court and jury: the latter of whom are to decide whether the circumftances alleged are proved to have actually exifted; the former, how far they extend to take away or mitigate the guilt. For all homicide is prefumed to be malicious, until the contrary appeareth upon evidence.

The punifhment of murder, and that of manflaughter,

slaughter, were formerly one and the same; both having the benefit of clergy: so that none but unlearned persons, who least knew the guilt of it, were put to death for this enormous crime. But now, by several statutes, the benefit of clergy is taken away from murderers through malice prepense, their abettors, procurers, and counsellors. In atrocious cases it was frequently usual for the court to direct the murderer, after execution, to be hung upon a gibbet in chains near the place where the fact was committed; but this was no part of the legal judgment; and the like is still sometimes practised in the case of notorious thieves. This, being quite contrary to the express command of the mosaical law, seems to have been borrowed from the civil law; which, besides the terror of the example, gives also another reason for this practice, viz. that it is a comfortable sight to the relations and friends of the deceased. But now, in England, it is enacted by statute 25 Geo. II. c. 37. that the judge, before whom any person is found guilty of wilful murder, shall pronounce sentence immediately after conviction, unless he sees cause to postpone it; and shall in passing sentence direct him to be executed on the next day but one (unless the same shall be Sunday, and then on the Monday following), and that his body be delivered to the surgeons to be dissected and anatomized; and that the judge may direct his body to be afterwards hung in chains, but in nowise to be buried without dissection. And, during the short but awful interval between sentence and execution, the prisoner shall be kept alone, and sustained with only bread and water. But a power is allowed to the judge, upon good and sufficient cause, to respite the execution, and relax the other restraints of this act. See further, PARRICIDE, and PETIT *Treason*.

MURDERERS, or *Murdering Pieces*, in a ship, are small pieces of ordnance, either of brass or iron, which have chambers put in at their breeches. They are used at the bulk-heads of the fore-castle, half-deck, or steerage, in order to clear the deck, on the ship's beind boarded by an enemy.

MURENA. See MURÆNA.

MURENGERS, two officers of great antiquity in the city of Chester, annually chosen out of the aldermen, to see that the walls are kept in repair, and to receive a certain toll and custom for the maintenance thereof.

MURET (Mark Anthony Francis) in Latin *Muretus*, was born at Muret, near Limoges, in 1526. He acquired a perfect knowledge of the Greek and Latin tongues without any instructor, and became one of the most learned men of his time. After having taught some time in Provence, he was made a professor at Paris in the same college with Turnebus and Buchanan. In 1554, he went into Italy; and in 1563 was professor of law, philosophy, and history, at Rome, where he died in 1585. His principal works are, 1. Excellent notes on Terence, Horace, Catullus, Tacitus, Cicero, Sallust, Aristotle, Xenophon, &c. 2. *Orationes*. 3. *Variæ Lectiones, Poemata, Hymni Sacri*. 4. *Disputationes in Lib. I. Pandectorum, de Origine Juris, &c.* 5. *Epistolæ, Juvenilia Carmina, &c.* Most of Muret's works have been printed in the Venice edition of 1737, in 5 vols 8vo.

MUREX, in zoology, a genus of insects belonging to the order of vermes testacea. This animal is of the snail-kind: the shell consists of one spiral valve, rough, with membranaceous furrows; and the aperture terminates in an entire canal, either streight, or somewhat ascending. There are 60 species, particularly distinguished by peculiarities in their shells, &c.

From a species of murex was obtained the famous Tyrian dye so much valued by the ancients. This, however, has long been superseded by the use of the cochineal. One of the shells producing the dye was a kind of buccinum; but the finest, or Tyrian purple, was got from the murex. These species of shells are found in various parts of the Mediterranean. Immense heaps of them are to be seen about Tarentum to this day, evincing one place where this precious liquor was extracted. See Plate CLXXVI. fig. 1.

In the accounts of a Spanish philosopher it is mentioned, that on the coasts of Guayaquil and Guatimala in Peru the murex is also found. The shell which contains it adheres to the rocks that are washed by the sea: it is of the size of a large walnut. The liquor may be extracted two ways; some kill the animal after they have drawn it out of the shell; then press it with a knife from head to tail; separate from the body the part where the liquor is collected, and throw away the rest. When this operation, after being repeated on several snails, has afforded a certain quantity of fluid, the thread intended to be dyed is dipped in it, and the process is finished. The colour, which is at first of the whiteness of milk, becomes afterwards green, and is not purple till the thread is dry. Those who disapprove of this method, draw the fish partly out of the shell, and, squeezing it, make it yield a fluid which serves for dying: they repeat this operation four times at different intervals, but always with less success. If they continue it, the fish dies. No colour at present known, says the abbé Raynal, can be compared to this, either as to lustre, liveliness, or duration. It succeeds better on cotton than wool, linen, or silk.

MURIA, *Alimentary salt*. See SALT.

MURRAIN, or GARGLE, a contagious disease among cattle. The symptoms are, a hanging down and swelling of the head, abundance of gum in the eyes, rattling in the throat, a short breath, palpitation at the heart, staggering, a hot breath, and a shining tongue. In order to prevent this disease, the cattle should stand cool in summer, and have plenty of good water: all carrion should be speedily buried; and as the feeding of cattle in wet places, on rotten grass and hay, often occasions this disease, dry and sweet fodder should be given them.

MURRAY, a county of Scotland, extending by the coast from the river Spey on the east to Beauly on the west, which is the boundary of the province of Ross; and comprehending the countries of Stathspey, Badenoch, Strathern, Srathnairn, and Strathnerick.

According to the account of the reverend Mr Shaw minister of Elgin, in answer to some queries of Mr Pennant, the country produces wheat, barley, oats, rye, pease, and beans. Of these, in plentiful years, upwards of 20,000 bolls are exported, besides serving the

Murray. the country itfelf and fome of the Highland countries. Some hemp is alfo cultivated, and a great deal of flax; of which linen is made, not only for home-confumption, but a confiderable quantity of linen-yarn is exported. Great quantities of potatoes are alfo cultivated. Several hundreds of black cattle alfo are exported from the Highlands of Murray, but few or none from the Lowlands.—Peculiar to this province is a kind of wood, called *red faugh*, or *fallow;* which is no lefs beautiful than mahogony. It is much more firm and tough than mahogony, and refembles the lighter-coloured kind of that wood. It receives a fine polifh, but is very fcarce, growing on rocks. But there are great forefts of firs and birches, which our author thinks are the remains of the Sylva Caledonia. Here alfo is found a remarkable root, called by the natives *carmele:* it grows in heaths and birch-woods to the bignefs of a large nut; and fometimes there are four or five roots joined together by fibres. It has a green ftalk, and fmall red flowers. Dio, fpeaking of of the Caledonians, fays, *Certum cibi genus parant ad omnia, quem fi ceperint quantum eft unius fabæ magnitudo, minime efurire aut fitire folent.* Cæfar alfo tells us of a root called *chara*, which his foldiers mixed with milk and made into bread when in want of provifion, which greatly relieved them. This root, Mr Shaw thinks, is the fame with the *carmele*, or *fweet root* of Murray. He informs us, that he hath often feen it dried, and kept for journeys through hills where no provifion was to be had: he has likewife feen it pounded and infufed; the liquor makes a more agreeable and wholefome liquor than mead. It grows in fuch plenty, that a cart-load of it can eafily be gathered.

Murray is interfected by the rivers Spey, Loffey, Findern, Nairn, Nefs, and Beauly. The river of Spey, rifing on the borders of Lochaber, is more than 60 Scots, or 100 Englifh miles long, but too rapid to be navigable. Upon this river great floats of fir and birch-wood are carried down to the Frith; the float is guided by a man fitting on a *courach*. This veffel is of an oval fhape, about four feet long and three broad; a fmall keel from head to ftern; a few ribs crofs the keel, and a ring of pliable wood round the lip of it; the whole covered with the rough hide of an ox or horfe. The rower fits on a tranfverfe feat in the middle, and holds in his hand a rope, the end of which is tied to the float, and with the other hand he manages a paddle, keeps the float in deep water, and brings it to fhore when he pleafes. In this province, alfo, is Loch Nefs, remarkable for its never freezing. There are many other lakes in this country, of which one called *Dundelchack* is remarkable in that it is never covered with ice before the month of January; but after that time one night's ftrong froft covers it all over. On the eaft fide of Loch Nefs, a large mile above the loch, is the waterfall of Foher, where the river *Feach-Len* falls over a fteep rock about 80 feet high; and a thick fog rifes from the place where it falls, occafioned by the violent dafhing of the water. There is a confiderable falmon-fifhery on the rivers Spey, Findern, Nefs, and Beauly, which ferves the towns and country, befides exporting to the value of 12,000 l. annually.

There are many natural caves in the hills of this country, which formerly were the receptacles of thieves and robbers, and now afford fhelter to hunters and fhepherds in ftormy weather. The moft remarkable mountain is *Carngern*, in Strathfpey. In it are found a particular kind of ftones well known to the lapidaries. They are of blue, green, yellow, and amber colours; fome fo large as to make fnuff-boxes, or fmall cups; fome of hexagonal or pentagonal figures, and tapering to a point at each end. The mountain of Benalar, in Badenoch, is by Mr Shaw reckoned to be the higheft land in Scotland, as waters flowing from it fall into the fea at Dundee, Inverlochy, and Garmoch in Murray.

Mus. MUS, in zoology, a genus of quadrupeds, belonging to the order of glires; the genuine character of which is, that the fore-teeth of the lower jaws are fubulated. There are fpecies.

1. The porcellus, or Guiney-pig, fo called from its being fuppofed to come only from Guinea, is a native of Brafil as well as Guinea. It is about the fize of a young pig, and hath erect hair not unlike it. The colour is white or white varied with orange and black in irregular blotches; hath no tail, but very large broad ears rounded at the fides. Thefe animals are of fuch a hot conftitution, that they copulate five or fix weeks after birth. They acquire not, however, their full growth before the eighth or ninth month. But this increafe of fize confifts only of fat; for the folid parts are fully unfolded before the age of fix months. The females go with young only three weeks: the firft litter confifts of four or five; the fecond of five or fix; and the fucceeding ones of feven or eight, and fometimes of 10 or 12. The mother fuckles her young 12 or 15 days: fhe banifhes them as foon as fhe receives the male, which happens at fartheft three weeks after her delivery; and if any of them perfift in following her, they are maltreated and killed by the male. As they breed fo faft, their multitudes would be innumerable, if there were not fo many enemies which deftroy them. They cannot refift either cold or moifture; when cold, they affemble and crowd clofe together, in which cafe they often all perifh together. They are alfo devoured in great numbers by cats, and many are killed by the males. Though perpetually throwing out urine, they never drink. They feed on all kinds of herbs; but efpecially on parfley, which they prefer to grain or bread; and they are likewife fond of apples and other fruits. They eat precipitately like the rabbit, little at a time, but very often; make a grunting noife like a little pig, and are very reftlefs. No mention is made by natural hiftorians of the manners of this animal in a wild ftate. Their fkin is hardly of any value; and their flefh, though eatable, is not fo good as to be much demanded: but it might be improved by keeping them in warrens, where they would have the benefit of the frefh air, and the liberty of choofing herbs agreeable to their tafte. Thofe kept in houfes have nearly the fame bad tafte with warren-rabbits; and thofe kept in gardens during the fummer, have an infipid, but lefs difagreeable flavour.

2. The aguti, is about the fize of a hare, has a fhort tail; four toes on the fore-feet, three on the hind ones; and a yellowifh belly. According to M. Buffon, it is an animal peculiar to the fouthern parts of America, being

Mus. ing never found in the old world. It is common in Brafil, Guiana, St Domingo, and all the iflands; and feems to require a warm climate in order to fubfift and multiply. However, they can live in France, if kept in a dry place, and fheltered from winter-frofts. The aguti is a very mifchievous animal, and bites cruelly: he grunts like a pig; is very voracious; fits on his hind-legs, and holds his food with the fore-feet when he eats: hides what he cannot confume: hops like a hare, and runs very faft both on plain and rifing grounds; but as his fore-legs are much fhorter than the hind-ones, he would tumble headlong if he did not flacken his courfe in defcending. Both his eye and his ear are fine; he ftops and liftens to the found of mufic: the flefh of thofe which are fat and well-fed is not very bad, though it be hard, and not very agreeable to the tafte. They fcald the aguti, and make him ready in the fame manner as a pig. He is hunted with dogs. When forced among the cut fugar-canes, he is foon taken; becaufe thefe grounds being generally covered a foot thick with ftraw and leaves, at each leap he finks in this litter, fo that a man may overtake and flay him with a baton. He commonly runs very nimbly before the dogs; and when he gains his retreat, he lies fquat, and remains obftinately in his concealment. The hunters are obliged to chace him out by filling his hole with fmoke. The animal, half fuffocated, utters mournful cries; but never iffues forth, unlefs when pufhed to the laft extremity. His cry, which he often repeats when difturbed or irritated, refembles that of a fmall hog. If taken young, he is eafily tamed, and goes out and returns of his own accord. Thefe animals commonly refide in the woods and hedges; where the females choofe a place well covered and bufhy, and there prepare a bed of leaves and hay for their young. They annually produce two or three, but generally two. Like the cats, they tranfport their young, two or three days after birth, into the hollows of trees, where they fuckle them for a fhort time; the young are foon in a condition to follow their mother, and to fearch for food.

Plate CLXXXIII fig. 2.

3. The leporinus, or Java hare, is about the fize of an ordinary hare: the hair of a reddifh brown-colour; the head fmall in proportion to the body; the eyes large and prominent; the ears like thofe of a rat; in other refpects the head refembles both a deer and hare; the hind-part of the body and thighs remarkably big; the legs long; four toes on the fore-feet, and three on the hind-feet: is a native of Java and Sumatra. The above defcription was taken from an an animal of this kind in the poffeffion of the duke of Richmond. It was very tame and inoffenfive, and fed only on fruit and other vegetables.

Plate CLXXXII. fig. 6

4. The citellus, or earlefs marmot, hath a fhort tail, an afh-coloured body, and no ears. It inhabits Bohemia, Auftria, Hungary, and Siberia. It hath been confounded with the cricetus, or hamfter; but, according to M. Buffon, the differences between them are very confpicuous, chiefly in the want of ears in the citellus; for though the ears of the hamfter are fhort, they are broad, and very obfervable; the citellus alfo never copulates with the hamfter, which is fufficient to remove every doubt with regard to the diverfity of their fpecies. This creature burrows, and forms its magazine of corn, nuts, &c. for its winter-food. It fits up like a fquirrel. By Gmelin's account, fome inhabit the fields in Siberia, others penetrate into granaries; the former make holes in the ground with a double entrance, and fleep during winter in the centre of their lodge: thofe which inhabit the granaries are in motion during the whole of the cold feafon. They couple in the beginning of May, and bring from five to eight young, which they bring up in their burrows, and cover with hay. They whiftle like the marmot; are very irafcible, and bite very feverely: their furs were once ufed by the ladies of Bohemia to make cloaks. Mus.

5. The lemmus, or lemming, hath a fhort tail, five toes on both fore and hind feet, and the body is variegated with green and yellow. This creature, which is one of the moft fingular that we know of, is faid to be a native of the mountains of Kolin in Lapland. They appear not every year; but at certain unforefeen periods they come in fuch numbers, that they fpread every where, and cover the whole furface of the earth. The arrival of the lemmings is confidered as a terrible fcourge, the effects of which it is impoffible to avoid. They make dreadful devaftations in the fields; lay wafte the gardens; ruin the crops; and leave nothing, except what is fhut up in houfes, where they never enter. They bark nearly like fmall dogs. When attacked, they neither fear clubs nor halberds, but dart againft thofe who ftrike them, outrageoufly biting, and fixing upon the weapons employed to kill them. When ftruck at with a ftick, they feize it fo forcibly with their teeth, that they allow themfelves to be carried to a confiderable diftance without quitting their hold. They dig holes in the earth, and make roads like the moles, in queft of roots. They fometimes make war, and divide themfelves into two armies along the lakes and meadows. Their enemies are foxes and ermines, who devour great numbers of them. Grafs that has been ate down, and fprings again, is faid to kill them: and they feem likewife to commit fuicide; for they are often found fufpended on the branches of trees; and they probably throw themfelves in troops into the waters like the fwallows. It would alfo appear, that the lemmings, like the rats, mutually deftroy and eat each other, when pafture fails them; and that this is the reafon why their deftruction is as fudden as their multiplication. At particular times they affemble together, and the whole die in company. They are very courageous, and defend themfelves againft other animals. It is not certainly known whence they come. The vulgar believe that they fall from the clouds along with the rain. Upon the renewal of the grafs they infallibly die. In fine weather they take to the water in vaft multitudes; but when a breeze of wind arifes, they are all drowned. The number of thefe animals is fo prodigious, that when they die the air is infected, and produces many difeafes. They even feem to infect the plants which they gnaw; for the pafture then kills the cattle. The flefh of the lemmings is not good to eat; and their fkin, though the hair be fine, does not anfwer for making furs, becaufe it is too thick. Plate CLXXXIV fig. 3.

6. The paca, or fpotted cavy, is an animal peculiar to the new world, particularly Brazil. It has a fhort tail, five toes on each foot, and three yellowifh lines on each fide. It refembles a pig of two months old; and its flefh is fat, and makes excellent food.

Even the ſkin is eat, like that of a pig. For theſe reaſons this animal is in perpetual requeſt. It is difficult for the hunters to take him alive. When ſurpriſed in his hole, which they lay open both before and behind, he defends himſelf, and even bites fiercely. His ſkin, though covered with coarſe ſhort hair, makes a very good fur, becauſe it is regularly ſpotted on both ſides. Theſe animals produce often and in great numbers; many of them are deſtroyed by men and beaſts of prey, and yet the ſpecies is always numerous.

When kept in a wooden cage or box, this animal remains perfectly tranquil during the day, eſpecially when plentifully ſupplied with food. He ſeems even to have an affection for his retreat as long as the day laſts; for, after feeding, he retires ſpontaneouſly into it. But when night approaches, by perpetual reſtleſſneſs and agitation, and by tearing the bars of his priſon with his teeth, he diſcovers a violent deſire of getting out. Nothing of this kind happens during the day, unleſs he has occaſion for ſome natural evacuation; for he cannot endure the ſmalleſt degree of dirtineſs in his little apartment; and when about to void his excrements, always retires to the moſt diſtant corner he can find. When his ſtraw begins to ſmell, he often throws it out, as if he meant to demand freſh litter. This old ſtraw he puſhes out with his muzzle, and goes in queſt of rags or paper to replace it. In a female cavy, the following extraordinary inſtance of cleanlineſs was obſerved. A large male rabbit being ſhut up with her when ſhe was in ſeaſon, ſhe took an averſion to him the moment he voided his excrement in their common apartment. Before this ſhe was very fond of him; licked his noſe, ears, and body; and allowed him to take almoſt the whole food that was given her. But as ſoon as the rabbit had infected the cage with his ordure, ſhe retired into the bottom of an old preſs, where ſhe made a bed with paper and rags, and returned not to her old lodging, till ſhe ſaw it neat, and freed from the unclean gueſt which had been preſented to her.

The ſpotted cavy is eaſily accuſtomed to a domeſtic life. Unleſs induſtriouſly irritated, he is gentle and tractable. He is fond of adulation, and licks the hands of the perſon who careſſes him. He knows thoſe who take care of him, and readily diſtinguiſhes their voices. When gently ſtroaked on the back, he ſtretches himſelf out, lies down on his belly, by a ſmall cry expreſſes his acknowledgment, and ſeems to aſk a continuance of the favour. When ſeized in a rough manner, however, he makes very violent efforts to eſcape.

Plate CLXXXIV fig. 1.

7. The marmota, or marmot, has a ſhort hairy tail, round ears, and gibbous cheeks. It is found only on the tops of the higheſt mountains, and is more ſubject to be rendered torpid by cold than any other. In the end of September, or beginning of October, he retires into his hole, from which he comes not out till the beginning of April. His retreat is capacious, broader than long, and very deep, ſo that it can contain ſeveral marmots, without any danger of corrupting the air. With their feet and claws, which are admirably adapted for the purpoſe, they dig the earth with ſurpriſing quickneſs, and throw it behind them. It is not a hole, or a ſtraight or winding tube, but a ſpecies of gallery made in the form of a Y, each branch of which has an aperture, and both terminate in one where the animal lodges. As the whole is made on the declivity of a mountain, the innermoſt part alone is on a level. Both branches of the Y are inclined, and the one is uſed for depoſiting the excrements of the animals, and the other for their going out and coming in. The place of their abode is well lined with moſs and hay, of which they make ample proviſion during the ſummer. It is even affirmed, that this labour is carried on jointly; that ſome cut the fineſt herbage, which is collected by others, and that they alternately ſerve as vehicles for tranſporting it to their dens. One, it is ſaid, lies down on his back, allows himſelf to be loaded with hay, extends his limbs, and others trail him in this manner by the tail, taking care not to overſet him. Theſe repeated frictions are aſſigned as the reaſon why the hair is generally rubbed off their backs. But it is more probable, that this effect is produced by their frequent digging of the earth. But, whatever may be in this, it is certain that they dwell together, and work in common at their habitations, where they paſs three-fourths of their lives. Thither they retire during rain, or upon the approach of danger; and never go out but in fine weather, and even then to no great diſtance. One ſtands centinel upon a rock, while the others ſport on the graſs, or are employed in cutting it to make hay. When the ſentinel perceives a man, an eagle, a dog, &c. he alarms the reſt with a loud whiſtle, and is himſelf the laſt to enter the hole. They make no proviſions for winter; nor have they in that ſeaſon any occaſion for them, as lying aſleep all that time. As ſoon as they perceive the firſt approaches of the ſleeping ſeaſon, they ſet to work in ſhutting up the two entrances of their habitation; and this they perform with ſuch labour and ſolidity, that it is eaſier to dig the earth any where elſe than in the parts they have fortified. They are at this time very fat, weighing ſometimes 20 pounds; and they continue to be plump for three months; but afterwards they gradually decay, and are extremely emaciated at the end of winter. When diſcovered in their retreats, they are found rolled up in the form of a ball, covered with hay; and they are carried off in ſo torpid a ſtate, that they may be killed without ſeeming to feel pain. The fatteſt are choſen for eating, and the young ones for taming. When taken young, they may be rendered nearly as tame as our other domeſtic animals. They learn to ſeize a ſtick, to dance, to perform various geſticulations, and to obey the voice of their maſter. Like the cat, the marmot has an antipathy againſt dogs. When he begins to be familiar in the houſe, and perceives that he is protected by his maſter, he attacks and bites dogs of the moſt formidable kind. Though not ſo large as a hare, he is ſtouter, and his ſtrength is aided by a peculiar ſuppleneſs and dexterity. With his fore-teeth, which are pretty long, he bites moſt cruelly; he attacks not, however, either dogs or men, unleſs previouſly irritated. If not prevented, he gnaws furniture and ſtuffs; and when confined, pierces even through wood. His voice reſembles the murmuring of a young dog when careſſed or in a ſporting humour; but, when irritated or frighted, he makes a whiſtling noiſe, ſo loud and piercing, that it hurts the ear. The marmots eat every thing preſented to them; as fleſh, bread, fruit, roots, pot-herbs, may-bugs, graſhoppers, &c. but milk and butter they prefer to every

every other aliment. Though lefs inclined to theft than the cat, they endeavour to flip into the dairy, where they drink great quantities of milk, making, like the cat, a murmuring noife expreffive of pleafure. Milk is alfo the only liquor that is agreeable to them; for they rarely drink water; and they refufe wine. They produce but once a-year, and the litter generally confifts of three or four. The growth of their young is very quick; they live only nine or ten years; and the fpecies is neither numerous nor much diffufed. The marmot would make very good eating, if it had not always a difagreeable flavour, which cannot be concealed but by ftrong feafonings.

8. The monax, or marmot of Canada, has a hairy tail, an afh-coloured body, roundifh ears, and four toes on the fore-feet, and five on the hind-ones. It is a native of America, and differs very little from the former.

9. The circetus, hamfter, or German marmot, is the moft famous as well as the moft deftructive of all the rats. It has a tail of a moderate length, round ears, a black belly, and reddifh fides, with three white fpots. This creature fleeps during the winter like the marmots; when in a torpid ftate, neither refpiration, nor any kind of feeling, can be perceived. The heart, however, beats 15 times in a minute, which has been difcovered by opening the cheft. The blood continues to be fluid, but the inteftines are not irritable; even an electrical fhock does not awake him; but in the open air he never becomes torpid. When dug up in his ftate of torpidity, the hamfter is found with his head bent under his belly between the two fore-legs, and thofe behind reft upon his muzzle. The eyes are fhut; and when the eye-lids are forced open, they inftantly clofe again. The members are ftiff, like thofe of a dead animal, and the whole body feels as cold as ice. When diffected during this ftate, he feems to feel very little; fometimes indeed he opens his mouth as if he wanted to refpire; but his lethargy is too ftrong to admit of his awakening entirely. This lethargy hath been afcribed folely to a certain degree of cold; which indeed may be true with regard to dormice, bats, &c. But experience fhews, that, in order to render the hamfter torpid, he muft alfo be excluded from all communication with the external air: for when he is fhut up in a cage filled with earth and ftraw, and expofed in winter to a degree of cold fufficient to freeze the water, he never becomes torpid: but when the cage is funk four or five feet under ground, and well fecured againft the accefs of the air, at the end of eight or ten days he is equally torpid as if he had been in his own burrow. If the cage is brought up to the furface, the hamfter will awake in a few hours, and refume his torpid ftate when put below the earth. The experiment may be repeated with the fame fuccefs as long as the froft continues. We have a farther proof that the abfence of the air is one of the caufes of torpidity in the hamfter; for when brought up from his hole in the coldeft weather, and expofed to the air, he infallibly awakes in a few hours. This experiment fucceeds as well in the night as in the day; which fhews that light has no fhare in producing the effect. It is curious to obferve the hamfter paffing from a torpid to an active ftate. He firft lofes the rigidity of his members, and then makes a profound refpiration, but at long intervals. His legs begins to move, he opens his mouth, and utters difagreeable and rattling founds. After continuing thefe operations for fome time, he opens his eyes, and endeavours to raife himfelf on his legs. But all thefe movements are ftill reeling and unfteady, like thofe of a man intoxicated with liquor. He, however, reiterates his efforts till he is enabled to ftand on his legs. In this attitude he remains fixed, as if he meant to reconnoitre and repofe himfelf after his fatigue; but he gradually begins to walk, eat, and act in his ufual manner. This paffage from a torpid to an active ftate, requires more or lefs time, according to the temperature of the air. When expofed to a cold air, he fometimes requires more than two hours to awake; and in a more temperate air he accomplifhes his purpofe in lefs than one hour. It is probable that, when the hamfter is in his hole, this change is performed imperceptibly, and that he feels none of the inconveniencies which arife from a fudden and forced revivifcence.

The hamfter is a very mifchievous animal; and fo exceedingly fierce, that he feems to have no other paffion but rage. In confequence of this, he attacks every other animal that comes in his way, without regarding the fuperior fize or ftrength of his antagonift; nay, as if he was ignorant of the method of faving himfelf by flight, he allows himfelf to be beat to pieces with a ftick, rather than yield. If he feizes a man's hand, he muft be killed before he quits his hold. When the hamfter perceives a dog at a diftance, he begins with emptying his cheek-pouches if they happen to be filled with grain, and which are fo capacious as to hold a quarter of a pint Englifh. He then blows them up fo prodigioufly, that the fize of the head and neck greatly exceeds that of the body. Laftly, he raifes himfelf on his hind-legs, and in this attitude darts on his enemy. If he catches hold, he never quits it but with the lofs of life. But the dog generally feizes him behind, and ftrangles him. This ferocious temper prevents the hamfter from being at peace with any other animal. He even makes war againft his own fpecies, not excepting the females. When two hamfters encounter, they never fail to attack each other, and the ftronger always devours the weaker. A combat between a male and a female lafts longer than between two males. They begin by purfuing and biting each other; then each of them retires to a fide as if to take breath; a little after, they renew the combat, and continue to fly and to fight till one of them falls. The vanquifhed uniformly ferves for a repaft to the conqueror.

The hamfters copulate about the end of April; when the males enter the apartments of the females, where they remain only a few days. If two males happen to meet in the fame hole, a furious combat enfues, which generally terminates in the death of the weakeft. The conqueror takes poffeffion of the female, and both, though at every other period they perfecute and kill each other, lay afide their natural ferocity during the few days their amours continue. They even mutually defend each other againft agreffors; and if a hole is opened about this time, the female defends her hufband with the utmoft fury. The females bring forth twice or thrice every year. Their litter is never fewer than fix, and more frequently than

Mus. from 16 to 18. Their growth is very rapid. At the age of 15 days they begin to dig the earth; and foon after, the mother banifhes them from her habitation; fo that at the age of about three weeks they are abandoned to their own management. The mother in general difcovers little affection for her offfpring; and when her hole is opened, flies in the moft daftardly manner, leaving her young ones to perifh. Her only folicitude at that time is to provide for her own defence. With this view fhe digs deeper into the earth, which fhe performs with amazing quicknefs. The young would willingly follow her; but fhe is deaf to their cries, and even fhuts the hole which fhe had made.

As the hamfter lives on grains, and dwells under the earth, fome kinds of foils are inconvenient for him. He requires a foil which is eafily pierced, and yet fo tenacious as not to tumble down. Stony, fandy, and argillaceous foils, are therefore improper, as well as meadows, forefts, and marfhy grounds. He likewife choofes countries which abound in all kinds of grain, that he may not be obliged to feek his food at great diftances. In Thuringia, the foil of which poffeffes all thefe qualities, the hamfters are more numerous than in any other country. The habitations are dug to the depth of three or four feet, and confift of more or fewer apartments, according to the age of the animal. The principal apartment is lined with ftraw, and ferves him for a lodging. The others are deftined for the prefervation of provifions, of which he amaffes great quantities during the autumn. Each hole has two apertures: the one defcends obliquely; and the other, through which the animal goes out and in, is perpendicular. The holes of the females, who never live with the males, are fomewhat different. In thofe where fhe brings forth, there is feldom above one chamber for provifions; becaufe the fhort time the young remain with her requires not a great ftore of food. But inftead of one perpendicular hole, fhe makes feven or eight, to give free paffage to her young. Sometimes the mother banifhes her offspring, and continues to poffefs this hole; but fhe commonly digs another, and lays up as much provifions as the feafon permits her to collect.

The hamfter feeds upon all kinds of herbs, roots, and grains, which the different feafons produce. He even eats the flefh of fuch animals as he can conquer. As he is not adapted for long journeys, his magazine is firft ftocked with the provifions which are neareft his abode. This is the reafon why fome of his chambers are frequently filled with one kind of grain only. When the harveft is reaped, he goes to a greater diftance in queft of provifions, and carries every article he can find, without diftinction, to his granary. To facilitate the tranfportation of his food, nature has furnifhed him with two pouches in the infide of each cheek. On the outfide, thefe pouches are membranous, fmooth, and fhining; and in the infide there are a great many glands, which fecrete a certain fluid, to preferve the flexibility of the parts, and to enable them to refift any accidents which may be occafioned by the roughnefs or fharpnefs of particular grains. Each of thefe receptacles is capable of containing an ounce and an half of grain, which, on his return to his lodging, he empties, by preffing his two fore-feet againft his cheeks. When we meet a hamfter having his cheeks filled with provifions, it is eafy to feize him with the hand, without the rifk of being bitten; becaufe in this condition he has not the free motion of his jaws. But if he is allowed a little time, he foon empties his pouches, and ftands upon his defence. The quantity of provifions found in the holes depends on the age and fex of the inhabitant. The old hamfters frequently amafs 100 pounds of grain; but the young, and the females, content themfelves with a quantity much fmaller. Their object in laying up provifions, is not to nourifh them during winter, which they pafs in fleep, and without eating; but to fupport them after they awake in the fpring, and previous to their falling into a torpid ftate, which refembles a profound fleep. At the approach of winter, the hamfters retire into their fubterraneous abodes, the entrance to which they fhut up with great addrefs. Here the animal repofes, in the fituation already defcribed, upon a bed of ftraw; and in this ftate he is commonly dug up. In winter the peafants generally go a *hamfter-nefting* as they call it; the retreat is known by a fmall emineuce of earth raifed near the oblique paffage formerly defcribed. The peafants dig down till they difcover the hoard, and are generally well paid for their trouble; as they often find two bufhels of corn, befides the fkins of the animals, which are valuable furs; and it is remarkable that the hair fticks fo faft to the fkin, that it cannot be plucked off without the utmoft difficulty. In fome feafons the hamfters are fo numerous, that they occafion a dearth of corn. Pole-cats are their greateft enemies; for they purfue them into their holes, and deftroy great numbers.

10. The terreftris, or fhort-tailed field-moufe, has a hairy tail, with four toes on the fore-feet, and five on the hind-ones, and ears fhorter than the hair. It inhabits Europe, and is found in great numbers in Newfoundland. It digs holes in the earth, where it amaffes grain, filberts, and acorns: but it appears to prefer corn to every other food. When the grain is ripe, the fhort-tailed field-mice affemble from all quarters, and often do great damage by cutting the ftalks of corn, in order to come at the ears. They follow the reapers, and eat up all the fallen and neglected grain. When the gleanings are devoured, they flock to the new-fown fields, and deftroy the crop of the enfuing year. In winter moft of them retire into the woods, where they feed upon filberts, acorns, and the feeds of trees. In particular years they appear in numbers fo immenfe, that they would deftroy every thing if they continued long: but they always kill and eat one another during a fcarcity of provifions. They befides are devoured by the long-tailed field-mice, by foxes, wild-cats, and weafels. Thefe creatures are often carried home in the fheaves of corn; and 100 of them have been found in houfing a rick. In fuch cafes it hath been obferved, that the dogs devoured all the mice of this fort they could find, rejecting the common kind; and, on the contrary, the cats would touch none but the laft. This animal makes its neft in moift meadows, and brings eight young at a time: it has a ftrong affection for them; one that was feduced into a wire-trap by placing its brood in it, was fo intent on foftering them, that it appeared quite regardlefs of its captivity. In Newfoundland, thefe mice

mice are very deftructive to gardens; but feldom do much damage in this way in Britain.

11. The amphibius, or water-rat, has a long hairy tail, but not palmated feet, as is faid by Linnæus. It is about the fize of a rat, but in its manners refembles the otter much more than the rat. Like the otter, it frequents the frefh water, and is found on the banks of rivers, brooks, and pools. Gudgeons, minnows, blays, and the fry of carps, pikes, and barbels, are its ordinary food. It likewife eats frogs, water-infects, and fometimes the roots of plants. He fwims with great eafe, keeps long under water, and carries off his prey to be devoured on the grafs or in his hole. He is fometimes furprifed by the fifhermen when fearching for craw-fifh; and he endeavours to efcape by biting their fingers, or leaping into the water. Like the otter, he avoids large rivers, or rather thofe which are much frequented. He never vifits houfes or barns; but keeps upon the margins of waters, from which he wanders not upon dry land fo far as the otter, who is fometimes found at the diftance of a league from water. Water-rats are feldom met with in elevated places or dry plains, but are extremely numerous in moift and marfhy valleys. The females come in feafon about the end of winter, and bring forth in the month of April, the litter generally confifting of fix or feven. Perhaps they bring forth more than once a-year; but of this we have no proper knowledge. This animal, as well as the otter, is eaten by the French peafants on *maigre*-days. Water-rats are found all over Europe, excepting in the polar regions. According to Bellon, they inhabit the banks of the Nile; but the figure he gives of them has fo little refemblance to our water-rat, that it is probable the Nile-rats belong to another fpecies of animals.

12. The rattus, or common rat, is the moft pernicious of any of our fmaller quadrupeds. Meat, corn, paper, cloaths, furniture, in fhort every conveniency of life, is a prey to this deftructive creature. Nor are its devaftations confined to thefe; for it will make equal havock among poultry, rabbits, or young game; nay, it hath been known to gnaw the extremities of infants when afleep. It is a domeftic animal, refiding very frequently in houfes, barns, or granaries; and it is furnifhed with fore-teeth of fuch ftrength as enable it to force its way through the hardeft wood or the oldeft morter. Several fmall animals have been confounded under the general name of *rat;* but the appellation feems properly to belong only to two; namely, the common black, and the brown rats. The black rats are not of a perfectly black colour, but of a deep iron grey, with an afh-coloured belly, the legs dufky, and almoft naked; they have a claw, in the place of a fifth toe, on the fore-feet; the length from the nofe to the tail feven inches, the tail nearly eight. It inhabits moft parts of Europe, but of late the numbers have been very much leffened by the other kind. It makes a lodge either for its day's refidence, or a neft for its young, near a chimney; and improves the warmth of it, by forming there a magazine of wool, bits of cloth, hay, or ftraw. It lodges alfo in cielings, and in the void fpaces between the wall and the wainfcotting. From thefe lurking places the rats iffue in queft of food, and tranfport thither every fubftance they can drag, forming confiderable magazines, efpecially when they have young to provide for. The female brings forth feveral times in a year, but always in the fummer-feafon. The litter generally confifts of five or fix; and in fpite of poifon, traps, and cats, they thus multiply to fuch a degree as fometimes to do a great deal of damage. In old country-houfes where grain is kept, and where the vicinity of barns and magazines facilitates their retreats, they often increafe fo prodigioufly, that the poffeffors are obliged to remove and defert their habitations, unlefs the rats happen to deftroy each other. This, however, frequently happens; for thefe creatures, when pinched for food, devour each other. When a famine happens by reafon of too many being crowded into one place, the ftrong kill the weak, open their heads, and firft eat the brain, and then the reft of the body. Next day the war is renewed, and continues in the fame manner till moft of them are deftroyed; which is the reafon why thefe animals, after being extremely troublefome for fome time, difappear all of a fudden, and do not return for a long time.

Rats are extremely lafcivious; they fqueak during their amours, and cry when they fight. They foon learn their young to eat; and when they begin to iffue from the hole, their mother watches, defends, and even fights with the cats, in order to fave them. A large rat is more mifchievous than a young cat, and nearly as ftrong; the rat ufes her fore-teeth, and the cat makes moft ufe of her claws; fo that fhe requires both to be vigorous, and accuftomed to fight, in order to deftroy her adverfary. The weafel, tho' fmaller, is a much more dangerous and formidable enemy to the rat, becaufe he can follow it into its retreat. Their ftrength being nearly equal, the combat often continues for a long time, but the method of ufing their arms is very different. The rat wounds only by reiterated ftrokes with his fore-teeth, which are better formed for gnawing than biting; and being fituated at the extremity of the lever or jaw, they have not much force. But the weafel bites cruelly with the whole jaw, and inftead of letting go its hold, fucks the blood from the wounded part, fo that the rat is always killed. The rat was firft introduced into America by the Europeans in 1544, and is now the peft of all that continent.

The brown or Norway rat is much larger than the black kind; being nine inches from the end of the nofe to the beginning of the tail; the length of the tail itfelf is the fame, the ufual weight 11 ounces. Notwithftanding its name, however, it is not known in Norway, nor in any part of Scandinavia. It was never known in Britain till about 45 years ago; and made its appearance in the neighbourhood of Paris only about 22 years ago. Mr Pennant fufpects, that this rat came originally in fhips from the Eaft Indies; a large brown fpecies being found there, called *bandicotes* by the natives, which burrow under ground. Barbot alfo mentions a fpecies inhabiting the fields in Guinea, and probably the fame with this. Wherever this creature has taken up its refidence, it hath totally extirpated the black kind: however, it is to be feared we fhall reap little benefit by the exchange; for the Norway rat hath the fame difpofition, with greater abilities for doing mifchief than the common kind. It burrows, like the water-rat, in the banks of rivers, ponds

ponds, and ditches; it takes the water very readily, and fwims and dives with great celerity: like the black fpecies, it preys on rabbits, poultry, and all kinds of game. It increafes moft amazingly faft, producing from 14 to 18 young at a time. Its bite is not only fevere but dangerous; the wound being immediately attended with great fwelling, and is a long time in healing. Thefe creatures are fo bold as to turn upon thofe who purfue them, and faften on the ftick or hand of fuch as offer to ftrike them.

13. The mufculus, or common moufe, has a long naked tail, four toes on the fore-feet, and five on the hind-feet, but no claw on the large toe. It has the fame inftinct, and the fame conftitution and natural difpofitions with the rat, differing only in the mere circumftances of fize and ftrength. The moufe never iffues from his hole but in queft of food, and runs in again upon the leaft alarm. He goes not, like the rat, from houfe to houfe, unlefs he be forced, and is not near fo deftructive. He is alfo capable of being tamed to a certain degree, though not fo perfectly as other animals. He hath many enemies, from whom he can efcape only by his agility and minutenefs. Owls, birds of prey, cats, weafels, and even rats, make war upon the mice, fo that they are deftroyed by millions; yet the fpecies ftill fubfifts by its amazing fecundity. They bring forth at all feafons, and feveral times in the year: the litter generally confifts of five or fix; and in lefs than 15 days the young difperfe, and are able to provide for themfelves. Ariftotle tells us, that having fhut up a pregnant moufe in a veffel, along with plenty of grain, he found in a fhort time after 120 mice, all fprung from the fame mother. All mice are whitifh under the belly, and fome are altogether white. Others are more or lefs brown and black. They are generally diffufed over Europe, Afia, and Africa; but it is alleged that they were introduced into America by the Europeans. It is certain, however, that this little animal follows man, and flies from uninhabited places; probably on account of its natural appetite for bread, cheefe, butter, &c. which men prepare for themfelves.

Plate CLXXXIII fig. 3.

14. The avellanarius, or dormoufe, is equal in fize to the former, but of a plumper appearance; the nofe is more blunt; the head, fides, belly and tail, are of a tawny red colour, the throat white. Dormice inhabit woods, or very thick hedges; forming their nefts in the hollow of fome low tree, or near the bottom of a clofe fhrub: they form little magazines of nuts, and eat in an upright pofture like the fquirrel. The confumption of their hoard, however, during the rigour of the feafon, is but fmall; for they fleep moft of the time, retiring into their holes; at the approach of winter, they roll themfelves up, and become torpid. Sometimes they experience a fhort revival in a warm funny day; when they take a little food, and relapfe into their former ftate. Thefe animals feldom appear far from their retreats, or in any open place; for which reafon they feem lefs common in Britain than they really are. They make their nefts of mofs, grafs, and dead leaves; and bring ufually three or four young at a time.

15. The quercinus, or garden-fquirrel, has a long hairy tail, with a black ring under the eyes. It is a native of the fouth of Europe, where it lives chiefly in gardens, though it fometimes is found in houfes. They are very deftructive to fruit, particularly peaches, which they feem to prefer to every other kind. They alfo eat peafe, apricots, and plumbs; and when foft fruits are not to be had, they will eat almonds, filberts, nuts, and even leguminous plants. Of thefe they carry off great quantities into their retreats, which they dig in the earth, and particularly in well cultivated gardens; for in old orchards they are often found in hollow trees, where they make beds of herbs, mofs, and leaves. Eight or ten of them are frequently found in the fame place, all benumbed, and rolled up in the midft of their provifion of fruits and nuts. They copulate in fpring, and bring forth in fummer. The litter confifts of five or fix young, who grow very quickly, but are not fertile till the next year. Their flefh is not eatable, but has the fame difagreeable odour with the domeftic rat.

16. The gregarius, or gregarious moufe, has a tail about one-third the length of its body, and fomewhat hairy; the body is of a greyifh colour, and the legs white. It is a native of Germany and Sweden, is fomewhat larger than the common moufe; eats fitting up; burrows, and lives under ground.

17. The fylvaticus, or long-tailed field-moufe, meafures, from the end of the nofe to the fetting on of the tail, four inches and an half; the tail is four inches long; the upper part of the body of a yellowifh-brown mixed with fome dufky hairs: the breaft is of an ochre colour, the reft of the under fide is white; the tail is covered with fhort hair. Thefe animals are found only in fields and gardens; in fome places they are called *bean-mice*, from the havock they make among beans when firft fown. They feed alfo on nuts, acorns, and grain, of which they amafs quantities, not proportioned to their wants, but to the capacity of the place where it is depofited, infomuch that a fingle animal will collect more than a bufhel. Thus they provide for other animals as well as themfelves: the hog comes in for a fhare; and the great damage done to the fields by thefe creatures, in rooting up the ground, is chiefly owing to their fearch after the concealed hoards of the field-mice.

The holes of the field-mice are generally more than a foot under ground, and often divided into two apartments, the one for living in with their young, and the other for a magzine. M. Buffon informs us, that he has often feen great damage done to the plantations by thefe animals. They carry off the new-fown acorns; by following the furrow of the plough, they dig up one after another, not leaving a fingle feed. This happens chiefly in thofe feafons when the acorns are fcarce: not finding a fufficient quantity in the woods, they come in queft of them in the cultivated fields, and often carry off fuch quantities that they corrupt in their magazines. Thefe creatures, according to the fame author, do more mifchief in a nurfery of trees than all the birds and other animals put together. The only way to prevent this damage is, to lay traps at ten paces afunder, through the extent of the fown field. No other apparatus is neceffary than a roafted walnut placed under a flat ftone, fupported by a ftick. The animals come to eat the walnut, which they prefer to acorns; and as it is fixed to the ftick, whenever they touch it, the ftone falls down, and crufhes

 crushes them to death. The same expedient M. Buffon also made use of with success against the short-tailed field-mouse, which also destroys acorns. In this way he found that upwards of 100 were taken each day, from a piece of ground consisting only of about 40 French arpents. From the 15th of November to the 8th of December, above 2000 were caught in this manner. Their numbers gradually diminished till the frost became severe, which is the time they retire into their holes, to feed on their magazines. In autumn they are most numerous; for if provisions fail during the winter, they devour one another. The long-tailed mice eat also the short-tailed species; and even thrushes, blackbirds, &c. which they find entangled in snares. They first eat the brain, and then the rest of the body. M. Buffon once kept a dozen of these mice in a cage, and furnished them with food every morning at eight o'clock. One day they were neglected for about a quarter of an hour, when one of their number was eaten up by the rest; next day another suffered the same fate; and in a few days only one remained: all the others had been killed, and partly devoured; and even the survivor himself had his feet and tail mutilated. These animals are very prolific, producing more than once a-year, and bringing nine or ten at a birth. They generally make the nest for their young very near the surface, and often in a thick tuft of grass.

Mr Pennant mentions a species of mouse which he calls the *less long-tailed field-mouse*, or harvest-mouse; and which, he says, is very numerous in Hampshire, particularly during harvest. They form their nest above the ground, between the straws of the standing corn, and sometimes in thistles: it is of a round shape, and composed of the blades of corn. They bring about eight young ones at a time. These never enter houses; but are often carried, in the sheaves of corn, into ricks: and 100 of them have frequently been found in a single rick, on pulling it down to be housed. Those that are not thus carried away in the sheaves, shelter themselves during winter under ground, and burrow deep, forming a warm bed for themselves of dead grass. They are the smallest of the British quadrupeds: the length from nose to tail is only two inches and a half; their tail two inches, and the weight one-sixth of an ounce. They are more slender than the other long-tailed field-mouse; and their back of a fuller red, inclining to the colour of a dormouse.

18. The striatus, or streaked mouse, has four toes on the fore-feet, and five on the hind-ones, longitudinal streaks on the body, with white spots. It is a native of India.

19. The longipes has a long covered tail, four toes on the fore-feet, five on the hind-ones, and very long thighs. It is found in the torrid zone, and is mentioned only by Linnæus.

Plate CLXXXIV fig. 2. 20. The jaculus, or jerboa, inhabits Barbary, Palestine, Egypt, and the deserts between Balsora and Aleppo. The head hath a great resemblance to that of the rabbit; but its eyes are larger, and its ears shorter, higher, and broader, in proportion to its size. The nose is flesh-coloured and naked, and the muzzle is thick and short. The opening of the mouth is very small, the upper jaw broad, and the under jaw narrow and short. The teeth are like those of the rabbit, and the whiskers round the mouth are composed of long black and white hairs. The fore-feet are extremely short, and never touch the ground; being used only as hands to convey victuals to the mouth. These hands have four fingers armed with claws, and the rudiments of a fifth without any claw. The hind-feet have only three toes, the middle one of which is the longest, and all three are armed with claws. The tail is three times longer than the body, and is covered with small stiff hairs, of the same colour with those on the back; and the extremity of it is garnished with longer, softer, and more bushy hair. The legs are naked and flesh-coloured, as well as the nose and ears. The top of the head and back are covered with reddish hair; and the flanks, the under-part of the head, the throat, the belly, and the insides of the thighs, are white. Below the reins, and near the tail, there is a large, black, transverse band, in the form of a crescent. These animals generally conceal their hands or fore-feet among the hair, so that at first sight they seem to have only two feet. In transporting themselves from place to place, they do not walk, or advance one foot before the other, but leap nimbly to the distance of five or six feet from the ground. When reposing themselves, they sit on their knees, and sleep only during the day. They eat grain and herbage like the hare. Their dispositions are mild, and yet they can never be perfectly tamed. They dig holes in the earth like rabbits, and in a much shorter time. Two that were kept in a house in London, burrowed almost through the brick-wall of the room where they were: they came out of their hole at night for food, and when caught were much fatter and sleeker than when confined to their box. This animal is eaten by the Arabs, who call it the *lamb of the children of Israel*. Bochart thinks it is the *Saphon* of holy writ, and displays a vast deal of learning on the subject.

An animal very much resembling the above is found in Siberia, where it is called *alagtaga*. It hath very long transparent ears; long whiskers; five toes on the fore-feet; three on the hind-feet pointing forward, and a fourth behind, about an inch above the heel: the colour of the upper-part of the body is tawny, the lower whitish; in the form of the body, legs, and tail, it agrees with the last. Like the former, this is extremely active; digs holes in the ground with vast agility with its fore-feet; tears the roots with its teeth, and flings back the earth with its hind-feet: if pursued, and finds it cannot escape by leaping, attempts to make a new hole: in some places these are so thick as to be dangerous to travellers, the horses perpetually falling in them. It provides against winter; cuts grass, and leaves it in heaps a foot square to dry, afterwards carrying it into the burrow.

Besides these, M. Buffon describes an animal which probably belongs to the same species, and which he calls the *tarsier*, or woolly jerboa; but says, he accidentally procured it from a person who could neither tell its name, nor from whence it came. It had a sharp-pointed nose; long, erect, naked, transparent ears; large eyes; two cutting teeth in each jaw; and, what is peculiar to this species, two canine teeth in each: it had five long slender fingers on each foot, resembling those of a monkey: the fore-legs moderately long; the hind-legs of a very remarkable length,

length, efpecially the fecond bone; that next the foot flender and naked; the tail exceedingly long and flender; the hair on the body long, foft, and woolly; the head of an afh-colour; the reft of the body tawny, mixed with an afh-colour: it was larger than a common moufe.

21. The volans, has a long hairy tail; four toes on the fore-feet, and five on the hind ones; and the fkin from the ears to the tail is extended like wings, by which means it is enabled to fly. It is a native of Virginia and Mexico.

MUSA, the PLANTAIN-TREE; a genus of the monœcia order, belonging to the polygamia clafs of plants. The moft remarkable fpecies are, 1. The *paradifaica*, or plantain. 2. The *mufa fapientum*, or banana-tree.

The firft fort is cultivated in all the iflands of the Weft Indies, where the fruit ferves the Indians for bread; and fome of the white people alfo prefer it to moft other things, efpecially to the yams and caffada bread. The plant rifes with a foft herbaceous ftalk, 15 or 20 feet high; the lower part of the ftalk is often as large as a man's thigh, diminifhing gradually to the top, where the leaves come out on every fide; thefe are often fix feet long, and near two feet broad, with a ftrong flefhy midrib, and a great number of tranfverfe veins running from the midrib to the borders. The leaves are thin and tender, fo that where they are expofed to the open air, they are generally torn by the wind; for as they are large, the wind has great power againft them: thefe leaves come out from the centre of the ftalk, and are rolled up at their firft appearance; but when they are advanced above the ftalk, they expand and turn backward: as thefe leaves come up rolled in the manner before-mentioned, their advance upward is fo quick, that their growth may almoft be difcerned by the naked eye; and if a fine line is drawn acrofs, level with the top of the leaf, in an hour's time the leaf will be near an inch above it. When the plant is grown to its full height, the fpikes of flowers will appear in the centre, which is often near four feet in length, and nods on one fide. The flowers come out in bunches, thofe in the lower part of the fpike being the largeft, the others diminifh in their fize upward; each of thefe bunches is covered with a fpath or fheath of a fine purple colour, which drops off when the flowers open. The upper part of the fpike is made up of male or barren flowers, which are not fucceeded by fruit, but fall off with their covers. The fruit of this is eight or nine inches long, and above an inch diameter, a little incurved, and has three angles; it is at firft green, but when ripe of a pale-yellow colour. The fkin is tough, and within is a foft pulp of a lufcious fweet flavour. The fpikes of fruit are often fo large as to weigh upwards of 40 lb. The fruit of this fort is generally cut before it is ripe, roafted in the embers, and eaten inftead of bread. The leaves are ufed for napkins and table-cloths, and are food for hogs.

The fecond fort differs from the firft, in having its ftalks marked with dark purple ftripes and fpots. The fruit is fhorter, ftraiter, and rounder: the pulp is fofter, and of a more lufcious tafte; fo is generally eaten by way of defert, and feldom ufed in the fame way as the plantain, therefore is not cultivated in fuch plenty.

Both thefe plants were carried to the Weft Indies from the Canary Iflands, to which place it is believed they were carried from Guinea, where they grow naturally. They are alfo cultivated in Egypt, and in moft other hot countries, where they grow to perfection in about 10 months, from their firft planting to the ripening of their fruit: when their ftalks are cut down, there will feveral fuckers come up from the root, which in fix or eight months will produce fruit; fo that by cutting down the ftalks at different times, there is a conftant fucceffion of fruit all the year.

In Europe there are fome of thefe plants preferved in the gardens of curious perfons, who have hot-houfes capacious enough for their reception, in many of which they have ripened their fruit very well; but as they grow very tall, and their leaves are large, they require more room in the ftove than moft people care to allow them. They are propagated by fuckers, which come from the roots of thofe plants which have fruited; and many times the younger plants, when they are ftinted in growth, will put out fuckers; thefe fhould be carefully taken off, preferving fome fibres to their roots, and planted in pots filled with light rich earth, and plunged into the tan-bed in the ftove: they may be taken off any time in fummer; and it is beft to take them off when young, becaufe if their roots are grown large, they do not put out new fibres fo foon; and when the thick part of the root is cut in taking them off, the plants often rot.

During the fummer-feafon thefe plants muft be plentifully watered; for the furface of their leaves being large, there is a great confumption of moifture by perfpiration in hot weather; but in the winter they muft be watered more fparingly, though at that feafon they muft be often refrefhed, but it muft not be given them in fuch quantities.

The pots in which thefe plants are placed fhould be large, in proportion to the fize of the plants; for their roots generally extend pretty far, and the earth fhould be rich and light. The degree of heat with which thefe plants thrive beft, is much the fame with the anana or pine-apple, in which Mr Miller had many of thefe plants produce their fruit in perfection, and they were near 20 feet high.

The moft fure method to have thefe plants fruit in Britain is, after they have grown fome time in pots, fo as to have made good roots, to fhake them out of the pots with the ball of earth to their roots, and plant them into the tan-bed in the ftove, obferving to lay a little old tan near their roots for their fibres to ftrike into; and in a few months the roots will extend themfelves many feet each way in the bark; and thefe plants will thrive a great deal fafter than thofe which are confined in pots or tubs. When the bark-bed wants to be renewed with frefh tan, there fhould be great care taken of the roots of the plants, not to cut or break them, as alfo to leave a large quantity of the old tan about them; becaufe if the new tan is laid too near them, it will fcorch their roots, and injure them. If the plants pufh out their flower-ftems in the fpring, there will be hopes of their perfecting their fruit; but when they come out late in the year, the plants will fometimes decay before the fruit is ripe. The

ftoves

Mus. ftoves in which they are placed fhould be at leaft 20 feet in height, otherwife there will not be room for their leaves to expand: for when the plants are in vigour, the leaves are often eight feet in length, and near three feet broad; fo that if the ftems grow to be 14 feet to the divifion of the leaves, and the houfe is not 20 feet high, the leaves will be cramped, which will retard the growth of the plant: befides, when the leaves are bent againft the glafs, there will be danger of their breaking them when they are growing vigoroufly; for, in one night, the ftems of fuch bent leaves have been known to force through the glafs, and by the next morning were advanced two or three inches above it.

The fruit of the banana-tree is four or five inches long, of the fize and fhape of a middling cucumber, and of a high, grateful flavour; the leaves are two yards long, and a foot broad in the middle; they join to the top of the body of the tree, and frequently contain in their cavities a great quantity of water, which runs out, upon a fmall incifion being made into the tree, at the junction of the leaves. Bananas grow in great bunches, that weigh a dozen pounds and upwards. The body of the tree is fo porous, as not to merit the name of wood; the tree is only perennial by its roots, and dies down to the ground every autumn.

When the natives of the Weft Indies, fays Labat, undertake a voyage, they make provifion of a pafte of banana; which, in cafe of need, ferves them for nourifhment and drink: for this purpofe, they take ripe bananas, and, having fqueezed them thro' a fine fieve, form the folid fruit into fmall loaves, which are dried in the fun or in hot afhes, after being previoufly wrapped up in the leaves of Indian flowering-reed. When they would make ufe of this pafte, they diffolve it in water, which is very eafily done; and the liquor, thereby rendered thick, has an agreeable acid tafte imparted to it, which makes it both refrefhing and nourifhing.

The banana is greatly efteemed, and even venerated, by the natives of Madeira, who term it the *forbidden fruit*, and reckon it a crime almoft inexpiable to cut it with a knife; becaufe, after diffection, it exhibits, as they pretend, a fimilitude of our Saviour's crucifixion; and to cut the fruit open with a knife, is, in their apprehenfion, to wound his facred image.

Some authors have imagined, that the banana-tree was that of the leaves of which our firft parents made themfelves aprons in Paradife. The facred text, indeed, calls the leaves employed for that purpofe *fig-leaves;* and Milton, in a moft beautiful but erroneous defcription, affirms the bearded or Bengal fig to have been the tree alluded to. But, befides that the fruit of the banana is often by the moft ancients authors called a *fig*, its leaves, by reafon of their great fize and folidity, were much more proper for a veil or covering than thofe of the Bengal fig, which are feldom above fix or eight inches long and three broad. On the other hand, the banana leaves being three, four, and five feet long, and proportionally broad, could not fail to be pitched upon in preference to all others; efpecially as they might be eafily joined, or fewed together, with the numerous thread-like filaments, that may, with the utmoft facility, be peeled from the body of this tree.

Mufæus. MUSÆUS, an ancient Greek poet, was, according to Plato and Diodorus Siculus, an Athenian, the fon of Orpheus, and chief of the Eleufinian myfteries inftituted at Athens in honour of Ceres: or, according to others, he was only the difciple of Orpheus; but, from the great refemblance which there was between his character and talents and thofe of his mafter, by giving a ftronger outline to the figure he was called his *fon*, as thofe were ftyled the *children of Apollo* who cultivated the arts of which he was the tutelar god.

Mufæus is allowed to have been one of the firft poets who verfified the oracles. He is placed in the Arundelian marbles, epoch 15. 1426 B. C. at which time his hymns are there faid to have been received in the celebration of the Eleufinian myfteries. Laertius tells us, that Mufæus not only compofed a theogony, but formed a fphere for the ufe of his companions; yet as this honour is generally given to Chiron, it is more natural to fuppofe, with Sir Ifaac Newton, that he enlarged it with the addition of feveral conftellations after the conqueft of the golden fleece. The fphere itfelf fhews that it was delineated after the Argonautic expedition, which is defcribed in the afterifms, together with feveral other more ancient hiftories of the Greeks, and without any thing later; for the fhip Argo was the firft long veffel which they had built: hitherto they had ufed round fhips of burthen, and kept within fight of the fhore; but now, by the dictates of the oracle, and confent of the princes of Greece, the flower of that country fail rapidly thro' the deep, and guide their fhip by the ftars. Burney's *Hift. of Mufic.*

Mufæus is celebrated by Virgil in the character of hierophant, or prieft of Ceres, at the head of the moft illuftrious mortals who have merited a place in Elyfium. Here he is made the conductor of Æneas to the recefs where he meets the fhade of his father Anchifes.

A hill near the citadel of Athens was called *Mufæum*, according to Paufanias, from Mufæus, who ufed to retire thither to meditate and compofe his religious hymns; at which place he was afterwards buried. The works which went under his name, like thofe of Orpheus, were by many attributed to Onomacritus. Nothing remains of this poet now, nor were any of his writings extant in the time of Paufanias, except a hymn to Ceres, which he made for the Lycomides. And as thefe hymns were likewife fet to mufic, and fung in the myfteries by Mufæus himfelf in the character of prieft, he thence perhaps acquired from future times the title of *mufician* as well as of *poet;* the performance of facred mufic being probably at firft confined to the priefthood in thefe celebrations, as it had been before in Egypt, whence they originated. However, he is not enumerated among ancient muficians by Plutarch; nor does it appear that he merited the title of *fon* and *fucceffor to Orpheus* for his mufical abilities, fo much as for his poetry, piety, and profound knowledge in religious myfteries.

MUSCA, or GNAT, in zoology; a genus of infects, belonging to the order of diptera. The mouth is furnifhed with a flefhy probofcis, and two lateral lips; it has no pappi. There are 129 fpecies, principally diftinguifhed by the peculiarities in their feelers.

MUSCADINE, a rich wine, of the growth of Provence, Languedoc, Cividad, &c.—The word, as well as the liquor, is French: fome fetch its original from *mufk;* the wine being fuppofed to have a little of the fmell of that perfume: others from *mufca*, a "fly," becaufe the flies are extremely fond of its grapes; as the Latins had their *vinum apianum*, fo called *ab apibus*, from the bees which fed on it.

The way of making mufcadine at Frontignac is as follows: They let the mufcadine grapes grow half dry on the vine; as foon as they are gathered, they tread and prefs them immediately, and tun up the liquor, without letting it ftand and work in the fat; the lee occafioning its goodnefs.

MUSCI, MOSSES, one of the feven families or claffes into which all vegetables are divided by Linnæus in the *Philofophia Botanica*. The characteriftics of thefe plants, according to the fexual fyftem, are,

1. Tops, without filaments or threads. 2. The male flower, conftituted by the prefence of the *antheræ* or tops, placed apart from the female, either on the fame or diftinct roots. 3. The female flowers deprived of the *piftillum*, or pointal. 4. The feeds devoid of both lobes (*cotyledones*), and proper coverings; fo that they exhibit the naked embryo.

This tribe of plants, as well as the mufhrooms, ferns, and fea-weed, is ftill imperfectly known. Dillenius, profeffor of botany at Oxford, was the firft who attempted an arrangement of them. In his *Catalogus Plantarum circa Giffam* publifhed at Francfort in 1719, and afterwards in his *Hiftoria Mufcorum* publifhed at Oxford in 1741, he divides the moffes into 16 genera. This arrangement, however, includes the lichens, fome of the fuci, and other plants which belong to very different families. The work in queftion is, notwithftanding, valuable, in having introduced the knowledge of upwards of 200 plants, which were unknown before Dillenius: it is, befides, of all his works of this kind, the beft executed, both for the defcriptions and figures, and fhould ferve as a model to fuch authors as intend to publifh in detail the hiftory of any particular family of plants.

Micheli, in a work intitled *Nova Plantarum Genera*, publifhed at Florence in folio in 1629, divides the moffes into two fections, from the figure and fituation of their flowers. Thefe fections comprehend together 16 genera, amongft which are improperly arranged, like thofe of Dillenius, feveral of the lichens and other fea-weed.

The difcovery of the feeds of the moffes, though made by Dillenius in 1719, is arrogated by Linnæus to himfelf, who did not begin to write till 1735.

In Ray's method, the moffes form the third clafs: in Tournefort's, they conftitute a fingle genus, by the name of *mufcus*, in the firft fection of the 17th clafs, which comprehends the moffes, mufhrooms, and fome of the algæ or fea-weed, and is diftinguifhed by the name of *afpermæ*, or plants without feed; the feeds of the moffes not having been detected by Tournefort.

In the fexual fyftem, thefe plants conftitute the fecond order of the clafs *cryptogamia*, which contains all the plants in which the parts of the flower and fruit are wanting, or not confpicuous. This order is fubdivided into 11 genera, from the prefence or abfence of the calix, which, in thefe plants, is a veil or cover, like a monk's cawl, that is placed over the male organs, or tops of the ftamina, and is denominated *calyptra;* from the fexes of the plants, which bear male and female flowers, fometimes on the fame, fometimes on diftinct roots; and from the manner of growth of the female flowers, which are fometimes produced fingly, fometimes in bunches or cones. Thefe diftinctions are moftly borrowed from Dillenius, whofe excellence in developing this part of the vegetable kingdom Linnæus very readily acknowledges.

MUSCI, is likewife the name of the 56th order in Linnæus's Fragments of a Natural Method. See BOTANY, p. 1317.

MUSCICAPA, or FLY-CATCHER, a genus of birds belonging to the order of pafferes. The moft remarkable fpecies is the grifola, or fpotted fly-catcher. It is a bird of paffage, appears in the fpring, breeds with us, and retires in Auguft. It builds its neft on the fides of trees, towards the middle: Morton fays, in the corners of walls where fpiders weave their webs. Mr Pennant has feen them followed by four or five young, but never faw their eggs. When the young can fly, the old ones withdraw with them into thick woods, where they frolic among the top-branches; dropping from the boughs frequently quite perpendicular on the flies that fport beneath, and rife again in the fame direction. It will alfo take its ftand on the top of fome ftake or poft, from whence it fprings forth on its prey, returning ftill to the fame ftand for many times together. They feed alfo on cherries, of which they feem very fond.

The head is large, of a brownifh hue fpotted obfcurely with black: the back of a moufe-colour: the wings and tail dufky; the interior edges of the quill-feathers edged with pale yellow: the breaft and belly white; the fhafts of the feathers on the former dufky; the throat and fides under the wings are dafhed with red: the bill is very broad at the bafe, is ridged in the middle, and round the bafe are feveral fhort briftles: the infide of the mouth is yellow: the legs and feet are fhort and black.

MUSCLE, in anatomy. See there, p. 363.

MUSCLE, in natural hiftory. See MYTULUS.

MUSEUM, a name which originally fignified a part of the palace of Alexandria, which took up at leaft one-fourth of the city. This quarter was called the *mufeum*, on account of its being fet apart for the mufes and the ftudy of the fciences. Here were lodged and entertained the men of learning; who were divided into many companies or colleges, according to the fciences of which they were the profeffors; and to each of thefe houfes or colleges was allotted a handfome revenue. The foundation of this eftablifhment is attributed to Ptolemy Philadelphus, who here placed his library. Hence the word *mufeum* is now applied to any place fet apart as a repofitory for things that have an immediate relation to the arts.

The mufeum at Oxford, called the *Afhmolean mufeum*, is a noble pile of building, erected at the expence of the univerfity, at the weft end of the theatre, at which fide it has a magnificent portal, fuftained by pillars of the Corinthian order. The front, which is to the ftreet, extends about 60 feet, where there is this infcription over the entrance in gilt characters, *Mufeum Afhmoleanum, fchola naturalis hiftoriæ, officina chymica.*

Mufeum. *chymica.* It was begun in 1679, and finifhed in 1683, when a valuable collection of curiofities was prefented to the univerfity by Elias Afhmole, Efq; which were the fame day repofited there: feveral acceffions have been fince made to the mufeum; among which are hieroglyphics, and other Egyptian antiquities, an entire mummy, Roman antiquities, altars, medals, lamps, &c. and a variety of natural curiofities.

The Britifh mufeum in London is a large, beautiful, and magnificent building, the nobleft cabinet of curiofities in the world. This edifice was erected in 1677; and was called *Montague-houfe*, from having been the town-refidence of the dukes of Montague. In the year 1753, the Britifh parliament, having paffed an act for purchafing the mufeum of the late Sir Hans Sloane, and the collection of manufcripts of the late Lord Oxford, called the *Harleian library*, for the ufe of the public, 26 truftees were appointed and incorporated, to provide a repofitory for thofe and fome other collections, which repofitory was to be called the *Britifh mufeum*. Thefe truftees elected 15 other truftees; and, having bought Montague-houfe, fitted it up for the reception of thefe collections: they alfo appointed officers to fuperintend the mufeum; and having ordained certain ftatutes with refpect to viewing the collection contained in it, the public were admitted to view it in 1757. Among the curiofities contained in the Mufeum are the following:

The library of Sir Hans Sloane, including books of drawings, manufcripts, and prints, in vols	50,000
Medals and coins, ancient and modern	23,000
Cameo's and intaglio's, about	700
Seals	268
Veffels of agate, jafper, &c.	542
Antiquities	1125
Precious ftones, agates, jafpers, &c.	2256
Metals, minerals, ores, &c.	2725
Cryftals, fpars, &c.	1864
Foffils, flints, ftones	1275
Earths, fands, falts	1035
Bitumens, fulphurs, ambers, &c.	399
Talcs, micæ, &c.	388
Corals, fpunges, &c.	1421
Teftacea, &c.	5843
Echini, echinitæ, &c.	659
Afteriæ, trochi, enterochi	241
Cruftaceæ, crabs, lobfters, &c.	363
Stellæ marinæ, ftar-fifhes, &c.	173
Fifhes and their parts	1555
Birds and their parts, eggs, and nefts of different fpecies	1172
Quadrupeds, &c.	1886
Vipers, ferpents, &c.	521
Infects, &c.	5439
Vegetables	12,506
Volumes of dried plants	334
Calculi, anatomical preparations, &c.	756
Mifcellaneous things natural	2098
Mathematical inftruments	55

Fifteen perfons are allowed to view it in one company; the time allotted is two hours; and when any number, not exceeding 15, are inclined to fee it, they muft fend a lift of their Chriftian names and furnames, additions, and places of abode, to the porter's lodge, in order to their being entered in the book: in a few days the refpective tickets will be made out, fpecifying the day and hour when they are to come; which, on being fent for, will be delivered. If by any accident fome of the parties are prevented from coming, it is proper they fend their ticket back to the lodge, as no body can be admitted with it but themfelves. It is to be remarked, that the fewer names there are in a lift, the fooner they are likely to be admitted to fee it.

MUSES, certain fabulous deities among the Pagans, fuppofed to prefide over the arts and fciences: for this reafon it is ufual for the poets, at the beginning of a poem, to invoke thefe goddeffes to their aid. Mufes.

The mufes were originally only fingers and muficians in the fervice of Ofiris, or the great Egyptian Bacchus, under the inftruction and guidance of his fon Orus; but in fucceeding times they were called the *daughters of Jupiter and Mnemofyne* or *Memory*.

Thefe are the only pagan divinities whofe worfhip has been continued through all fucceeding changes in the religion and fentiments of mankind. Profeffors of every liberal art in all the countries of Europe ftill revere them; particularly the poets, who feldom undertake the flighteft work without invoking their aid.

Sir Ifaac Newton tells us, that the finging women of Ofiris were celebrated in Thrace by the name of the *mufes;* and that the daughters of Pierus, a Thracian, imitating them, were celebrated by the fame name.

Diodorus Siculus informs us, that Alcman of Meffene, a lyric poet who flourifhed in the 27th Olympiad, 670 years B. C. makes them the daughters of Uranus and Terra. It has been afferted by fome ancient writers, that at firft they were only three in number; but Homer, Hefiod, and other profound mythologifts, admit of nine (A).

In his hymn to Apollo, Homer fays,

——By turns the *nine* delight to fing.

And Hefiod, in his theogony, names them all. They are faid feverally to prefide over fome art or fcience, as mufic, poetry, dancing, aftronomy. By fome they are called *virgins*, becaufe the virtues of education appear unalterable: they are called *mufes* from a Greek word which fignifies to explain myfteries, becaufe they have taught things the moft curious and important to know, and which are above the comprehenfion of vulgar minds. Each of their names is faid to include fome particular allegory; *Clio*, for inftance, has been thus called, becaufe thofe who are praifed in verfe acquire immortal fame; *Euterpe*, on account of the pleafure accruing to thofe who hear learned poetry; *Thalia* implies for ever flourifhing; *Melpomene*, that her melody infinuates itfelf into the inmoft receffes of the foul; *Terpfichore* marks the plea- Burney's *Hift. of Mufic.*

(A) It has been faid, that when the citizens of Sicyon directed three fkilful ftatuaries to make each of them ftatues of the three Mufes, they were all fo well executed, that they did not know which to choofe, but erected all the nine, and that Hefiod and Homer only gave them names.

pleafure which thofe receive who are verfed in the liberal arts; *Erato* feems to indicate, that the learned command the efteem and friendfhip of all mankind; *Polyhymnia*, that many poets are become immortal by the number of hymns which they have addreffed to the gods; *Urania*, that thofe whom fhe inftructs elevate their contemplations and celebrity to the heavens and the ftars; and laftly, the exquifite voice of *Calliope* has acquired her that appellation, as the inventrefs and guardian of eloquence and rhetoric.

An epigram of Callimachus gives the attributes of the mufes in as many lines.

Calliope the deeds of heroes fings;
Great *Clio* fweeps to hiftory the ftrings;
Euterpe teaches mimes their filent fhow;
Melpomene prefides o'er fcenes of wo;
Terpfichore the flute's foft pow'r difplays;
And *Erato* gives hymns the gods to praife;
Polymnia's fkill infpires melodious ftrains;
Urania wife, the ftarry courfe explains;
And gay *Thalia's* glafs points out where folly reigns.

This epigram does not, however, exactly correfpond with the ideas of other poets, or of the ancient painters, in characterifing the attributes of the mufes. The ancients had numberlefs ingenious and fanciful ideas concerning the mufes. Fulgentius informs us, from the teftimony of various ancient authors, that Apollo was painted with a cithara of *ten ftrings*, as a fymbol of the union of the god with the nine mufes, and to fhew that the human voice is compofed of *ten parts;* of which the four firft are the front-*teeth*, placed one againft the other, fo ufeful for the appulfe of the tongue in forming founds, that, without any one of them, a whiftle would be produced inftead of a voice; the fifth and fixth are the two *lips*, like cymbals, which, by being ftruck againft each other, greatly facilitate fpeech; the feventh is the *tongue*, which ferves as a plectrum to articulate founds; the eighth is the *palate*, the concave of which forms a belly to the inftrument; the ninth is the *throat*, which performs the part of a flute; and the tenth the *lungs*, which fupply the place of bellows.

Pythagoras, and afterwards Plato, make the mufes the foul of the planets in our fyftem; from whence the imaginary mufic of the fpheres.

MUSGRAVE (Dr William), a learned phyfician and antiquary, was born at Charlton-Mufgrave in Somerfetfhire, about the year 1657; and ftudied at New-college, Oxford. Having diftinguifhed himfelf by his knowledge in his profeffion, and his fkill in natural philofophy, he was elected fellow of the Royal Society; and being made fecretary in 1684, he continued the Philofophical Tranfactions from n° 167 to n° 178 inclufive. After having taken his degrees in phyfic, and being admitted a fellow of the college of phyficians, he went and fettled at Exeter, where he practifed phyfic with great reputation and fuccefs. Being a man of extenfive learning, he compofed, at his leifure-hours, feveral curious and valuable works; as, 1. *De arthritide anomala five interna differtatio.* 2. *De arthritide fymptomatica differtatio.* 3. *Julii Vitalis epitaphium, cum commentario.* 4. *De legionibus epiftola.* 5. *De aquilis Romanis epiftola.* 6. *Infcriptio Terraconenfis, cum commentario.* 7. *Geta Britannicus*, &c. 8. *Belgium Britannicum.* This learned phyfician died in 1721.

MUSHROOM, in botany. See AGARICUS and FUNGUS.—Phyficians have difputed much about the qualities of mufhrooms; fome confidering them as a rich nourifhment, and perfectly innocent, when properly chofen; and others afferting them to be extremely deleterious. Moft of the fungi are indeed of a hurtful quality; and, with refpect to the whole tribe, the efculent are very few. Efculent mufhrooms are very nutritive, very readily alkalefcent, and more fo without intermediate acefcency than any other vegetable: they are therefore a rich nourifhment, and much akin to animal-food; on which account they may be indulged in confiderable quantity to ftrong perfons. It requires, however, fkill to diftinguifh this efculent kind; and very few, efpecially of thofe who are commonly employed to gather them, viz. the fervants, have ftudied Clufius, or other authors who have been at the pains to diftinguifh them. Perhaps our efculent mufhrooms, if old, acquire a dangerous acrimony; and for thefe reafons Dr Cullen is of opinion that it is for the moft part prudent to avoid them. In the warmer climates they may be ufed as light food; but here it is prepofterous to ufe them along with animal-food, as they do not correct its alkaline tendency.

M U S I C;

THE art of combining sounds in a manner agreeable to the ear. This combination may be either simultaneous or successive: in the first case, it constitutes harmony; in the last, melody. But though the same sounds, or intervals of sound, which give pleasure when heard in succession, will not always produce the same effect in harmony; yet the principles which constitute the simpler and more perfect kinds of harmony, are almost, if not entirely, the same with those of melody. By *perfect harmony*, we do not here mean that plenitude, those complex modifications of harmonic sound which are admired in practice; but that harmony which is called *perfect* by theoricians and artists; that harmony which results from the coalescence of simultaneous sounds produced by vibrations in the proportions of thirds, fifths, and octaves, or their duplicates.

The principles upon which these various combinations of sound are founded, and by which they are regulated, constitute a science, which is not only extensive but profound, when we would investigate the principles from whence these happy modifications of sound result, and by which they are determined; or when we would explore the sensations, whether mental or corporeal, with which they affect us. The ancient definitions of music are not proportioned in their extent to our present ideas of that art; but M. Rousseau betrays a temerity highly inconsistent with the philosophical character, when from thence he infers, that their ideas were vague and undetermined. Every soul susceptible of refinement and delicacy in taste or sentiment, must be conscious that there is a music in action as well as in sound; and that the ideas of beauty and decorum, of harmony and symmetry, are, if we may use the expression, equally constituent of visible as of audible music. These illustrious minds, whose comprehensive prospects in every science where taste and propriety prevail took in nature at a single glance, would behold with contempt and ridicule those narrow and microscopic views of which alone their successors in philosophy have discovered themselves capacious. With these definitions, however, we are less concerned, as they bear no proportion to the ideas which are now entertained of music. Nor can we follow M. Rousseau, from whatever venerable sources his authority may be derived, in adopting his Egyptian etymology for the word *music*. The established derivation from *Musa* could only be questioned by a paradoxical genius. Is the fact sufficiently authenticated, that music had been practised in Egypt before it was known in Greece? And though it were true, would it follow from thence, that the Greeks had borrowed the name as well as the art from Egypt? If the art of music be so natural to man that vocal melody is practised wherever articulate sounds are used, there can be little reason for deducing the idea of music from the whistling of winds through the reeds that grew on the river Nile. And indeed, when we reflect with how easy a transition we may pass from the accents of speaking to diatonic sounds, when we observe how early children adapt the language of their amusements to measure and melody however rude, when we consider how early and universally these practices take place, there is no avoiding the conclusion, that the idea of music is connatural to man, and implied in the original principles of his constitution. We have already said, that the principles on which it is founded, and the rules by which it is conducted, constitute a science. The same maxims when applied to practice form an art: hence its first and most capital division is into *speculative* and *practical* music.

Speculative music is, if we may be permitted to use the expression, the knowledge of the nature and use of those materials which compose it; or, in other words, of all the different relations between the high and low, between the harsh and the sweet, between the swift and the slow, between the strong and the weak, of which sounds are susceptible; relations which, comprehending all the possible combinations of music and sounds, seem likewise to comprehend all the causes of the impressions which their succession can make upon the ear and upon the soul.

Practical music is the art of applying and reducing to practice those principles which result from the theory of agreeable sounds, whether simultaneous or successive; or, in other words, to conduct and arrange sounds according to the proportions resulting from consonance, from duration and succession, in such a manner as to produce upon the ear the effect which the composer intends. This is the art which we call *composition* *. With respect to the actual production of sounds by voices or instruments, which is called *execution*, this department is merely mechanical and operative; which, only presupposing the powers of sounding the intervals true, of exactly proportioning their degrees of duration, of elevating or depressing sounds according to these gradations which are prescribed by the tone, and to the value required by the time, demands no other knowledge but a familiar acquaintance with the characters used in music, and a habit of expressing them with promptitude and facility.

* See *Composition*.

Speculative music is likewise divided into two departments; *viz.* the knowledge of the proportions of sounds or their intervals, and that of their relative durations; that is to say, of measure and of time.

The first is what among the ancients seems to have been called *harmonical* music. It shews in what the nature of air or melody consists; and discovers what is consonant or discordant, agreeable or disagreeable, in the modulation. It discovers, in a word, the effects which sounds produce in the ear by their nature, by their force, and by their intervals; which is equally applicable to their consonance and their succession.

The second has been called *rhythmical*, because it treats of sounds with regard to their time and quantity. It contains the explication of their continuance, of their proportions, of their measures whether long or short, quick or slow, of the different modes of time and the parts into which they are divided, that to these the succession of sounds may be conformed.

Practical music is likewise divided into two departments,

ments, which correfpond to the two preceding.

That which anfwers to *harmonical* mufic, and which the ancients called *melopée*, teaches the rules for combining and varying the intervals, whether confonant or diffonant, in an agreeable and harmonious manner.

The fecond, which anfwers to the *rhythmical* mufic, and which they called *rhythmopée*, contains the rules for applying the different modes of time, for underftanding the feet by which verfes were fcanned, and the diverfities of meafure; in a word, for the practice of the rhythmus.

Mufic is at prefent divided more fimply into *melody* and *harmony;* for fince the introduction of *harmony* the proportion between the length and fhortnefs of founds, or even that between the diftance of returning cadences, are of lefs confequence amongft us. For it often happens in modern languages, that the verfes affume their meafures from the mufical air, and almoft entirely lofe the fmall fhare of proportion and quantity which in themfelves they poffefs.

By melody the fucceffions of found are regulated in fuch a manner as to produce pleafing airs*.

* See *Melody.*

Harmony confifts in uniting to each of the founds, in a regular fucceffion, two or more different founds, which fimultaneoufly ftriking the ear foothe it by their concurrence. See HARMONY.

Mufic, according to Rouffeau, may be, and perhaps likewife ought to be, divided into the *phyfical* and the *imitative*. The firft is limited to the mere mechanifm of founds, and reaches no further than the external fenfes, without carrying its impreffions to the heart, and can produce nothing but corporeal fenfations more or lefs agreeable. Such is the mufic of fongs, of hymns, of all the airs which only confift in combinations of melodious founds, and in general all mufic which is merely harmonious.

It may, however, be queftioned whether every found, even to the moft fimple, is not either by nature, or by early and confirmed affociation, *imitative*. If we may truft our own feelings, there is no fuch thing in nature as mufic which gives mechanical pleafure alone. For if fo, it muft give fuch pleafure as we receive from taftes, from odours, or from other grateful titillations; but we abfolutely deny that there are any mufical fenfations or pleafures in the fmalleft degree analogous to thofe. Let any piece of mufic be refolved into its elementary parts and their proportions, it will then eafily appear from this analyfis, that fenfe is no more than the vehicle of fuch perceptions, and that mind alone can be fufceptible of them. It may indeed happen, from the number of the performers and the complication of the harmony, that meaning and fentiment may be loft in the multiplicity of founds; but this, though it may be harmony, lofes the name of *mufic*.

The fecond department of his divifion, by lively and accentuated inflections, and by founds which may be faid to fpeak, expreffes all the paffions, paints every poffible picture, reflects every object, fubjects the whole of nature to its fkilful imitations, and impreffes even on the heart and foul of man fentiments proper to affect them in the moft fenfible manner. This, continues he, which is the genuine lyric and theatrical mufic, was what gave double charms and energy to ancient poetry; this is what, in our days, we exert ourfelves in applying to the drama, and what our fingers execute on the ftage. It is in this mufic alone, and not in harmonics or the refonance of nature, that we muft expect to find accounts of thofe prodigious effects which it formerly produced.

But, with Mr Rouffeau's permiffion, all mufic which is not in fome degree characterized by thefe pathetic and imitative powers, deferves no better name than that of a *mufical jargon*, and can only be effectuated by fuch a complication and intricacy of harmony, as may confound, but cannot entertain the audience. This character, therefore, ought to be added as effential to the definition of mufic; and it muft be attributed to our neglect of this alone, whilft our whole attention is beftowed on harmony and execution, that the beft performances of our artifts and compofers are heard with liftlefs indifference and ofcitation, nor ever can conciliate any admirers, but fuch as are induced, by pedantry and affectation, to pretend what they do not feel. Still may the curfe of indifference and inattention purfue and harrow up the fouls of every compofer or performer, who pretends to regale our ears with this mufical legerdemain, till the grin of fcorn, or the hifs of infamy, teach them to correct this depravity of tafte, and entertain us with the voice of nature!

Whilft moral effects are fought in the natural effects of found alone, the fcrutiny will be vain, and difputes will be maintained without being underftood: but founds, as reprefentatives of objects, whether by nature or affociation, introduce new fcenes to the fancy and new feelings to the heart; not from their mechanical powers, but from the connection eftablifhed by the Author of our frame between founds and the objects which either by natural refemblance or unavoidable affociation they are made to reprefent.

It would feem that mufic was one of thofe arts which were firft difcovered; and that vocal was prior to inftrumental mufic, if in the earlieft ages there was any mufic which could be faid to be purely inftrumental. For it is more than probable, that mufic was originally formed to be the vehicle of poetry; and of confequence, though the voice might be fupported and accompanied by inftruments, yet mufic was never intended for inftruments alone.

We are told by ancient authors, that all the laws whether human or divine, exhortations to virtue, the knowledge of the characters and actions of gods and heroes, the lives and atchievements of illuftrious men, were written in verfe, and fung publicly by a quire to the found of inftruments; and it appears from the Scriptures, that fuch from the earlieft times was the cuftom among the Ifraelites. Nor was it poffible to find means more efficacious for impreffing on the mind of man the principles of morals, and infpiring the love of virtue. Perhaps, however, this was not the refult of a premeditated plan; but infpired by fublime fentiments and elevation of thought, which in accents that were fuited and proportioned to their celeftial nature endeavoured to find a language worthy of themfelves and expreffive of their grandeur.

It merits attention, that the ancients were fo fenfible of the value and importance of this divine art, not only as a fymbol of that univerfal order and fymmetry which prevails through the whole frame of material and intelligent nature, but as productive of the moft momentous effects both in moral and political life.

life. Plato and Ariſtotle, who diſagreed almoſt in every other maxim of politics, are unanimous in their approbation of muſic, as an efficacious inſtrument in the formation of the public character and in conducting the ſtate; and it was the general opinion, that whilſt the gymnaſtic exerciſes rendered the conſtitution robuſt and hardy, muſic humanized the character, and ſoftened thoſe habits of roughneſs and ferocity by which men might otherwiſe have degenerated into ſavages. The gradations by which voices were exerted and tuned, by which the invention of one inſtrument ſucceeded to another, or by which the principles of muſic were collected and methodized in ſuch a manner as to give it the form of an art and the dignity of a ſcience, are topics ſo fruitful of conjecture and ſo void of certainty, that we muſt leave them to employ minds more ſpeculative and inventions more prolific than ours, or transfer them to the *Hiſtory* of Muſic as a more proper place for ſuch diſquiſitions. For the amuſement of the curious, Rouſſeau in his *Muſical Dictionary*, Plates C and N, has tranſcribed ſome fragments of Grecian, Perſian, American, Chineſe, and Swiſs muſic, with which performers may entertain themſelves at leiſure. When they have tried the pieces, it is imagined they will be leſs ſanguinely fond than that author of aſcribing the power of muſic to its affinity with the national accents where it is compoſed. This may doubtleſs have its influence; but there are other cauſes more permanent and leſs arbitrary to which it owes its moſt powerful and univerſal charms.

The muſic now moſt generally celebrated and practiſed is that of the Italians, or their ſucceſsful imitations. The Engliſh, from the invaſion of the Saxons, to that more late tho' lucid æra in which they imbibed the art and copied the manner of the Italians, had a muſic which neither pleaſed the ſoul nor charmed the ear. The primitive muſic of the French deſerves no higher panegyric. Of all the barbarous nations, the Scots and Iriſh ſeem to have poſſeſſed the moſt affecting original muſic. The firſt conſiſts of a melody characteriſed by tenderneſs: It melts the ſoul to a pleaſing penſive languor. The other is the native expreſſion of grief and melancholy. Taſſoni informs us, that in his time a prince from Scotland had imported into Italy a lamentable kind of muſic from his own country; and that he himſelf had compoſed pieces in the ſame ſpirit. From this expreſſive, though laconic deſcription, we learn, that the character of our national muſic was even then eſtabliſhed; yet ſo groſs is our ignorance and credulity, that we aſcribe the beſt and moſt impaſſioned airs which are extant among us to David Rizzio; as if an Italian Lutaniſt, who had lived ſo ſhort a time in Scotland, could at once, as it were by inſpiration, have imbibed a ſpirit and compoſed in a manner ſo different from his own. It is yet more ſurpriſing that Geminiani ſhould have entertained and publiſhed the ſame prejudice, upon the miſerable authority of popular tradition alone; for the fact is authenticated by no better credentials. The primitive muſic of the Scots may be divided into the *marchal*, the *paſtoral*, and the *feſtive*. The *firſt* conſiſts either in marches, which were played before the chieftains, in imitation of the battles which they fought, or in lamentations for the cataſtrophes of war and the extinction of families. Theſe wild effuſions of natural melody preſerve ſeveral of the rules preſcribed for compoſition. The ſtrains, though rude and untutored, are frequently terrible or mournful in a very high degree. The part or march is ſometimes in common, ſometimes in treble time; regular in its meaſures, and exact in the diſtance between its returning cadences; moſt frequently, though not always, loud and briſk. The *pibroch*, or imitation of battles, is wild, and abrupt in its tranſitions from interval to interval and from key to key; various and deſultory in its movements; frequently irregular in the return of its cadences; and in ſhort, through the whole, ſeems inſpired with ſuch fury and enthuſiaſm, that the hearer is irreſiſtibly infected with all the rage of precipitate courage, notwithſtanding the rudeneſs of the accents by which it is kindled. To this the *paſtoral* forms a ſtriking contraſt. Its accents are plaintive, yet ſoothing; its harmony generally flat; its modulations natural and agreeable; its rhythmus ſimple and regular; its returning cadences at equal diſtance; its tranſitions from one concinnous interval to another, at leaſt for the moſt part; its movements ſlow, and may be either in common or treble time. It ſcarcely admits of any other harmony than that of a ſimple baſs. A greater number of parts would cover the air, and deſtroy the melody. To this we ſhall add what has been ſaid upon the ſame ſubject by Dr Franklin. Writing to Lord K———, he proceeds thus:

"Give me leave on this occaſion, to extend a little the ſenſe of your poſition, 'That melody and harmony are ſeparately agreeable, and in union delightful;' and to give it as my opinion, that the reaſon why the Scotch tunes have lived ſo long, and will probably live for ever (if they eſcape being ſtifled in modern affected ornament) is merely this, that they are really compoſitions of melody and harmony united, or rather that their melody is harmony. I mean, the ſimple tunes ſung by a ſingle voice. As this will appear paradoxical, I muſt explain my meaning. In common acceptation, indeed, only an agreeable *ſucceſſion* of ſounds is called *melody;* and only the *coexiſtence* of agreeable ſounds, *harmony*. But ſince the memory is capable of retaining for ſome moments a perfect idea of the pitch of a paſt ſound, ſo as to compare it with the pitch of a ſucceeding ſound, and judge truly of their agreement or diſagreement, there may and does ariſe from thence a ſenſe of harmony between the preſent and paſt ſounds, equally pleaſing with that between two preſent ſounds. Now the conſtruction of the old Scotch tunes is this, that almoſt every ſucceeding emphatical note is a third, a fifth, an octave, or in ſhort ſome note that is in concord with the preceding note. Thirds are chiefly uſed, which are very pleaſing concords. I uſe the word *emphatical*, to diſtinguiſh thoſe notes which have a ſtreſs laid on them in ſinging the tune, from the lighter connecting notes that ſerve merely, like grammar-articles in common ſpeech, to tack the whole together.

"That we have a moſt perfect idea of a ſound juſt paſt, I might appeal to all acquainted with muſic, who knows how eaſy it is to repeat a ſound in the ſame pitch with one juſt heard. In tuning an inſtrument, a good ear can as eaſily determine that two ſtrings are in uniſon by ſounding them ſeparately, as by ſounding them together; their diſagreement is alſo as

as eafily, I believe I may fay more eafily and better diftinguifhed when founded feparately; for when founded together, though you know by the beating that one is higher than the other, you cannot tell which it is. I have afcribed to memory the ability of comparing the pitch of a prefent tone with that of one paft. But if there fhould be, as poffibly there may be, fomething in the ear fimilar to what we find in the eye, that ability would not be entirely owing to memory. Poffibly the vibrations given to the auditory nerves by a particular found may actually continue fome time after the caufe of thefe vibrations is paft, and the agreement or difagreement of a fubfequent found become by comparifon with them more difcernible. For the impreffion made on the vifual nerves by a luminous object will continue for 20 or 30 feconds."

After fome experiments to prove the permanancy of vifible impreffions, he continues thus:

"Farther, when we confider by whom thefe ancient tunes were compofed, and how they were firft performed, we fhall fee that fuch harmonical fucceffions of founds was natural and even neceffary in their conftruction. They were compofed by the minftrels of thofe days, to be played on the harp accompanied by the voice. The harp was ftrung with wire, which gives a found of long continuance; and had no contrivance like that of the modern harpfichord, by which the found of the preceding note could be ftopt the moment a fucceeding note begin. To avoid actual difcord, it was therefore neceffary that the fucceeding emphatic note fhould be a cord with the preceding, as their founds muft exift at the fame time. Hence arofe that beauty in thofe tunes that has fo long pleafed, and will pleafe for ever, though men fcarce know why. That they were originally compofed for the harp, and of the moft fimple kind, I mean a harp without any half-notes but thofe in the natural fcale, and with no more than two octaves of ftrings, from C to C, I conjecture from another circumftance; which is, that not one of thefe tunes, really ancient, has a fingle artificial half-note in it; and that in tunes where it is moft convenient for the voice to ufe the middle notes of the harp, and place the key in F, there the B, which if ufed fhould be a B flat, is always omitted, by paffing over it with a third. The connoiffeurs in modern mufic will fay I have no tafte: but I cannot help adding, that I believe our anceftors, in having a good fong, diftinctly articulated, fung to one of thofe tunes, and accompanied by the harp, felt more real pleafure than is communicated by the generality of modern operas, exclufive of that arifing from the fcenery and dancing. Moft tunes of late compofition, not having this natural harmony united with their melody, have recourfe to the artificial harmony of a bafs, and other accompanying parts. This fupport, in my opinion, the old tunes do not need, and are rather confufed than aided by it. Whoever has heard *James Ofwald* play them on his violincello, will be lefs inclined to difpute this with me. I have more than once feen tears of pleafure in the eyes of his auditors; and yet, I think, even *his* playing thofe tunes would pleafe more if he gave them lefs modern ornament."

As thefe obfervations are for the moft part true and always ingenious, we need no other apology for quoting them at length. It is only proper to remark, that the tranfitions in Scots mufic by confonant intervals, does not feem, as Dr Franklin imagines, to arife from the nature of the inftruments upon which they played. It is more than probable, that the ancient Britifh harp was not ftrung with wire, but with the fame materials as the Welfh harps at prefent. Thefe ftrings have not the fame permanency of tone as metal, fo that the found of a preceding emphatic note muft have expired before the fubfequent accented note could be introduced. Befides, they who are acquainted with the manœuvre of the Irifh harp, know well that there is a method of difcontinuing founds no lefs eafy and effectual than upon the harpfichord. When the performer finds it proper to interrupt a note, he has no more to do but return his finger gently upon the ftring immediately ftruck, which effectually ftops its vibration.

That fpecies of Scotch mufic which we have diftinguifhed by the name of *feftive* feems now limited to reels and country-dances. Thefe may be either in common or treble time. They moft frequently confift of two ftrains: each of thefe contains eight or twelve bars. They are truly rhythmical; but the mirth which they excite feems rather to be infpired by the vivacity of the movement, than either by the force or variety of the melody. They have a manœuvre and expreffion peculiar to themfelves, which it is impoffible to defcribe, and which can only be exhibited by good performers.

Thus far we have purfued the general idea of mufic. We fhall, after the hiftory, give a more particular detail of the fcience from Monfieur D'Alembert.

HISTORY OF MUSIC.

1 The uncertainty of facts in mufical hiftory whether ancient or modern.

THE ancient hiftory of mufic, even among the moft cultivated nations, is now either fo entirely loft, or fo unhappily obfcured, that we can make but few certain, and perhaps no fatisfactory difcoveries in it. And as no annals could be tranfmitted to pofterity of that mufic which prevailed among fuch people as are called *barbarous*, our accounts of it muft be ftill lefs authentic and fatisfactory, than thofe of the former. Even at periods which are more recent, and may for that reafon be thought more within the fphere of our inveftigation, we are equally at a lofs both for the æras and the authors of fome effential improvements in mufic. Yet thofe parts of its hiftory, which are either already known, or may be difcovered, if related at full length with proper illuftrations, would produce a work little inferior in fize to the whole extent of that *Encyclopedia* of which it only conftitutes a part. All, therefore, which can be expected from this preliminary account, is to give a fhort and curfory detail of its primary ftate, and its moft important revolutions, fo far as hiftory will enable us, by enlightening our refearches, to accomplifh this defign. But if our accounts are thought concife and imperfect, we fhall all along direct

direct the views of our readers to fources which may prove more copious and more adequate to their curiofity.

2
Opinions concerning the origin of mufic.

It has been pretended by Father Kircher and others, that mufic prevailed in Egypt before it was known in Greece. Thefe authors derive its name from a word which is primitive in the Egyptian language, and attribute the invention of the art to the ftridulous murmur of the winds whiftling through reeds, or other vegetable tubes, which grew upon the banks of the river Nile. But if this idle and legendary account of the difcovery merits any attention at all, it muft relate to inftrumental mufic alone: for it cannot be imagined that mankind, if in the leaft degree attentive to the natural modulation of their own voices, and to fuch tranfitions of found as were agreeable or difagreeable, would have recourfe for their ideas of melody to objects fo extrinfic and fo contingent as the whiftling of winds through a reed. Man is certainly as much a mufical as he is a vocal animal; nor is the act of finging in him lefs inftinctive than in birds, though his powers are more extenfive and more fufceptible of culture than theirs. If we believe the accounts of fuch as have been attentive to the mufic of the groves, they will tell us, that though the feathered warblers have a mufical inftinct, yet the modes of its exertion are as really acquired by birds from their parents or tutors as by men *. Nor is it eafy to conceive a human creature, endowed with the natural powers of mufical fenfation, and advanced to any degree of maturity, without fuppofing at the fame time that he has tried feveral mufical experiments, and that in fome degree he has formed and cultivated his natural organs. At the fame time, it cannot be denied, that the degrees of found, paffing through tubes of different textures, lengths, and diameters, or of ftrings whofe magnitudes and degrees of cohefion were different, muft be afcertained by experiment alone. But whether thefe experiments were the refult of contingency or defign, whether obfervation took the hint from nature, or began of itfelf to make trials and preferve their refults, it feems now too late to determine.

* See the article SINGING of *Birds*.

3
Origin of inftrumental mufic.

The origin of inftrumental mufic appears to have been at a period much prior to the date of authentic hiftory; and when we look for its epoch or its difcoverer, we are carried at once into the wild regions of fable and mythology. The god Mercury, or Hermes, is faid to be the inventor of the lyre *, by diftending ftrings of different tenfions and diameters upon the fhell of a tortoife which he found upon the fhore. The firft exhibition of the fiftula, or fhepherd's pipe, is afcribed to Pan. But of thefe beings and their actions, little or nothing can be afcertained with proper evidence †. We muft therefore content ourfelves with fuch later accounts as merit any degree of confidence.

* Sea the article LYRE.

† See the articles HERMES and MERCURY.

4
The Grecian lyre in its original ftate a fimple inftrument.

The Grecian lyre, in its original ftate, feems to have been an inftrument of the utmoft fimplicity: for, according to fome, the Mercurian lyre confifted only of three, and according to others only of four, ftrings. Thefe being touched open, could only produce the fame number of founds: from whence we may eafily conclude, that the powers of this inftrument could not be very extenfive. This tetrachord, as fome fay, was conjoined; others maintain that it was disjoined, and that its intervals were not even diatonic. It is, however, allowed, that its two extremes produced an octave; and that the two intermediate ftrings divided it by a fourth on each fide, with a tone in the midft, in the following manner:

Ut,———Trite diezeugménon.
Sol,———Lichanos méfon.
Fa,———Parhypate méfon.
Ut,———Parhypate hypaton.

This is what Boëtius calls the tetrachord of Mercury; though Diodorus afferts, that the lyre of Mercury had only three ftrings. This *fyftem* did not long remain confined to fo fmall a number of founds. Chorebus, the fon of Athis king of Lydia, added to it a fifth ftring; Hyagnis, a fixth; Terpander, a feventh, to equal the number of the planets; and at laft, Lychaon of Samos the eighth.

5
The fcale extended.

This is the account of Boëtius. But Pliny fays, that Terpander having added three ftrings to the four which were original, firft played upon the cithara with feven ftrings: that Simonides joined to them an eighth, and Timotheus a ninth. Nicomachus the Gerafenian attributes this eighth chord to Pythagoras, the ninth to Theophraftus of Piereus, afterwards the tenth to Hyfteus of Colophon. Pherecratus, in the dialogue of Plutarch, makes the *fyftem* advance with a more rapid progrefs: he gives twelve ftrings to the cythara of Menalippides, and as many to that of Timotheus. And as Pherecratus was contemporary with thefe muficians, if we fuppofe that he really faid what Plutarch attributes to him, his teftimony will have confiderable importance in a fact which was obvious to his own immediate obfervation.

6
Ancient authors on mufic irreconcileable.

But how fhall we obtain any certainty among fuch a number of contradictions as are found not only in the doctrines of the authors, but in the order of the events which they relate? For inftance, the tetrachord of Mercury evidently gives the octave or diapafon. How then could it happen, that, after the addition of three ftrings, the whole fcale was found to be diminifhed by one degree, and reduced to the interval of a feventh? This is, however, what the greateft number of authors leave us to underftand; and among others Nicomachus, who tells us, that Pythagoras, finding the whole *fyftem* compofed only of two conjoined tetrachords, which between their extremes formed a diffonant interval, rendered it a confonance, by dividing thefe two tetrachords by the interval of a tone, which produced the octave.

Whatever be the cafe, there is at leaft one thing certain, that the fyftem of the Greeks was infenfibly extended as well above as below, till it reached, and even furpaffed, the compafs of a difdiapafon or double octave; a feries which they call a *perfect fyftem*, and which was likewife termed the *greateft* and the *moft unchangeable*; becaufe, between its two extremes, which betwixt themfelves formed a perfect confonance, were contained all the fimple, the double, the direct, or the inverted chords, every particular fyftem, and according to them the greateft intervals, which can take place in melody.

7
The nature of the perfect fyftem.

This whole *fyftem* confifted of four tetrachords, three conjoined and one disjoined; and of a fingle note redundant, which was added below the whole to complete the double octave; from whence the ftring which

which formed it took the name of *proſlambanomene*, or the additional ſtring. This, one would imagine, could only form fifteen notes in the diatonick genus; there were, however, ſixteen. This was becauſe the diſjunction being ſometimes perceived between the ſecond and third tetrachord, and at other times between the third and fourth, it happened, in the firſt caſe, that the ſound *la* or A, the higheſt in the ſecond tetrachord, the *ſi* or B natural, with which the third tetrachord began, immediately followed in aſcending; or otherwiſe, in the ſecond caſe, that the ſame ſound *la*, with which note itſelf the third tetrachord begun, was immediately followed by *ſi* or B flat; for the firſt gradation of every tetrachord, in the diatonick ſpecies, conſiſted always of a ſemitone. This difference then produced a ſixteenth ſound, on account of the *ſi* or B, which was natural or flat according to its various poſitions in the different tetrachords. The ſixteen ſounds were expreſſed by eighteen different names; that is to ſay, that *ut* or C, and *re* or D, being either the ſharpeſt or the middle ſounds of the third tetrachord, according to the two manners of disjoining the tetrachords, they gave to each of theſe two ſounds a name which determined its poſition.

But as the fundamental ſound was varied according to the mode, from the ſituation occupied by each mode in the general ſyſtem aroſe a difference of acuteneſs and gravity, which very much multiplied the ſounds: for though the different modes had many ſounds in common, there were likewiſe ſome peculiar to each mode, or to ſome of them alone. Thus, in the diatonick genus alone, the extent of all the ſounds admitted in the fifteen modes enumerated by Aliphius amounted to three octaves; and as the difference between the fundamental ſound of each mode and that of its contiguous ſound was a ſemitone only, it is evident, that all that ſpace divided by ſemitones produced, in the general ſcale, the quantity of thirty-four ſounds practiſed in ancient muſic; which, if we deduct all the replicates of the ſame ſound, and confine ourſelves to the limits of an octave, it will be found to be chromatically diviſible into twelve different ſounds, as in modern muſic. This is obvious from the table placed by Meibomius at the front of Aliphius's work. Theſe remarks are neceſſary to refute the error of thoſe who believe, upon the credit of ſome moderns, that the whole of ancient muſic was limited to ſixteen ſounds.

In Rouſſeau's Muſical Dictionary, Plate H, fig. 12. will be found a table of the general ſyſtem amongſt the Greeks, taken in one mode only, and according to the diatonic genus. With reſpect to the enharmonic and chromatic genera, the tetrachords were divided by very different proportions; but as they always contained four ſounds and three conſecutive intervals, in the ſame manner as the diatonic genus, each of theſe ſounds, in its particular genus, bore the ſame names which correſponded with them in the diatonic. For this reaſon Rouſſeau, whom we follow, has not given particular tables for each of theſe genera. The curious may conſult thoſe of Meibomius, placed at the front of the work of Ariſtoxenus. They will there find ſix; one for the enharmonic genus, three for the chromatic, and two for the diatonic, according to the ſituations of each of theſe genera in the ſyſtem of Ariſtoxenus.

Such, in its perfection, was the general ſyſtem of the Greeks; which remained almoſt in the ſame ſtate till the eleventh century, the time when Guy d'Arezzo made conſiderable changes in it. He added below a new ſtring, which he called *hypoproſlambanomene*, or "ſub-added," and above a fifth tetrachord. Beſides this, he invented, as they ſay, a flat, to diſtinguiſh the ſecond ſound of a conjunctive tetrachord from the firſt of the ſame tetrachord when disjunctive; that is to ſay, he fixed the double ſignification of the letter B, which St Gregory before him had already given to the note *ſi* or B. For ſince it is certain that the Greeks had for a long time theſe very conjunctions and disjunctions of the tetrachord, and of conſequence ſigns for expreſſing each degree in theſe different caſes, it follows, that this was not a new ſound introduced into the ſyſtem of Guido, but merely a new name which he gave to that ſound; thus reducing to one degree what, among the Greeks, had conſtituted two. It muſt likewiſe be obſerved concerning his hexachords, which were ſubſtituted for their tetrachords, that it was leſs a change of ſyſtem than of method; and that all which reſulted from it was another manner of ſolfa'ing the ſame ſounds. But the *character* of Guido, and the alterations which he made in the ancient ſcale, may be more properly reſumed when we reach the period in which he lived. 8 The Grecian ſcale changed that whic is now in uſe by G do Aretin

We have already ſeen from Rouſſeau, that the different accounts of the ſyſtem and its improvements, of the different kinds of muſic, and of the modes to be met with among ancient harmoniſts, are ſo various and ſo obſcure, that, in theſe diſquiſitions, little or no ſatisfaction can be obtained. For aſcertaining with accuracy the diverſity of intervals, Pythagoras, the philoſopher of Samos, invented the monochord, or the different diviſions of one ſingle ſtring by which the conſonances were produced, and found the ſame ratios which are given in the ſubſequent elements of muſic, in Malcolm's account of the ſcale, and in ſeveral other authors unneceſſary to be enumerated. For a fuller and more exact account of this monochord, and its uſe, ſee the Hiſtory of Muſic by Sir John Hawkins, Vol. I. p. 449. where the neceſſity of applying it to practice is inculcated by Guido. 9 The invention and uſe of the monochord

Had ſucceeding writers upon the ſcience been more attentive to the real conſtitution of the ſcale, and the principles derived from a monochord properly divided, we might have expected their account of the other phænomena in muſic to have been more preciſe and more perſpicuous; but for a conſiderable time after that philoſopher, the accounts of ancient muſic tranſmitted to us are either ſuperficial and curſory, or unintelligible. The modes, of which Aliphius reckoned fifteen, are by Ptolemy limited to ſeven. Even of the ſeven Ptolemaic modes, it would ſeem that five muſt be merely poſſible and nominal; two only real and practical. Theſe appear to coincide with the major and minor mode of the moderns, by which effects ſimilar to thoſe aſcribed to the ancient modes are produced. Still, however, this hypotheſis is attended with ſome difficulty: The effects attributed to the modes of the moderns ſeem to be no more than cheerfulneſs and melancholy; whereas it would appear that different ſentiments were thought to be naturally excited by all the different modes of the ancients, ſuch as courage and terror, fury and complacency, &c. Yet 10 Diverſity of opinions concerning modes.

Yet if by ancient modes we are to underſtand any given intervals which predominate in a piece of muſic, it is far from being eaſy to conceive any other explication which will ſo rationally account for the modes of Ptolemy, as that which we have immediately before recited. A more particular detail of this author, of Boetius, and of Ariſtides Quintilianus, than it is in our power to give, circumſcribed as we are by limits much too narrow for ſuch an undertaking, will be found in Sir John Hawkins's Hiſtory of Muſic, Vol. I. Theſe are ſome of the chief writers whoſe works remain to us, and have eſcaped the depredations of time. Moſt of the other ancient writers upon muſic either appear to have been loſt, or only to have treated the ſubject occaſionally. Among theſe may be reckoned Vitruvius, author of a treatiſe on architecture, who, in his deſcription of theatres, takes the opportunity of propoſing ſome muſical improvements, of making ſome caſual obſervations upon the art, and of deſcribing an hydraulic organ. But as a more particular account of theſe would throw no additional light upon the theory of ancient muſic, for this we muſt once more remit the curious to *Meibomius de re Muſica*, and to the hiſtory by Sir John Hawkins above quoted.

The province to which our efforts are neceſſarily confined, directs our attention not ſo much to the hiſtory of thoſe who cultivated the art, as to the art itſelf, and its various revolutions.

The diſcovery of the monochord and its diviſions, was not the only ſpeculation in muſic peculiar to Pythagoras. He likewiſe thought the earth and ſeven planets, or ſolar ſyſtem, reſembled a muſical diapaſon; and from thence formed the romantic idea of the muſic of the ſpheres. For a more ſatisfactory account of this celeſtial concert, the curious reader may peruſe the *Somnium Scipionis*, a fragment of Cicero, and the *Obſervations upon numbers* by his commentator Macrobius.

Pythagoras, the philoſopher of Samos, as we have ſaid above, who taught in Italy, was the firſt who inveſtigated the relations of ſound by meaſuring a muſical ſtring, and obſerving the tones produced by the vibrations of its different parts, whilſt the others were at reſt. Theſe he expreſſed by numbers, and thus aſcertained the ratio which one ſound bears to another. This inveſtigation was afterwards carried farther, and delineated more diſtinctly, by Euclid; and gave riſe to a controverſy which divided the theoretical writers on ancient muſic into two principal ſects, viz. the followers of Pythagoras, who maintained that intervals could only be aſcertained by the vibrations of ſonorous bodies compared one with another; and thoſe of Ariſtoxenus, who aſſerted the judgment of the ear to be the ultimate criterion of intervals. Perhaps neither were abſolutely right, nor entirely wrong. Without aſcertaining by experiments and calculations the diſtances of tones, or quantities of intervals, we can by no means obtain the ſame certainty of their exactitude, whether in tuning inſtruments of fixed ſcales, or in performing upon thoſe whoſe notes admit of variation, and where the temperament is immediate and occaſional. So far the Pythagoreans are right. Yet the Ariſtoxenians might likewiſe urge, that, though we could ſuppoſe a being acquainted with all the properties, relations, and modes of quantity, in their full extent; if ſuch a one, with all this knowledge, ſhould attempt from mere theory to compoſe a piece of good muſic, he might be eternally engaged in the ſame employment to no purpoſe, and have the mortification to ſee himſelf every inſtant outdone by a mere mechanical performer, who had been long inured to judge of intervals, and practiſed in the laws of harmony. In ſhort, the whole powers of geometry and algebra may be exhauſted, without producing a muſical ſtrain which will give real pleaſure to the ear. An adept, therefore, in this delightful art, will regulate his practice by his theory, and confirm his theory by his practice. He will not imagine the neceſſity of experiment and calculation ſuperſeded by the deciſion of his ear; nor will he endeavour to extort from the abſtract nature of numbers (which are equally applicable to all ſubjects that contain quantity) thoſe rules which taſte and ſenſation alone can ſuggeſt, and of which they are the ultimate ſtandard.

11 The application of numbers to muſical intervals divide muſicians into different ſects.

12 The principles of theſe ſects eſtimated.

Nicomachus the Geraſenian lived A. C. 60, and wrote a book called *Introduction to harmony*, which ſeems to be one of the cleareſt and moſt intelligible of the Greeks.

In the *Sympoſiaca* of Plutarch is a dialogue on muſic, containing many anecdotes with reſpect to the invention of ſeveral different ſpecies of muſic and poetry. There Phrynis and Timotheus are recorded to have been ſtigmatized for adding what were eſteemed ſupernumerary ſtrings to the lyre, which at that time had only ſeven, to mark the different degrees of the diapaſon. But the additional ſtrings were tuned by intervals leſs than diatonic. This dialogue, however, is acknowledged to be obſcure, and its authenticity queſtioned.

13 The forms and powers of ancient inſtruments.

After exploring what can be known concerning the ancient muſic, from the theories and writings of thoſe whoſe works have been tranſmitted to us, the forms and powers of their inſtruments occur next to be examined. Theſe can only be collected from verbal deſcriptions, or from deſigns either expreſſed in colours or by ſculpture. From theſe, modern muſicians have not ſcrupled to form a moſt contemptible idea of practical muſic among the ancients. But are we ſure, that the deſcriptions are perfectly complete and thoroughly underſtood? If they were, does there not ſtill remain a poſſibility, that they might be tuned and handled in a manner productive of effects to which we are ſtrangers? Of our inſtruments now in uſe, the difference between one manner of performing and another is ſo aſtoniſhing, that one ſhould imagine it might render us cautious in forming any concluſions concerning inſtruments, which are perhaps neither perfectly deſcribed nor exactly delineated, deſcribed by authors of a period ſufficiently diſtant to render the idioms of the language in which they wrote obſcure. And tho' the forms exhibited in colours or by ſculpture may be thought more permanent and more univerſally intelligible, they are yet ſufficiently ſubjected to the injuries of time to render their repreſentations ſuſpicious.

14 The power of ancient muſic, tho' exaggerated in fable, muſt have been great to give theſe fables credit.

It cannot be doubted, but that the accounts of the ancients, of the power and efficacy of their muſic, were frequently fabulous and hyperbolical; but ſtill they are ſuch as, when diveſted of theſe accidental circumſtances, muſt convince any man of common ſenſe, who admits the

the evidence of history, that they are superior to what we at present experience in music with all its boasted improvements. It may well be admitted, that the miracles ascribed to Orpheus and Amphion are false in their literal sense; but no person will imagine, that, even among the superstitious and illiterate vulgar, fables of this kind could have obtained any degree of attention, or been entertained with any other sentiments than those of ridicule, if the truths which they adumbrated had not been uncommonly striking. Nor would it have been relished as a tolerable legend, that music had the power of animating stones and trees, if its visible effects upon sensitive beings at that period had not been wonderfully transporting. It is therefore a degree of incredulity which does no great honour to the authority of modern testimony, to doubt the assertion of Horace, when he tells us, that, by the force of music, the human savage was allured from his acorns, his brutal pastimes, and his sanguine broils, to the more decent habits and amiable employments of

15 The music of barbarous nations covered with obscurity.

social life. It has been formerly observed, that among such nations as were esteemed barbarous, we meet with no accounts either of music or its instruments which either deserve credit or attention. It is not easy to conceive how the Jews, who had made such a great progress in arts and civilization, should still have remained so backward in their musical acquisitions, as they must have been if we take for granted the figures and powers of their instruments, as delineated by Kircher, and transcribed by Sir John Hawkins. Nor will the advantages which are generally allowed to the instruments of other barbarous nations, afford a satisfactory account how they were able either to compose or perform such pieces of music as we know them to have possessed. We must therefore with good reason suspect, that the authors of such descriptions have either been grossly ignorant of the subject, or shamefully careless and remiss in the performance of their task.

Almost in every period since the restitution of literature, an important controversy has been agitated by virtuosi of different opinions in the theory of music.

16 Harmony, whether known to the ancients or not, uncertain.

Some have maintained that harmony was, and others that it was not, known to the ancients. By some of these it was contended, that the knowledge of harmony naturally results from the knowledge of consonances; that by tuning their instruments the ancients must have been familiar to the various coalescences of sound, and that of consequence they could not be ignorant of the pleasure which they produce. Several passages likewise from such dissertations or fragments as have escaped the rage of time, are collected to prove that the ancients must have been acquainted with harmony or symphonical music.

The opponents of this hypothesis have alleged, that from the sensations or ideas of simple chords no conception could be formed of the effects produced by their conjunction or succession. It is on all hands agreed, that several voices and instruments were used by the Greeks and Romans in performing the same piece of music; but the antiharmonists, as we may term them, will not admit that the intervals of these voices or instruments were varied: nay, it is affirmed that they performed always in octave or unison one to the other; and from thence it is pretended, that all the passages which seem to import the acquaintance of the ancients with practical harmony may be rationally and consistently explained. This, however, notwithstanding the labours of French critics, will still remain extremely doubtful to any person who has either perused the dialogue above mentioned as ascribed to Plutarch, or other passages to the same purpose. 17

Origin and author of harmony doubtful.

Nor can it be reasonably thought, that, at a period so barbarous as the 12th century, harmony, though rude and simple, should have been the creature of naked invention in places where every other branch of literature and degree of culture were unknown. Yet it is clear from the monkish historians of that æra, that harmony was even then in practice, where it could hardly be supposed to be immediately transmitted by a progress so rapid from other parts of the world, where the finer organization of the natives, the more propitious aspect of nature, and the more obvious vestiges of ancient improvement, might be thought favourable to the invention, culture, and propagation of the fine arts. Nor is it a weak presumption, in favour of the knowledge of antiquity in harmony, that the adherence of a contrary opinion can neither ascertain the epoch nor the parent of symphonic music. Yet had it been, as they pretend, a modern invention, barbarous and ignorant as the general character of human nature was during that gloomy interval from the decline of the Roman empire to the resuscitation of letters, the author of an improvement so new and extraordinary could not have escaped the public notice. His name, his character, and his discoveries, must have been recorded by the cloistered authors of his time with 18

This an argument for the antiquity of harmony.

panegyric and admiration. We cannot therefore cease to think with the author of *The principles and power of harmony*, p. 133. that the ancients were better acquainted with this species of music than the moderns are willing to allow; though perhaps it may be admitted, that its powers were neither so thoroughly known, nor so generally and successfully practised, as afterwards. 19

Revival of music.

After the long and cruel devastation of the Goths and Vandals, music seems first to have been revived for the service of the church. It was then of two different kinds, one of which was called the *Ambrosian* and the other the *Gregorian* chant. Of these, the last prevailed, and became universal, till corrupted by the ignorance or false taste of its teachers and performers. This degeneracy became at last the subject of high remonstrance and complaint. It seems to have consisted in a total negligence of rhythmus, and in a perversion of that licence of gracing the notes, which is so essential to all emphatic and animated music. It became, however, so contagious and diffusive, that monarchs thought the rescue of the *Cantus Gregorianus* an object worthy of their interposition. They accordingly authorised more profound adepts and more accurate performers to teach and practise it in its purity through their several dominions. The *antiphonaries*, or books of ecclesiastical music, were rectified, and a more correct and legitimate taste re-established. Thus the *Cantus Gregorianus* once more triumphed over ignorance and barbarity, and obtained a reception worthy of its original sublimity. It is denominated among the French, and by Rousseau in particular, *plain chant*. That author scruples not to reckon it

it a precious remain of antiquity. For a ſhort account of the nature and revolutions of this muſic, may be conſulted the article *Plain Chant* in his Muſical Dictionary. From whence it appears, that the Gregorian muſic was not originally different from the Ambroſian, but the latter only an improvement upon the former. One would be tempted to ſuſpect, that the firſt gradation of this muſic towards its decline was occaſioned by transferring it from verſe to proſe. In conſequence of which, that ſtrict and inviolable regard to meaſured ſounds, ſo conſpicuous in ancient muſic, and ſo effectually preſerved by the aptitude of meaſured notes to meaſured ſyllables, was loſt. There is, we know, even in proſaic compoſitions, a rhythmus. The Roman orators were accuſtomed to ſcan their ſentences in proſe. But though even periods of this kind were by no means emancipated from the laws of rhythmus, yet were they much more looſe and indefinite than poetical numbers, which were conſtituted by feet and ſyllables whoſe quantities were determined. From thence, and from the cadences by which they are marked, alone, can reſult that regularity and ſatisfaction in which the muſical ear acquieſces, and without which every thing is unintelligible. It was this religious obſervation of determined and regular quantities in ancient poetry, which preſerved and regulated the due proportion of ſounds, and which, when abandoned, left the value of notes, with reſpect to their duration, impoſſible to be determined, till other characters and ſigns were ſuperadded, which diſcovered the

20 Inventions of characters to expreſs the rhythmus.

real eſtimate of every note, and ſhowed to what degree it ſhould be protracted, or by what quantity of duration limited. This ſeems to have been the next advance in muſical improvement; but it had one pernicious effect, which was, to render muſic independent of poetry. Yet theſe ſiſter-arts ſeem to be twin-born from heaven; and perhaps, in no caſe could the laws of nature have ſuffered a more cruel and impious violation than in ſeparating the one from the other.

21 Affinity between muſic and poetry.

Modulated ſound is a more genuine, powerful, and univerſal vehicle of ſentiment, than any articulate or arbitrary ſigns can poſſibly be. But articulate ſigns may be ſo happily adjuſted by convention, as to expreſs degrees, varieties, and modes of ſentiment or emotion, which in modulated ſounds are leſs definitely ſignified, if ſignified at all. Thus ſounds give energy and ſweetneſs to word, words variety and definiteneſs to ſounds.

We have already obſerved, that Guy d'Arezzio, otherwiſe named *Guido Aretinus* †, was the inventor of that diſpoſition of the muſical ſcale which is now in uſe. He could not, therefore, be the author of harmony, which we know to have been practiſed ſome centuries before his time, but only of a new ſet of characters by which it was expreſſed. This muſician, by changing the tetrachords into hexachords, highly improved the ſcale, diſcovered more accurately the poſition of ſemitones, and rendered its intonation much more practicable. He likewiſe adapted the ſyllables *ut*, *re*, *mi*, *fa*, *ſol*, *la*, to the various ſounds which compoſe it, from the following Sapphic verſes in a hymn to St John.

SOLve polluti *LAbii reatum.*
SANCTE JOANNES.

The rhythmus in muſic, or the regular diviſion and meaſures of ſound, had formerly been determined by the quantities of the feet in poetry; and, independent of theſe, ſeems to have been entirely indefinite. The invention of a rhythmus capable of ſubſiſting by itſelf, is aſcribed to one *Johannes de Muris*. Yet there is conſiderable reaſon to believe that it had been invented by one *Franco*, who lived a number of years before him.

22 Diviſion of muſic into eccleſiaſtical and ſecular.

In theſe times there was a ſecular as well as ſacred muſic. The Troubadours, or Provençal poets, compoſed ſongs of different kinds, which they ſung to their harps or violins for public entertainment. Hence it happened, that harmony, melody, and rhythmus, admitted of immenſely greater varieties than they had hitherto done. We have formerly ſaid, that in ancient muſic, the quantities or values of every note were determined by thoſe of the ſyllables to which they anſwered. It is, however, by no means improbable, that at a very early period, in their private rehearſals, or practice for improvement, whether in taſte or execution, the muſicians frequently played the inſtrumental parts without being accompanied either by the voice or the words to which they had been ſet. The impreſſions of thoſe poetical meaſures to which the parts correſponded, were abundantly ſufficient to preſerve in the memory of the performer the idea of the rhythmus, and of courſe to determine the value of each particular note. But when airs were either ſet to pieces in proſe, or compoſed without any regard to ſyllabical duration, the quantity of each note was abſolutely indefinite.

23 Origin of the term counterpoint.

When therefore muſic begun to be ſet in parts, it was indiſpenſably neceſſary that the points which mark the notes intended to correſpond one with another, ſhould be ſet in direct oppoſition. Hence the denomination of *counterpoint*. But when characters, or different forms of characters, were invented for expreſſing the different durations of ſounds, or their relative proportions one to another, the ſame preciſion in oppoſing note to note became leſs neceſſary, and was on that account leſs ſcrupulouſly obſerved. It might, perhaps, be neither an unpleaſing nor uninſtructive deduction, after having delineated the nature of ſimple counterpoint, to trace it thro' all its different ſpecies or diviſions; but the contracted ſphere in which we are at preſent conſtrained to move, obliges us to confine theſe excurſions. Such readers as may wiſh more profoundly and minutely to examine this matter, will find it more perſpicuouſly and fully explained in Sir John Hawkins's Hiſtory. To this they may likewiſe recur for an idea of the characters or methods by which the preciſe duration of particular notes might be aſcertained. For us, it ſuffices to add, that the method now in practice, which are explained in the following elements, will be found more ſimple, whilſt at the ſame time, it is equally expreſſive and intelligible.

24 Diviſion of ſecular muſic.

The airs into which ſecular muſic was originally diſtinguiſhed ſeem to have been the madrigal, the ſong, the cantata, the canon. Theſe were vocal, or at leaſt common to voices and inſtruments; but the ſolo, the phantaſia, the concerto, were progreſſive changes in inſtrumental muſic. By what gradations they proceeded, and who were the inventors of each particular ſpecies, we cannot attempt to ſhow, not only becauſe ſuch a diſquiſition would be incompatible with

the limits of our plan, but becauſe we ſhould find it frequently impracticable either to inveſtigate the hints from which ſuch innovations aroſe, or the perſons by whom they were made.

25 Revival of dramatic muſic.

If muſic be allowed to poſſeſs imitative powers, it will follow, that in proportion as the objects are intereſting, the imitation muſt likewiſe engage and command attention. From this, it will be acknowledged, that as imitation is the chief purpoſe of dramatic muſic; as the actions, characters, and ſituations exhibited in the drama, are the moſt intereſting that can poſſibly be diſplayed; and as the dramatic is allowed to be the moſt perfect of all poſſible imitations; ſo of all muſic, the dramatic, in its perfection, ought to be the moſt powerful and enchanting. It is therefore a reſearch of no ſmall importance, to diſcover when this kind of muſic was firſt revived, and by what degrees it arrived at its preſent ſtate.

It is generally agreed, that the Greeks and Romans ſung their tragedies and comedies from beginning to end; but no monument of theſe compoſitions remains to us: ſo that the muſic of the drama is as really a modern invention as if no ſuch thing had ſubſiſted among the ancients, ſince the mere knowledge of a fact could by no means throw any light upon the manner in which it was produced. All that has been tranſmitted to us concerning the ancient theatrical muſic, can only inform us, that it was pathetic and imitative to a high degree. But upon theſe hints few compoſers will think themſelves ſufficiently inſtructed to proceed. This arduous enterpriſe, however, was nobly begun and ſucceſsfully proſecuted by one *Jacapo Peri*. A poet, whoſe name was *Ottavio Rinuccino* in the city of Florence, having compoſed a dramatic paſtoral upon the ſtory of Apollo and Daphne, engaged this excellent muſician to ſet it. Both being warmed with the ſame ideas, and animated by the ſame deſign, ſo happily ſucceeded, that other poets and muſicians were generally approved and admired in proportion as they purſued the veſtiges of theſe great maſters. A ſecond performance of the ſame kind, called *Eurydice*, compoſed by the authors of the former paſtoral, was repreſented in Florence in the year 1600, upon occaſion of the marriage of Mary de Medicis with Henry IV of France. But a detail of the gradations by which theatrical muſic roſe to its preſent perfection, would be a taſk too extenſive for the limits by which we are circumſcribed. Nor is it in our power, for the ſame reaſon, to enter more minutely and critically into the nature of thoſe compoſitions called *operas*. Let it ſuffice to add, that, in common with tragedy and comedy, they are repreſentations of action. In conſequence of this, they require the ſame unity of deſign, the ſame diverſity of characters and paſſions, with the former. Hence it follows, that ſome parts of them will be ſimply narrative, ſome pathetic, and others more emphatically deſcriptive. Muſic ſuited to the firſt of theſe is called *recitativo*. Its diſtinguiſhing characteriſtics are, to expreſs the nature and degree of ſentiment exhibited by the ſpeaker, to be ſcrupulouſly adapted to the peculiar genius of that language which it is deſigned to accompany; and to be exactly modelled according to the accents of that nation, for which it was formed. Some authors have pretended that the irreſiſtible efficacy of melody was founded upon this principle alone. But if that poſition be true, in what manner ſhall we account for the wonderful influence of an Italian recitativo upon a Britiſh audience, and for other phænomena of the ſame kind too numerous to be mentioned? Such parts of the muſic as are intended for more pathetic declamations may be called *airs*. In theſe the words, both with reſpect to their quantity and order, may be treated with greater freedom. The melody is leſs in the tone of converſation, and the harmony more complex. In this, however, there is no ſmall hazard leſt ſentiment ſhould be loſt in ſound; and it requires no ſmall degree of judgment, delicacy, and taſte in the compoſer, at once to fill the harmony and preſerve the ſentiment. But of this the reader will find a more complete account under the article Air in this Dictionary. The chorus is intended to expreſs ſome emphatic event, to celebrate ſome diſtinguiſhed hero, or to praiſe ſome beneficent god. It is properly the voice of triumph and exultation. The harmony ſhould therefore be as full and expreſſive as poſſible. But for the rules of ſuch compoſitions, one muſt refer the reader to ſuch theoretical and practical muſicians as have been moſt ſucceſsful in deſcribing and cultivating dramatic muſic. What remains for us is to ſubjoin a liſt of thoſe who have been moſt remarkable for their accuracy in the theory, or for their excellence in the practice, of muſic in general.

26 Delineation of the opera.

27 Catalogue of theatrical and practical muſicians.

Of John de Muris we have already ſpoken, who lived in the year 1330, and to whom, by miſtake, has been attributed the invention of thoſe characters by which, in modern times, the value of notes, and their relative proportions one to another, have been aſcertained. But this expedient for making viſible the different durations of notes as conſtituent of one rhythmus or particular movement, we have found to be firſt introduced by one Franco, who lived prior to John de Muris.

Laſus was the firſt who wrote on muſic; but his work is loſt, as well as ſeveral other books of the Greeks and Romans upon the ſame ſubject. Ariſtoxenus, the diſciple of Ariſtotle, and leader of a ſect in muſic, is the moſt ancient author who remains to us upon this ſcience. After him came Euclid of Alexandria. Ariſtidis Quintilianus wrote after Cicero. Alyphus afterwards ſucceeded; then Guadentius, Nicomachus, and Bacchius.

Marcus Meibomius has favoured us with a beautiful edition of theſe ſeven Greek authors, with a Latin tranſlation and notes.

Plutarch, as has already been ſaid, wrote a dialogue upon *muſic*. Ptolemy, a celebrated mathematician, wrote in Greek a treatiſe intitled *The Principles of Harmony*, about the time of the emperor Antoninus. This author endeavoured to preſerve a medium between the Pythagoreans and the Ariſtoxenians. A long time afterwards, Manuel Pryennius wrote likewiſe upon the ſame ſubject.

Among the Latins, Boetius wrote in the times of Theodoric; and not diſtant from the ſame period Martianus, Caſſiodorus, and St Auguſtine.

The number of the moderns is almoſt indefinite. The moſt diſtinguiſhed are, Zarlino, Salinas *, Valgulio, Galileo, Doni, Kircher, Merſenne, Parran, Perault, Wallis, Deſcartes, Holden, Mengoli, Malcolm, Baretti, Vallotti, Marcus Meibomius, Chriſtopher Simpſon; Tartini, whoſe book is full of deep reſearches and

* See the article Blind.

and of genius, but tedious from its prodigious length, and perplexed with obſcurity; and M. Rameau, whoſe writings have had this ſingular good luck, to have produced a great fortune without being read almoſt by any one. Beſides, the world may now be ſpared the pains of peruſing them, ſince M. d'Alembert has taken the trouble of explaining to the public the ſyſtem of the fundamental baſs, the only uſeful and intelligible diſcovery which we find in Rameau's writings. To theſe we may add Dr Smith, author of a learned and mathematical treatiſe, intitled, *Harmonics*, or *The Philoſophy of muſical Sounds*; Mr Stillingfleet, author of the *Principles and the Power of Harmony*, or *An explication of Tartini's ſyſtem*; Dr Pepuſch, and his noble pupil the Lord Abercorn; Mr Aviſon, late organiſt at Newcaſtle, who wrote a treatiſe on *Muſical Expreſſion* with the politeneſs and elegance of a gentleman, the depth and preciſion of a ſcholar, the ſpirit and energy of a genius. The names of Rouſſeau and d'Alembert have been ſo often repeated during the courſe of theſe muſical lucubrations, that it would be ſuperfluous to reſume their characters in this place. Among the authors already mentioned, it would be unpardonable to omit the names of Sir John Hawkins and Dr Burney, each of whom has favoured the world with a hiſtory of muſic: The firſt protracted to five volumes in quarto, replete with muſical erudition, but ſeldom original; frequently careleſs, and ſometimes too circumſtantial and inelegant to be entertaining. Of the laſt the world has only as yet ſeen one volume. This abounds with deſcriptions, events, and diſquiſitions, highly worthy of attention: but, on account of the limits which the author has preſcribed to himſelf, many things have been omitted which would have been equally acceptable to literary curioſity, and explicative of muſical ſcience.

ELEMENTS OF MUSIC,

THEORETICAL and PRACTICAL (†).

PRELIMINARY DISCOURSE.

28 Muſicians conſidered in a double view.

MUSIC may be conſidered, either as an art, which has for its object one of the greateſt pleaſures of which our ſenſes (‡) are ſuſceptible; or as a ſcience, by which that art is reduced to principles. This is the double view in which we mean to treat of muſic in this work.

29 Progreſs of muſic like that of other arts and ſciences.

It has been the caſe with muſic as with all the other arts invented by men: ſome facts were at firſt diſcovered by accident; ſoon afterwards reflection and obſervation inveſtigated others; and from theſe facts, properly diſpoſed and united, philoſophers were not ſlow in forming a body of ſcience, which afterwards increaſed by degrees.

The firſt theories of muſic were perhaps as ancient as the earlieſt age which we know to have been diſtinguiſhed by philoſphy, even as the age of Pythagoras; nor does hiſtory leave us any room to doubt, that from the period when that philoſopher taught, the ancients cultivated muſic, both as an art and as a ſcience, with great aſſiduity. But there remains to us much uncertainty concerning the degree of perfection to which they brought it. Almoſt every queſtion which has been propoſed with reſpect to the muſic of the ancients has divided the learned; and may probably ſtill continue to divide them, for want of monuments ſufficient in their number, and inconteſtable in their nature, from whence we might be enabled to exhibit teſtimonies and diſcoveries inſtead of ſuppoſitions and conjectures. As we cannot throw any new light upon this ſubject, all that can be done is to refer our readers to the different authors who have treated of ancient muſic. It were to be wiſhed, that, in order to elucidate as much as

30 The hiſtory of muſic a deſideratum in literature.

(†) To deliver the elementary principles of muſic, theoretical and practical, in a manner which may prove at once entertaining and inſtructive, without protracting this article much beyond the limits preſcribed in our plan, appears to us no eaſy taſk. We therefore heſitated for ſome time, whether to try our own ſtrength, or to follow ſome eminent author on the ſame ſubject. Of theſe the laſt ſeemed preferable. Amongſt theſe authors, none appeared to us ſo eligible as the treatiſe of M. D'Alembert, being the moſt methodical, perſpicuous, conciſe, and elegant diſſertation which we have met with. As this work is hitherto unknown to Engliſh readers, it ought to have all the merit of an original. We have given a faithful tranſlation of it; but in the notes, ſeveral remarks are added, and many authors quoted, which will not be found in the original. It is a work ſo ſyſtematically compoſed, that all attempts to abridge it, without rendering it obſcure and imperfect, would be impracticable. It is perhaps impoſſible to render the ſyſtem of muſic intelligible in a work of leſs compaſs than that with which our readers are now preſented; and, in our judgment, a performance of this kind, which is written in ſuch a manner as not to be generally underſtood, were much better ſuppreſſed.

(‡) In this paſſage, and in the definitions of melody and harmony, our author ſeems to have adopted the vulgar error, that the pleaſure of muſic terminates in corporeal ſenſe. He would have pronounced it abſurd to aſſert the ſame thing of painting. Yet if the former be no more than a mere pleaſure of corporeal ſenſe, the latter muſt likewiſe be ranked in the ſame predicament. We acknowledge that corporeal ſenſe is the vehicle of ſound; but it is plain from our immediate feelings, that the reſults of ſound arranged according to the principles of melody, or combined and diſpoſed according to the laws of harmony, are the objects of a reflex or internal ſenſe.

For a more ſatisfactory diſcuſſion of this matter, the reader may conſult that elegant and judicious treatiſe on Muſical Expreſſion by Mr Aviſon. In the mean time it may be neceſſary to add, that, in order to ſhun the appearance of affectation, we ſhall uſe the ordinary terms by which muſical ſenſations, or the mediums by which they are conveyed, are generally denominated.

as poſſible, a point ſo momentous in the hiſtory of the ſciences, ſome perſon of learning, equally ſkilled in the Greek language and in muſic, ſhould exert himſelf to unite and diſcuſs in the ſame work the moſt probable opinions eſtabliſhed or propoſed by the learned upon a ſubject ſo difficult and curious. This philoſophical hiſtory of ancient muſic is a work which might highly embelliſh the literature of our times.

In the mean time, till an author can be found, ſufficiently inſtructed in the arts and in hiſtory, to undertake ſuch a labour with ſucceſs, we ſhall content ourſelves with conſidering the preſent ſtate of muſic, and limit our endeavours to the explication of thoſe acceſſions which have accrued to the theory of muſic in theſe latter times.

There are two departments in muſic, melody * and harmony †. Melody is the art of arranging ſeveral ſounds in ſucceſſion one to another in a manner agreeable to the ear; harmony is the art of pleaſing that organ by the union of ſeveral ſounds which are heard at one and the ſame time. Melody has been known and felt through all ages: perhaps the ſame cannot be affirmed of harmony (§), we know not whether the ancients made any uſe of it or not, nor at what period it began to be practiſed.

* See *Melody*.
† See *Harmony*.

Not but that the ancients certainly employed in their muſic thoſe chords which were moſt perfect and ſimple; ſuch as the octave, the fifth, and the third: but it ſeems doubtful, whether they knew any of the other conſonances or not, or even whether in practice they could deduce the ſame advantages from the ſimple chords which were known to them, that have afterwards accrued from experience and combinations.

If that harmony which we now practiſe owes its origin to the experience and reflection of the moderns, there is the higheſt probability, that the firſt eſſays of this art, as of all the others, were feeble, and the progreſs of its efforts almoſt imperceptible; and that, in the courſe of time, improving by ſmall gradations, the ſucceſſive labours of ſeveral geniuſes have elevated it to that degree of perfection in which at preſent we find it.

31
The origin of arts often accidental, and their progreſs gradual.

The firſt inventor of harmony eſcapes our inveſtigation, from the ſame cauſes which leave us ignorant of thoſe who firſt invented each particular ſcience; becauſe the original inventors could only advance one ſtep, a ſucceeding diſcoverer afterwards made a more ſenſible improvement, and the firſt imperfect eſſays in every kind were loſt in the more extenſive and ſtriking views to which they led. Thus the arts which we now enjoy, are for the moſt part far from being due to any particular man, or to any nation excluſively: they are produced by the united and ſucceſſive endeavours of mankind; they are the reſults of ſuch continued and united reflections, as have been formed by all men at all periods and in all nations.

It might, however, be wiſhed, that after having aſcertained, with as much accuracy as poſſible, the ſtate of ancient muſic by the ſmall number of Greek authors which remain to us, the ſame application were immediately directed to inveſtigate the firſt inconteſtable traces of harmony which appear in the ſucceeding ages, and to purſue theſe traces from period to deriod. The products of theſe reſearches would doubtleſs be very imperfect, becauſe the books and monuments of the middle ages are by far too few to enlighten that gloomy and barbarous æra; yet theſe diſcoveries would ſtill be precious to a philoſopher, who delights to obſerve the human mind in the gradual evolutions of its powers, and the progreſs of its attainments.

32
Delineations of the laws of harmony recent and imperfect.

The firſt compoſitions upon the laws of harmony which we know, are of no higher antiquity than two ages prior to our own; and they were followed by many others. But none of theſe eſſays was capable of ſatiſfying the mind concerning the principles of harmony: they confined themſelves almoſt entirely to the ſingle occupation of collecting rules, without endeavouring to account for them; neither had their analogies one with another, nor their common ſource, been perceived; a blind and unenlightened experience was the only compaſs by which the artiſt could direct and regulate his courſe.

33
Its precepts not deduced from any principle till by M. Rameau.

M. Rameau was the firſt who began to transfuſe light and order through this chaos. In the different tones produced by the ſame ſonorous body, he found the moſt probable origin of harmony, and the cauſe of that pleaſure which we receive from it. His principle he unfolded, and ſhewed how the different phænomena of muſic were produced by it: he reduced all the conſonances to a ſmall number of ſimple and fundamental chords, of which the others are only combinations or various arrangements. He has, in ſhort, been able to diſcover, and render ſenſible to others, the mutual dependence between melody and harmony.

34
The author's motives for writing theſe elements.

Though theſe different topics may be contained in the writings of this celebrated artiſt, and in theſe writings may be underſtood by philoſophers who are likewiſe adepts in the art of muſic; ſtill, however, ſuch muſicians as were not philoſphers, and ſuch philoſophers as were not muſicians, have long deſired to ſee theſe objects brought more within the reach of their capacity: ſuch is the intention of the treatiſe I now preſent to the public. I had formerly compoſed it for the uſe of ſome friends. As the work appeared to them clear and methodical, they have engaged me to publiſh it, perſuaded (though perhaps with too much credulity), that it might be uſeful to facilitate the progreſs of initiates in the ſtudy of harmony.

This was the only motive which could have determined me to publiſh a book of which I might without

(§) Though no certainty can be obtained what the ancients underſtood of harmony, nor in what manner and in what period they practiſed it; yet it is not without probability, that, both in ſpeculation and practice, they were in poſſeſſion of what we denominate *counterpoint*. Without ſuppoſing this, there are ſome paſſages in the Greek authors which can admit of no ſatisfactory interpretation. See the *Origin and Progreſs of Language*, Vol. II. Beſides, we can diſcover ſome veſtiges of harmony, however rude and imperfect, in the hiſtory of the Gothic ages, and amongſt the moſt barbarous people. This they could not have derived from more cultivated countries, becauſe it appears to be incorporated with their national muſic. The moſt rational account, therefore, which can be given, ſeems to be, that it was conveyed in a mechanical or traditionary manner through the Roman provinces from a more remote period of antiquity.

Prelim. Diſcourſe.

out heſitation aſſume the honour, if its materials had been the fruits of my own invention, but in which I can now boaſt no other merit than that of having developed, elucidated, and perhaps in ſome reſpects improved, the ideas of another (c).

35 Improvements of this edition.

The firſt edition of this eſſay, publiſhed 1752, having been favourably received by the world, and copies no longer to be found in the hands of bookſellers, I have endeavoured to render this more perfect.

35 Account of the work in general.

The detail which I mean to give of my labour, will preſent the reader with a general idea of the principle of M. Rameau, of the conſequences deduced from it, of the manner in which I have diſpoſed this principle and its conſequences; in ſhort, of what is ſtill a-wanting, and might be advantageous to the theory of this amiable art; of what ſtill remains for the learned to contribute towards the perfection of this theory; of the rocks and quickſands which they ought to avoid in this reſearch, and which could ſerve no other purpoſe than to retard their progreſs.

36 Rameau's origin of harmony.

Every ſonorous body, beſides its principal ſound, likewiſe exhibits to the ear the 12th and 17th major of that ſound. This multiplicity of different, yet concordant ſounds, known for a conſiderable time, conſtitutes the baſis of the whole theory of M. Rameau, and the foundation upon which he builds the whole ſuperſtructure of a muſical ſyſtem *. In theſe our *elements* may be ſeen, how from this experiment one may deduce, by an eaſy operation of reaſon, the chief points of melody and harmony; the perfect † chord, as well major as minor; the two ‡ tetrachords employed in ancient muſic; the formation of our diatonic ‖ ſcale; the different values § which the ſame ſound may have in that ſcale, according to the turn which is given to the baſs *; the alterations ¶ which we obſerve in that ſcale, and the reaſon why they are totally imperceptible to the ear; the rules peculiar to the mode † major; the difficulty in ‡ intonation of forming three tones ‖ in ſucceſſion; the reaſon why two perfect chords are proſcribed in immediate ſucceſſion in the diatonic order; the origin of the minor mode, its ſubordination to the mode major, and its variations; the uſe of diſcord §; the cauſes of ſuch effects as are produced by different kinds of muſic, whether diatonic, chromatic *, or enharmonic †; the principles and laws of temperament ‡. In this diſcourſe we can only point out thoſe different objects, the ſubſequent eſſay being deſigned to explain them with the minuteneſs and preciſion which they require.

* See *Syſtem.* † See *Chord.* ‡ See *Tetrachord.* ‖ See *Diatonic.* § See *Value.* * See *Baſs.* ¶ See *Alteration.* † See *Mode.* ‡ See *Intonation.* ‖ See *Tone.* § See *Diſcord.* * See *Chromatic.* † See *Enharmonic.* ‡ See *Temperament.*

One end which we have propoſed in this treatiſe, was not only to place the diſcoveries of M. Rameau in their moſt conſpicuous and advantageous light, but even in particular reſpects to render them more ſimple. For inſtance, beſides the fundamental experiment which we have mentioned above, that celebrated muſician, to render the explication of ſome particular phænomena in muſic more acceſſible, had recourſe to another experiment; I mean that which ſhows that a ſonorous body ſtruck and put in vibration, forces its 12th and 17th major in deſcending to divide themſelves and produce a tremulous ſound. The chief uſe which M. Rameau made of this ſecond experiment was to inveſtigate the origin of the minor mode, and to give a ſatisfactory account of ſome other rules eſtabliſhed in harmony; and with reſpect to this in our firſt edition we have implicitly followed him: in this we have found means to deduce from the firſt experiment alone the formation of the minor mode, and beſides to diſengage that formation from all the queſtions which were foreign to it.

It is the ſame caſe with ſome other points (as the origin of the chord of the ſub-dominant §, and the explication of the ſeventh in ſome peculiar reſpects), upon which it is imagined that we have ſimplified, and perhaps in ſome meaſure extended, the principles of the celebrated artiſt.

§ See *Subdominant.*

We have likewiſe baniſhed from this edition, as from the former, every conſideration of geometrical, arithmetical, and harmonical proportions and progreſſions, which authors have endeavoured to find in the mixture and protraction of tones produced by a ſonorous body; perſuaded as we are, that M. Rameau was under no neceſſity of paying the leaſt regard to theſe proportions, which we believe to be not only uſeleſs, but even, if we may venture to ſay ſo, fallacious when applied to the theory of muſic. In ſhort, though the relations produced by the octave, the fifth, and the third, &c. were quite different from what they are; though in theſe chords we ſhould neither remark any progreſſion nor any law; though they ſhould be incommenſurable one with another; the protracted tone of a ſonorous body, and the multiplied ſounds which reſult from it, are a ſufficient foundation for the whole harmonic ſyſtem.

37 Theoretical muſicians cautioned with regard to the admiſſion of mathematical or metaphyſical principles in muſic.

But though this work is intended to explain the theory of muſic, and to reduce it to a ſyſtem more complete and more luminous than has hitherto been done, we ought to caution thoſe who ſhall read this treatiſe, that they may be careful not to deceive themſelves, either by miſapprehending the nature of our object, or the end which our endeavours purſue.

We muſt not here look for that ſtriking evidence which is peculiar to geometrical diſcoveries alone, and which can be ſo rarely obtained in theſe mixed diſquiſitions, where natural philoſophy is likewiſe concerned: into the theory of muſical phænomena there muſt always enter a particular kind of metaphyſics, which theſe phænomena implicitly take for granted, and which brings along with it its natural obſcurity. In this ſubject, therefore, it would be abſurd to expect what is called *demonſtration*: it is an atchievement of no ſmall importance, to have reduced the principal facts to a ſyſtem conſiſtent with itſelf, and firmly connected in its parts; to have deduced them from one ſimple experiment; and to have eſtabliſhed upon this foundation the moſt common and eſſential rules of the muſical art. But in another view, if here it be improper to require that intimate and unalterable conviction which can only be produced by the ſtrongeſt evidence, we remain in the mean time doubtful whether it is poſſible to elucidate this ſubject more ſtrongly.

After this declaration, one ſhould not be aſtoniſhed, that, amongſt the facts which are deduced from our fundamental experiment, there ſhould be ſome which appear immediately to depend upon that experiment, and others which are deduced from it in a way more remote

(c) See M. Rameau's letter upon this ſubject, *Merc. de Mai* 1752.

Prelim. Discourse.

remote and less direct. In disquisitions of natural philosophy, where we are scarcely allowed to use any other arguments, except such as arise from analogy or congruity, it is natural that the analogy should be sometimes more sometimes less sensible: and we will venture to assert, that such a mind must be very improper for philosophy, which cannot recognise and distinguish this gradation and the different circumstances on which it proceeds. It is not even surprising, that in a subject where analogy alone can take place, this conductress should desert us all at once in our attempts to account for certain phænomena. This likewise happens in the suject which we now treat; nor do we conceal the fact, however mortifying, that there are certain points (though there number be but small) which appear still in some degree unaccountable from our principle. Such, for instance, is the procedure of the diatonic scale in descending; the formation of the chord commonly termed the *sixth redundant* * or *superfluous*, and some other facts of less importance, for which as yet we can scarcely offer any satisfactory account except from experience alone.

* See *Redundant*.

Thus, though the greatest number of the phænomena in the art of music appear to be deducible in a simple and easy manner from the protracted tone of sonorous bodies, one ought not perhaps with too much temerity to affirm as yet, that this mixed and protracted tone is *demonstratively* the only original principle of harmony (D). But in the mean time it would not be less unjust to reject this principle, because certain phænomena appear to be deduced from it with less success than others. It is only necessary to conclude from this, either that by future scrutinies means may be found for reducing these phænomena to this principle; or that harmony has perhaps some other unknown principle, more general than that which results from the protracted and compounded tone of sonorous bodies, and of which this is only a branch; or lastly, that we ought not perhaps to attempt the reduction of the whole science of music to one and the same principle;

38 Rameau's primary experiment has not as yet accounted for all the phænomena of music. Perhaps some other may be necessary.

which, however, is the natural effect of an impatience so frequent even among philosophers themselves, which induces them to take a part for the whole, and to judge of objects in their full extent by the greatest number of their appearances.

In those sciences which are called *physico-mathematical*, (and amongst this number perhaps the science of sounds may be placed), there are some phænomena which depend only upon one single principle, and one single experiment: there are others which necessarily suppose a greater number both of experiments and principles, whose combination is indispensable in forming an exact and complete system; and music perhaps is in this last case. It is for this reason, that, whilst we bestow on M. Rameau all due praise, we should not at the same time neglect to stimulate the learned in their endeavours to carry them still to higher degrees of perfection, by adding if it is possible such improvements as may be wanting to consummate the science.

Whatever the result of their efforts may be, the reputation of this intelligent artist has nothing to fear: he will still have the advantage of being the first who rendered music a science worthy of philosophical attention; to have made its practice more simple and easy; and to have taught musicians to employ in this subject the light of reason and analogy.

We would the more willingly persuade those who are skilled in theory and eminent in practice to extend and improve the views of him who before them pursued and pointed out the career, because many amongst them have already made laudable attempts, and have even been in some measure successful in diffusing new light through the theory of this enchanting art. It was with this view that the celebrated Tartini has presented us in 1754 with a treatise of harmony, founded on a principle different from that of M. Rameau. This principle is the result of a most beautiful experiment (†). If at once two different sounds are produced from two instruments of the same kind, these two sounds

39 Tartini's experiment.

(D) The *demonstration* of the principles of harmony by M. Rameau was not thus entitled in the exposition which he presented in the year 1749 to the Academy of Sciences, and which that society besides approved with all the eulogiums which the author deserved; the title, as inserted in the register of the academy, was, "A memorial, in which are explained the foundations of a system of music theoretical and practical." It is likewise under this title that it was announced and approved of by the Commissioners, who in their printed report, which the public may read along with M. Rameau's memorial, have never dignified his theory with any other name than that of a *system*, the only name in reality which is expressive of its nature. M. Rameau, who, after the approbation of the academy, has thought himself at liberty to adorn his system with the name of a *demonstration*, did not certainly recollect what the academy has frequently declared; that, in approving any work, it was by no means implied that the principles of that work appeared to them demonstrated. In short, M. Rameau himself, in some writings posterior to what he calls his *demonstration*, acknowledges, that upon particular points in the theory of the musical art, he is under a necessity of having recourse to analogy and aptitude; this excludes every idea of demonstration, and restores the theory of the musical art, exhibited by M. Rameau, to the class in which it can only be ranked with propriety, I mean the class of probabilities.

(†) Had the utility of the preliminary discourse in which we are now engaged been less important and obvious than it really is, we should not have given ourselves the trouble of translating, nor our readers that of perusing it. But it must be evident to every one, that the cautions here given, and the advices offered, are no less applicable to students than to authors The first question here decided, is, Whether pure mathematics can be successfully applied to the theory of music. The author is justly of a contrary opinion. It may certainly be doubted with great justice, whether the solid contents of sonorous bodies, and their degrees of cohesion or elasticity, can be ascertained with sufficient accuracy to render them the subjects of musical speculation, and to determine their effects with such precision as may render the conclusions deduced from them geometrically

Prelim. Discourse.

founds generate * a third different from both the others. They have inserted in the *Encyclopédie*, under the article *Fundamental*, a detail of this experiment according to M. Tartini; and we owe to the public an information of which in composing this article we were ignorant: M. Rameau, a member of the Royal Society at Montpellier, had presented to that society in the year 1753, before the work of M. Tartini had appeared, a memorial printed the same year, and where may be found the same experiment displayed at full length. In relating this fact, which it was necessary for us to do, it is by no means our intention to detract in any degree from the reputation of M. Tartini; we are persuaded that he owes this discovery to his own researches alone: but we think ourselves obliged in honour to give a public testimony in favour of him who was the first in exhibiting this discovery.

See Generate.

40 [Thi]s discovery originally due [t]o Rameau.

But whatever be the case, it is in this experiment that M. Tartini attempts to find the origin of harmony: his book, however, is written in a manner so obscure, that it is impossible for us to form any judgment of it; and we are told that others distinguished for their knowledge of the science are of the same opinion. It were to be wished that the author would engage some man of letters, equally practised in music and skilled in the art of writing, to unfold these ideas which he has not discovered with sufficient perspicuity, and from whence the art might perhaps derive considerable advantage if they were placed in a proper light. Of this I am so much the more persuaded, that even though this experiment should not be regarded by others in the same view with M. Tartini as the foundation of the musical art, it is nevertheless extremely probable that one might use it with the greatest advantage to enlighten and facilitate the practice of harmony (E).

In exhorting philosophers and artists to make new attempts for the advancement of the theory of music, we ought at the same time to let them know the danger of mistaking what is the real end of their researches. Experience is the only foundation upon which they can proceed; it is alone by the observation of facts, by bringing them together in one view, by shewing their dependency upon one, if possible, or at least upon a very small number of primary facts, that they can reach the end to which they so ardently aspire, the important end of establishing an exact theory of music, where nothing is wanting, nothing obscure, but every thing discovered in its full extent, and in its proper light. The philosopher who is properly enlightened, will not give himself the trouble to explain such facts as are less essential to his art, because he can discern those on which he ought to expatiate for its proper illustration. If one would estimate them according to their proper value, he will only find it necessary to cast his eyes upon the attempts of natural philosophers who have discovered the greatest skill in their science; to explain, for instance, the multiplicity of tones produced by sonorous bodies. These sages, after having remarked (what is by no means difficult to conclude) that the universal vibration of a musical string is a mixture of several partial vibrations, from thence infer, that a sonorous body ought to produce a multiplicity of tones, as it really does. But why should this multiplied sound only appear to contain three, and why these three preferable to others? Some pretend that there are particles in the air, which, by their different degrees of magnitude and texture, being naturally susceptible of different oscillations, produce the multiplicity of sound in

41 Mechanical conclusions inadequate to the situation of musical phænomena.

cally true. It is admitted, that sound is a secondary quality of matter, and that secondary qualities have no obvious connection which we can trace with the sensations produced by them. Experience, therefore, and not speculation, is the grand criterion of musical phænomena. For the effects of geometry in illustrating the theory of music, (if any will still be so credulous as to pay them much attention), the English reader may consult Smith's Harmonics, Malcom's dissertation on music, and Pleydel's treatise on the same subject inserted in a former edition of this work. Our author next treats of the famous discovery made by Sig. Tartini, of which the reader may accept the following compendious account.

If two sounds be produced at the same time properly tuned and with due force, from their conjunction a third sound is generated, so much more distinctly to be perceived by delicate ears as the relation between the generating sounds is more simple; yet from this rule we must except the unison and octave. From the fifth is produced a sound unison with its lowest generator; from the fourth, one which is an octave lower than the highest of its generators; from the third major, one which is an octave lower than its lowest; and from the sixth minor (whose highest note forms an octave with the lowest in the third formerly mentioned) will be produced a sound lower by a double octave than the highest of the lesser sixth; from the third minor, one which is double the distance of a greater third from its lowest; but from the sixth major (whose highest note makes an octave to the lowest in the third minor), will be produced a sound only lower by double the quantity of a greater third, than the highest; from the second major, a sound lower by a double octave than the lowest; from a second minor, a sound lower by triple the quantity of a third major than the highest; from the interval of a diatonic or greater semitone, a sound lower by a triple octave than the highest; from that of a minor or chromatic semitone, a sound lower by the quantity of a fifth four times multiplied than the lowest, &c. &c. But that these musical phænomena may be tried by experiments proper to ascertain them, two hautboys tuned with scrupulous exactness must be procured, whilst the musicians are placed at the distance of some paces one from the other, and the hearers in the middle. The violin will likewise give the same chords, but they will be less distinctly perceived, and the experiment more fallacious, because the vibrations of other strings may be supposed to enter into it.

If our English reader should be curious to examine these experiments and the deductions made from them in the theory of music, he will find them clearly explained and illustrated in a treatise called *Principles and power of harmony*, printed at London in the year 1771.

(E) See the article FUNDAMENTAL in the French *Encyclopédie*, vol. vii. p. 63.

in queftion. But what do we know of all this hypothetical doctrine? And though it fhould even be granted, that there is fuch a diverfity of tenfion in thefe aërial particles, how fhould this diverfity prevent them from being all of them confounded in their vibrations by the motions of a fonorous body? What then fhould be the refult, when the vibrations arrive at our ears, but a confufed and inappretiable ‡ noife, where one could not diftinguifh any particular found? (F)

‡ See *Inappretiable.*

41
Metaphyfical conclufions lefs adequate.

If philofophical muficians ought not to lofe their time in fearching for mechanical explications of the phænomena in mufic, explications which will always be found vague and unfatisfactory; much lefs is it their province to exhauft their powers in vain attempts to rife above their fphere into a region ftill more remote from the profpect of their faculties, and to lofe themfelves in a labyrinth of metaphyfical fpeculations upon the caufes of that pleafure which we feel from harmony. In vain would they accumulate hypothefis on hypothefis, to find a reafon why fome chords fhould pleafe us more than others. The futility of thefe fuppofititious accounts muft be obvious to every one who has the leaft penetration. Let us judge of the reft by the moft probable which has till now been invented for that purpofe. Some afcribe the different degrees of pleafure which we feel from chords, to the more or lefs frequent coincidence of vibrations; others to the relations which thefe vibrations have among themfelves as they are more or lefs fimple. But why fhould this coincidence of vibrations, that is to fay, their fimultaneous impulfe on the fame organs of fenfation, and the accident of beginning frequently at the fame time, prove fo great a fource of pleafure? Upon what is this gratuitous fuppofition founded? And though one fhould grant it, would it not follow from thence, that the fame chord fhould fucceffively and rapidly affect us with contrary fenfations, fince the vibrations are alternately coincident and difcrepant? On the other hand, how fhould the ear be fo fenfible to the fimplicity of relations, whilft, for the moft part, thefe relations are entirely unknown to him whofe organs are notwithftanding fenfibly affected with the charms of agreeable mufic? We may conceive without difficulty how the eye judges of relations; but how does the ear form fimilar judgments? Befides, why fhould certain chords which are extremely pleafing in themfelves, fuch as the fifth, lofe almoft nothing of the pleafure which they give us, when they are altered, and of confequence when the fimplicity of their relations are deftroyed; whilft other chords, which are likewife extremely agreeable, fuch as the third, become harfh almoft by the fmalleft alteration; nay, whilft the moft perfect and the moft agreeable of all chords, I mean the octave, cannot fuffer the moft inconfiderable change? Let us in fincerity confefs our ignorance concerning the genuine caufes of thefe effects. The metaphyfical conjectures concerning the accouftic organs are probably in the fame predicament with thofe which are formed concerning the organs of vifion, if one may fpeak fo, in which philofophers have even till now made fuch inconfiderable progrefs, and in all likelihood will not be furpaffed by their fucceffors (G).

Since the theory of mufic, even to thofe who confine themfelves within its limits, implies queftions from which every wife mufician will abftain, with much greater reafon fhould they avoid idle excurfions beyond the boundaries of that theory, and endeavours to inveftigate between mufic and the other fciences chimerical relations which have no foundation in nature. The fingular opinions advanced upon this fubject by fome even of the moft celebrated muficians, deferve not to be refcued from oblivion, nor refuted; and ought only to be regarded as a new proof how far men of genius may deviate from truth and tafte, when they engage in fubjects of which they are ignorant.

The rules which we have attempted to eftablifh concerning the track which every one ought to purfue in the theory of the mufical art, may fuffice to fhew our readers the end which we have propofed, and which we have endeavoured to attain in this work. We have nothing to do here (for it is proper that we repeat it), we have nothing to do with the mechanical principles of protracted and harmonic tones produced by fonorous bodies; principles which, till now, have been explored in vain, and which perhaps may be long explored with the fame fuccefs: we have ftill lefs to do with the metaphyfical caufes of thofe pleafing fenfations which are impreffed on the mind by harmony; caufes which are ftill lefs difcovered, and which, according to all appearances, will remain latent in perpetual obfcurity. We are alone concerned to fhow how the chief and moft effential laws of harmony may be deduced from one fingle experiment; and for which, if we may fpeak fo, preceding artifts have been under a neceffity of groping in the dark.

With an intention to render this work as generally ufeful as poffible, I have endeavoured to adapt it to the capacity even of thofe who are abfolutely uninftructed in mufic. To accomplifh this defign, it appeared neceffary to purfue the following plan.

43
Plan of the treatife.

To begin with a fhort introduction, in which are defined the technical terms moft frequently ufed in this art; fuch as *chord*, *harmony*, *tone*, *third*, *fifth*, *octave*, &c.

Afterwards to enter into the theory of harmony, which is explained according to M. Rameau, with all poffible perfpicuity. This is the fubject of the *Firft Part*; which, as well as the introduction, prefuppofes no other knowledge of mufic than that of the names and powers of the fyllables *ut*, *re*, *mi*, *fa*, *fol*, *la*, *fi*, which

(F) One may fee this fubject treated at greater length in the *Encyclopédie*, at the word FUNDAMENTAL.

(G) To thefe arguments others may ftill be added, which may be found under the article CONSONANCE in the *Encyclopédie*, where this queftion has been very fuccefsfully treated by M. Rouffeau.—† Thus far the author; but with refpect to his ftrictures concerning the metaphyfics of vifion, the little progrefs which philofophers have made in it, and the little probability of their being furpaffed by their fucceffors, we cannot forbear to remark, that M. D'Alembert would have been lefs precipitate and fanguine in his decifions had he read Dr Reid's *Inquiry into the human mind on the principles of common fenfe.*

which all the world knows (†).

The theory of harmony requires some arithmetical calculations, which are necessary for comparing sounds one with another. These calculations are very short, extremely simple, and conducted in such a manner as to be sensibly comprehended by every one; they demand no operation but what is clearly explained, and which every school-boy with the slightest attention may perform. Yet, that even the trouble of this may be spared to such as are not disposed to take it, I have not inserted these calculations in the body of the treatise, but transferred them to the notes, which the reader may omit, if he can satisfy himself by taking for granted the propositions contained in the work, which will be found proved in the notes.

These calculations I have not endeavoured to multiply; I could even have wished to suppress them, if it had been possible: so much did it appear to me to be apprehended that my readers might be misled upon this subject, and might either believe themselves, or at least suspect me of believing, all this arithmetic necessary to form an artist. Calculations may indeed facilitate the understanding of certain points in the theory, as of the relations between the different notes in the gammut and of the temperament; but the calculations necessary for treating of these points are so simple, and, to speak more properly, of so little importance, that nothing can require a less minute or ostentatious display. Do not let us imitate those musicians who, believing themselves geometers, or those geometers who, believing themselves musicians, fill their writings with figures upon figures; imagining, perhaps, that this apparatus is necessary to the art. The propensity of adorning their works with a false air of science, can only impose upon credulity and ignorance, and serve no other purpose but to render their treatises more obscure and less instructive. In the character of a geometer, I think I have some right to protest here (if I may be permited to express myself in this manner) against such ridiculous abuse of geometry in music.

44 Mathematical conclusions not transferable to sensible objects without caution.

This I may do with so much more reason, that in this subject the foundations of those calculations are in some manner hypothetical, and can never arise to a degree of certainty above hypothesis. The relation of the octave as 1 to 2, that of the fifth as 2 to 3, that of the third major as 4 to 5, &c. are not perhaps the genuine relations established in nature; but only relations which approach them, and such as experience can discover. For are the results of experience any thing more but mere approaches to truth?

But happily these approximated relations are sufficient, though they should not be exactly agreeable to truth, for giving a satisfactory account of those phænomena which depend on the relations of sound; as in the difference between the notes in the gammut, of the alterations necessary in the fifth and third, of the different manner in which instruments are tuned, and other facts of the same kind. If the relations of the octave, of the fifth, and of the third, are not exactly such as we have supposed them, at least no experiments can prove that they are not so; and since these relations are signified by a simple expression, since they are besides sufficient for all the purposes of theory, it would not only be useless, but even contrary to sound philosophy, should any one incline to invent other relations, to form the basis of any system of music less easy and simple than that which we have delineated in this treatise.

The *second part* contains the most essential rules of composition *, or in the other words the practice of harmony. These rules are founded on the principles laid down in the *first part;* yet those who wish to understand no more than is necessary for practice, without exploring the reasons why such practical rules are necessary, may limit the objects of their study to the *introduction* and the *second part*. They who have read the *first part*, will find at every rule contained in the *second*, a reference to that passage in the *first* where the reasons for establishing that rule are given.

* See *Composition.*

45 Some rules, on account of their intricacy, transferred to the notes.

That we may not present at once too great a number of objects and precepts, I have transferred to the notes in the second part several rules and observations which are less frequently put in practice, which perhaps it may be proper to omit till the treatise is read a second time, when the reader is well acquainted with the essential and foundamental rules explained in it.

This second part, strictly speaking, presupposes, no more than the first, any habit of singing, nor even any knowledge of music; it only requires that one should know, not even the rules and manner of intonation, but merely the position of the notes in the cleff *fa* on the fourth line, and of that of *sol* upon the second: and even this knowledge may be acquired from the work itself; for in the beginning of the second part I explain the positions of the cleffs and of the notes. Nothing else is necessary but to render it a little familiar to our memory, and we shall have no more difficulty in it.

46 All the rules of composition not to be expected in an elementary essay.

It would be wrong to expect here all the rules of composition, and especially those which direct the composition of music in several parts, and which, being less severe and indispensable, may be chiefly acquired by practice, by studying the most approved models, by

(†) The names of the seven notes used by the French are here retained, and will indeed be continued thro' the whole ensuing work; as we imagine, that, if properly associated with the sounds which they denominate, they will tend to impress these sounds more distinctly on the memory of the scholar than the letters C, D, E, F, G, A, B, from which characters, except in sol-fa'ing the notes in the diatonic series are generally named in Britain. Amongst us, in the progress of intonation, the syllables *ut, re,* and *si*, have been omitted, by which means the teachers of church-music have rendered it still more difficult to express by the four remaining denominations the various changes of the semitones in the octave. As these artificially change their places, the seven syllables above-mentioned also diversify their powers, and are variously arranged according to the intervals in which the notes they are intended to signify may be placed.

For an account of these variations, see Rousseau's musical dictionary, article GAMME. See also the Essay towards a rational system of music, by John Holden, part i. chap. 1.

Definitions.

by the aſſiſtance of a proper maſter, but above all by the cultivation of the ear and of the taſte. This treatiſe is properly nothing elſe, if I may be allowed the expreſſion, but the rudiments of muſic, intended for explaining to beginners the fundamental principles, not the practical detail of compoſition. Thoſe who wiſh to enter more deeply into this detail, will either find it in Mr Rameau's treatiſe of harmony, or in the code of muſic which he publiſhed more lately (I), or laſtly in the explication of the theory and practice of muſic by M. Bethizi (K): this laſt book appears to me clear and methodical.

One may look upon it (with reſpect to a practical detail) as a ſupplement to my own performance; I do this juſtice to the author with ſo much more cheerfulneſs, as he is entirely unknown to me, and as his animadverſions upon my work appear to me leſs ſevere than it deſerved (L).

47 Nature the eſſential miſtreſs of muſical compoſition.

Is it neceſſary to add, that, in order to compoſe muſic in a proper taſte, it is by no means enough to have familiarized with much application the principles explained in this treatiſe? Here can only be learned the mechaniſm of the art; it is the province of nature alone to accompliſh the reſt. Without her aſſiſtance, it is no more poſſible to compoſe agreeable muſic by having read theſe elements, than to write verſes in a proper manner with the Dictionary of Richelet. In one word, it is the elements of muſic alone, and not the principles of genius, that the reader may expect to find in this treatiſe.

Such was the aim I purſued in its compoſition, and ſuch ſhould be the ideas of the reader in its peruſal. Once more let me add, that to the diſcovery of its fundamental principles I have not the remoteſt claim. The ſole end which I propoſed was to be uſeful; to reach that end, I have omitted nothing which appeared neceſſary, and I ſhould be ſorry to find my endeavours unſucceſsful.

DEFINITIONS OF SEVERAL TECHNICAL TERMS.

I. *What is meant by Melody, by Chord, by Harmony, by Interval.*

48 Melody, what.

1. Melody is nothing elſe but a ſeries of ſounds which ſucceed one to another in a manner agreeable to the ear.

49 Chord and harmony, what.

2. That is called a *chord* which ariſes from the mixture of ſeveral ſounds heard at the ſame time; and harmony is properly a ſeries of chords which in their ſucceſſion one to another delights the ear. A ſingle chord is likewiſe ſometimes called *harmony*, to ſignify the coaleſcence of ſounds which that chord creates, and the ſenſation produced in the ear by that coaleſcence. We ſhall occaſionally uſe the word *harmony* in this laſt ſenſe, but in ſuch a manner as never to leave our meaning ambiguous.

3. In melody and harmony, the diſtance between one ſound and another is called an *interval*; and this is increaſed or diminiſhed as the ſounds between which it intervenes are higher or lower one than the other. See *Interval*.

4. That we may learn to diſtinguiſh the intervals, and the manner of perceiving them, let us take the ordinary ſcale *ut, re, mi, fa, ſol, la, ſi, UT,* C, D, E, F, G, A, B, C, which every perſon whoſe ear or voice is not extremely falſe naturally modulates. Theſe are the obſervations which will occur to us in ſinging this gammut.

50 Account of the ſimple intervals.

The ſound *re* is higher or ſharper than the ſound *ut*, the ſound *mi* higher than the ſound *re*, the ſound *fa* higher than the ſound *mi*, &c. and ſo through the whole octave; ſo that the interval or the diſtance from the ſound *ut* to the ſound *re*, is leſs than the interval or diſtance between the ſound *ut* and the ſound *mi*, the interval from *ut* to *mi* is leſs than that between *ut* and *fa*, &c. and in ſhort that the interval from the firſt to the ſecond *ut* is the greateſt of all. To diſtinguiſh the firſt from the ſecond *ut*, I have marked the laſt with capital letters.

51 The diſtinction between ſtrong and faint, or acute and grave.

5. In general, the interval between two ſounds is proportionably greater, as one of theſe ſounds is higher or lower with relation to the other: but it is neceſſary to obſerve, that two ſounds may be equally high or low, though unequal in their force. The ſtring of a violin touched with a bow produces always a ſound equally high, whether ſtrongly or faintly ſtruck; the ſound will only have a greater or leſſer degree of ſtrength. It is the ſame with vocal modulation; let any one form a ſound by gradually impelling or ſwelling the voice, the ſound may be perceived to increaſe in its energy, whilſt it continues always equally low or equally high.

52 Between tonic and ſemitonic intervals.

6. We muſt likewiſe obſerve concerning the ſcale, that the intervals between *ut* and *re*, between *re* and *mi*, between *fa* and *ſol*, between *ſol* and *la*, between *la* and *ſi*, are equal, or at leaſt nearly equal; and that the intervals between *mi* and *fa*, and between *ſi* and *ut*, are likewiſe equal among themſelves, but conſiſt almoſt only of half the former. This fact is known and recogniſed by every one: the reaſon for it ſhall be given in the ſequel; in the mean time every one may aſcertain its reality by the aſſiſtance of an experiment (A).

7. It

(I) From my general recommendation of this code, I except the reflections on the principles of ſound which are at the end, and which I ſhould not adviſe any one to read.

(K) Printed at Paris by Lambert in the year 1754.

(L) That criticiſm and my anſwers may be ſeen in the *Journeaux Economiques* of 1752.

(A) This experiment may be eaſily tried. Let any one ſing the ſcale of *ut, re, mi, fa, ſol, la, ſi, UT,* C, D, E, F, G, A, B, C, it will be immediately obſerved without difficulty, that the laſt four notes of the octave *ſol, la, ſi, UT,* G, A, B, C, are quite ſimilar to the firſt *ut, re, mi, fa*; inſomuch, that if, after having ſung this ſcale, one would chooſe to repeat it, beginning with *ut* in the ſame tone which was occupied by *ſol* in the former ſcale, the note *re* of the laſt ſcale would have the ſame ſound with the note *la* in the firſt, the *mi* with the *ſi*, and the *fa* with the *ut*.

From whence it follows, that the interval between *ut* and *re*, is the ſame as between *ſol* and *la*; between *re* and

Definitions.

7. It is for this reaſon that they have called the interval from *mi* to *fa*, and from *ſi* to *ut*, a ſemitone; whereas thoſe between *ut* and *re*, *re* and *mi*, *fa* and *ſol*, *ſol* and *la*, *la* and *ſi*, are tones.

* See the figure marked A.

The *tone* is likewiſe called a *ſecond major* *, and the *ſemitone* a *ſecond minor* †.

* See *Interval*.

8. To deſcend or riſe diatonically, is to deſcend or riſe from one ſound to another by the interval of a tone or of a ſemitone, or in general by ſeconds, whether major or minor; as from *re* to *ut*, or from *ut* to *re*; from *fa* to *mi*, or from *mi* to fa.

II. *The Terms by which the different Intervals of the Gammut are denominated.*

53 Third minor, what.

9. An interval compoſed of a tone and a ſemitone, as from *mi* to *ſol*, from *la* to *ut*, or from *re* to *fa*, is called a *third minor*.

54 Third major, what.

An interval compoſed of two full tones, as from *ut* to *mi*, from *fa* to *la*, or from *ſol* to *ſi*, is called a *third major*.

55 Fourth, what

An interval compoſed of two tones and a ſemitone, as from *ut* to *fa*, or from *ſol* to *ut*, is called a *fourth* ‡.

56 Triton, what.

An interval conſiſting of three full tones, as from *fa* to *ſi*, is called a *triton* or *fourth redundant*.

57 Fifth, what.

An interval conſiſting of three tones and a ſemitone, as from *ut* to *ſol*, from *fa* to *ut*, from *re* to *la*, or from *mi* to *ſi*, &c. is called a *fifth*.

58 Sixth minor, what.

An interval compoſed of three tones and two ſemitones, as from *mi* to *ut*, is called a *ſixth minor*.

59 Sixth major, what.

An interval compoſed of four tones and a ſemitone, as from *ut* to *la*, is called a *ſixth major*.

60 Seventh minor, what.

An interval conſiſting of four tones and two ſemitones, as from *re* to *ut*, is called a *ſeventh minor*.

An interval compoſed of five tones and two ſemitones, as from *ut* to *ſi*, is called a *ſeventh major*. Definitions.

61 Seventh major, what.

And in ſhort, an interval conſiſting of five tones and two ſemitones, as from *ut* to *UT*, is called an *octave*.

62 Octave, what.

A great many of the intervals which have now been mentioned, are ſtill ſignified by other names, as may be ſeen in the beginning of the ſecond part; but thoſe which we have now given are the moſt common, and the only terms which our preſent purpoſe demands.

63 Uniſon, what.

10. Two ſounds equally high, or equally low, however unequal in their force, are ſaid to be in *uniſon* one with the other.

11. If two ſounds form between them any interval, whatever it be, we ſay, that the higheſt when aſcending is in that interval with relation to the loweſt; and when deſcending, we pronounce the loweſt in the ſame interval with relation to the higheſt. Thus in the third minor *mi*, *ſol*, where *mi* is the loweſt and *ſol* the higheſt ſound, *ſol* is a third minor from *mi aſcending*, and *mi* is third minor from *ſol in deſcending*.

12. In the ſame manner, if, ſpeaking of two ſonorous bodies, we ſhould ſay, that the one is a fifth above the other *in aſcending*, this infers that the ſound given by the one is at the diſtance of a fifth *aſcending* from the ſound given by the other.

III. *Of Intervals greater than the Octave.*

See fig. B.

13. If after having ſung the ſcale *ut*, *re*, *mi*, *fa*, *ſol*, *la*, *ſi*, *UT*, one would carry this ſcale ſtill farther in aſcent, it would be diſcovered without difficulty that a new ſcale would be formed, UT, RE, MI, FA, &c. entirely ſimilar to the former, and of which the ſounds will be an octave aſcending, each to its correſpondent note in the former ſcale: thus RE, the ſecond note of the ſecond ſcale, will be an octave in aſcent to the *re* of

and *mi*, as between *la* and *ſi*; and *mi* and *fa*, as between *ſi* and *ut*.

It will likewiſe be found, that from *re* to *mi*, from *fa* to *ſol*, there is the ſame interval as from *ut* to *re*. To be convinced of this, we need only ſing the ſcale once more; then ſing it again, beginning with *ut*, in this laſt ſcale, in the ſame tone which was given to *re* in the firſt; and it will be perceived, that the *re* in the ſecond ſcale will have the ſame ſound, at leaſt as far as the ear can diſcover, with the *mi* in the former ſcale; from whence it follows, that the interval between *re* and *mi* is, at leaſt as far as the ear can perceive, equal to that between *ut* and *re*. It will alſo be found, that the interval between *fa* and *ſol* is, ſo far as our ſenſe can determine, the ſame with that between *ut* and *re*.

This experiment may perhaps be tried with ſome difficulty by thoſe who are not inured to form the notes and change the key; but ſuch may very eaſily perform it by the aſſiſtance of a harpſichord, by means of which the performer will be ſaved the trouble of retaining the ſounds in one intonation whilſt he performs another. In touching upon this harpſichord the keys *ſol*, *la*, *ſi*, *ut*, and in performing with the voice at the ſame time *ut*, *re*, *mi*, *fa*, in ſuch a manner that the ſame ſound may be given to *ut* in the voice with that of the key *ſol* in the harpſichord, it will be found that *re* in the vocal intonation ſhall be the ſame with *la* upon the harpſichord, &c.

It will be found likewiſe by the ſame harpſichord, that if one ſhould ſing the ſcale beginning with *ut* in the ſame tone with *mi* on the inſtrument, the *re* which ought to have followed *ut*, will be higher by an extremely perceptible degree than the *fa* which follows *mi*: thus it may be concluded, that the interval between *mi* and *fa* is leſs than that between *ut* and *re*; and if one would riſe from *fa* to another ſound which is at the ſame diſtance from *fa* as *fa* from *mi*, he would find in the ſame manner, that the interval from *mi* to this new ſound is almoſt the ſame as that between *ut* and *re*. The interval then from *mi* to *fa* is nearly half of that between *ut* and *re*.

Since then, in the ſcale thus divided, *ut*, *re*, *mi*, *fa*, / *ſol*, *la*, *ſi*, *Ut*,
the firſt diviſion is perfectly like the laſt; and ſince the intervals between *ut* and *re*, between *re* and *mi*, and between *fa* and *ſol*, are equal; it follows, that the intervals between *ſol* and *la*, and between *la* and *ſi*, are likewiſe equal to every one of the three intervals between *ut* and *re*, between *re* and *mi*, and between *fa* and *ſol*; and that the intervals between *mi* and *fa* and between *ſi* and *ut* are alſo equal, but that they only conſtitute one half of the others.

Definitions. of the firft fcale; in the fame manner MI fhall be the octave to *mi*, &c. and fo of the reft.

64 Ninth, what. 14. As there are nine notes from the firft *ut* to the fecond RE, the interval between thefe two founds is called a *ninth*, and this ninth is compofed of fix full tones and two femitones. For the fame reafon the interval from *ut* to FA is called an *eleventh*, and the interval between *ut* and SOL, a *twelfth*, &c.

65 Eleventh and twelfth, what. It is plain that the *ninth* is the octave of the *fecond*, the *eleventh* of the *fourth*, and the *twelfth* of the *fifth*, &c.

§ See *Interval* and *Double Octave*. The octave above the octave of any found is called a *double octave* §; the octave of the double octave is called a *triple octave*; and fo of the reft.

The double octave is likewife called a *fifteenth*; and for the fame reafon the double octave of the third is called a *feventeenth*, the double octave of the fifth a *nineteenth*, &c. (B)

IV. *What is meant by Sharps and Flats.*

66 Sharp and flats, what. See *Interval*. 15. It is plain that one may imagine the five tones which enter into the fcale, as divided each into two femitones; thus one may advance from *ut* to *re*, forming in his progrefs an intermediate found, which fhall be higher by a femitone than *ut*, and lower in the fame degree than *re*. A found in the fcale is called *fharp*, when it is raifed by a femitone; and it is marked with this character ※: thus *ut* ※ fignifies *ut fharp*; that it is to fay, *ut* raifed by a femitone above its pitch in the natural fcale. A found in the fcale depreffed by a femitone is called *flat*, and is marked thus, ♭: thus *la*♭ fignifies *la flat*, or *la* depreffed by a femitone. Definitions.

V. *What is meant by Confonances and Diffonances.*

16. A chord compofed of founds whofe union or coalefcence pleafes the ear is called a *confonance*; and the founds which form this chord are faid to be confonant one with relation to the other. The reafon of this denomination is, that a chord is found more perfect, as the founds which form it coalefce more clofely among themfelves. 67 Confonance, what. See *Chord*.

17. The octave of a found is the moft perfect of confonances of which that found is fufceptible; then the fifth, afterwards the third, &c. This is a fact founded on experiment.

18. A number of founds fimultaneoufly produced whofe union is difpleafing to the ear is called a *diffonance*, and the founds which form it are faid to be diffonant one with relation to the other. The fecond, the triton, and the feventh of a found, are diffonants with relation to it. Thus the fonnds *ut re*, *ut fi*, or *fa fi*, &c. fimultaneoufly heard, form a diffonance. The reafon which renders diffonance difagreeable, is, that the founds which compofe it feem by no means coalefcent to the ear, and are heard each of them by itfelf as diftinct founds, tho' produced at the fame time. 68 Diffonance, what. See *Difcord*.

PART

(B) Let us fuppofe two vocal ftrings formed of the fame matter, of the fame thicknefs, and equal in their tenfion, but unequal in their length, it will be found by experience,

1ft, That if the fhorteft is equal to half the longeft, the found which it will produce muft be an octave above the found produced by the longeft.

2dly, That if the fhorteft conftitutes a third part of the longeft, the found which it produces muft be a twelfth above the found produced by the longeft.

3dly, That if it conftitutes the fifth part, its found will be a feventeenth above.

Befides, it is a truth demonftrated and generally admitted, that in proportion as one mufical ftring is lefs than another, the vibrations of the leaft will be more frequent (that is to fay, its departures and returns through the fame fpace), in the fame time; for inftance, in an hour, a minute, a fecond, &c. in fuch a manner that one ftring which conftitutes a third part of another, forms three vibrations, whilft the largeft has only accomplifhed one. In the fame manner a ftring which is one half lefs than another, performs two vibrations, whilft the other only completes one; and a ftring which is only the fifth part of another, will perform five vibrations in the fame time which is occupied by the other in one.

From thence it follows, that the found of a ftring is proportionally higher or lower, as the number of its vibrations is greater or fmaller in a given time; for inftance, in a fecond.

It is for that reafon that if we reprefent any found whatever by 1, one may reprefent the octave above by 2, that is to fay, by the number of vibrations formed by the ftring which produces the octave, whilft the longeft ftring only vibrates once; in the fame manner we may reprefent the twelfth above the found 1 by 3, the feventeenth major above by 5, &c. But it is very neceffary to remark, that by thefe numerical expreffions, we do not pretend to compare founds as fuch; for founds in themfelves are nothing but mere fenfations, and it cannot be faid of any fenfation that it is double or triple to another: thus the expreffions 1, 2, 3, &c. employed to denominate a found, its octave above, its twelfth above, &c. fignify only, that if a ftring performs a certain number of vibrations, for inftance, in a fecond, the ftring which is in the octave above fhall double the number in the fame time, the ftring which is in the twelfth above fhall triple it, &c.

Thus to compare founds among themfelves is nothing elfe than to compare among themfelves the numbers of vibrations which are formed in a given time by the ftrings that produce thefe founds.

Tranſlation. Intended to give ſuch Readers as do not underſtand French, an idea of the Song.

At length the victim in my power I ſee,
This fatal year reſigns him to my rage;
Subdued by ſleep he lies, and leaves me free,
With chaſtening hand my fury to aſſwage.
That mighty heart invincible and fierce,
Which all my captives free'd from ſervile chains;
That mighty heart, my vengeful hand ſhall pierce,
My rage inventive wanton in his pains.
Ha. in my ſoul what perturbation reigns!
What would compaſsion in his favour plead?
Strike, hand. O heaven! what charm thy force reſtrains?
Obey my wrath. I ſigh; yet let it bleed.
And is it thus my juſt revenge improves
The fair occaſion to chaſtize my foe?
As I approach, a ſofter paſsion moves,
And all my boaſting fury melts in wo.
Trembling, relaxed, and faithleſs to my hate,
The dreadful taſk this coward arm declines.

How cruel thus to urge his inſtant fate,
Depriv'd of life amid his great deſigns!
In youth how blooming! what a heavenly grace,
Thro' all his form, reſiſtleſs power diſplays!
How ſweet the ſmile that dwells upon his face,
Relentleſs rage diſarming whilſt I gaze!
Tho' to the proweſs of his conquering arms
Earth ſtood with all her hoſts oppoſed in vain;
Yet is he form'd to ſpread more mild alarms,
And bind all nature in a ſofter chain.
Can then his blood, his precious blood, alone
Extinguiſh all the vengeance in my heart?
Tho' ſtill ſurviving, might he not atone
For all the wrongs I feel, by gentler ſmart?
Since all my charms, unfeeling, he defies,
Let Magic force his ſtubborn ſoul ſubdue;
Whilſt I, inflexible to tears and ſighs,
With hate (if I can hate) his peace purſue.

Pl. 16.

Part I. THEORY of HARMONY.

Chap. I. *Preliminary and Fundamental Experiments.*

Experiment I.

19. WHEN a ſonorous body is ſtruck till it gives a ſound, the ear, beſides the principal ſound and its octave, perceives two other ſounds very high, of which one is the twelfth above the principal ſound, that is to ſay, the octave to the fifth of that ſound; and the other is the ſeventeenth major above the ſame ſound, that is to ſay, the double octave of its third major.

19. This experiment is peculiarly ſenſible upon the thick ſtrings of the violoncello, of which the ſound being extremely low, gives to an ear, though not very much practiſed, an opportunity of diſtinguiſhing with ſufficient eaſe and clearneſs the twelfth and ſeventeenth now in queſtion (c).

21. The principal ſound is called the *generator* *; and

* See Generator.

(c) Since the octave above the ſound 1 is 2, the octave below that ſame ſound ſhall be $\frac{1}{2}$; that is to ſay, that the ſtring which produces this octave ſhall have performed half its vibration whilſt the ſtring which produces the ſound 1 ſhall have completed one. To obtain therefore the octave above any ſound, the operator muſt multiply the quantity which expreſſes the ſound by 2; and to obtain the octave below, he muſt on the contrary divide the ſame quantity by 2.

It is for that reaſon that if any ſound whatever, for inſtance *ut*, is denominated	1
Its octave above will be	2
Its double octave above	4
Its triple octave above	8
In the ſame manner its octave below will be	$\frac{1}{2}$
Its double octave below	$\frac{1}{4}$
Its triple octave below,	$\frac{1}{8}$
And ſo of the reſt.	
Its twelfth above	3
Its twelfth below	$\frac{1}{3}$
Its ſeventeenth major above	5
Its ſeventeenth major below	$\frac{1}{5}$

The fifth then above the ſound 1 being the octave beneath the twelfth, ſhall be, as we have immediately obſerved, $\frac{3}{2}$; which ſignifies that this ſtring performs $\frac{3}{2}$ vibrations, that is to ſay one vibration and a half, during a ſingle vibration of the ſtring which gives the ſound 1.

To obtain the fourth above the ſound 1, we muſt take the twelfth below that ſound, and the double octave above that twelfth. In effect, the twelfth below *ut*, for inſtance, is *fa*, of which the double octave *fa* is the fourth above *ut*. Since then the twelfth below 1 is $\frac{1}{3}$, it follows that the double octave above this twelfth, that is to ſay, the fourth from the ſound 1 in aſcending, will be $\frac{1}{3}$ multiplied by 4, or $\frac{4}{3}$.

In ſhort, the third major being nothing elſe but the double octave beneath the ſeventeenth, it follows, that the third major above the ſound 1 will be 5 divided by 4, or in other words $\frac{5}{4}$.

The third major of a ſound, for inſtance the third major *mi*, from the ſound *ut*, and its fifth *ſol*, form between them a third minor *mi, ſol*; now *mi* is $\frac{5}{4}$, and *ſol* $\frac{3}{2}$, by what has been immediately demonſtrated: from whence it follows, that the third minor, or the interval between *mi* and *ſol*, ſhall be expreſſed by the relation of the fraction $\frac{5}{4}$ to the fraction $\frac{3}{2}$.

To determine this relation, it is neceſſary to remark, that $\frac{5}{4}$ are the ſame thing with $\frac{10}{8}$, and that $\frac{3}{2}$ are the ſame thing with $\frac{12}{8}$: ſo that $\frac{5}{4}$ ſhall be to $\frac{3}{2}$ in the ſame relation as $\frac{10}{8}$ to $\frac{12}{8}$; that is to ſay, in the ſame relation as 10 to 12, or as 5 to 6. If, then, two ſounds form between themſelves a third minor, and that the firſt is repreſented by 5, the ſecond ſhall be expreſſed by 6; or what is the ſame thing, if the firſt is repreſented by 1, the ſecond ſhall be expreſſed by $\frac{6}{5}$.

Thus the third minor, an harmonic ſound which is even found in the protracted and coaleſcent tones of a ſonorous body between the ſound *mi* and *ſol*, an harmonic of the principal ſound, may be expreſſed by the fraction $\frac{6}{5}$.

N. B. One may ſee by this example, that in order to compare two ſounds one with another which are expreſſed by fractions, it is neceſſary firſt to multiply the numerator of the fraction which expreſſes the firſt by the denominator of the fraction which expreſſes the ſecond, which will give a primary number; as here the numerator 5 of the fraction $\frac{5}{4}$, multiplied by 2 of the fraction $\frac{3}{2}$ has given 10. Afterwards may be multiplied the numerator of the ſecond fraction by the denominator of the firſt which will give a ſecondary number, as here 12 is the product of 4 multiplied by 3; and the relation between theſe two numbers (which in the preceding example are 10 and 12), will expreſs the relation between theſe ſounds, or, what is the ſame thing, the interval which there is between the one and the other; in ſuch a manner, that the farther the relation between theſe ſounds departs from unity, the greater the interval will be.

Such is the manner in which we may compare two ſounds one with another whoſe numerical value is known. We ſhall now ſhow the manner how the numerical expreſſion of a ſound may be obtained, when the relation which it ought to have with another ſound is known whoſe numerical expreſſion is given.

Let

and the two other sounds which it produces, and with which it is accompanied, are, inclusive of its octave, called its *harmonics* §.

69 Generator what.

§ See *Harmonic*.

Experiment II.

22. There is no person insensible of the resemblance which subsists between any sound and its octave, whether above or below. These two sounds, when heard together, almost entirely coalesce in the organ of sensation. We may besides be convinced (by two facts which are extremely simple) of the facility with which one of these sounds may be taken for the other.

Let it be supposed that any person has an inclination to sing a tune, and having at first begun this air upon a pitch too high or too low for his voice, so that he is obliged, lest he should strain himself too much, to sing the tune in question on a key higher or lower than the first; I affirm, that, without being initiated in the art of music, he will naturally take his new key in the octave below or the octave above the first; and that in order to take this key in any other interval except the octave, he will find it necessary to exert a sensible degree of attention. This is a fact of which we may easily be persuaded by experience.

Another fact. Let any person sing a tune in our presence, and let it be sung in a tone too high or too low for our voice; if we wish to join in singing this air, we naturally take the octave below or above, and frequently, in taking this octave, we imagine it to be the unison (D).

Chap. II. *The Origin of the Modes Major and Minor; of the most natural Modulation, and the most perfect Harmony.*

70 Fundamental and harmonics, what.

23. To render our ideas still more precise and permanent, we shall call the tone produced by the sonorous body *ut*: it is evident, by the first experiment, that this sound is always attended by its 12th and 17th major; that is to say, with the octave of *sol*, and the double octave of *mi*.

24. This octave of *sol* then, and this double octave of *mi*, produce the most perfect chord which can be joined with *ut*, since that chord is the work and choice of nature (E).

25. For the same reason, the modulation formed by *ut* with the octave of *sol* and the double octave of *mi*, sung one after the other, would likewise be the most simple and natural of all modulations which do not descend or ascend directly in the diatonic order, if our voices had sufficient compass to form intervals so great without difficulty: but the ease and freedom with which we can substitute its octave to any sound, when it is more convenient for the voice, afford us the means of representing this modulation. 71 Harmony reduced to chords, fifths, and octaves.

26. It is on this account that, after having sung the tone *ut*, we naturally modulate the third *mi*, and the fifth *sol*, instead of the double octave of *mi*, and the octave of *sol*; from whence we form, by joining the octave of the sound *ut*, this modulation, *ut*, *mi*, *sol*, *ut*, which in effect is the simplest and easiest of them all; and which likewise has its origin even in the protracted and compounded tones produced by a sonorous body. 72 Mode major, what.

27. The modulation *ut*, *mi*, *sol*, *ut*, in which the chord *ut*, *mi*, is a third major, constitutes that kind of harmony or melody which we call the *mode major*; from whence it follows, that this mode results from the immediate operation of nature. See *Mode*. See likewise *Interval*.

28. In the modulation *ut*, *mi*, *sol*, of which we have now been treating, the sounds *mi* and *sol* are so proportioned one to the other, that the principal sound *ut* (art. 19.) causes both of them to resound; but the second tone *mi* does not cause *sol* to resound, which only forms the interval of a third minor. 73 Mode minor, what.

29. Let us then imagine, that, instead of this sound *mi*, one should substitute between the sounds *ut sol* another note which (as well as the sound *ut*) has the power of causing *sol* to resound, and which is, however, different from the sound *ut*; the sound which we explore ought to be such, by art. 19. that it may have for its 17th major *sol*, or one of the octaves of *sol*; of consequence the sound which we seek ought to be a 17th major below *sol*, or, what is the same thing, a third major below the same *sol*. Now the sound *mi* being a third minor beneath *sol*, and the third major being (art. 9.) greater by a semitone than the third minor, it follows, that the sound of which we are

Let us suppose, for example, that the third major of the fifth $\frac{3}{2}$ is sought. That third major ought to be, by what has been shown above, the $\frac{5}{4}$ of the fifth; for the third major of any sound whatever is the $\frac{5}{4}$ of that sound. We must then look for a fraction which expresses the $\frac{5}{4}$ of $\frac{3}{2}$; which is done by multiplying the numerators and denominators of both fractions one by the other, from whence results the new fraction $\frac{15}{8}$. It will likewise be found that the fifth of the fifth is $\frac{9}{4}$, because the fifth of the fifth is the $\frac{3}{2}$ of $\frac{3}{2}$.

Thus far we have only treated of fifths, fourths, thirds major and minor, in ascending; now it is extremely easy to find by the same rules the fifths, fourths, thirds major and minor in descending. For suppose *ut* equal to 1, we have seen that its fifth, its fourth, its third, its major and minor in ascending, are $\frac{3}{2}$, $\frac{4}{3}$, $\frac{5}{4}$, $\frac{6}{5}$. To find its fifth, its fourth, its third major and minor in descending, nothing more is necessary than to reverse these fractions, which will give $\frac{2}{3}$, $\frac{3}{4}$, $\frac{4}{5}$, $\frac{5}{6}$.

(D) It is not then imagined that we change the value of a sound in multiplying or dividing it by 2, by 4, or by 8, &c. the number which expresses these sounds, since by these operations we do nothing but take the simple, double, or triple octave, &c. of the sound in question, and that a sound coalesces with its octave.

(E) The chord formed with the twelfth and seventeenth major united with the principal sound, being exactly conformed to that which is produced by nature, is likewise for that reason the most agreeable of all; especially when the composer can proportion the voices and instruments together in a proper manner to give this chord its full effect. M. Rameau has executed this with the greatest success in the opera of *Pygmalion*, page 34. where Pygmalion sings with the chorus, *L'amour triomphe*, &c.: in this passage of the chorus, the two parts of the vocal and instrumental bass gives the principal sound and its octave; the first part above, or treble, and that of the counter-tenor, produce the seventeenth major, and its octave, in descending; and in short, the second part, or tenor above, gives the twelfth.

Theory of Harmony.

are in ſearch ſhall be a ſemitone beneath the natural *mi*, and of conſequence *mi* ♭.

30. This new arrangement, *ut*, *mi* ♭, *ſol*, in which the ſounds *ut* and *mi* ♭ have both the power of cauſing *ſol* to reſound, though *ut* does not cauſe *mi* ♭ to reſound, is not indeed equally perfect with the firſt arrangement *ut*, *mi*, *ſol*; becauſe in this the two ſounds *mi* and *ſol* are both the one and the other generated by the principal ſound *ut*; whereas, in the other, the ſound *mi* ♭ is not generated by the ſound *ut*; but this arrangement *ut*, *mi* ♭, *ſol*, is likewiſe dictated by nature (art. 19.), though leſs immediately than the former; and accordingly experience evinces that the ear accommodates itſelf almoſt as well to the latter as to the former.

74 rigin of mode minor. See Mode. See ſo Interval.

31. In this modulation or chord *ut*, *mi* ♭, *ſol*, *ut*, it is evident that the third from *ut* to *mi* ♭ is minor; and ſuch is the origin of that mode which we call *minor* (F).

75 erfect hords, hat.

32. The moſt perfect chords then are, 1. All chords related one to another, as *ut*, *mi*, *ſol*, *ut*, conſiſting of any ſound of its third major, of its fifth, and of its octave. 2. All chords related one to another, as *ut*, *mi* ♭, *ſol*, *ut*, conſiſting of any ſound, of its third minor, of its fifth, and of its octave. In effect, theſe two kinds of chords are exhibited by nature; but the firſt more immediately than the ſecond. The firſt are called *perfect chords major*, the ſecond *perfect chords minor*.

CHAP. III. *Of the Series which the Fifth requires, and of the Laws which it obſerves.*

76 unda-mental baſs hat.

33. SINCE the ſound *ut* cauſes the ſound *ſol* to be heard, and is itſelf heard in the ſound *fa*, which ſounds *ſol* and *fa* are its two-twelfths, we may imagine a modulation compoſed of that ſound *ut* and its two-twelfths, or, which is the ſame thing (art. 22.), of its two-fifths, *fa* and *ſol*, the one below, the other above; which gives the modulation or ſeries of fifths *fa*, *ut*, *ſol*, which I call the *fundamental baſs* of *ut* by fifths.

We ſhall find in the ſequel (Chap. XVIII.) that there may be ſome fundamental baſes by thirds, deduced from the two ſeventeenths, of which the one is an attendant of the principal ſound, and of which the other includes that ſound. But we muſt advance ſtep by ſtep, and ſatisfy ourſelves at preſent to conſider immediately the fundamental baſs by fifths.

34. Thus, from the ſound *ut*, one may make a tranſition indifferently to the ſound *ſol*, or to the ſound *fa*.

35. One may, for the ſame reaſon, continue this kind of fifths in aſcending, and in deſcending, from *ut*, in this manner:

mi ♭, *ſi* ♭, *fa*, *ut*, *ſol*, *re*, *la*, &c.

And from this ſeries of fifths one may paſs to any ſound which immediately precedes or follows it.

77 Exception to the rule.

36. But it is not allowed in the ſame manner to paſs from one ſound to another which is not immediately contiguous to it; for inſtance, from *ut* to *re*, or from *re* to *ut*: for this very ſimple reaſon, that the ſound *re* is not contained in the ſound *ut*, nor the ſound *ut* in that of *re*; and thus theſe ſounds have not any alliance the one with the other, which may authoriſe the tranſition from one to the other.

78 Two perfect chords in ſucceſſion proſcribed.

37. And as theſe ſounds *ut* and *re*, by the firſt experiment, naturally bring along with them the perfect chords conſiſting of greater intervals *ut*, *mi*, *ſol*, *ut*, *re*, *fa*※, *la*, *re*; hence may be deduced this rule, That two perfect chords, eſpecially if they are major (G), cannot ſucceed one another diatonically in a fundamental baſs; we mean, that in a fundamental baſs two ſounds cannot be diatonically placed in ſucceſſion, each of which, with its harmonics, forms a perfect chord, eſpecially if this perfect chord be major in both.

CHAP. IV. *Of Modes in general.*

79 Mode in general, what.

38. A *mode*, in muſic, is nothing elſe but the order of ſounds preſcribed, as well in harmony as melody, by the ſeries of fifths. Thus the three ſounds *fa*, *ut*, *ſol*, and the harmonics of each of theſe three ſounds, that is to ſay, their thirds major and their fifths, compoſe all the major modes which are proper to *ut*.

80 Modes, how repreſented by the ſeries of fifths.

39. The ſeries of fifths then, or the fundamental baſs *fa*, *ut*, *ſol*, of which *ut* holds the middle ſpace, may

(F) The origin which we have here given of the mode minor, is the moſt ſimple and natural that can poſſibly be given. In the firſt edition of this treatiſe, I had followed M. Rameau in deducing it from the following experiment.—If you put in vibration a muſical ſtring AB, and if there are at the ſame time contiguous to this two other ſtrings CF, LM, of which the firſt ſhall be a twelfth below the ſtring AB, and the ſecond LM a ſeventeenth major below the ſame AB, the ſtrings CF, LM, will vibrate without being ſtruck as ſoon as the ſtring AB ſhall give a ſound, and divide themſelves by a kind of undulation, the firſt into three, the laſt into five equal parts; in ſuch a manner, that, in the vibration of the ſtring CF, you may eaſily diſtinguiſh two points at reſt D, E, and in the tremulous motion of the ſtring LM four acquieſcent points N, O, P, Q, all placed at equal diſtances from each other, and dividing the ſtrings into three or five equal parts. In this experiment, ſays M. Rameau, if we repreſent by *ut* the tone of the ſtring AB, the two other ſtrings will repreſent the ſounds *fa* and *la* ♭; and from thence M. Rameau deduces the modulation *fa*, *la* ♭, *ut*, and of conſequence the mode minor. The origin which we have aſſigned to the minor mode in this new edition, appears to me more direct and more ſimple, becauſe it pre-ſuppoſes no other experiment than that of art. 19. and becauſe alſo the fundamental ſound *ut* is ſtill retained in both the modes, without being obliged, as M. Rameau found himſelf, to change it into *fa*. *See fig.* C.

(G) I ſay *eſpecially if they are major*; for in the major chord *re*, *fa*※, *la*, *re*, beſides that the ſounds *ut* and *re* have no common harmonical relation, and are even diſſonant between themſelves (Art. 18.), it will likewiſe be found, that *fa*※ forms a diſſonance with *ut*. The minor chord *re*, *fa*, *la*, *re*, would be more tolerable, becauſe the natural *fa* which occurs in this chord carries along with it its fifth *ut*, or rather the octave of that fifth: It has likewiſe been ſometimes the practice of compoſers, though rather by a licence indulged them than ſtrictly agreeable to their art, to place a minor in diatonic ſucceſſion to a major chord.

may be regarded as reprefenting the mode of *ut*. One may likewife take the feries of fifths, or fundamental bafe, *ut*, *fol*, *re*, as reprefenting the mode of *fol*; in the fame manner *fi*♭, *fa*, *ut*, will reprefent the mode of *fa*.

By this we may fee, that the mode of *fol*, or rather the fundamental bafs of that mode, has two founds in common with the fundamental bafs of the mode of *ut*. It is the fame with the fundamental bafs of the mode *fa*.

81 Principal mode, and adjuncts, what. See *Adjunct*.

40. The mode of *ut (fa, ut, fol,)* is called the *principal mode* with refpect to the modes of thefe two fifths, which are called its two *adjuncts*.

82 Modes relifhed in proportion as their founds are common.

41. It is then, in fome meafure, indifferent to the ear whether a tranfition be made to the one or to the other of thefe adjuncts, fince each of them has equally two founds in common with the principal mode. Yet the mode of *fol* feems a little more eligible: for *fol* is heard amongft the harmonics of *ut*, and of confequence is implied and fignified by *ut*; whereas *ut* does not caufe *fa* to be heard, though *ut* is included in the fame found *fa*. It is hence that the ear, affected by the mode of *ut*, is a little more prepoffeffed for the mode of *fol* than for that of *fa*. Nothing likewife is more frequent, nor more natural, than to pafs from the mode of *ut* to that of *fol*.

83 Dominant and fub-dominant, what. See *Dominant*.

42. It is for this reafon, as well as to diftinguifh the two fifths one from the other, that we call *fol* the fifth above the generator the *dominant* found, and the fifth *fa* beneath the generator the *fubdominant*.

84 Tranfition to contiguous founds, how to be managed.

43. It remains to add, as we have feen in the preceding chapter, that, in the feries of fifths, we may indifferently pafs from one found to that which is contiguous: In the fame manner, and for the fame reafon, one may pafs from the mode of *fol* to the mode of *re*, after having made a tranfition from the mode of *ut* to the mode of *fol*, as from the mode of *fa* to the mode of *fi* ♭. But it is neceffary, however, to obferve, that the ear which has been immediately affected with the principal mode feels always a ftrong propenfity to return to it. Thus the further the mode to which we make a tranfition is removed from the principal mode, the lefs time we ought to dwell upon it; or rather, to fpeak in the terms of the art, the lefs ought the phrafe (‡ *aa*) of that mode to be protracted.

CHAP. V. *Of the Formation of the Diatonic Scale as ufed by the Greeks.*

44. FROM this rule, that two founds which are contiguous may be placed in immediate fucceffion in the feries of fifths, *fa*, *ut*, *fol*, it follows, that one may form this modulation, or this fundamental bafs, by fifths, *fol*, *ut*, *fol*, *ut*, *fa*, *ut*, *fa*.

See fig. D.

85 Formation of the Greek diatonic fcale by the fundamental bafs.

45. Each of the founds which forms this modulation brings neceffarily along with itfelf its third major, its fifth, and its octave; infomuch that he who, for inftance, fings the note *fol* may be reckoned to fing at the fame time the notes *fol*, *fi*, *re*, *fol*: in the fame manner the found *ut* in the fundamental bafs brings along with it this modulation, *ut*, *mi*, *fol*, *ut*; and, in fhort, the fame found *fa* brings along with it *fa*, *la*, *ut*, *fa*. This modulation then, or this fundamental bafs,

fol, *ut*, *fol*, *ut*, *fa*, *ut*, *fa*,

gives the following diatonic feries,

fi, *ut*, *re*, *mi*, *fa*, *fol*, *la*.

which is precifely the diatonic fcale of the Greeks. We are ignorant upon what principles they had formed this fcale; but it may be fenfibly perceived, that that feries arifes from the bafs *fol*, *ut*, *fol*, *ut*, *fa*, *ut*, *fa*; and that of confequence this bafs is juftly called *fundamental*, as being the real primitive modulation, that which conducts the ear, and which it feels to be implied in the diatonic modulation *fi*, *ut*, *re*, *mi*, *fa*, *fol*, *la*, (H). See D.

46. We fhall be ftill more convinced of this truth by the following remarks.

In the modulation *fi*, *ut*, *re*, *mi*, *fa*, *fol*, *la*, the founds

(‡ *aa*) As the mere Englifh reader, unacquainted with the technical phrafeology of mufic, may be furprifed at the ufe of the word *phrafe* when transferred from language to that art, we have thought proper to infert the definition of Rouffeau.

A *phrafe*, according to him, is in melody a feries of modulations, or in harmony a fucceffion of chords, which form without interruption a fenfe more or lefs complete, and which terminate in a repofe by a cadence more or lefs perfect.

(H) Nothing is eafier than to find in this fcale the value or proportions of each found with relation to the found *ut*, which we call 1; for the two founds *fol* and *fa* in the bafs are $\frac{3}{2}$ and $\frac{2}{3}$; from whence it follows,

1. That *ut* in the fcale is the octave of *ut* in the bafs; that is to fay, 2.
2. That *fi* is the third major of *fol*; that is to fay $\frac{5}{4}$ of $\frac{3}{2}$ (note C), and of confequence $\frac{15}{8}$.
3. That *re* is the fifth of *fol*; that is to fay $\frac{3}{2}$ of $\frac{3}{2}$, and of confequence $\frac{9}{4}$.
4. That *mi* is the third major of the octave of *ut*, and of confequence the double of $\frac{5}{4}$; that is to fay, $\frac{5}{2}$.
5. That *fa* is the double octave of *fa* of the bafs, and confequently $\frac{8}{3}$.
6. That *fol* of the fcale is the octave of *fol* of the bafs, and confequently 3.
7. In fhort, that *la* in the fcale is the third major of *fa* of the fcale; that is to fay, $\frac{5}{4}$ of $\frac{8}{3}$, or $\frac{10}{3}$.

Hence then will refult the following table, in which each found has its numerical value above or below it.

Diatonic Scale.	$\frac{15}{8}$	2	$\frac{9}{4}$	$\frac{5}{2}$	$\frac{8}{3}$	3	$\frac{10}{3}$
	fi,	*ut*,	*re*,	*mi*,	*fa*,	*fol*,	*la*.
Fundamental Bafs.	*fol*,	*ut*,	*fol*,	*ut*,	*fa*,	*ut*,	*fa*.
	$\frac{3}{2}$	1,	$\frac{3}{2}$	1	$\frac{2}{3}$	1	$\frac{2}{3}$

And if, for the conveniency of calculation, we choofe to call the found *ut*, of the fcale 1; in this cafe there is nothing to do but to divide each of the numbers by 2, which reprefent the diatonic fcale, and we fhall have

$\frac{15}{16}$	1	$\frac{9}{8}$	$\frac{5}{4}$	$\frac{4}{3}$	$\frac{3}{2}$	$\frac{5}{3}$
fi,	*ut*,	*re*,	*mi*,	*fa*,	*fol*,	*la*.

Theory of Harmony.

ſounds *re* and *fa* form between themſelves a third minor, which is not ſo perfectly true as that between *mi* and *ſol* (1). Nevertheleſs this alteration in the third minor between *re* and *fa* gives the ear no pain, becauſe that *re* and that *fa*, which do not form between themſelves a true third minor, form, each in particular, conſonances perfectly juſt with the ſounds in the fundamental baſs which correſpond with them: for *re* in the ſcale is the true fifth of *ſol*, which anſwers to it in the fundamental baſs; and *fa* in the ſcale is the true octave of *fa*, which anſwers to it in the ſame baſs.

85 Altered intervals, no objection.

47. If, therefore, theſe ſounds in the ſcale form conſonances perfectly true with the notes which correſpond to them in the fundamental baſs, the ear gives itſelf little trouble to inveſtigate the alterations which there may be in the intervals which theſe ſounds in the ſcale form between themſelves. This is a new proof that the fundamental baſs is the genuine guide of the ear, and the true origin of the diatonic ſcale.

86 Reaſons why this ſcale includes only ſeven ſounds.

48. Moreover, this diatonic ſcale includes only ſeven ſounds, and goes no higher than *ſi*, which would be the octave of the firſt: a new ſingularity, for which a reaſon may be given by the principles above eſtabliſhed. In reality, in order that the ſound *ſi* may ſucceed immediately in the ſcale to the ſound *la*, it is neceſſary that the note *ſol*, which is the only one from whence *ſi* as a harmonic may be deduced, ſhould immediately ſucceed to the ſound *fa*, in the fundamental baſs, which is the only one from whence *la* can be harmonically deduced. Now, the diatonic ſucceſſion from *fa* to *ſol* cannot be admitted in the fundamental baſs, according to what we have remarked (art. 36.) The ſounds *la* and *ſi*, then, cannot immediately ſucceed one another in the ſcale: we ſhall ſee in the ſequel why this is not the caſe in the ſeries *ut, re, mi, fa, ſol, la, ſi, UT*, which begins upon *ut*; whereas the ſcale in queſtion here begins upon *ſi*.

87 Completion of the Greek octave.

49. The Greeks likewiſe, to form an entire octave, added below the firſt *ſi* the note *la*, which they diſtinguiſhed and ſeparated from the reſt of the ſcale, and which for that reaſon they called *proſlambanomene*, that is to ſay, a ſtring or note ſubadded to the ſcale, and put before *ſi* to form the entire octave.

Theory of Harmony.

See Proſlambanomene.

88 The ſcale compoſed of two ſimilar conjunctive tetrachords.

50. The diatonic ſcale *ſi, ut, re, mi, fa, ſol, la*, is compoſed of two tetrachords, that is to ſay, of two diatonic ſcales, each conſiſting of four ſounds, *ſi, ut, re, mi*, and *mi, fa, ſol, la*. Theſe two tetrachords are exactly ſimilar; for from *mi* to *fa* there is the ſame interval as from *ſi* to *ut*; from *fa* to *ſol* the ſame as from *ut* to *re*, from *ſol* to *la* the ſame as from *re* to *mi* (L): this is the reaſon why the Greeks diſtinguiſhed theſe two tetrachords; yet they joined them by the note *mi*, which is common to both, and which gave them the name of *conjunctive tetrachords*.

89 Intervals in both tetrachords equal.

51. Moreover, the intervals between any two ſounds, taken in each tetrachord in particular, are preciſely true: thus, in the firſt tetrachord, the intervals of *ut mi*, and *ſi re*, are thirds, the one major and the other minor, exactly true, as well as the fourth *ſi mi* (M); it is the ſame thing with the tetrachord *mi, fa, ſol, la*, ſince this tetrachord is exactly like the former.

90 Intervals between the notes of different tetrachords diſſimilar.

52. But the caſe is not the ſame when we compare two ſounds taken each from a different tetrachord; for we have already ſeen, that the note *re* in the firſt tetrachord forms with the note *fa* in the ſecond a third minor, which is not true. In like manner it will be found, that the fifth from *re* to *la* is not exactly true, which is evident; for the third major from *fa* to *la* is true, and the third minor from *re* to *fa* is not ſo: now, in order to form a true fifth, a third major and a third minor, which are both exactly true, are neceſſary.

91 Another reaſon for diſtinguiſhing the ſcale into two tetrachords.

53. From thence it follows, that every conſonance is abſolutely perfect in each tetrachord taken by itſelf; but that there is ſome alteration in paſſing from one tetrachord to the other. This is a new reaſon for diſtinguiſhing the ſcale into theſe two tetrachords.

92 The ſource of tones major and minor inveſtigated.

54. It may be aſcertained by calculation, that in the tetrachord *ſi, ut, re, mi*, the interval, or the tone from

[d]

(1) In order to compare *re* with *fa*, we need only compare $\frac{9}{8}$ with $\frac{4}{3}$; the relation between theſe fractions will be (Note C), that of 9 times 3 to 8 times 4; that is to ſay, of 27 to 32: the third minor, then, from *re* to *fa*, is not true; becauſe the proportion of 27 to 32 is not the ſame with that of 5 to 6, theſe two proportions being between themſelves as 27 times 6 is to 32 times 5, that is to ſay, as 162 to 160, or as the halves of theſe two numbers, that is to ſay, as 81 to 80.

M. Rameau, when he publiſhed, in 1726, his *New theoretical and practical Syſtem of Muſic*, had not as yet found the true reaſon of the alteration in the conſonance which is between *re* and *fa*, and of the little attention which the ear pays to it. For he pretends, in the work now quoted, that there are two thirds minor, one in the proportion of 5 to 6, the other in the proportion of 27 to 32. But the opinion which he has afterwards adopted, ſeems much preferable. In reality, the genuine third minor, is that which is produced by nature between *mi* and *ſol*, in the continued tone of thoſe ſonorous bodies, of which *mi* and *ſol* are the two harmonics; and that third minor, which is in the proportion of 5 to 6, is likewiſe that which takes place in the minor mode, and not that third minor which is falſe and different, being in the proportion of 27 to 32.

(L) The proportion of *ſi* to *ut* is as $\frac{15}{16}$ to 1, that is to ſay as 15 to 16; that between *mi* and *fa* is as $\frac{5}{4}$ to $\frac{4}{3}$ that is to ſay (note C) as 5 times 3 to 4 times 4, or as 15 to 16: theſe two proportions then are equal. In the ſame manner, the proportion of *ut* to *re* is as 1 to $\frac{9}{8}$, or as 8 to 9; that between *fa* and *ſol* is as $\frac{4}{3}$ to $\frac{3}{2}$; that is to ſay (note C), as 8 to 9. The proportion of *mi* to *ut* is as $\frac{5}{4}$ to 1, or as 5 to 4; that between *fa* and *la* is as $\frac{5}{3}$ to $\frac{4}{3}$, or as 5 to 4: the proportions here then are likewiſe equal.

(M) The proportion of *mi* to *ut* is as $\frac{5}{4}$ to 1, or as 5 to 4, which is a true third major; that from *re* to *ſi* is as $\frac{9}{8}$ to $\frac{15}{16}$; that is to ſay, as 9 times 16 to 15 times 8, or as 9 times 2 to 15, or as 6 to 5. In like manner, we ſhall find, that the proportion of *mi* to *ſi* is as $\frac{5}{4}$ to $\frac{15}{16}$; that is to ſay, as 5 times 16 to 15 times 4, or as 4 to 3, which is a true fourth.

2

Theory of Harmony.

from *re* to *mi*, is a little leſs than the interval or tone from *ut* to *re* (N). In the ſame manner, in the ſecond tetrachord *mi, fa, ſol, la,* which is, as we have proved, perfectly ſimilar to the firſt, the note from *ſol* to *la* is a little leſs than the note from *fa* to *ſol*. It is for this reaſon that they diſtinguiſh two kinds of tones; the greater tone *, as from *ut* to *re*, from *fa* to *ſol*, &c.; and the leſſer †, as from *re* to *mi*, from *ſol* to *la*, &c.

* Greater tone. See *Interval*.
† Leſſer tone. See *Interval*.

Chap. VI. *The formation of the Diatonic Scale among the Moderns, or the ordinary Gammut.*

93
The modern ſcale, how formed.

55. We have juſt ſhown in the preceding chapter, how the ſcale of the Greeks is formed, *ſi, ut, re, mi, fa, ſol, la,* by means of a fundamental baſs compoſed of three ſounds only, *fa, ut, ſol*: but to form the ſcale *ut, re, mi, fa, ſol, la, ſi, UT,* which we uſe at preſent, we muſt neceſſarily add to the fundamental baſs the note *re*, and form, with theſe four ſounds *fa, ut, ſol, re,* the following fundamental baſs:

See fig. E. *ut, ſol, ut, fa, ut, ſol, re, ſol, ut;*

See *Scale*. from whence we deduce the modulation or ſcale.

ut, re, mi, fa, ſol, la, ſi, UT.

In effect (O), *ut* in the ſcale belongs to the harmony of *ut* which correſponds with it in the baſs; *re*, which is the ſecond note in the gammut, is included in the harmony of *ſol*, the ſecond note of the baſs; *mi*, the third note of the gammut, is a natural harmonic of *ut*, which is the third ſound in the baſs, &c.

94
The Greek diatonic ſcale ſimpler than ours, and why.

56. From thence it follows, that the diatonic ſcale of the Greeks is, at leaſt in ſome reſpects, more ſimple than ours; ſince the ſcale of the Greeks (chap. v.) may be formed alone from the mode proper to *ut*; whereas ours is originally and primitively formed, not only from the mode of *ut* (*fa, ut, ſol*), but likewiſe from the mode of *ſol*, (*ut, ſol, re*.)

It will likewiſe appear, that this laſt ſcale conſiſts of two parts; of which the one, *ut, re, mi, fa, ſol,* is in the mode of *ut*; and the other, *ſol, la, ſi, ut,* in that of *ſol*.

95
The note *ſol* twice repeated in the diatonic ſcale from its harmonic relations to the fundamental baſs.

57. It is for this reaſon that the note *ſol* is found to be twice repeated in immediate ſucceſſion in this ſcale; once as the fifth of *ut*, which correſponds with it in the fundamental baſs; and again, as the octave of *ſol*, which immediately follows *ut* in the ſame baſs. As to what remains, theſe two conſecutive *ſol's* are otherwiſe in perfect uniſon. It is for this reaſon that we are ſatisfied with ſinging only one of them when one modulates the ſcale *ut, re, mi, fa, ſol, la, ſi, UT*: but this does not prevent us from employing a pauſe or repoſe, expreſſed or underſtood, after the ſound *fa*. There is no perſon who does not perceive this whilſt he himſelf ſings the ſcale. 96

The modern ſcale compoſed of two disjunctive tetrachords of different modes.

58. The ſcale of the moderns, then, may be conſidered as conſiſting of two tetrachords, disjunctive indeed, but perfectly ſimilar one to the other, *ut, re, mi, fa,* and *ſol, la, ſi, ut,* one in the mode of *ut*, the other in that of *ſol*. For what remains, we ſhall ſee in the ſequel by what artifice one may cauſe the ſcale *ut, re, mi, fa, ſol, la, ſi, UT,* to be regarded as belonging to the mode of *ut* alone. For this purpoſe it is neceſſary to make ſome changes in the fundamental baſs, which we have already aſſigned: but this ſhall be explained at large in chap. xiii. 67

The mode of *ſol* introduced in the fundamental baſs productive of conveniences.

59. The introduction of the mode proper to *ſol* in the fundamental baſs has this happy effect, that the notes *fa, ſol, la, ſi,* may immediately ſucceed each other in aſcending the ſcale, which cannot take place (art. 48.) in the diatonic ſeries of the Greeks, becauſe that ſeries is formed from the mode of *ut* alone. From whence it follows:

1. That we change the mode at every time when we modulate three notes in ſucceſſion.

2. That if theſe three notes are ſung in ſucceſſion in the ſcale *ut, re, mi, fa, ſol, la, ſi, UT,* this cannot be done but by the aſſiſtance of a pauſe expreſſed or underſtood after the note *fa*; inſomuch, that the three tones *fa, ſol, la, ſi,* (three only becauſe the note *ſol* which is repeated is not enumerated) are ſuppoſed to belong to two different tetrachords. 98

Change of mode the cauſe of the difficulty in ſinging three conſecutive tones aſcending.

60. It ought not then any longer to ſurpriſe us, that we feel ſome difficulty whilſt we aſcend the ſcale in ſinging three tones in ſucceſſion, becauſe this is impracticable without changing the mode; and if one pauſes in the ſame mode, the fourth ſound above the firſt note will never be higher than a ſemitone above that which immediately precedes it; as may be ſeen by *ut, re, mi, fa,* and by *ſol, la, ſi, ut,* where there is no more than a ſemitone between *mi* and *fa*, and between *ſi* and *ut*.

61. We

(N) The proportion of *re* to *ut* is as $\frac{9}{8}$ to 1, or as 9 to 8; that of *mi* to *re* is as $\frac{5}{4}$ to $\frac{9}{8}$, that is to ſay, as 40 to 36, or as 10 to 9: now $\frac{10}{9}$ is leſs removed from unity than $\frac{9}{8}$; the interval then from *re* to *mi* is a little leſs than that from *ut* to *re*.

If any one would wiſh to know the proportion which $\frac{10}{9}$ bear to $\frac{9}{8}$, he will find (note C), that it is as 8 times 10 to 9 times 9, that is to ſay, as 80 to 81. Thus the proportion of a minor to a major tone is as 80 to 81; this difference between the major and minor tone, is what the Greeks called a *comma*. Though real, it is imperceptible to the ear.

We may remark, that this difference of a comma is found between the third minor when true and harmonical, and the ſame chord when it ſuffers alteration *re fa*, of which we have taken notice in the ſcale (note I); for we have ſeen, that this third minor thus altered is in the proportion of 80 to 81 with the true third minor.

(O) The values or eſtimates of the notes ſhall be the ſame in this as in the former ſcale, excepting only the tone *la*; for *re* being repreſented by $\frac{9}{8}$, its fifth ſhall be expreſſed by $\frac{27}{16}$; ſo that the ſcale will be numerically ſignified thus:

1	$\frac{9}{8}$	$\frac{5}{4}$	$\frac{4}{3}$	$\frac{3}{2}$	$\frac{27}{16}$	$\frac{15}{8}$	2
ut,	*re,*	*mi,*	*fa,*	*ſol,*	*la,*	*ſi,*	*UT.*

Where you may ſee, that the note *la* of this ſcale is different from that in the ſcale of the Greeks; and that the *la* in the modern ſeries ſtands in proportion to that of the Greeks as $\frac{27}{16}$ to $\frac{5}{3}$, that is to ſay, as 81 to 80; theſe two *la's* then likewiſe differ by a *comma*.

Theory of Harmony.

99 Intervals, though altered in themſelves, form true conſonances with the fundamental baſs.

61. We may likewiſe obſerve in the ſcale *ut, re, mi, fa*, that the third minor from *re* to *fa* is not true, for the reaſons which have been already given (art 49.) It is the ſame caſe with the third minor from *la* to *ut*, and with the third major from *fa* to *la*: but each of theſe ſounds form otherwiſe conſonances perfectly true, with their correſpondent ſounds in the fundamental baſs.

62. The thirds *la ut, fa la*, which were true in the former ſcale, are falſe in this; becauſe in the former ſcale *la* was the third of *fa*, and here it is the fifth of *re*, which correſponds with it in the fundamental baſs.

100 Fewer altered conſonances in the Greek ſcale than in ours.

63. Thus it appears, that the ſcale of the Greeks contains fewer conſonances that are altered than ours (P); and this likewiſe happens from the introduction of the mode of *ſol* into the fundamental baſs (Q).

We ſee likewiſe that the value of *la* in the diatonic ſcale, a value which authors have been divided in aſcertaining, ſolely depends upon the fundamental baſs, and that it muſt be different according as the note *la* has *fa* or *re* for its baſs. See the note (O).

Chap. VII. *Of Temperament.*

101 Temperament, why neceſſary.

64. The alterations which we have obſerved in the intervals between particular ſounds of the diatonic ſcale, naturally lead us to ſpeak of temperament. To give a clear idea of this, and to render the neceſſity of it palpable, let us ſuppoſe that we have before us an inſtrument with keys, a harpſichord, for inſtance, conſiſting of ſeveral octaves or ſcales, of which each includes its twelve ſemitones.

Let us chooſe in that harpſichord one of the ſtrings which will ſound the note UT, and let us tune the ſtring SOL to a perfect fifth with UT in aſcending; let us afterwards tune to a perfect fifth with this SOL the RE which is above it; we ſhall evidently perceive that this RE will be in the ſcale above that from which we ſet out: but it is alſo evident that this RE muſt have in the ſcale a *re* which correſponds with it, and which muſt be tuned a true octave below RE; and between this and SOL there ſhould be the interval of a fifth; ſo that the *re* in the firſt ſcale will be a true fourth below the SOL of the ſame ſcale. We may afterwards tune the note LA of the firſt ſcale to a juſt fifth with this laſt *re*; then the note MI in the higheſt ſcale to a true fifth with this new LA, and of conſequence the *mi* in the firſt ſcale to a true fourth beneath this ſame LA: Having finiſhed this operation, it will be found that the laſt *mi*, thus tuned, will by no means form a juſt third major from the ſound UT (R): that is to ſay, that it is impoſſible for *mi* to conſtitute at the ſame time the third major of UT, and the true fifth of LA; or, what is the ſame thing, the true fourth of LA in deſcending.

See fig. F.

Theory of Harmony.

65. What is ſtill more, if, after having ſucceſſively and alternately tuned the ſtrings UT, SOL, *re*, LA, *mi*, in perfect fifths and fourths one from the other, we continue to tune ſucceſſively by true fifths and fourths the ſtrings *mi, ſi, fa*※, *ut*※, *ſol*※, *re*※, *mi*※, *ſi*※; we ſhall find, that, though *ſi*※, being a ſemitone higher than the natural note, ſhould be equivalent to UT natural, it will by no means form a juſt octave to the firſt *ut* in the ſcale, but be conſiderably higher (S); yet

(d 2)

(P) In the ſcale of the Greeks, the note *la* being a third from *fa*, there is an altered fifth between *la* and *re*: but in ours, *la* being a fifth to *re*, produces two altered thirds, *fa la*, and *la ut*; and likewiſe a fifth altered, *la mi*, as we ſhall ſee in the following chapter. Thus there are in our ſcale two intervals more than in the ſcale of the Greeks which ſuffer alteration.

(Q) But here it may be with ſome colour objected. The ſcale of the Greeks, it may be ſaid, has a fundamental baſs more ſimple than ours; and beſides, in it there are fewer chords which will not be found exactly true: why then, notwithſtanding this, does ours appear more eaſy to be ſung than that of the Greeks? The Grecian ſcale begins with a ſemitone, whereas the intonation prompted by nature ſeems to impel us to riſe by a full tone at once. This objection may be thus anſwered. The ſcale of the Greeks is indeed better diſpoſed than ours for the ſimplicity of the baſs, but the arrangement of ours is more ſuitable to natural intonation. Our ſcale commences by the fundamental ſound *ut*, and it is in reality from that ſound that we ought to begin; it is from this that all the others naturally ariſe, and upon this that they depend; nay, if I may ſpeak ſo, in this they are included: on the contrary, neither the ſcale of the Greeks, nor its fundamental baſs, commences with *ut*; but it is from this *ut* that we muſt depart, in order to regulate our intonation, whether in riſing or deſcending: now, in aſcending from *ut*, the intonation, even of the Greek ſcale, gives the ſeries *ut, re, mi, fa, ſol, la*: and ſo true is it that the fundamental ſound *ut* is here the genuine guide of the ear, that if, before we modulate the ſound *ut*, we ſhould attempt to riſe to it by that note in the ſcale which is moſt immediately contiguous, we cannot reach it but by the note *ſi*; and by the ſemitone from *ſi* to *ut*. Now to make a tranſition from *ſi* to *ut* by this ſemitone, the ear muſt of neceſſity be prediſpoſed for that modulation, and conſequently preoccupied with the mode of *ut*: if this were not the caſe, we ſhould naturally riſe from *ſi* to *ut*※, and by this operation paſs into another mode.

(R) The LA conſidered as the fifth of *re* is $\frac{27}{16}$, and the fourth beneath this LA will conſtitute $\frac{3}{4}$ of $\frac{27}{16}$, that is to ſay, $\frac{81}{64}$; $\frac{81}{64}$ then ſhall be the value of *mi*, conſidered as a true fourth from LA in deſcending: now *mi*, conſidered as the third major of the ſound UT, is $\frac{5}{3}$, or $\frac{80}{64}$: theſe two *mi*'s then are between themſelves in the proportion of 81 to 80; thus it is impoſſible that *mi* ſhould be at the ſame time a perfect third major from UT, and a true fourth beneath LA.

(S) In effect, if you thus alternately tune the fifth above, and the fourth below, in the ſame octave, you may here ſee what will be the proceſs of your operation.

UT, SOL, a fifth; *re* a fourth; LA a fifth; *mi* a fourth; *ſi* a fifth; *fa*※ a fourth; *ut*※ a fifth; *ſol*※ a fourth; RE※ a fifth; *la*※ a fourth; MI※ or FA a fifth; *ſi*※ a fourth: now it will be found, by a very eaſy computation, that the firſt UT being repreſented by 1, SOL ſhall be $\frac{3}{2}$, *re* $\frac{9}{8}$, LA $\frac{27}{16}$, *mi* $\frac{81}{64}$, &c. and ſo of the

yet this *fi*※ upon the harpsichord ought not to be different from the octave above UT; for every *fi*※ and every UT is the same sound, since the octave or the scale only consists of twelve semitones.

102
Reasons and rules for temperament.

66. From thence it necessarily follows, 1. That it is impossible that all the octaves and all the fifths should be just at the same time, particularly in instruments which have keys, where no intervals less than a semitone are admitted. 2. That, of consequence, if the fifths are justly tuned, some alteration must be made in the octaves; now the sympathy of sound which subsists between any note and its octave, does not permit us to make such an alteration: this perfect coalescence of sound is the cause why the octave should serve as limits to the other intervals, and that all the notes which rise above or fall below the ordinary scale, are no more than replications, *i. e.* repetitions, of all that have gone before them. For this reason, if the octave were altered, there could be no longer any fixed point either in harmony or melody. It is then absolutely necessary to tune the *ut* or *fi*※ in a just octave with the first; from whence it follows, that, in the progression of fifths, or, what is the same thing, in the alternate series of fifths and fourths, UT, SOL, *re*, LA, *mi*, *si*, *fa*※, *ut*※, *sol*※, *re*※, *la*※, *mi*※, *fi*※, it is necessary that all the fifths should be altered, or at least some of them. Now, since there is no reason why one should rather be altered than another, it follows, that we ought to alter them all equally. By these means, as the alteration is made to influence all the fifths, it will be in each of them almost imperceptible; and thus the fifth, which, after the octave, is the most perfect of all consonances, and which we are under a necessity of altering, must only be altered in the least degree possible.

67. It is true, that the thirds will be a little harsh: but as the interval of sounds which constitutes the third, produces a less perfect coalescence than that of the fifth, it is necessary, says M. Rameau, to sacrifice the justice of that chord to the perfection of the fifth; for the more perfect a chord is in its own nature, the more displeasing to the ear is any alteration which can be made in it. In the octave the least alteration is insupportable.

68. This change in the intervals of instruments which have, or even which have not, keys, is that which we call *temperament*. 103
Its definition.

69. It results then from all that we have now said, that the theory of temperament may be reduced to this question.—The alternate succession of fifths and fourths having been given, UT, SOL, *re*, LA, *mi*, *si*, *fa*※, *ut*※, *sol*※, *re*※, *la*※, *mi*※, *fi*※, in which *fi*※ or *ut* is not the true octave of the first UT, it is proposed to alter all the fifths equally, in such a manner that the two *ut's* may be in a perfect octave the one to the other. 104
Principle whence its theory may be deduced.

70. For a solution of this question, we must begin with tuning the two *ut*'s in a perfect octave the one to the other; in consequence of which, we will render all the semitones which compose the octave as equal as possible. By this means (T) the alteration made in each fifth will be very inconsiderable, but equal in all of 105
Practical directions for temperament.

the rest till you arrive at *fi*※, which will be found $\frac{531441}{262144}$. This fraction is evidently greater than the number 2, which expresses the perfect octave *ut* to its correspondent UT; and the octave below *fi*※ would be one half of the same fraction, that is to say $\frac{531441}{524288}$, which is evidently greater than UT represented by unity. This last fraction $\frac{531441}{524288}$ is composed of two numbers; the numerator of the fraction is nothing else but the number 3 multiplied 11 times in succession by itself, and the denominator is the number 2 multiplied 18 times in succession by itself.. Now it is evident, that this fraction, which expresses the value of *fi*※, is not equal to the unity which expresses the value of the sound UT; though, upon the harpsichord, *fi*※ and UT are identical. This fraction rises above unity by $\frac{7153}{524288}$, that is to say, by about $\frac{1}{73}$; and this difference was called the *comma of Pythagoras*. It is palpable that this comma is much more considerable than that which we have already mentioned, note (N), and which is only $\frac{1}{85}$.

We have already proved that the series of fifths produces an *ut* different from *fi*※, the series of thirds major gives another still more different. For, let us suppose this series of thirds, *ut*, *mi*, *sol*※, *fi*※, we shall have *mi* equal to $\frac{5}{4}$, *sol*※ to $\frac{25}{16}$, and *fi*※ to $\frac{125}{64}$, whose octave below is $\frac{125}{128}$; from whence it appears, that this last *fi* is less than unity (that is to say, than *ut*), by $\frac{3}{128}$, or by $\frac{1}{42}$, or near it: A new comma, much greater than the preceding, and which the Greeks have called *apotome major*.

It may be observed, that this *fi*※, deduced from the series of thirds, is to the *fi*※ deduced from the series of fifths, as $\frac{125}{128}$ is to $\frac{531441}{524288}$; that is to say, in multiplying by 524288, as 125 multiplied by 4096 is to 531441, or as 512000 to 531441, that is to say, nearly as 26 is to 27: from whence it may be seen, that these two *fi*'s※ are very considerably different one from the other, and even sufficiently different to make the ear sensible of it; because the difference consists almost of a minor semitone, whose value, as will afterwards be seen (art. 139.), is $\frac{25}{24}$.

Moreover, if, after having found the *sol*※ equal to $\frac{25}{16}$, we then tune by fifths and by fourths, *sol*※, *re*※, *la*※, *mi*※, *fi*※, as we have done with respect to the first series of fifths, we find that the *fi*※ must be $\frac{2025}{2048}$; its difference, then, from unity, or, in other words, from UT, is $\frac{23}{2048}$, that is to say, about $\frac{1}{89}$; a comma still less than any of the preceding, and which the Greeks have called *apotome minor*.

In a word, if, after having found *mi* equal to $\frac{5}{4}$ in the progression of thirds, we then tune by fifths and fourths *mi*, *si*, *fa*※, *ut*※, &c. we shall arrive at a new *fi*※, which shall be $\frac{32805}{32768}$, and which will not differ from unity but by about $\frac{1}{885}$, which is the last and smallest of all the commas; but it must be observed, that, in this case, the thirds major from *mi* to *sol*※, from *sol*※ to *fi*※ or *ut*, &c. are extremely false, and greatly altered.

(T) All the semitones being equal in the temperament proposed by M. Rameau, it follows, that the twelve semitones *ut*, *ut*※, *re*, *re*※, *mi*, *mi*※, &c. shall form a continued geometrical progression; that is to say, a series in which *ut* shall be to *ut*※ in the same proportion as *ut*※ to *re*, as *re* to *re*※, &c. and so of the rest.

These

of them.

71. In this, then, the theory of temperament consists: but as it would be difficult in practice to tune a harpsichord or organ by thus rendering all the semitones equal, M. Rameau, in his *Generation Harmonique*, has furnished us with the following method, to alter all the fifths as equally as possible.

106 Rameau's method of temperament proposed.

72. Take any key of the harpsichord which you please, but let it be towards the middle of the instrument; for instance, UT: then tune the note SOL a fifth above it, at first with as much accuracy as possible; this you may imperceptibly diminish: tune afterwards the fifth to this with equal accuracy, and diminish it in the same manner; and thus proceed from one fifth to another in ascent: and as the ear does not appretiate so exactly sounds that are extremely sharp, it is necessary, when by fifths you have risen to notes extremely high, that you should tune in the most perfect manner the octave below the last fifth which you had immediately formed; then you may continue always in the same manner; till in this process you arrive at the last fifth from *mi*※ to *si*※, which should of themselves be in tune; that is to say, they ought to be in such a state, that *si*※, the highest note of the two which compose the fifth, may be identical with the sound UT, with which you began, or at least the octave of that sound perfectly just: it will be necessary then to try if this UT, or its octave, forms a just fifth with the last found *mi*※ or *fa* which has been already tuned. If this be the case, we may be certain that the harpsichord is properly tuned. But if this last fifth be not true, in this case it will be too sharp, and it is an indication that the other fifths have been too much diminished, or at least some of them; or it will be too flat, and consequently discover that they have not been sufficiently diminished. We must then begin and proceed as formerly, till we find the last fifth in tune of itself, and without our immediate interposition (*v*).

By

These twelve semitones are formed by a series of thirteen sounds, of which *UT* and its octave *ut* are the first and last. Thus to find by computation the value of each sound in the temperament, which is the present object of our speculations, our scrutiny is limited to the investigation of eleven other numbers between 1 and 2 which may form with the 1 and the 2 a continued geometrical progression.

However little any one is practised in calculation, he will easily find each of these numbers, or at least a number approaching to its value. These are the characters by which they may be expressed, which mathematicians will easily understand, and which others may neglect.

UT	*ut*※	*re*	*re*※	*mi*	*fa*	*fa*※	*sol*	*sol*※
1	$\sqrt[12]{2}$	$\sqrt[12]{2^2}$	$\sqrt[12]{2^3}$	$\sqrt[12]{2^4}$	$\sqrt[12]{2^5}$	$\sqrt[12]{2^6}$	$\sqrt[12]{2^7}$	$\sqrt[12]{2^8}$
	la	*la*※	*si*	*ut*				
	$\sqrt[12]{2^9}$	$\sqrt[12]{2^{10}}$	$\sqrt[12]{{}^{11}}$	$\sqrt[12]{{}^{12}}$				

It is obvious, that in this temperament all the fifths are equally altered. One may likewise prove, that the alteration of each in particular is very inconsiderable; for it will be found, for instance, that the fifth from *ut* to *sol*, which should be $\frac{3}{2}$, ought to be diminished by about $\frac{1}{12}$ of $\frac{1}{73}$; that is to say, by $\frac{1}{876}$, a quantity almost inconceivably small.

It is true, that the thirds major will be a little more altered; for the third major from *ut* to *mi*, for instance, shall be increased in its interval by about $\frac{1}{100}$: but it is better, according to M. Rameau, that the alteration should fall upon the third than upon the fifth, which after the octave is the most perfect chord, and from the perfection of which we ought never to degenerate but as little as possible.

Besides, it has appeared from the series of thirds major *ut*, *mi*, *sol* ※, *si*※, that this last *si*※ is very different from *ut* (note s); from whence it follows, that if we would tune this *si*※ in unison with the octave of *ut*, and alter at the same time each of the thirds major by a degree as small as possible, they must all be equally altered. This is what occurred in the temperament which we propose; and if in it the third be more altered than the fifth, it is a consequence of the difference which we find between the degrees of perfection in these intervals; a difference, with which, if we may speak so, the temperament proposed conforms itself. Thus this diversity of alteration is rather advantageous than inconvenient.

(*v*) All that remains, is to acknowledge, with M. Rameau, that this temperament is far remote from that which is now in practice: you may here see in what this last temperament consists as applied to the organ or harpsichord. They begin with *UT* in the middle of the keys, and they flatten the four first fifths *sol*, *re*, *la*, *mi*, till they form a true third major from *mi* to *ut*; afterwards, setting out from this *mi*, they tune the fifths *si*, *fa*※, *ut*※, *sol*※, but flattening them still less than the former, so that *sol*※ may almost form a true third major with *mi*. When they have arrived at *sol*※, they stop; they resume the first *ut*, and tune to it the fifth *fa* in descending, then the fifth *si*♭, &c. and they heighten a little all the fifths till they have arrived at *la*♭, which ought to be the same with the *sol*※ already tuned.

If, in the temperament commonly practised, some thirds are found to be less altered than in that prescribed by M. Rameau, in return, the fifths in the first temperament are much more false, and many thirds are likewise so; insomuch, that upon a harpsichord tuned according to the temperament in common use, there are five or six modes which the ear cannot endure, and in which it is impossible to execute any thing. On the contrary, in the temperament suggested by M. Rameau, all the modes are equally perfect; which is a new argument in its favour, since the temperament is peculiarly necessary in passing from one mode to another, without shocking the ear; for instance, from the mode of *ut* to that of *sol*, from the mode of *sol* to that of *re*, &c. It is true, that this uniformity of modulation will to the greatest number of musicians appear a defect: for they imagine, that, by tuning the semitones of the scale unequal, they give each of the modes a peculiar character;

so

Theory of Harmony.

By this method all the twelve ſounds which compoſe one of the ſcales ſhall be tuned: nothing is neceſſary but to tune with the greateſt poſſible exactneſs their octaves in the other ſcales, and the harpſichord ſhall be well tuned.

107
Alterations by either method hardly diſagreeable.

We have given this rule for temperament, from M. Rameau; and it belongs only to diſintereſted artiſts to judge of it. However this queſtion be determined, and whatever kind of temperament may be received, the alterations which it produces in harmony will be but very ſmall, or not perceptible to the ear, whoſe attention is entirely engroſſed in attuning itſelf with the fundamental baſs, and which ſuffers, without uneaſineſs, theſe alterations, or rather takes no notice of them, becauſe it ſupplies from itſelf what may be wanting to the truth and perfection of the intervals.

Simple and daily experiments confirm what we now advance. Liſten to a voice which is accompanied, in ſinging, by different inſtruments; though the temperament of the voice, and the temperaments of each of the inſtruments, are all different one from another, yet you will not be in the leaſt affected with the kind of cacophony which ought to reſult from theſe diverſities, becauſe the ear ſuppoſes theſe intervals true of which it does not appreciate the differences.

We may give another experiment. Strike upon an organ the three keys *mi*, *ſol*, *ſi*, you will hear nothing but the minor perfect chord; tho' *mi*, by the conſtruction of that inſtrument, muſt cauſe *ſol*※ likewiſe to be heard; though *ſol* ſhould have the ſame effect upon *re*, and *ſi* upon *fa*※; inſomuch, that the ear is at once affected with all theſe ſounds, *re*, *mi*, *fa*※, *ſol*, *ſol*※, *ſi*: how many diſſonances perceived at the ſame time, and what a jarring multitude of diſcordant ſenſations, would reſult from thence to the ear, if the perfect chord with which it is preoccupied had not power entirely to abſtract its attention from ſuch ſounds as might offend!

CHAP.

ſo that, according to them, the ſcale of *ut*,

ut, *re*, *mi*, *fa*, *ſol*, *la*, *ſi*, *UT*,

is not perfectly ſimilar to the gammut or diatonic ſcale of the mode of *mi*

mi, *fa*※, *ſol*※, *la*※, *ſi*, *ut*※, *re*※, *mi*,

which, in their judgment, renders the modes of *ut* and *mi* proper for different manners of expreſſion. But after all that we have ſaid in this treatiſe on the formation of diatonic intervals, every one ſhould be convinced, that, according to the intention of nature, the diatonic ſcale ought to be perfectly the ſame in all its modes: The contrary opinion, ſays M. Rameau, is a mere prejudice of muſicians. The character of an air ariſes chiefly from the intermixture of the modes; from the greater or leſſer degrees of vivacity in the movement; from the tones, more or leſs grave, or more or leſs acute, which are aſſigned to the generator of the mode; and from the chords more or leſs beautiful, as they are more or leſs deep, more or leſs flat, more or leſs ſharp, which are found in it.

In ſhort, the laſt advantage of this temperament is, that it will be found conformed, or at leaſt very little different from that which they practiſe upon inſtruments without keys; as the baſs-viol, the violin, in which true fifths and fourths are preferred to thirds and ſixths tuned with equal accuracy; a temperament which appears incompatible with that commonly uſed in tuning the harpſichord.

Yet we muſt not ſuffer our readers to be ignorant, that M. Rameau, in his *New Syſtem of Muſic*, printed in 1726, had adopted the ordinary temperament. In that work, (as may be ſeen CHAP. XXIV.), he pretends that the alteration of the fifths is much more ſupportable than that of the thirds major; and that this laſt interval can hardly ſuffer a greater alteration than the octave, which, as we know, cannot ſuffer the ſlighteſt alteration. He ſays, that if three ſtrings are tuned, one by an octave, the other by a fifth, and the next by a third major to a fourth ſtring, and if a ſound be produced from the laſt, the ſtring tuned by a fifth will vibrate, though a little leſs true than it ought to have been; but that the octave and the third major, if altered in the leaſt degree, will not vibrate: and he adds, that the temperament which is now practiſed, is founded upon that principle. M. Rameau goes ſtill farther; and as, in the ordinary temperament, there is a neceſſity for altering the laſt thirds major, and to make them a little more ſharp, that they may naturally return to the octave of the principal ſound, he pretends that this alteration is tolerable, not only becauſe it is almoſt inſenſible, but becauſe it is found in modulations not much in uſe, unleſs the compoſer ſhould chooſe it on purpoſe to render the expreſſion ſtronger. "For it is proper to remark, (ſays he), that we receive different impreſſions from the intervals in proportion to their different alterations: for inſtance, the third major, which naturally elevates us to joy, in proportion as we feel it, heightens our feelings even to a kind of fury, when it is tuned too ſharp; and the third minor, which naturally inſpires us with tenderneſs and ſerenity, depreſſes us to melancholy when it is too flat." All this ſtrain, as you may ſee, is immenſely different from that which this celebrated muſician afterwards exhibited in his *Generation Harmonique*, and in the performances which followed it. From this we can only conclude, that the reaſons, which, after him, we have urged for the new temperament, muſt without doubt have appeared to him very ſtrong, becauſe in his mind they have ſuperſeded thoſe which he had formerly adduced in favour of the ordinary temperament.

We do not pretend to give any deciſion for either the one or the other of theſe methods of temperament, each of which appears to us to have its particular advantages. We ſhall only remark, that the choice of the one or the other muſt be left abſolutely to the taſte and inclination of the reader; without, however, admitting this choice to have any influence upon the principles of the ſyſtem of muſic, which we have followed even till this period, and which muſt always ſubſiſt, whatever temperament we adopt.

Chap. VIII. *Of Repoſes or Cadences* (†).

108 Cadences perfect and imperfect, what and why. See *Repoſe* or *Cadence.*

73. In a fundamental baſs whoſe procedure is by fifths, there always is, or always may be, a *repoſe*, or criſis, in which the mind acquieſces in its tranſition from one ſound to another: but a repoſe may be more or leſs diſtinctly ſignified, and of conſequence more or leſs perfect. If one ſhould riſe by fifths; if, for inſtance, we paſs from *ut* to *ſol*; it is the generator which paſſes to one of theſe fifths, and this fifth was already pre-exiſtent in its generator: but the generator exiſts no longer in this fifth; and the ear, as this generator is the principle of all harmony and of all melody, feels a deſire to return to it. Thus the tranſition from a ſound to its fifth in aſcent, is termed an *imperfect repoſe*, or *imperfect cadence*; but the tranſition from any ſound to its fifth in deſcent, is denominated a *perfect cadence*, or an *abſolute repoſe*: it is the offſpring which returns to its generator, and as it were recovers its exiſtence once more in that generator itſelf, with which when ſounding it reſounds (chap. i.)

109 Perfect cadences more or leſs perfect, and why.

74. Amongſt abſolute repoſes, there are ſome, if we may be allowed the expreſſion, more abſolute, that is to ſay, more perfect, than others. Thus in the fundamental baſs

ut, ſol, ut, fa, ut, ſol, re, ſol, ut,

which forms, as we have ſeen, the diatonic ſcale of the moderns, there is an abſolute repoſe from *re* to *ſol*, as from *ſol* to *ut*: yet this laſt abſolute repoſe is more perfect than the preceding, becauſe the ear, prepoſſeſſed with the mode of *ut* by the multiplied impreſſion of the ſound *ut* which it has already heard thrice before, feels a deſire to return to the generator *ut*; and it accordingly does ſo, by the abſolute repoſe *ſol, ut*.

110 Cadence in melody different from what it is in harmony.

75. We may ſtill add, that what is commonly called *cadence* in melody, ought not to be confounded with what we name *cadence* in harmony.

In the firſt caſe, this word only ſignifies an agreeable and rapid alternation between two contiguous ſounds, called likewiſe a *trill* or *ſhake*; in the ſecond, it ſignifies a repoſe or cloſe. It is however true, that this ſhake implies, or at leaſt frequently enough preſages, a repoſe, either preſent or impending, in the fundamental baſs (x).

111 Cadences in the fundamental baſs neceſſary in the diatonic ſcale, and which the moſt perfect.

76. Since there is a repoſe in paſſing from one ſound to another in the fundamental baſs, there is alſo a repoſe in paſſing from one note to another in the diatonic ſcale, which is formed from it, and which this baſs repreſents: and as the abſolute repoſe *ſol ut*, is of all others the moſt perfect in the fundamental baſs, the repoſe from *ſi* to *ut*, which anſwers to it in the ſcale, and which is likewiſe terminated by the generator, is for that reaſon the moſt perfect of all others in the diatonic ſcale aſcending.

112 Definition and uſe of a ſenſible note.

77. It is then a law dictated by nature itſelf, that if you would aſcend diatonically to the generator of a mode, you can only do this by means of the third major from the fifth of that very generator. This third major, which with the generator forms a ſemitone, has for that reaſon been called the *ſenſible note*, as introducing the generator, and preparing us for the moſt perfect repoſe. See *Senſible Note.*

We have already proved, that the fundamental baſs is the principle of melody. We ſhall beſides make it appear in the ſequel, that the effect of a repoſe in melody ariſes ſolely from the fundamental baſs.

Chap. IX. *Of the Minor Mode and its Diatonic Series.*

113 The diatonic ſeries of the minor mode aſcertained by different examples.

78. In the ſecond chapter, we have explained (art. 29. 30. 31. and 32.) by what means, and upon what principle the minor chord *ut, mi♭, ſol, ut*, may be formed, which is the characteriſtical chord of the minor mode. Now what we have there ſaid, taking *ut* for the principal and fundamental ſound, we might likewiſe have ſaid of any other note in the ſcale, aſſumed in the ſame manner as the principal and fundamental ſound: but as in the minor chord *ut, mi♭ ſol, ut*, there occurs a *mi♭* which is not found in the ordinary diatonic ſcale, we ſhall immediately ſubſtitute, for greater eaſe and conveniency, another chord, which is likewiſe minor and exactly ſimilar to the former, of which all the notes are found in the ſcale.

79. The ſcale affords us three chords of this kind, viz. *re, fa, la, re, la, ut, mi, la*, and *mi, ſol, ſi, mi*. Amongſt theſe three we ſhall chooſe *la, ut, mi, la*; becauſe this chord, without including any ſharp or flat, has two ſounds in common with the major chord *ut, mi, ſol, ut*; and beſides, one of theſe two ſounds is the very ſame *ut*: ſo that this chord appears to have the moſt immediate, and at the ſame time the moſt ſimple, relation with the chord *ut, mi, ſol, ut*. Concerning this we need only add, that this preference of the chord *la, ut, mi, la*, to every other minor chord, is by no means in itſelf neceſſary for what we have to ſay in this chapter upon the diatonic ſcale of the minor mode. We might in the ſame manner have choſen any other minor chord; and it is only, as we have ſaid, for greater eaſe and conveniency, that we fix upon this.

114 Tonic or key in harmony, what. See *Principal.* See *Tonic.*

80. Let us now remark, that in every mode, whether major or minor, the *principal* ſound which implies the perfect chord, whether major or minor, may be called the *tonic note* or *key*; thus *ut* is the key in its proper mode, *la* in the mode of *la*, &c. Having laid down this principle,

114 The formation of the ſcale purſued.

81. We have ſhown how the three ſounds *fa, ut, ſol*, which conſtitutes (art. 38.) the mode of *ut*, of which the firſt *fa* and the laſt *ſol* are the two fifths of *ut*, one deſcending the other riſing, produce the ſcale

ſi,

(†) That the reader may have a clear idea of the term before he enters upon the ſubject of this chapter, it may be neceſſary to caution him againſt a miſtake into which he may be too eaſily led, by the ordinary ſignification of the word *repoſe*. In muſic, therefore, it is far from being ſynonimous with the word *reſt*. It is, on the contrary, the termination of a muſical *phraſe* which ends in a cadence more or leſs emphatic, as the ſentiment implied in the phraſe is more or leſs complete. Thus a repoſe in muſic anſwers the ſame purpoſe as punctuation in language. See Repos in Rouſſeau's Muſical Dictionary.

(x) M. Rouſſeau, in his letter on French muſic, has called this alternate undulation of different ſounds a *trill*, from the Italian word *trillo*, which ſignifies the ſame thing; and ſome French muſicians already appear to have adopted this expreſſion.

Theory of Harmony.

si, ut, re, mi, fa, sol, la, of the major mode, by means of the fundamental bass *sol, ut, sol, ut, fa, ut, fa:* let us in the same manner take the three sounds *re, la, mi,* which constitute the mode of *la,* for the same reason that the sounds *fa, ut, sol,* constitute the mode of *ut;* and of them let us form this fundamental bass, perfectly like the preceding, *mi, la, mi, la, re, la, re:* let us afterwards place below each of these sounds one of their harmonics, as we have done (chap. v.) for the first scale of the major mode; with this difference, that we must suppose *re* and *la* as implying their thirds minor in the fundamental bass to characterise the minor mode; and we shall have the diatonic scale of that mode,

See fig. D.

See fig G.

sol※, *la, si, ut, re, mi, fa.*

82. The *sol*※, which corresponds with *mi* in the fundamental base, forms a third major with that *mi,* though the mode be minor; for the same reason that a third from the fifth of the fundamental sound ought to be major (art. 77.) when that third rises to the fundamental sound *la.*

See *Imply* or *Carry.*

83. It is true, that, in causing *mi* to *imply* its third major *sol,* one might also rise to *la* by a diatonic progress. But that manner of rising to *la* would be less perfect than the preceding; for this reason (art. 76.), that the absolute repose or perfect cadence *mi, la,* which is found in the fundamental bass, ought to be represented in the most perfect manner in the two notes of the diatonic scale which answer to it, especially when one of these two notes is *la,* the key itself upon which the repose is made. From whence it follows, that the preceding note *sol* ought rather to be sharp than natural; because *sol*※, being included in *mi* (art. 19.), much more perfectly represents the note *mi* in the bass, than the natural note *sol* could do, which is not included in *mi.*

116 Diversities in the sales of the major and minor mode.

84. We may remark this first difference between the scale

sol※, *la,* , *ut, re, mi, fa,*

and the scale which corresponds with it in the major mode

si, ut, re, mi, fa, sol, la,

that from *mi* to *fa,* which are the two last notes of the former scale, there is only a semitone; whereas from *sol* to *la,* which are the two last sounds of the latter series, there is the interval of a complete tone: but this is not the only discrimination which may be found between the scales of the two modes.

117 Investigation of these differences and their reasons.

85. To investigate these differences, and to discover the reason for which they happen, we shall begin by forming a new diatonic scale of the minor mode, similar to the second scale of the major mode,

See fig. E.

ut, re, mi, fa, sol, sol, la, si, ut.

That last series, as we have seen, was formed by means of the fundamental bass *fa, ut, sol, re,* disposed in this manner,

ut, sol, ut, fa, ut, sol, re, sol, ut.

Let us take in the same manner the fundamental bass *re la mi si,* and arrange it in the following order,

See fig. H.

la, mi, la, re, la, mi, si, mi, la,

and it will produce the scale immediately subjoined,

la, si, ut, re, mi, mi, fa※, *sol*※, *la,*

in which *ut* forms a third minor with *la,* which in the fundamental bass corresponds with it, which denominates the minor mode: and on the contrary *sol*※ forms a third major with *mi* in the fundamental bass, because *sol*※ rises towards *la,* (art. 82. and 83.)

86. We see besides a *fa*※, which does not occur in the former,

sol※, *la, si, ut, re, mi, fa,*

where *fa* is natural. It is because, in the first scale, *fa* is a third minor from *re* in the bass; and in the second, *fa*※ is the fifth from *si* in the bass.

87. Thus the two scales of the minor mode are still in this respect more different one from the other than the two scales of the major mode; for we do not remark this difference of a semitone between the two scales of the major mode. We have only observed (art. 63.) some difference in the value of *la* as it stands in each of these scales, but this amounts to much less than a semitone.

118 Difference between the two scales of the minor mode greater than between those of the major.

88. From thence it may be seen why *fa* and *sol* are sharp when ascending in the minor mode; nay, besides, the *fa* is only natural in the first scale *sol*※, *la, si, ut, re, mi, fa,* because this *fa* cannot rise to *sol*※, (art. 48.)

119 *Fa* and *sol* sharp in the minor mode, and why.

89. It is not the same case in descending. For *mi,* the fifth of the generator, ought not to imply the third major *sol*※, but in the case when that *mi* descends to the generator *la* to form a perfect repose, (art. 77. and 83.); and in this case the third major *sol*※ rises to the generator *la*: but the fundamental bass *la mi* may, in descending, give the scale *la sol* natural, provided *sol* does not rise towards *la.*

120 The case different in descending, and why.

90. It is much more difficult to explain how the *fa,* which ought to follow this *sol* in descending, is natural and not sharp; for the fundamental bass

la, mi, si, mi, la, re, la, mi, la,

produces in descending,

la, sol, fa※, *mi, mi, re, ut, si, la.*

And it is plain that the *fa* cannot be otherwise than sharp, since *fa*※ is the fifth of the note *si* of the fundamental bass. In the mean time, experience evinces that the *fa* is natural in descending in the diatonic scale of the major mode of *la,* especially when the preceding *sol* is natural; and it must be acknowledged, that here the fundamental bass appears in some measure defective.

121 Explication of the descending scale in the minor mode from a fundamental bass difficult.

M. Rameau has invented the following means for obtaining a solution of this difficulty. According to him, in the diatonic scale of the minor mode in descending, *la, sol, fa, mi, re, ut, si, la, sol,* may be regarded simply as a note of passage, merely added to give sweetness to the modulation, and as a diatonic gradation by which we may descend to *fa* natural. It is easily perceived, according to M. Rameau, by this fundamental bass,

122 Rameau's solution, though the only one, yet unsatisfactory.

la, re, la, re, la, mi, la,

which produces

la, fa, mi, re, ut, si, la;

which may be regarded, as he says, as the real scale of the minor mode in descending; to which is added *sol* natural between *la* and *fa,* to preserve the diatonic order.

This answer appears the only one which can be given to the difficulty above proposed: but I know not whether it will fully satisfy the reader; whether he will not see with regret, that the fundamental bass does not produce, to speak properly, the diatonic scale of the minor

Theory of Harmony.

minor mode in deſcent, when at the ſame time this ſame baſs ſo happily produces the diatonic ſcale of that identical mode in aſcending, and the diatonic ſcale of the major mode whether in riſing or deſcending (Y).

Chap. X. *Of relative Modes.*

123 Modes relative, what. See *Mode.*

91. Two modes which are of ſuch a nature that we can paſs from the one to the other, are called *relative modes*. Thus we have already ſeen, that the major mode of *ut* is relative to the major mode of *fa* and to that of *ſol*. It may likewiſe appear from what goes before, how many intimate connections there are between the *ſpecies* (†) or major mode of *ut*, and the *ſpecies* or minor mode of *la*. For, 1. The perfect chords, one major *ut mi ſol ut*, the other minor *la ut mi la*, which characteriſe each of thoſe two kinds of modulation * or harmony, have two ſounds in common, *ut* or *mi*. 2. The diatonic ſcale of the minor mode of *la* in deſcent, abſolutely contains the ſame ſounds with the gammut or diatonic ſcale of the major mode of *ut*.

* See *Modulation.*

It is for this reaſon that the tranſition is ſo natural and eaſy from the major mode of *ut* to the minor mode of *la*, or from the minor mode of *la* to the major mode of *ut*, as experience proves.

92. In the minor mode of *mi*, the minor perfect chord *mi ſol ſi mi*, which characteriſes it, has likewiſe two ſounds, *mi*, *ſol*, in common with the perfect chord major *ut mi ſol ut*, which characteriſes the major mode of *ut*. But the minor mode of *mi* is not ſo cloſely related nor allied to the major mode of *ut* as to the minor mode of *la*; becauſe the diatonic ſcale of the minor mode of *mi* in deſcent has not, like the ſeries of the minor mode of *la*, all theſe ſounds in common with the ſcale of *ut*. In reality, this ſcale is *mi re ut ſi la ſol fa*♯ *mi*, where there occurs a *fa* ſharp which is not in the ſcale of *ut*. We may add, that though the minor mode of *mi* is leſs relative to the major mode of *ut* than that of *la*; yet the artiſt does not heſitate ſometimes to paſs immediately from the one to the other.

Of this may be ſeen one inſtance (among many others) in the prologue *des Amours des Dieux*, at this paſſage, *Ovide eſt l'objet de la fete*, which is in the minor mode of *mi*, though what immediately precedes it is in the major mode of *ut*.

We may ſee beſides, that when we paſs from one mode to another by the interval of a third, whether in deſcending or riſing, as from *ut* to *la*, or from *la* to *ut*, from *ut* to *mi*, or from *mi* to *ut*, the major mode becomes minor, or the minor mode becomes major.

93. There is ſtill another minor mode, into which an immediate tranſition may be made in iſſuing from the major mode of *ut*. It is the minor mode of *ut* itſelf in which the perfect minor chord *ut mi*♭ *ſol ut* has two ſounds, *ut* and *ſol*, in common with the perfect major chord *ut mi ſol ut*. Nor is there any thing more common than a tranſition from the major mode of *ut* to the minor mode, or from the minor to the major (Z).

Chap. XI. *Of Diſſonance.*

124 Caſes in which the mode is uncertain.

94. We have already obſerved, that the mode of *ut* (*fa*, *ut*, *ſol*,) has two ſounds in common with the mode of *ſol*, (*ut*, *ſol*, *re*); and two ſounds in common with the mode of *fa* (*ſi*♭, *fa*, *ut*); of conſequence this procedure of the baſs *ut ſol*, may belong to the mode of *ut*, or to the mode of *ſol*, as the procedure of the baſs *fa ut*, or *ut fa*, may belong to the mode of *ut* or the mode of *fa*. When any one therefore paſſes from *ut* to *fa* or to *ſol* in a fundamental baſs, he is ſtill ignorant even to that criſis what mode he is in. It would be however advantageous to know it, and to be able by ſome means to diſtinguiſh the generator from its fifths.

125 How we may inveſtigate the generator and its fifths, and by that means determine the mode.

95. This advantage may be obtained by uniting at the ſame time the ſounds *ſol* and *fa* in the ſame harmony, that is to ſay, by joining to the harmony *ſol ſi re* of the fifth *ſol*, the other fifth *fa* in this manner, *ſol*

(Y) For what remains when *ſol* is ſaid to be natural in deſcending the diatonic ſcale of the minor mode of *la*, this only ſignifies, that this *ſol* is not neceſſarily ſharp in deſcending as it is in riſing; for this *ſol*, beſides, may be ſharp in deſcending to the minor mode of *la*, as may be proved by numberleſs examples, of which all muſical compoſers are full. It is true, that when the ſound *ſol* is found ſharp in deſcending to the minor mode of *la*, ſtill we are not ſure that the mode is minor till the *fa* or *ut* natural is found; both of which impreſs a peculiar character on the minor mode, viz. *ut* natural, in riſing and in deſcending, and the *fa* natural in deſcending.

(†) *Species* was the only word which occurred to the tranſlator in Engliſh by which he could render the French word *genre*. It is, according to Rouſſeau, intended to expreſs the different diviſions and diſpoſitions of the intervals which formed the two tetrachords in the ancient diatonic ſcale; and as the gammut of the moderns conſiſts likewiſe of two tetrachords, though diverſified from the former, as our author has ſhown at large, the *genre*, or *ſpecies* as the tranſlator has been obliged to expreſs it, muſt conſiſt in the various diſpoſitions and diviſions of the different intervals between the notes or ſemitones which compoſe the modern ſcale.

(Z) There are likewiſe other minor modes, into which we may paſs in our egreſs from the mode major of *ut*; as that of *fa* minor, in which the perfect minor chord *fa*, *la*♭, *ut*, includes the ſound *ut*, and whoſe ſcale in aſcent *fa*, *ſol*, *la*♭, *ſi*♭, *ut*, *re*, *mi*, *fa*, only includes the two ſounds *la*♭, *ſi*♭, which do not occur in the ſcale of *ut*. We find an example of this tranſition from the mode major of *ut* to that of *fa* minor, in the opera of *Pygmalion* by M. Rameau, where the *ſarabando* is in the minor mode of *fa*, and the *rigadoon* in the mode major of *ut*. This kind of tranſition, however, is not frequent.

The minor mode of *re* has only in its ſcale aſcending *re*, *mi*, *fa*, *ſol*, *la*, *ſi*, *ut*♯, *re*, one *ut* ſharp which is not found in the ſcale of *ut*. For this reaſon a tranſition may likewiſe be made, without grating the ear, from the mode of *ut* major to the mode of *re* minor; but this paſſage is leſs immediate than the former, becauſe the chords *ut*, *mi*, *ſol*, *ut*, *re*, *fa*, *la*, *re*, not having a ſingle ſound in common, one cannot (art. 37.) paſs immediately from the one to the other.

ſol, ſi, re, fa; this *fa* which is added, forms a diſſonance with *ſol* (art. 18.) It is for that reaſon that the chord *ſol ſi re fa*, is called a *diſſonant* chord, or a chord of the ſeventh. It ſerves to diſtinguiſh the fifth *ſol* from the generator *ut*, which always implies, without mixture or alteration, the perfect chord *ut, mi, ſol, ut*, reſulting from nature itſelf (art. 32.) By this we may ſee, that when we paſs from *ut* to *ſol*, one paſſes at the ſame time from *ut* to *fa*, becauſe *fa* is found to be comprehended in the chord of *ſol;* and the mode of *ut* by theſe means plainly appears to be determined, becauſe there is none but that mode to which the ſounds *fa* and *ſol* at once belong.

126 Manner of treating diſſonances continued.

96. Let us now ſee what may be added to the harmony *fa, la, ut*, of the fifth *fa* below the generator, to diſtinguiſh this harmony from that of the generator. It ſeems probable at firſt, that we ſhould add to it the other fifth *ſol*, ſo that the generator *ut*, in paſſing to *fa*, may at the ſame time paſs to *ſol*, and that by this the mode ſhould be determined: but this introduction of *ſol*, in the chord *fa, la, ut*, would produce two ſeconds in ſucceſſion *fa, ſol, ſol, la*, that is two ſay, two diſſonances whoſe union would prove extremely harſh to the ear; an inconvenience which ought carefully to be avoided. For if, to diſtinguiſh the mode, we ſhould alter the harmony of the fifth *fa* in the fundamental baſs, it muſt only be altered in the leaſt degree poſſible.

127 Chord of the great ſixth.

97. For this reaſon, inſtead of *ſol*, we ſhall take its fifth *re*, which is the ſound that approaches it the neareſt; and we ſhall have, inſtead of the fifth *fa*, the chord *fa, la, ut, re*, which is called a *chord of the great ſixth*.

One may here remark the analogy there is obſerved between the harmony of the fifth *ſol*, and that of the fifth *fa*.

128 The ſubject of diſſonances continued.

98. The fifth *ſol*, in riſing above the generator, gives a chord entirely conſiſting of thirds aſcending from *ſol*, *ſol, ſi, re, fa;* now the fifth *fa* being below the generator *ut* in deſcending, we ſhall find, as we go lower by thirds from *ut* towards *fa*, the ſame ſounds *ut, la, fa, re*, which form the chord *fa, la, ut, re*, given to the fifth *fa*.

99. It appears beſides, that the alteration of the harmony in the two fifths conſiſts only in the third minor *re, fa*, which was reciprocally added to the harmony of theſe two fifths.

CHAP. XII. *Of the Double Uſe, or Employment of Diſſonance.*

129 Account of the double employment.

100. It is evident by the reſemblance of ſounds to their octaves, that the chord *fa, la, ut, re*, is in effect the ſame as the chord *re, fa, la, ut*, taken inverſely *, that the inverſe of the chord *ut, la, fa, re*, has been found (art. 98.) in deſcending by thirds from the generator *ut* (AA).

* See *Inverted*.

130 Difference between dominant and tonic dominant.

101. The chord *re, fa, la, ut*, is a chord of the ſeventh like the chord *ſol, ſi, re, fa:* with this only difference, that in this the third *ſol, ſi*, is major; whereas in the ſecond, the third *re, fa*, is minor. If the *fa* were ſharp, the chord *re, fa*✳, *la, ut*, would be a genuine chord of the dominant, like the chord *ſol, ſi, re, fa;* and as the dominant *ſol* may deſcend to *ut* in the fundamental baſs, the dominant *re* implying or carrying with the third major *fa*✳ might in the ſame manner deſcend to *ſol*.

102. Now I ſay, that if the *fa*✳ ſhould be changed into *fa* natural, *re*, the fundamental tone of this chord *re, fa, la, ut*, might ſtill deſcend to *ſol;* for the change from *fa*✳ to *fa* natural, will have no other effect, than to preſerve the impreſſion of the mode of *ut*, inſtead of that of the mode of *ſol*, which the *fa*✳ would have here introduced. For what remains, the note *re* will always preſerve its character as the dominant, on account of the mode of *ut*, which forms a ſeventh. Thus in the chord of which we treat, *re, fa, la, ut, re*, may be conſidered as an *imperfect dominant;* I call it *imperfect*, becauſe it carries with it the third minor *fa*, inſtead of the third major *fa*✳. It is for this reaſon that in the ſequel I ſhall call it ſimply the *dominant*, to diſtinguiſh it from the dominant *ſol*, which ſhall be named the *tonic dominant*.

See *Dominant*.

103. Thus the ſounds *fa* and *ſol*, which cannot ſucceed each other (art. 36.) in a diatonic baſs, when they only carry with them the perfect chords *fa, la, ut, ſol, ſi, re*, may ſucceed one another if you join *re* to the harmony of the firſt, and *fa* to the harmony of the ſecond; and if you invert the firſt chord, that is to ſay, if you give to the two chords this form, *re, fa, la, ut, ſol, ſi, re, fa*.

131 Seeming contradictions reconciled.

104. Beſides, the chord *fa, la, ut, re*, being allowed to ſucceed the perfect chord *ut, mi, ſol, ut*, it follows

(AA) "M. Rameau, in ſeveral paſſages of his works, (for inſtance, in *p.* 110, 111, 112, and 113, of the *Generation Harmonique*,) appears to conſider the chord *re, fa, la, ut*, as the primary chord and generator of the chord *fa, la, ut, re*, which is nothing but that chord itſelf reverſed; in other paſſages (particularly in *p.* 116 of the ſame performance), he ſeems to conſider the firſt of theſe chords as nothing elſe but the reverſe of the ſecond. It would ſeem that this great artiſt has neither expreſſed himſelf upon this ſubject with ſo much uniformity nor with ſo much preciſion as is required. For my own part, I think there is ſome foundation for conſidering the chord *fa, la, ut, re*, as primitive; 1. Becauſe in this chord, the fundamental and principal note is the ſub-dominant *fa*, which ought in effect to be the fundamental and principal ſound in the chord of the ſub-dominant. 2. Becauſe that without having recourſe, with M. Rameau, to harmonical and arithmetical progreſſions, of which the conſideration appears to us quite foreign to the queſtion, we have found a probable and even a ſatisfactory reaſon for adding the note *re* to the harmony of the fifth *fa*, (art. 96 and 97.) The origin thus aſſigned for the chord of the ſub-dominant appears to us the moſt natural, though M. Rameau does not appear to have felt its full value; for ſcarcely has it been ſlightly inſinuated by him."——

Thus far our author. We do not enter with him into the controverſy concerning the origin of the chord in queſtion; but only propoſe to add to his definition of the ſub-dominant, Rouſſeau's idea of the ſame note. It is a name, ſays he, given by M. Rameau to the fourth note in any modulation relative to a given key, which of conſequence is in the ſame interval from the key in deſcending as the dominant in riſing; from which circumſtance it takes its name.

follows for the ſame reaſons, that the chord *ut, mi, ſol, ut*, may be ſucceeded by *re, fa, la, ut;* which is not contradictory to what we have above ſaid (art. 37.), that the ſounds *ut* and *re* cannot ſucceed one another in the fundamental baſs: for in the paſſage quoted, we had ſuppoſed that both *ut* and *re* carried with them a perfect chord major; whereas, in the preſent caſe, *re* carries the third minor *fa* and likewiſe the ſound *ut*, by which the chord *re fa la ut* is connected with that which precedes it *ut mi ſol ut*, and in which the ſound *ut* is found. Beſides, this chord, *re fa la ut*, is properly nothing elſe but the chord *fa la ut re* inverted, and, if we may ſpeak ſo, diſguiſed.

132 Double employment, what, and why ſo called. * See *Double employment.*

105. This manner of preſenting the chord of the ſub-dominant under two different forms, and of employing it under theſe two different forms, has been called by M. Rameau its *double office* or *employment* *. This is the ſource of one of the fineſt varieties in harmony; and we ſhall ſee in the following chapter the advantages which reſult from it.

We may add, that as this double employment is a kind of licence, it ought not to be practiſed without ſome precaution. We have lately ſeen that the chord *re fa la ut*, conſidered as the inverſe of *fa la ut re*, may ſucceed to *ut mi ſol ut;* but this liberty is not reciprocal: and though the chord *fa la ut re*, may be followed by the chord *ut mi ſol ut*, we have no right to conclude from thence that the chord *re fa la ut*, conſidered as the inverſe of *fa la ut re*, may be followed by the chord *ut mi ſol ut*. For this the reaſon ſhall be given Chap. XVI.

Chap. XIII. *Concerning the Uſe of this Double Employment, and its Rules.*

133 By the double uſe of the abovementioned chord, the impreſſion of the mode may be preſerved.

106. We have ſhown (Chap. vi.) how the diatonic ſcale, or ordinary gammut, may be formed from the fundamental baſs *fa, ut, ſol, re*, by twice repeating the word *ſol* in that ſeries; ſo that this gammut is primitively and originally compoſed of two ſimilar tetrachords, one in the mode of *ut*, the other in that of *ſol*. Now it is poſſible, by means of this double employment, to preſerve the impreſſion of the mode of *ut* through the whole extent of the ſcale, without twice repeating the note *ſol*, or even without ſuppoſing this repetition. For this effect we have nothing to do but form the following fundamental baſe,

ut, ſol, ut, fa, ut, re, ſol, ut:

in which *ut* is underſtood to carry with it the perfect chord *ut mi ſol ut; ſol*, the chord *ſol ſi re fa; fa*, the chord *fa la ut re;* and *re*, the chord *re fa la ut*. It is plain from what has been ſaid in the preceding chapter, that in this caſe *ut* may aſcend to *re* in the fundamental baſs, and *re* deſcend to *ſol;* and that the impreſſion of the mode of *ut* is preſerved by the *fa* natural which forms the third minor *re fa*, inſtead of the third major which *re* ought naturally to imply.

107. This fundamental baſs will give, as it is evident, the ordinary diatonic ſcale,

ut, re, mi, fa, ſol, la, ſi, UT,

which of conſequence will be in the mode of *ut* alone; and if one ſhould chooſe to have the ſecond tetrachord in the mode of *ſol*, it will be neceſſary to ſubſtitute *fa*※ inſtead of *fa* natural in the harmony of *re* (BB).

108. Thus the generator *ut* may be followed according to pleaſure in aſcending diatonically either by a tonic dominant (*re fa*※ *la ut*), or by a ſimple dominant (*re fa la ut*).

109. In the minor mode of *la*, the tonic dominant *mi* ought always to imply its third major *mi ſol*※, when this dominant *mi* deſcends to the generator *la* (art. 83.); and the chord of this dominant ſhall be *mi ſol*※ *ſi re*, entirely ſimilar to *ſol ſi re fa*. With reſpect to the ſub-dominant *re*, it will immediately imply the third minor *fa*, to denominate the minor mode; and we may add *ſi* above its chord *re fa la*, in this manner *re fa la ſi*, a chord ſimilar to that of *fa la ut re;* and as we have deduced from the chord *fa la ut re*, that of *re fa la ut*, we may in the ſame manner deduce from the chord *re fa la ſi*, a new chord of the ſeventh *ſi re fa la*, which will exhibit the *double employment of diſſonances* in the minor mode.

110. One may employ this chord *ſi re fa la*, to preſerve the impreſſion of the mode of *la* in the diatonic ſcale of the minor mode, and to prevent the neceſſity of twice repeating the ſound *mi:* but in this caſe, the *fa* muſt be rendered ſharp, and change this chord to *ſi re fa*※ *la*, the fifth of *ſi* is *fa*※, as we have ſeen above; this chord is then the inverſe of *re fa*※ *la ſi*, where the ſub-dominant implies the third major; which ought not to ſurpriſe us. For in the minor mode of *la*, the ſecond tetrachord *mi fa*※ *ſol*※ *la* is exactly the ſame as it would be in the major mode of *la;* now, in the major mode of *la*, the ſub-dominant *re* ought to imply the third major *fa*※.

134 Diverſities in the minor mode more numerous than in the major.

111. From thence we may ſee that the minor mode is ſuſceptible of a much greater number of varieties than the major: likewiſe the major mode is the product of nature alone; whereas the minor is, in ſome meaſure,

(BB) We need only add, that it is eaſy to ſee, that this fundamental baſe *ut ſol, ut fa, ut re, ſol ut*, which formed the aſcending ſcale *ut, re, mi, fa, ſol, la, ſi, UT*, cannot by inverting it, and taking it inverſely in this manner *ſi, ut, ſol, re, ut, fa, ut, ſol, UT*, form the diatonic ſcale *UT, ſi, la, ſol, fa, mi, re, ut*, in deſcent. In reality, from the chord *ſol, ſi, re, fa*, we cannot paſs to the chord *re, fa, la, ut*, nor from thence to *ut, mi, ſol, ut*. It is for this reaſon that in order to have the fundamental baſs of the ſcale *UT, ſi, la, ſol, fa, mi, re, ut*, in deſcent, we muſt either determine to invert the fundamental baſs mentioned in art. 55. in this manner, *ut, ſol, re, ſol, ut, fa, ut, ſol, ut*, in which the ſecond *ſol* and the ſecond *ut* anſwer to the *ſol* alone in the ſcale; or otherwiſe we muſt form the fundamental baſs *ut, ſol, re, ſol, ut, ſol, ut*, in which all the notes imply perfect chords major, except the ſecond *ſol*, which implies the chord of the ſeventh *ſol, ſi, re, fa*, and which anſwers to the two notes of the ſcale *ſol, fa*, both comprehended in the chord *ſol, ſi, re, fa*.

Which ever of theſe two baſſes we ſhall chooſe, it is obvious that neither the one nor the other ſhall be wholly in the mode of *ut*, but in the mode of *ut* and in that of *ſol*. From whence it follows, that the double employment which gives to the ſcale a fundamental baſs all in the ſame mode when aſcending, cannot do the ſame in deſcending; and that the fundamental baſs of the ſcale in deſcending will be neceſſarily in two different modes.

Theory of Harmony

meaſure, the product of art. But in return, the major mode has received from nature, to which it owes its immediate formation, a force and energy which the minor cannot boaſt.

CHAP. XIV. *Of the Different Kinds of Chords of the Seventh.*

135 Inveſtigation whether art, in conſequence of ſome ſucceſsful advances, may not be carried farther.

112. THE diſſonance added to the chord of the dominant and of the ſub-dominant, though in ſome meaſure inſinuated by nature (Chap. xi.), is nevertheleſs a work of art: but as it produces great beauties in harmony by the variety which it introduces into it, let us diſcover whether, in conſequence of this firſt advance, art may not ſtill be carried farther.

113. We have already three different kinds of chords of the ſeventh, *viz.*

136 Different chords of the ſeventh.

1. The chord *ſol ſi re fa*, compoſed of a third major followed by two thirds minor.

2. The chord *re fa la ut*, or *ſi re fa*♯ *la*, compoſed of a third major between two minors.

3. The chord *ſi re fa la*, compoſed of two thirds minor followed by a major.

114. There are ſtill two other kinds of chords of the ſeventh which are employed in harmony; one is compoſed of a third minor between two thirds major, *ut mi ſol ſi*, or *fa la ut mi;* the other is wholly compoſed of thirds minor *ſol*♯ *ſi re fa.* Theſe two chords, which at firſt appear as if they ought not to enter into harmony if we rigorouſly keep to the preceding rules, are nevertheleſs frequently practiſed with ſucceſs in the fundamental baſs. The reaſon is this:

137 The chords laſt deſcribed admiſſible, and why.

115. According to what has been ſaid above, if we would add a ſeventh to the chord *ut mi ſol*, to make a dominant of *ut*, one can add nothing but *ſi*♭; and in this caſe *ut mi ſol ſi*♭ would be the chord of the tonic dominant in the mode of *fa*, as *ſol ſi re fa* is the chord of the tonic dominant in the mode of *ut:* but if you would preſerve the impreſſion of the mode of *ut* in the harmony, you then change this *ſi*♭ into *ſi* natural, and the chord *ut mi ſol ſi*♭ becomes *ut mi ſol ſi.* It is the ſame caſe with the chord *fa la ut mi*, which is nothing elſe but the chord *fa la ut mi*♭; in which one may ſubſtitute for *mi*♭, *mi* natural, to preſerve the impreſſion of the mode of *ut*, or of that of *fa.*

Beſides, in ſuch chords as *ut mi ſol ſi*, *fa la ut mi*, the ſounds *ſi* and *mi*, though they form a diſſonance with *ut* in the firſt caſe, and with *fa* in the ſecond, are nevertheleſs ſupportable to the ear, becauſe theſe ſounds *ſi* and *mi* (art. 19.) are already contained and underſtood, the firſt in the note *mi* of the chord *ut mi ſol ſi*, as likewiſe in the note *ſol* of the ſame chord; the ſecond in the note *la* of the chord *fa la ut mi*, as likewiſe in the note *ut* of the ſame chord. All together then ſeem to allow the artiſt to introduce the note *ſi* and *mi* into theſe two chords (CC).

138 Chords of the ſeventh continued and explained.

116. With reſpect to the chord of the ſeventh *ſol*♯ *ſi re fa*, wholely compoſed of thirds minor, it may be regarded as formed from the union of the two chords of the dominant and of the ſub-dominant in the minor mode. In effect, in the minor mode of *la*, for inſtance, theſe two chords are *mi ſol*♯ *ſi re*, and *re fa la ſi*, whoſe union produces *mi*, *ſol*♯, *ſi*, *re*, *fa*, *la:* Now if we ſhould ſuffer this chord to remain thus, it would be diſagreeable to the ear, by its multiplicity of diſſonances, *re mi*, *mi la*, *la ſol*♯, *la ſi*, *re ſol*♯, (art. 18.); ſo that, to avoid this inconveniency, the generator *la* is immediately expunged, which (art. 19.) is as it were underſtood in *re*, and the fifth or dominant *mi* whoſe place the ſenſible note *ſol*♯ is ſuppoſed to hold: thus there remains no more than the chord *ſol*♯ *ſi re fa*, wholly compoſed of thirds minor, and in which the dominant *mi* is conſidered as underſtood; in ſuch a manner that the chord *ſol*♯ *ſi re fa*, repreſents the chord of the tonic dominant *mi ſol*♯ *ſi re*, to which we have joined the chord of the ſub-dominant *re fa la ſi*, but in which the dominant *mi* is always reckoned the principal note (DD).

117. Since, then, from the chord *mi ſol*♯ *ſi re*, we may paſs to the perfect *la ut mi la*, and *vice verſa;* we may in like manner paſs from the chord *ſol*♯ *ſi re fa*, to the chord *la ut mi la*, and from this laſt to the chord *ſol*♯ *ſi re fa:* this remark will be very uſeful to us in the ſequel.

CHAP. XV. *Of the Preparation of Diſcords.*

139 Diſſonance, what.

118. In every chord of the ſeventh, the higheſt note, that is to ſay, the ſeventh above the fundamental, is called a *diſſonance* or *diſcord;* thus *fa* is the diſſonance of the chord *ſol ſi re fa*, *ut* in the chord *re fa la ut*, &c.

140 Manner of preparing diſſonances inveſtigated.

119. When the chord *ſol ſi re fa* follows the chord *ut mi ſol ut*, as this may happen, and in reality often happens, it is obvious that we do not find the diſſonance *fa* in the preceding chord *ut mi ſol ut.* Nor ought it indeed to be found in that chord; for this diſſonance is nothing elſe but the ſub-dominant added to the harmony of the dominant to determine the mode: now, the ſub-dominant is not found in the harmony of the generator.

120. For the ſame reaſon, when the chord of the ſub-

(CC) On the contrary, a chord ſuch as *ut mi*♭ *ſol ſi*, in which *mi* would be flat, could not be admitted in harmony, becauſe in this chord the *ſi* is not included and underſtood in *mi*♭. It is the ſame caſe with ſeveral other chords, ſuch as *ſi re fa la*♯, *ſi re*♯ *fa la*, &c. It is true, that in the laſt of theſe chords, *la* is included in *fa*, but it is not contained in *re*♯; and this *re*♯ likewiſe forms with *fa* and with *la* a double diſſonance, which, joined with the diſſonance *ſi fa*, would neceſſarily render this chord not very pleaſing to the *ear:* we ſhall yet, however, ſee in the ſecond part, that this chord is ſometimes uſed.

(DD) We have ſeen above (art 109.) that the chord *ſi re fa la*, in the minor mode of *la*, may be regarded as the inverſe of the chord *re fa la ſi:* it would likewiſe ſeem, that, in certain caſes, this chord *ſi re fa la* may be conſidered as compoſed of the two chords *ſol ſi re fa*, *fa la ut re*, of the dominant and of the ſub-dominant of the major mode of *ut;* which chords may be joined together, after having excluded from them, 1. The dominant *ſol*, repreſented by its third major *ſi*, which is preſumed to retain its place. 2. The note *ut* which is underſtood in *fa;* which will form this chord *ſi re fa la.* The chord *ſi re fa la*, conſidered in this point of view, may be underſtood as belonging to the major mode of *ut* upon certain occaſions.

ſub-dominant *fa la ut re* follows the chord *ut mi ſol ut*, the note *re*, which forms a diſſonance with *ut*, is not found in the preceding chord.

It is not ſo when the chord *re fa la ut* follows the chord *ut mi ſol ut;* for *ut*, which forms a diſſonance in the ſecond chord, ſtands as a conſonance in the preceding.

141 Diſſonance is only tolerable to the ear when found in preceding chords.

121. In general, diſſonance being the production of art (Chap. xi.), eſpecially in ſuch chords as are not of the tonic dominant nor ſub-dominant; the only means to prevent its diſpleaſing the ear by appearing too heterogeneous to the chord, is, that it may be, if we may ſpeak ſo, announced to the ear by being found in the preceding chord, and by that means ſerve to connect the two chords. From whence follows this rule:

142 Preparation of diſſonances how performed.

122. In every chord of the ſeventh, which is not the chord of the tonic dominant, that is to ſay, (art. 102.) which is not compoſed of a third major followed by two thirds minor, the diſſonance which this chord forms ought to ſtand as a conſonance in the chord which precedes it.

See *Preparation.*

This is what we call a *prepared diſſonance.*

123. From thence it follows, that in order to prepare a diſſonance, it is abſolutely neceſſary that the fundamental baſs ſhould aſcend by the interval of a ſecond, as

UT mi ſol ut, RE fa la ut;

or deſcend by a third, as

UT mi ſol ut, LA ut mi ſol;

or deſcend by a fifth, as

UT mi ſol ut, FA la ut mi:

in every other caſe the diſſonance cannot be be prepared. This is what may be eaſily aſcertained. If, for inſtance, the fundamental baſs riſes by a third, as *ut mi ſol ut, mi ſol ſi re*, the diſſonance *re* is not found in the chord *ut mi ſol ut*. The ſame might be ſaid of *ut mi ſol ut, ſol ſi re fa*, and *ut mi ſol ut, ſi re fa la*, in which the fundamental baſs riſes by a fifth or deſcends by a ſecond.

124. It may only be added, that when a tonic, that is to ſay, a note which carries with it a perfect chord, is followed by a dominant in the interval of a fifth or third, this procedure may be regarded as a proceſs from that ſame tonic to another, which has been rendered a dominant by the additiou of the diſſonance.

Moreover, we have ſeen (art. 119, and 120.) that a diſſonance does not ſtand in need of preparation in the chords of the tonic dominant and of the ſub-dominant: from whence it follows, that every tonic carrying with it a perfect chord, may be changed into a tonic dominant (if the perfect chord be major), or into a ſub-dominant (whether the chord be major or minor) by adding the diſſonance all at once.

Chap. XVI. *Of the Rule for* reſolving *Diſſonances.*

143 Diſſonances to be reſolved, muſt be diſguiſed and made to appear in the character of harmonics.

125. We have ſeen (Chap. v. and vi.) how the diatonic ſcale, ſo natural to the voice, is formed by the harmonics of fundamental ſounds; from whence it follows, that the moſt natural ſucceſſion of harmonical ſounds is to be diatonic. To give a diſſonance then, in ſome meaſure, as much the character of an harmonic ſound as may be poſſible, it is neceſſary that this diſſonance, in that part of the modulation where it is found, ſhould deſcend or riſe diatonically upon another note, which may be one of the conſonances of the ſubſequent chord.

144 In the chord of the tonic dominant, the diſſonance ſhould rather riſe than deſcend, and why.

126. Now in the chord of the tonic dominant it ought rather to deſcend than to riſe; for this reaſon. Let us take, for inſtance, the chord *ſol ſi re fa* followed by the chord *ut mi ſol ut;* the part which formed the diſſonance *fa* ought to deſcend to *mi* rather than riſe to *ſol*, though both the ſounds *mi* and *ſol* are found in the ſubſequent chord *ut mi ſol ut;* becauſe it is more natural and more conformed to the connection which ought to be found in every part of the muſic, that *ſol* ſhould be found in the ſame part where *ſol* has already been ſounded, whilſt the other part was ſounding *fa*, as may be here ſeen (parts firſt and fourth)

Firſt part,	- -	*fa mi*,
Second,	- - -	*ſi ut*,
Third,	- - -	*re ut*,
Fourth,	- - -	*ſol ſol*,
Fundamental baſs,	-	*ſol ut.*

145 Conſequences of the former rule.

127. For the ſame reaſon, in the chord of the ſimple dominant *re fa la ut*, followed by *ſol ſi re fa*, the diſſonance *ut* ought rather to deſcend to *ſi* than riſe to *re*.

146 Another conſonance.

128. In ſhort, for the ſame reaſon, we ſhall find, that in the chord of the ſub-dominant *fa la ut re*, the diſſonance *re* ought to riſe to *mi* of the following chord *ut mi ſol ut*, rather than deſcend to *ut;* whence may be deduced the following rules.

147 But is deduced from the former propoſitions.

129. 1°. In every chord of the dominant, whether tonic or ſimple, the note which conſtitutes the ſeventh, that is to ſay the diſſonance, ought diatonically to deſcend upon one of the notes which form a conſonance in the ſubſequent chord.

2°. In every chord of the ſub-dominant, the diſſonance ought to riſe diatonically upon the third of the ſubſequent chord.

148 Diſſonance reſolved, what. See *Reſolution.*

130. A diſſonance which deſcends or riſes diatonically according to theſe two rules, is called a *diſſonance reſolved.*

From theſe rules it is a neceſſary reſult, that the chord of the ſeventh *re fa la ut*, though one ſhould even conſider it as the inverſe of *fa la ut re*, cannot be ſucceeded by the chord *ut mi ſol ut*, ſince there is not in this laſt chord of *ſi* any note upon which the diſſonance *ut* of the chord *re fa la ut* can deſcend.

One may beſides find another reaſon for this rule, in examining the nature of the double employment of diſſonances. In effect, in order to paſs from *re fa la ut*, to *ut mi ſol ut*, it is neceſſary that *re fa la ut*, ſhould in this caſe be underſtood as the inverſe of *fa la ut re*. Now the chord *re fa la ut*, can only be conceived as the inverſe of *fa la ut re*, when this chord *re fa la ut* precedes or immediately follows the *ut mi ſol ut;* in every other caſe the chord *re fa la ut* is a primitive chord, formed from the perfect minor chord *re fa la*, to which the diſſonance *ut* was added, to take from *re* the character of a tonic. Thus the chord *re fa la ut*, could not be followed by the chord *ut mi ſol ut*, but after having been preceded by the ſame chord. Now, in this caſe, the *double employment* would be entirely a futile expedient, without producing any agreeable effect, becauſe, inſtead of this ſucceſſion

ceſſion of chords, *ut mi ſol ut, re fa la ut, ut mi ſol ut*, it would be much more eaſiy and natural to ſubſtitute this other, which furniſhes this natural proceſs, *ut mi ſol ut, fa la ut re, ut mi ſol ut*. The proper uſe of the double employment is, that, by means of inverting the chord of the ſub-dominant, it may be able to paſs from that chord thus inverted, to any other chord except that of the tonic, to which it naturally leads.

CHAP. XVII. *Of the Broken or Interrupted Cadence.*

149 The teſt of perfection in cadences to be found in the fundamental baſs.

131. IN a fundamental baſe which moves by fifths, there is always, as we have formerly obſerved (Chap. viii.), a repoſe more or leſs perfect from one ſound to another; and of conſequence there muſt likewiſe be a repoſe more or leſs perfect from one ſound to another in the diatonic ſcale, which reſults from that baſs. It may be demonſtrated by a very ſimple experiment, that the cauſe of a repoſe in melody is ſolely in the fundamental baſs expreſſed or underſtood. Let any perſon ſing theſe three notes *ut re ut*, performing on the *re* a ſhake, which is commonly called a *cadence*; the modulation will appear to him to be finiſhed after the ſecond *ut*, in ſuch a manner that the ear will neither expect nor wiſh any thing to follow. The caſe will be the ſame if we accompany this modulation with its natural fundamental baſs *ut ſol ut*: but if, inſtead of that baſs, we ſhould give it the following, *ut ſol la*; in this caſe the modulation *ut re ut* would not appear to be finiſhed, and the ear would ſtill expect and deſire ſomething more. This experiment may eaſily be made.

150 Broken cadences, what, and why. See *Cadence*.

132. This paſſage *ſol la*, when the dominant *ſol* diatonically aſcends upon the note *la*, inſtead of deſcending by a fifth upon the generator *ut*, as it ought naturally to do, is called a *broken cadence*; becauſe the perfect cadence *ſol ut*, which the ear expected after the dominant *ſol*, is, if we may ſpeak ſo, broken and ſuſpended by the tranſition from *ſol* to *la*.

133. From thence it follows, that if the modulation *ut re ut* appeared finiſhed when we ſuppoſed no baſs to it at all, it is becauſe its natural fundamental baſs *ut ſol ut* is ſuppoſed to be implied; becauſe the ear deſires ſomething to follow this modulation, as ſoon as it is reduced to the neceſſity of hearing another baſs.

151 Origin of interrupted cadence in the double employment of diſſonances,

134. The interrupted cadence may, as it ſeems to me, be conſidered as having its origin in the *double employment of diſſonances*; ſince this cadence, like the double employment, only conſiſts in a diatonic procedure of the baſs aſcending (chap. xii.) In effect, nothing hinders us to deſcend from the chord *ſol ſi re fa* to the chord *ut mi ſol la*, by converting the tonic *ut* into a ſub-dominant, that is to ſay, by paſſing all at once from the mode of *ut* to the mode of *ſol*: now to deſcend from *ſol ſi re fa* to *ut mi ſol la* is the ſame thing as to riſe from the chord *ſol ſi re fa* to the chord *la ut mi ſol*, in changing the chord of the ſubdominant *ut mi ſol la* for the imperfect chord of the dominant, according to the laws of the double employment.

152 Manner of performing this cadence.

135. In this kind of cadence, the diſſonance of the firſt chord is reſolved by deſcending diatonically upon the fifth of the ſubſequent chord. For inſtance, in the broken cadence *ſol ſi re fa, la ut mi ſol*, the diſſonance *fa* is reſolved by deſcending diatonically upon the fifth *mi*.

153 Interrupted cadence, what. See *Cadence*.

136. There is ſtill another kind of cadence called an *interrupted cadence*, where the dominant deſcends by a third to another dominant, inſtead of deſcending by a fifth upon the tonic, as in this proceſs of the baſs, *ſol ſi re fa, mi ſol ſi re*; in the caſe of an interrupted cadence, the diſſonance of the former chord is reſolved by deſcending diatonically upon the octave of the fundamental note of the ſubſequent chord, as may be here ſeen, where *fa* is reſolved upon the octave of *mi*.

154 Origin of this kind of cadence, likewiſe in the double employment.

137. This kind of interrupted cadence, as it ſeems to me, has likewiſe its origin in the double employment of diſſonances. For let us ſuppoſe theſe two chords in ſucceſſion, *ſol ſi re fa, ſol ſi re mi*, where the note *ſol* is ſucceſſively a tonic dominant and ſub-dominant; that is to ſay, in which we paſs from the mode of *ut* to the mode of *re*; if we ſhould change the ſecond of theſe chords into the chord of the dominant, according to the laws of the double employment, we ſhall have the interrupted cadence *ſol ſi re fa, mi ſol ſi re*.

CHAP. XVIII. *Of the Chromatic Species.*

155 Fundamental baſs may be formed by thirds major.

138. THE ſeries or fundamental baſs by fifths produces the diatonic ſpecies in common uſe (chap. vi.): now the third major being one of the harmonics of a fundamental ſound as well as the fifth, it follows, that we may form fundamental baſſes by thirds major, as we have already formed fundamental baſſes by fifths.

156 A chromatic interval, or minor ſemitone, how found. See *fig*. K.

139. If then we ſhould form this baſs *ut, mi, ſol*♯, the two firſt ſounds carrying each along with it their thirds major and fifths, it is evident that *ut* will give *ſol*, and that *mi* will give *ſol*♯: now the ſemitone which is between this *ſol* and this *ſol*♯ is an interval much leſs than the ſemitone which is found in the diatonic ſcale between *mi* and *fa*, or between *ſi* and *ut*. This may be aſcertained by calculation (EE); it is for this reaſon that the ſemitone from *mi* to *fa* is called *major*, and the other *minor* (FF).

140. If

(EE) In reality, *ut* being ſuppoſed 1 as we have always ſuppoſed it, *mi* is $\frac{4}{5}$, and *ſol*♯ $\frac{25}{16}$: now *ſol* being $\frac{3}{2}$, *ſol*♯ then ſhall be to *ſol* as $\frac{25}{16}$ to $\frac{3}{2}$; that is to ſay, as 25 times 2 to 3 times 16: the proportion then of *ſol*♯ to *ſol* is as 25 to 24, an interval much leſs than that of 16 to 15, which conſtitutes the ſemitone from *ut* to *ſi*, or from *fa* to *mi* (note L).

(FF) It may be obſerved, that a minor joined to a major ſemitone, will form a minor tone; that is to ſay, if one riſes, for inſtance, from *mi* to *fa*, by the interval of a ſemitone major, and afterwards from *fa* to *fa*♯ by the interval of a minor ſemitone, the interval from *mi* to *fa*♯ will be a minor tone. For let us ſuppoſe *mi* to be 1, *fa* will $\frac{16}{15}$, and *fa*♯ will be $\frac{25}{24}$ of $\frac{16}{15}$; that is to ſay, 25 times 16 divided 24 times 15, or $\frac{10}{9}$; *mi* then is to *fa*♯ as 1 is to $\frac{10}{9}$, the interval which conſtitutes the minor tone (note N.)

With reſpect to the tone major, it cannot be exactly formed by two ſemitones; for, 1. Two major ſemitones in

Theory of Harmony.

140. If the fundamental bafs fhould proceed by thirds minor in this manner, *ut*, *mi*♭, a fucceffion which is allowed when we have inveftigated the origin of the minor mode (chap. ix.), we fhall find this modulation *fol*, *fol*♭, which would likewife give a minor femitone (GG).

157 An intonation minor femitone difficult to be hit, and why.

141. The minor femitone is hit by young practitioners in intonation with more difficulty than the femitone major. For which this reafon may be affigned: The femitone major which is found in the diatonick fcale, as from *mi* to *fa*; refults from a fundamental bafs by fifths *ut fa*, that is to fay, by a fucceffion which is moft natural, and for this reafon the eafieft to the ear. On the contrary, the minor femitone arifes from a fucceffion by thirds, which is ftill lefs natural than the former. Hence, that fcholars may truly hit the minor femitone, the following artifice is employed. Let us fuppofe, for inftance, that they intend to rife from *fol* to *fol*♯; they rife at firft from *fol* to *la*, then defcend from *la* to *fol*♯ by the interval of a femitone major; for this *fol* fharp, which is a femitone major below *la*, proves a femitone minor above *fol*. [See the notes (EE) and (FF).]

158 Minor femitone to be found in every procedure of the fundamental bafs by thirds.

142. Every procedure of the fundamental bafs by thirds, whether major or minor, rifing or defcending, gives the minor femitone. This we have already feen from the fucceffion of thirds in afcending. The feries of thirds minor in defcending, *ut*, *la*, gives *ut*, *ut*♯ (HH); and the feries of thirds major in defcending, *ut*, *la*♭, gives *ut*, *ut*♭ (II).

Theory of Harmony.

159 The minor femitone when prevalent, conftitutes chromatic mufic.

143. The minor femitone conftitutes the fpecies called *chromatic*; and with the fpecies which moves by diatonic intervals, refulting from the fucceffion of fifths (chap. v. and vi.), it comprehends the whole of melody.

Chap. XIX. *Of the Enharmonic Species.*

160 Diefis or enharmonic interval, what, and how formed.

144. The two extremes, or higheft and loweft notes, *ut fol*♯, of the fundamental bafs by thirds major, *ut mi fol*♯, give this modulation *ut fi*♯; and thefe two founds *ut*, *fi*♯, differ between themfelves by a fmall interval which is called the *diëfis*, or *enharmonic fourth* of a tone* (LL), which is the difference between a femitone major and a femitone minor (MM). This quarter tone is inappretiable by the ear, and impracticable upon feveral of our inftruments. Yet have means been found to put it in practice in the following manner, or rather to perform what will have the fame effect upon the ear.

* See *Fourth of a Tone*.

161 Manner of feemingly introducing this interval upon inftruments of fixed fcales.

145. We have explained (art. 116.) in what manner the chord *fol*♯ *fi re fa* may be introduced into the minor mode, entirely confifting of thirds minor perfectly true, or at leaft fuppofed fuch. This chord fupplying the place of the chord of the dominant (art. 116.)

in immediate fucceffion would produce more than a tone major. In effect, $\frac{16}{15}$ multiplied by $\frac{16}{15}$ gives $\frac{256}{225}$, which is greater than $\frac{3}{8}$, the interval which conftitutes (note N), the major tone. 2. A femitone minor and a femitone major would give lefs than a major tone, fince they amount only to a true minor. 3. And, *à fortiori*, two minor femitones would give ftill lefs.

(GG) In effect, *mi*♭ being $\frac{6}{5}$, *fol*♭ will be $\frac{6}{5}$ of $\frac{6}{5}$; that is to fay, (note C) $\frac{36}{25}$: now the proportion of $\frac{3}{2}$ to $\frac{36}{25}$ (note C) is that of 3 times 25 to 2 times 36; that is to fay, as 25 to 24.

(HH) *La* being $\frac{5}{6}$, *ut*♯ is $\frac{5}{4}$ of $\frac{5}{6}$; that is to fay $\frac{25}{24}$, and *ut* is 1: the proportion then between *ut* and *ut*♯ is that of 1 to $\frac{25}{24}$, or of 24 to 25.

(II) *La*♭ being the third major below *ut*, will be $\frac{4}{5}$ (note C): *ut*♭, then, is $\frac{7}{5}$ of $\frac{4}{5}$; that is to fay $\frac{24}{25}$. The proportion, then, between *ut* and *ut*♭ is as 25 to 24.

(LL) *Sol*♯ being $\frac{25}{16}$, and *fi*♯ being $\frac{5}{4}$ of $\frac{25}{16}$, we fhall have *fi*♯ equal (note C) to $\frac{125}{64}$, and its octave below fhall be $\frac{125}{128}$; an interval lefs than unity by about $\frac{3}{128}$ or $\frac{1}{43}$. It is plain then from this fraction, that the *fi*♯ in queftion muft be confiderably lower than *ut*.

This interval has been called *the fourth of a tone*, and this denomination is founded on reafon. In effect, we may diftinguifh in mufic four kinds of quarter tones.

1. The fourth of a tone major: now, a tone major being $\frac{9}{8}$, and its difference from unity being $\frac{1}{8}$, the difference of this quarter tone from unity will be almoft the fourth of $\frac{1}{8}$; that is to fay, $\frac{1}{32}$.

2. The fourth of a tone minor; and as a tone minor, which is $\frac{10}{9}$, differs from unity by $\frac{1}{9}$, the fourth of a minor tone will differ from unity about $\frac{1}{36}$.

3. One half of a tone major; and as this femitone differs from unity by $\frac{1}{15}$, one half of it will differ from unity about $\frac{1}{30}$.

4. Finally, one half of a femitone minor, which differs from unity by $\frac{1}{24}$: its half then will be $\frac{1}{48}$.

The interval, then, which forms the enharmonic fourth of a tone, as it does not differ from unity but by $\frac{1}{43}$, may juftly be called the *fourth of a tone*, fince it is lefs different from unity than the largeft interval of a quarter tone, and more than the leaft.

We fhall add, that fince the enharmonic fourth of a tone is the difference between a femitone major and a femitone minor; and fince the tone minor is formed (note FF) of two femitones, one major and the other minor; it follows, that two femitones major in fucceffion form an interval larger than that of a tone by the enharmonic fourth of a tone; and that two minor femitones in fucceffion form an interval lefs than a tone by the fame fourth of a tone.

(MM) That is to fay, that if you rife from *mi* to *fa*, for inftance, by the interval of a femitone major, and afterwards, returning to *mi*, you fhould rife by the interval of a femitone minor to another found which is not in the fcale, and which I fhall mark thus, *fa*+, the two founds *fa*+ and *fa* will form the enharmonic fourth of a tone: for *mi* being 1, *fa* will be $\frac{16}{15}$; and *fa*+ $\frac{25}{24}$: the proportion then between *fa*+ and *fa* is that of $\frac{25}{24}$ to $\frac{16}{15}$ (note C); that is to fay, as 25 times 15 to 16 times 24; or otherwife, as 25 times 5 to 16 times 8, or as 125 to 128. Now this proportion is the fame which is found, in the beginning of the preceding note, to exprefs the enharmonic fourth of a tone.

Theory of Harmony.

116.) from thence we may pafs to that of the tonic or generator *la* (art. 117.). But we muft remark,

1. That this chord *fol※ fi re fa*, entirely confifting of thirds minor, may be inverted or modified according to the three following arrangements, *fi re fa fol※*, *re fa fol※ fi*, *fa fol※ fi re*; and that in all thefe three different ftates, it will ftill remain compofed of thirds minor; or at leaft there will only be wanting the enharmonic fourth of a tone to render the third minor between *fa* and *fol※* entirely juft; for a true third minor, as that from *mi* to *fol* in the diatonic fcale, is compofed of a femitone and a tone both major. Now from *fa* to *fol* there is a tone major, and from *fol* to *fol※* there is only a minor femitone. There is then awanting (art. 144.) the enharmonic fourth of a tone, to render the third *fa fol※* exactly true.

2. But as this divifion of a tone cannot be found in the gradations of any fcale practicable upon moft of our inftruments, nor be appretiated by the ear, the ear takes the different chords,

fi re fa fol※
re fa fol※ fi,
fa fol※ fi re,

which are abfolutely the fame, for chords compofed every one of thirds minor exactly juft.

Now the chord *fol※ fi re fa*, belonging to the minor mode of *la*, where *fol※* is the fenfible note; the chord *fi re fa fol※*, or *fi re fa la♭*, will, for the fame reafon, belong to the minor mode of *ut*, where *fi* is the fenfible note. In like manner, the chord *re fa fol※ fi*, or *fi re fa la♭ ut♭*, will belong to the minor mode of *mi♭*, and the chord *fa fol※ fi re*, or *fa la♭ ut♭ mi♭♭*, to the minor mode of *fol♭*.

After having paffed then by the mode of *la* to the chord *fol※ fi re fa* (art. 117.), one may by means of this laft chord, and by merely fatisfying ourfelves to invert it, afterwards pafs all at once to the modes of *ut* minor, of *mi♭* minor, or of *fol♭* minor; that is to fay, into the modes which have nothing, or almoft nothing, in common with the minor mode of *la*, and which are entirely foreign to it (†).

162 The alteration, however, by which it is effectuated, abrupt and fenfible.

146. It muft, however, be acknowledged, that a tranfition fo abrupt, and fo little expected, cannot deceive nor elude the ear; it is ftruck with a fenfation fo unlooked-for without being able to account for the paffage to itfelf. And this account has its foundation in the enharmonic fourth of a tone; which is overlooked as nothing, becaufe it is inappretiable by the ear; but of which, tho' its value is not afcertained, the whole harfhnefs is fenfibly perceived. The inftant of furprife, however, immediately vanifhes; and that aftonifhment is turned into admiration, when one feels himfelf tranfported as it were all at once, and almoft imperceptibly, from one mode to another, which is by no means relative to it, and to which he never could have immediately paffed by the ordinary feries of fundamental notes.

Chap. XX. *Of the Diatonic Enharmonic Species.*

147. If we form a fundamental bafs, which rifes alternately by fifths and thirds, as *fa*, *ut*, *mi*, *fi*, this bafs will give the following modulation, *fa*, *mi*, *mi*, *re※*; in which the femitones from *fa* to *mi*, and from *mi* to *re※*, are equal and major (NN). *See fig.* M.

This fpecies of modulation or of harmony, in which all the femitones are major, is called the *enharmonic diatonical* fpecies. The major femitones peculiar to this fpecies give it the name of *diatonic*, becaufe major femitones belong to the diatonic fpecies; and the tones which are greater than major by the excefs of a fourth, refulting from a fucceffion of major femitones, give it the name of *enharmonic* (note LL). *See Enharmonic.*

Chap. XXI. *Of the Chromatic Enharmonic Species.*

163 Chromatic enharmonic intervals, how formed.

148. If we pafs alternately from a third minor in defcending to a third major in rifing, as *ut*, *ut*, *la*, *ut※*, *ut※*, we fhall form this modulation *mi♭*, *mi*, *mi*, *mi*, *mi※*, in which all the femitones are minor (OO). *See fig.* N.

164 From this fpecies, the effects of harmony and melody appear to be in the fundamental bafs.

This fpecies is called the *chromatic enharmonical* fpecies: the minor femitones peculiar to this kind give it the name of *chromatic*, becaufe minor femitones belong to the chromatic fpecies; and the femitones which are leffer by the diminution of a fourth refulting from a fucceffion of minor femitones, give it the name of *enharmonic* (note LL).

149. Thefe new fpecies confirm what we have all along faid, that the whole effects of harmony and melody refide in the fundamental bafs.

165 Diatonic fpecies moft agreeable, and why.

150. The diatonic fpecies is the moft agreeable, becaufe

(†) As this method for obtaining or fupplying enharmonic gradations cannot be practifed on every occafion when the compofer or practitioner would wifh to find them, efpecially upon inftruments where the fcale is fixed and invariable, except by a total alteration of their œconomy, and re-tuning the ftrings, Dr Smith in his Harmonics has propofed an expedient for redreffing or qualifying this defect, by the addition of a greater number of keys or ftrings, which may divide the tone or femitone into as many appretiable or fenfible intervals as may be neceffary. For this, as well as for the other advantageous improvements which he propofes in the ftructure of inftruments, we cannot with too much warmth recommend the perufal of his learned and ingenious book to fuch of our readers as afpire to the character of genuine adepts in the theory of mufic.

(NN) It is obvious, that if *fa* in the bafs be fuppofed 1, *fa* of the fcale will be 2, *ut* of the bafs $\frac{3}{2}$, and *mi* of the fcale $\frac{5}{4}$ of $\frac{3}{2}$, that is, $\frac{15}{8}$; the proportion of *fa* to *mi* is as 2 to $\frac{15}{8}$, or as 1 to $\frac{15}{16}$. Now *mi* of the bafs being likewife $\frac{5}{4}$ of $\frac{3}{2}$, or $\frac{15}{8}$, *fi* of the bafs is $\frac{3}{2}$ of $\frac{15}{8}$, and its third major *re※* $\frac{5}{4}$ of $\frac{3}{2}$ of $\frac{15}{8}$, or $\frac{15}{8}$ of $\frac{15}{8}$; this third major, approximated as much as poffible to *mi* in the fcale by means of octaves, will be $\frac{15}{16}$ of $\frac{15}{8}$: *mi* then of the fcale will be to *re※* which follows it, as $\frac{15}{8}$ is to $\frac{15}{16}$ of $\frac{15}{8}$, that is to fay, as 1 to $\frac{15}{16}$. The femitones then from *fa* to *mi*, and from *mi* to *re※*, are both major.

(OO) It is evident that *mi♭* is $\frac{6}{5}$ (note C), and that *mi* is $\frac{5}{4}$: thefe two *mi*'s, then, are between themfelves as $\frac{6}{5}$ to $\frac{5}{4}$, that is to fay, as 6 times 4 to 5 times 5, or as 24 to 25, the interval which conftitutes the minor femitone. Moreover, the *la* of the bafs is $\frac{5}{6}$, and *ut※* $\frac{5}{4}$ of $\frac{5}{6}$, or $\frac{25}{24}$: *mi※* then is $\frac{5}{4}$ of $\frac{25}{24}$, the *mi* in the fcale is likewife to the *mi※* which follows it, as 24 to 25. All the femitones therefore in this fcale are minor.

Theory of Harmony.

because the fundamental bafs which produces it is formed from a fucceffion of fifths alone, which is the moft natural of all others.

166 The chromatic next. 151. The chromatic being formed from a fucceffion of thirds, is the moft natural after the preceding.

167 Laftly, the enharmonic. 152. Finally, the enharmonic is the leaft agreeable of all, becaufe the fundamental bafs which gives it is not immediately indicated by nature. The fourth of a tone which conftitutes this fpecies, and which is itfelf inappretiable to the ear, neither produces nor can produce its effect, but in proportion as imagination fuggefts the fundamental bafs from whence it refults; a bafs whofe procedure is not agreeable to nature, fince it is formed of two founds which are not contiguous one to the other in the feries of thirds (art. 144.)

Chap. XXII. *Showing that Melody is the Offspring of Harmony.*

168 The effects of melody to be inveftigated in harmony expreffed or underftood. 153. All that we have hitherto faid, as it feems to me, is more than fufficient to convince us, that melody has its original principle in harmony; and that it is in harmony, expreffed or underftood, that we ought to look for the effects of melody.

154. If this fhould ftill appear doubtful, nothing more is neceffary than to pay due attention to the firft experiment (art 19.), where it may be feen that the principal found is always the loweft, and that the fharper founds which it generates are with relation to it what the treble of an air is to its bafs.

155. Yet more, we have proved, in treating of broken cadence (Chap. xvii.), that the diverfification of baffes produces effects totally different in a modulation which, in other refpects, remains the fame.

156. Can it be ftill neceffary to adduce more convincing proofs? We have nothing to do but examine the different baffes which may be given to this very fimple modulation *fol ut;* of which it will be found fufceptible of a great many, and each of thefe baffes will give a different character to the modulation *fol ut*, though in itfelf it remains always the fame; in fuch a manner that we may change the whole nature and effects of a modulation, without any other alteration except that of changing its fundamental bafs.

M. Rameau has fhown, in his *New Syftem of Mufic*, printed at Paris 1726, *p.* 44. that this modulation *fol ut*, is fufceptible of 20 different fundamental baffes. Now the fame fundamental bafs, as may be feen in our fecond part, will afford feveral continued or thorough baffes. How many means, of confequence, may be practifed to vary the expreffion of the fame modulation?

169 Confequences deducible from this principle. 157. From thefe different obfervations it may be concluded, 1. That an agreeable melody, naturally implies a bafs extremely fweet and adapted for finging; and that reciprocally, as muficians exprefs it, a bafs of this kind generally prognofticates an agreeable melody (pp).

2. That the character of a juft harmony is only to form in fome meafure one fyftem with the modulation, fo that from the whole taken together the ear may only receive, if we may fpeak fo, one fimple and indivifible impreffion.

3. That the character of the fame modulation may be diverfified, according to the character of the bafs which is joined with it.

But notwithftanding the dependency of melody upon harmony, and the fenfible influence which the latter may exert upon the former; we muft not however from thence conclude, with fome celebrated muficians, that the effects of harmony are preferable to thofe of melody. Experience proves the contrary. [See, on this account, what is written on the licence of mufic, printed in tom. iv. of D'Alembert's *Melanges de Literature*, p. 448.]

General Remark.

The diatonic fcale or gammut being compofed of twelve femitones, it is clear that each of thefe femitones taken by itfelf may be the generator of a mode; and that thus there muft be twenty-four modes in all, twelve major and twelve minor. We have affumed the major mode of *ut*, to reprefent all the major modes in general, and the minor mode of *la* to reprefent the modes minor, to avoid the difficulties arifing from fharps and flats, of which we muft have encountered either a greater or leffer number in the other modes. But the rules we have given for each mode are general, whatever note of the gammut be taken for the generator of a mode.

Part II. Principles and Rules of COMPOSITION.

170 Compofition in harmony, what. See *Compofition*. 158. Composition, which is likewife called *counterpoint*, is not only the art of compofing an agreeable air, but alfo that of compofing a great many airs in fuch a manner that when heard at the fame time, they may unite in producing an effect agreeable and delightful to the ear; this is what we call *compofing mufic in feveral parts*.

The higheft of thefe parts is called the *treble*, the loweft is termed the *bafs;* the other parts, when there are any, are termed *middle parts;* and each in particular is fignified by a different name.

Chap. I. *Of the Different Names given to the fame Interval.*

171 Particular intervals fignified by different names, and why. 159. In the introduction (art. 9.), which is at the front of this treatife, we have feen a detail of the moft common names which are given to the different intervals. But there are particular intervals which have obtained different names, according to particular circumftances; which it is proper to explain.

172 Second redundant, what. 160. An interval compofed of a tone and a femitone, which is commonly called a *third minor*, is likewife

(pp) There are likewife feveral eminent muficians, who in their compofitions, if we can depend on what has been affirmed, begin with determining and writing the bafs. See *l'Encyclopédie*, tom. 7. p. 61. This method, however, appears in general more proper to produce a learned and harmonious mufic, than a ftrain prompted by genius and animated by enthufiafm.

Principles of Compoſition. wiſe ſometimes called a *ſecond redundant;* ſuch is the interval from *ut to re*※ in aſcending, or that of *la* to *ſol*♭ deſcending.

173 Why ſo called. This interval is ſo termed, becauſe one of the ſounds which form it is always either ſharp or flat, and that, if you deduce that ſharp or that flat, the interval will be that of a ſecond.

174 Falſe fifth, what. 161. An interval compoſed of two tones and two ſemitones, as that from *ſi* to *fa*, is called a *falſe fifth.* This interval is the ſame with the *triton* (art. 9.), ſince two tones and two ſemitones are equivalent to three tones. There are, however, ſome reaſons for diſtinguiſhing them, as will appear below.

175 Fifth redundant, what. 162. As the interval from *ut* to *re*※ in aſcending, has been called a ſecond redundant, they likewiſe call the interval from *ut* to *ſol*※ in aſcending a *fifth redundant*, or from *ſi* to *mi*♭ in deſcending, each of which intervals are compoſed of four tones.

176 Diſtinguiſhed from the ſixth minor. This interval is, in the main, the ſame with that of the ſixth minor (art. 9.): but in the fifth redundant there is always a ſharp or a flat; inſomuch, that if this ſharp or flat were deduced, the interval would become a true fifth.

177 Seventh diminiſhed, what. 163. For the ſame reaſon, an interval compoſed of three tones and three ſemitones, as from *ſol*※ to *fa* in aſcending, is called a *ſeventh diminiſhed;* becauſe, if you deduced the ſharp from *ſol*, the interval from *ſol* to *fa* will become that of an ordinary ſeventh. The interval of a ſeventh diminiſhed is in other reſpects the ſame with that of the ſixth major (art. 9.)

178 Seventh major and redundant coincident. 164. The major ſeventh is likewiſe ſometimes called a *ſeventh redundant* (QQ.)

CHAP. II. *Compariſon of the Different Intervals.*

179 Notes in different octaves or ſcales replications each of the other. 165. IF we ſing *ut ſi* in deſcending by a ſecond, and afterwards *ut ſi* in aſcending by a ſeventh, theſe two *ſi*'s ſhall be octaves one to the other; or, as we commonly expreſs it, they will be *replications* one of the other.

180 Hence to deſcend to one replication, and riſe to another, has the ſame effect. 166. On account then of the reſemblance between every ſound and its octave (art. 22.), it follows, that *to riſe by a ſeventh*, or *deſcend by a ſecond*, amount to one and the ſame thing.

167. In like manner, it is evident that the ſixth is nothing but a replication of the third, nor the fourth but a replication of the fifth.

181 Detail of replications. 168. The following expreſſions either are, or ought to be, regarded as ſynonimous.

182 Examples of this.

To riſe	by a ſecond.	To deſcend	by a ſeventh.
To deſcend		To riſe	
To riſe	by a third.	To deſcend	by a ſixth.
To deſcend		To riſe	
To riſe	by a fourth.	To deſcend	by a fifth.
To deſcend		To riſe	

169. Thus, therefore, we ſhall employ them indifferently the one for the other; ſo that when we ſay, for inſtance, *to riſe by a third*, it may be ſaid with equal propriety *to deſcend by a ſixth*, &c.

CHAP. III. *Of the different Cleffs; of the Value or Quantity; of the Rithmus; and of Syncopation.*

183 Cleffs, what. 170. THERE are three cleffs * in muſic; the cleff of *fa* , or ; the cleff of *ut* ; and the cleff of *ſol* . But, in Britain, the following characters are uſed: The F, or baſs-cleff ; the C, or tenor cleff ; and the G, or treble cleff .

184 And how placed. The cleff of *fa* is placed on the fourth line, or on the third; and the line upon which this cleff is placed gives the name of *fa*, or *F*, to all the notes which are upon that line. See fig. O.

The cleff of *ut* is placed upon the fourth, the third, the ſecond, or the firſt line; and in theſe different poſitions all the notes upon that line where the cleff is placed take the name of *ut*, or *C*. See fig. P.

Laſtly, the cleff of *ſol* is placed upon the ſecond or firſt line; and all the notes upon that line where the cleff is placed take the name of *ſol*, or G. See fig. Q.

185 Names of notes to be inveſtigated from the poſition of the cleffs. 171. As the notes are placed on the lines, and in the ſpaces between the lines, any one, when he ſees the cleff, may eaſily find the name of any note whatever. Thus he may ſee, that, in the firſt cleff of *fa*, the note which is placed on the loweſt line ought to be *ſol;* that the note which occupies the ſpace between the two firſt lines ſhould be *la;* and that the note which is on the ſecond line is a *ſi*, &c. (RR). See fig. O.

* See *Cleff.*

(QQ.) The chief uſe of theſe different denominations is to diſtinguiſh chords: for inſtance, the chord of the redundant fifth and that of the diminiſhed ſeventh, are different from the chord of the ſixth; the chord of the ſeventh redundant from that of the ſeventh major. This will be explained in the following chapters.

(RR) It is on account of the different compaſſes of voices and inſtruments that theſe cleffs have been invented.

The maſculine voice, which is the loweſt, may at its greateſt depth, without ſtraining, deſcend to *ſol*, which is in the laſt line of the firſt cleff of *fa;* and the female voice, which is the ſharpeſt, may at its higheſt pitch riſe to a *ſol*, which is a triple octave above the former.

The loweſt of maſculine voices is adapted to a part which may be called a *mean baſs*, and its cleff is that of *fa* on the fourth line; this cleff is likewiſe that of the violoncello and of the deepeſt inſtruments. A mean baſs extremely deep is called a *baritonus* or *counter-baſs*.

The maſculine voice, which is next in depth to what we have called the *mean baſs*, may be termed the *concordant baſs*. Its cleff is that of *fa* on the third line.

The maſculine voice which follows the *concordant baſs* may be denominated a *tenor;* a voice of this pitch is the moſt common, yet ſeldom extremely agreeable. Its cleff is that of *ut* on the fourth line. This cleff is alſo that of the baſſoon or baſs hautboy.

The higheſt maſculine voice of all may be called *counter tenor*. Its cleff is that of *ut* on the third line. It is likewiſe the cleff of tenor violins, &c.

172. A

The

Principles of Composition.

172. A note before which there is a ſharp (marked thus ✳) ought to be raiſed by a ſemitone; and if, on the contrary, there is a ♭ before it, it ought to be depreſſed by a ſemitone, (♭ being the mark of a flat).

186 Marks and powers of ſharps, flats, and naturals, what.

The natural (marked thus ♮) reſtores to its natural value a note which had been raiſed or depreſſed by a ſemitone.

173. When you place at the cleff a ſharp or a flat, all the notes upon the line on which this ſharp or flat is marked are ſharp or flat. Thus let us take, for inſtance, the cleff of *ut* upon the firſt line, and let us place a ſharp in the ſpace between the ſecond and third line, which is the place of *fa*; all the notes which ſhall be marked in that ſpace will be *fa*✳; and if you would reſtore them to their original value of *fa* natural, you muſt place a ♮ or a ♭ before them. See fig. R. See fig. S.

In the ſame manner, if a flat be marked at the cleff, and if you would reſtore the note to its natural ſtate, you muſt place a ♮ or a ✳ before it. See fig. X.

187 Bars and times, what.

174. Every piece of muſic is divided into different equal times, which they call *meaſures* or *bars;* and each bar is likewiſe divided into different times.

There are properly two kinds of meaſures or modes of time (*See* T): the meaſure of two times, or of common time, which is marked by the figure 2 placed at the beginning of the tune; and the meaſure of three times, or of triple time, which is marked by the figure 3 placed in the ſame manner. (*See* V). See *Time.*

The different bars are diſtinguiſhed by perpendicular lines.

In a bar we diſtinguiſh between the *perfect* and *imperfect* time; the *perfect* time is that which we *beat*, the *imperfect* that in which we *lift up the hand or foot*. A bar conſiſting of four times ought to be regarded as compounded of two bars, each conſiſting of two times: thus there are in this bar two perfect and two imperfect times. In general, by the words *perfect* and *imperfect*, even the parts of the ſame time are diſtinguiſhed: thus the firſt note of each time is reckoned as belonging to the *perfect* part, and the others as belonging to the *imperfect*. See fig. Y.

188 The value of notes in duration.

175. The longeſt of all notes is a ſemibreve. A minim is half its value; that is to ſay, in ſinging, we only employ the ſame duration in performing two minims which was occupied in one ſemibreve. A minim in the ſame manner is equivalent to two crotchets, the crotchet to two quavers, &c.

189 Syncopation, what.

176. A note which is divided into two parts by a time, that is to ſay, which begins at the end of a time, and terminates in the time following, is called (ss) a *ſyncopated note*. (*See* Z; where the notes *ut*, *ſi*, and *la*, are each of them ſyncopated.) (†). See *Syncopation.*

[f 2] 177. A

The deepeſt female voice immediately follows the counter tenor, and may be called *baſs in alt*. Its cleff is that of *ut* upon the firſt line. The cleff of *ut* upon the ſecond line is not in frequent uſe.

The ſharpeſt female voice is called *treble;* its cleff is that of *ſol* on the ſecond line.

This laſt cleff, as well as that of *ſol* on the firſt line, is likewiſe the cleff of the ſharpeſt inſtruments, ſuch as the violin, the flute, the trumpet, the hautboy, the flagelet, &c.

The *ut* which may be ſeen in the cleffs of *fa* and in the cleffs of *ut* is a fifth above the *fa* which is on the line of the cleff of *fa;* and the *ſol* which is on the two cleffs of *ſol* is a fifth above *ut:* inſomuch that *ſol* which is on the loweſt line of the firſt cleff of *fa*, is lower by two whole octaves than the *ſol* which is on the loweſt line of the ſecond cleff of *ſol*.

[Thus far the tranſlator has followed his original as accurately as poſſible; but this was by no means an eaſy taſk. Among all the writers on muſic which he has found in Engliſh, there is no ſuch thing as different names for each particular part which is employed to conſtitute full or complete harmony. He was therefore under a neceſſity of ſubſtituting by analogy ſuch names as appeared moſt expreſſive of his author's meaning. To facilitate this attempt, he examined in Rouſſeau's muſical dictionary the terms by which the different parts were denominated in D'Alembert; but even Rouſſeau, with all his depth of thought and extent of erudition, inſtead of expreſſing himſelf with that preciſion which the ſubject required, frequently applies the ſame names indiſcriminately to different parts, without aſſigning any reaſon for this promiſcuous and licentious uſe of words. The Engliſh reader therefore will be beſt able to form an accurate idea of the different parts, by the nature and ſituation of the cleffs with which they are marked; and if he ſhould find any impropriety in the names which are given them, he may adopt and aſſociate others more agreeable to his ideas.]

(ss) Syncopation conſiſts in a note which is protracted in two different times belonging partly to the one and partly to the other, or in two different bars; yet not ſo as entirely to occupy or fill up the two times, or the two bars. A note, for inſtance, which begins in the imperfect time of a bar, and which ends in the perfect time of the following, or which in the ſame bar begins in the imperfect part of one time and ends in the perfect of the following, is ſyncopated. A note which of itſelf occupies one or two bars, whether the meaſure conſiſts of two or three times, is not conſidered as ſyncopated: this is a conſequence of the preceding definition. This note is ſaid to be *continued* or *protracted*. In the end of the example Z, the *ut* of the firſt bar conſiſting of three times is not ſyncopated, becauſe it occupies two whole times. It is the ſame caſe with *mi* of the ſecond bar, and with the *ut* of the fourth and fifth. Theſe therefore are continued or protracted notes.

(†) *Times* and *bars* in muſic anſwer the very ſame end as punctuation in language. They determine the different periods of the movement, or the various degree of completion, which the ſentiment, expreſſed by that movement, has attained. Let us ſuppoſe, for inſtance, a compoſer in muſic intending to expreſs grief or joy, in all its various gradations, from its firſt and fainteſt ſenſation, to its acme or higheſt poſſible degree. We do not ſay that ſuch a progreſs of any paſſion either has been or can be delineated in practice, yet it may ſerve to illuſtrate what we mean to explain. Upon this hypotheſis, therefore, the degrees of the ſentiment will paſs from leſs to more ſenſible, as it riſes to its moſt intenſe degree. The firſt of theſe gradations may be called a *time*

177. A note followed by a point or dot is increased half its value. The *ſi*, for inſtance, in the fifth bar of the example Y, followed by a point, has the va-
190 lue (*) or duration of a minim and of a crotchet at the ſame time.

190 Value of a pointed note.

Chap. IV. *Containing a Definition of the principal Chords.*

191 Perfect chords, what.

178. The chord compoſed of a third, a fifth, and an octave, as *ut mi ſol ut*, is called a *perfect chord* (art. 32).

If the third be major, as in *ut mi ſol ut*, the perfect chord is denominated *major:* if the third be minor, as in *la ut mi la*, the perfect chord is minor. The perfect chord major conſtitutes what we call the *major mode;* and the perfect chord minor, what we term the *minor mode* (art. 31).

192 Chord of the ſeventh, what, and how to be practiſed.

179. A chord compoſed of a third, a fifth, and a ſeventh, as *ſol ſi re fa*, or *re fa la ut*, &c. is called a *chord of the ſeventh*. It is obvious that ſuch a chord is wholly compoſed of thirds in aſcending.

All chords of the ſeventh are practiſed in harmony, ſave that which might carry the third minor and the ſeventh major, as *ut mi♭ ſol ſi;* and that which might carry a falſe fifth and a ſeventh major, as *ſi re fa la*✱. (chap. xiv. Part I.).

193 Thoſe of different kinds.

180. As thirds are either major or minor, and as they may be differently arranged, it is clear that there are different kinds of chords of the ſeventh; there is even one, *ſi re fa la*, which is compoſed of a third, a falſe fifth, and a ſeventh.

194 Of the greater ſixth, what.

181. A chord compoſed of a third, a fifth, and a ſixth, as *fa la ut re*, *re fa la ſi*, is called a *chord of the greater ſixth*.

195 Tonic, what, and its chords, how figured.

182. Every note which carries a perfect chord is called a *tonic*, and the perfect chord is marked by an 8, by a 3, or by a 5, which is written above the note; but frequently theſe numbers are ſuppreſſed. Thus in the example I. the two *ut*'s equally carry a perfect chord.

196 Dominant, what, and how figured.

183. Every note which carries a chord of the ſeventh is called a *dominant* (art. 102); and this chord is marked by a 7 written above the note. Thus in the example II. *re* carries the chord *re fa la ut*, and *ſol* the chord *ſol ſi re fa*.

It is neceſſary to remark, that among the chords of the ſeventh we do not reckon the chord of the ſeventh diminiſhed, which is only improperly called a *chord of the ſeventh:* and of which we ſhall ſay more below.

197 Sub-dominant, what, and how figured.

184. Every note which carries the chord of the great ſixth, is called a *ſub-dominant*, (art 97, and 42.) and is marked with a 6. Thus in the example III. *fa* carries the chord of *fa la ut re*. You ought to remark that the ſixth ſhould always be major, (art. 97, and 109).

198 Fundamental note, what. See *Fundamental.*

185. In every chord, whether perfect, or a chord of the ſeventh, or of the great ſixth, the note which carries this chord, and which is the flatteſt or loweſt, is called the *fundamental note*. Thus *ut* in the example I. *re* and *ſol* in the example II. and *fa* in the example III. are fundamental notes.

199 Diſſonance of a chord, what.

186. In every chord of the ſeventh, and of the great ſixth, the note which forms the ſeventh or ſixth above the fundamental, that is to ſay, the higheſt note of the chord, is called a *diſſonance*. Thus in the chords

time, which is likewiſe the moſt convenient diviſion of a bar or meaſure into its elementary or aliquot parts, and may be deemed equivalent to a comma in a ſentence; a bar denotes a degree ſtill more ſenſible, and may be conſidered as having the force of a ſemicolon; a ſtrain brings the ſentiment to a tolerable degree of perfection, and may be reckoned equal to a colon: the full period is the end of the imitative piece. It muſt have been remarked by obſervers of meaſure in melody or harmony, that the notes of which a bar or meaſure conſiſts, are not diverſified by their different durations alone, but likewiſe by greater or leſſer degrees of emphaſis. The moſt emphatic parts of a bar are called the *accented parts;* thoſe which require leſs energy in expreſſion are called the *unaccented*. The ſame obſervation holds with regard to times as bars. The ſtroke, therefore, of the hand or foot in beating marks the accented part of the bar, the elevation or preparation for the ſtroke marks the unaccented part. Let us once more reſume our compoſition intended to expreſs the different periods in the progreſs of grief or joy. There are ſome revolutions in each of theſe ſo rapid as not to be marked by any ſenſible tranſition whether diatonic or conſonant. In this caſe, the moſt expreſſive tone may be continued from one part of a time or meaſure to another, and end before the period of that time or meaſure in which it begins. Here therefore is a natural principle upon which the practice of ſyncopation may be founded even in melody: but when muſic is compoſed in different parts to be ſimultaneouſly heard, the continuance of one note not divided by regular times and meaſures, nor beginning and ending with either of them, whilſt the other parts either aſcend or deſcend according to the regular diviſions of the movement, has not only a ſenſible effect in rendering the imitation more perfect, but even gives the happieſt opportunities of diverſifying the harmony, which of itſelf is a moſt delightful perception.

For the various diſpoſitions of accent in times and meaſures, according to the movement of any piece, ſee a Treatiſe on Muſic by Alexander Malcolm.

For the opportunities of diverſifying harmony afforded by ſyncopation, ſee Rameau's Principles of Compoſition.

(*) To prevent ambiguity or confuſion of ideas, it is neceſſary to inform our readers, that we have followed M. D'Alembert in his double ſenſe of the word *value*, though we could have wiſhed he had diſtinguiſhed the different meanings by different words. A ſound may be either eſtimated by its different degrees of intenſeneſs, or by its different quantities of duration.

To ſignify both thoſe ideas the word *value* is employed by D'Alembert. The reader, therefore, will find it of importance to diſtinguiſh the value of a note in height from its value in duration. This he may eaſily do, by conſidering whether the notes are treated as parts of the diatonic ſcale, or as continued for a greater or leſſer duration.

Principles of Compoſition.

chords of the ſeventh *ſol ſi re fa, re fa la ut, fa* and *ut* are the diſſonances, viz. *fa* with relation to *ſol* in the firſt chord, and *ut* with relation to *re* in the ſecond. In the chord of the great ſixth *fa la ut re, re* is the diſſonance (art. 120.); but that *re* is only, properly ſpeaking, a diſſonance with relation to *ut* from which it is a *ſecond*, and not with reſpect to *fa* from which it is a *ſixth major* (art. 17, and 18).

200 Tonic and ſimple dominant, what.

187. When a chord of the ſeventh is compoſed of a third major followed by two thirds minor, the fundamental note of this chord is called the *tonic dominant*. In every other chord of the ſeventh the fundamental is called the *ſimple dominant*, (art. 102.) Thus in the chord *ſol ſi re fa*, the fundamental *ſol* is the *tonic dominant*; but in the other chords of the ſeventh, as *ut mi ſol ſi, re fa la ut*, &c. the fundamentals *ut* and *re* are *ſimple dominants*.

201 Major chords, how rendered minor, and *vice verſa*.

188. In every chord, whether perfect, or of the ſeventh, or of the ſixth, if you have a mind that the third above the fundamental note ſhould be major, though it is naturally minor, you muſt place a ſharp above the fundamental note. For example, if I would mark the perfect major chord *re fa※ la re*, as the third *fa* above *re* is naturally minor, I place above *re* a ſharp, as you may ſee in example IV. In the ſame manner the chord of the ſeventh *re fa※ la ut*, and the chord of the great ſixth *re fa※ la ſi*, is marked with a ※ above *re*, and above the ※ a 7 or a 6, (ſee V. and VI.).

On the contrary, when the third is naturally major, and if you ſhould incline to render it minor, you muſt place above the fundamental note a ♭. Thus the examples VII. VIII. IX. ſhew the chords *ſol ſi♭ re ſol, ſol ſi♭ re fa, ſol ſi♭ re mi*, (TT).

Chap. V. *Of the Fundamental Baſs.*

202 Fundamental baſs, how formed.

189. Invent a modulation at your pleaſure; and under this modulation let there be ſet a baſs compoſed of different notes, of which ſome may carry a perfect chord, others that of the ſeventh, and others that of the great ſixth, in ſuch a manner that each note of the modulation which anſwers to each of the baſs, may be one of thoſe which enters into the chord of that note in the baſs; this baſs being compoſed according to the rules which ſhall be immediately given, will be the *fundamental baſs* of the modulation propoſed. See Part I. where *the nature and principles of the fundamental baſs* are explained.

See Fundamental baſs.

Thus (Exam. XVIII.) you will find that this modulation, *ut re mi fa ſol la ſi ut*, has or may admit for its fundamental baſs, *ut* $\overset{7}{\textit{ſol}}$ *ut* $\overset{6}{\textit{fa}}$ *ut* $\overset{7}{\textit{re}}$ $\overset{7}{\textit{ſol}}$ *ut*.

In reality, the firſt note *ut* in the upper-part is found in the chord of the firſt note *ut* in the baſs, which chord is *ut mi ſol ut*; the ſecond note *re* in the treble is found in the chord *ſol ſi re fa*, which is the chord of the ſecond note in the baſs, &c. and the baſs is compoſed only of notes which carry a perfect chord, or that of the ſeventh, or that of the great ſixth. Moreover, it is formed according to the rules which we are now about to give.

Chap. VI. *Rules for the Fundamental Baſs.*

203 Rules for the formation of this baſs.

190. All the notes of the fundamental baſs being only capable of carrying a perfect chord, or the chord of the ſeventh, or that of the great ſixth, are either tonics, or dominants, or ſub-dominants; and the dominants may be either ſimple or tonic.

The fundamental baſs ought always to begin with a tonic, as much as it is practicable. And now follow the rules for all the ſucceeding chords; rules which are evidently derived from the principles eſtabliſhed in the *Firſt Part* of this treatiſe. To be convinced of this, we ſhall find it only neceſſary to review the articles 34, 91, 122, 124, 126, 127.

Rule I.

191. In every chord of the tonic, or of the tonic dominant, it is neceſſary that at leaſt one of the notes which form that chord ſhould be found in the chord that precedes it.

Rule II.

192. In every chord of the ſimple dominant, it is neceſſary that the note which conſtitutes the ſeventh, or

(TT) We may only add, that there is no occaſion for marking theſe ſharps or flats when they are originally placed at the cleff. For inſtance, if the ſharp be upon the cleff of *fa* (ſee Exam. X.), one may ſatisfy himſelf with ſimply writing *re*, without a ſharp to mark the perfect chord major of *re, re fa※ la re*. In the ſame manner, in the Example XI. where the flat is at the cliff upon *ſi*, one may ſatisfy himſelf with ſimply writing *ſol*, to mark the perfect chord minor of *ſol ſi♭ re ſol*.

But if a caſe occurs where there is a ſharp or a flat at the cleff, if any one ſhould wiſh to render the chord minor which is major, or *vice verſa*, he muſt place above the fundamental note a ♮, or natural. Thus the Example XII. marks the minor chord *re fa la re*, and Example XIII. the major chord *ſol ſi re ſol*.—Frequently, in lieu of a natural, a flat is uſed to ſignify the minor chord, and a ſharp to ſignify the major. Thus Example XIV. marks the minor chord *re fa la re*, and Example XV. the major chord *ſol ſi re ſol*.

When in a chord of the great ſixth, the diſſonance, that is to ſay, the ſixth, ought to be ſharp, and when the ſharp is not found at the cleff, they write before or after the 6 a ※; and if this ſixth ſhould be flat according to the cleff, they write a ♮.

In the ſame manner, if in a chord of the ſeventh of the tonic dominant, the diſſonance, that is to ſay, the ſeventh, ought to be flat or natural, they write by the ſide of the ſeventh a ♭ or a ♮. Many muſicians, when a ſeventh from the ſimple dominant ought to be altered by a ſharp or a natural, have likewiſe written by the ſide of the ſeventh a ※ or a ♮; but M. Rameau ſuppreſſes theſe characters. The reaſon ſhall be given below, when we ſpeak of chords by ſuppoſition.

If there be a ſharp on the cleff of *fa*, and if I ſhould incline to mark the chord *ſol ſi re fa*, or the chord *la ut mi fa*, I would place before the ſeventh or the ſixth a ♮ or a ♭.

In the ſame manner, if there be a flat on the cleff at *ſi*, and if I ſhould incline to mark the chord *ut mi ſol ſi*, I would place before the ſeventh a ※ or a ♮, and ſo of the reſt.

or dissonance, should likewise be found in the preceding chord.

RULE III.

193. In every chord of the sub-dominant, at least one of its consonances must be found in the preceding chord. Thus, in the chord of the sub-dominant *fa la ut re*, it is necessary that *fa*, *la*, or *ut*, which are the consonances of the chord, should be found in the chord preceding. The dissonance *re* may either be found in it or not.

RULE IV.

194. Every simple or tonic dominant ought to descend by a fifth. In the first case, that is to say, when the dominant is simple, the note which follows can only be a dominant; in the second it may be any one you choose; or, in other words, it may either be a tonic, a tonic dominant, a simple dominant, or a sub-dominant. It is necessary, however, that the conditions prescribed in the second rule should be observed, if it be a simple dominant.

This last reflection is necessary, as you will presently see. For let us assume the succession of the two chords *la ut♯ mi sol, re fa la ut*, (see Exam. XIX.) this succession is by no means legitimate, though in it the first dominant descends by a fifth; because the *ut* which forms the dissonance in the second chord, and which belongs to a simple dominant, is not in the preceding chord. But the succession will be admissible, if, without meddling with the second chord, one should take away the sharp carried by the *ut* in the first; or if, without meddling with the first chord, one should render *ut* or *fa* sharp in the second (UU); or in short, if one should simply render the *re* of the second chord a tonic dominant, in causing it to carry *fa♯* instead of *fa* natural (119. & 122.).

It is likewise by the same rule that we ought to reject the succession of the two following chords,

re fa la ut, sol si re fa♯;

(see Exam. XX.).

RULE V.

195. Every sub-dominant ought to rise by a fifth; and the note which follows it may, at your pleasure, be either a tonic, a tonic dominant, or a sub-dominant.

REMARK.

204 Other rules substituted.

Of the five fundamental rules which have now been given, instead of the three first, one may substitute the three following, which are nothing but consequences from them, and which you may pass unnoticed if you think it proper.

RULE I.

If a note of the fundamental bass be a tonic, and rise by a fifth or a third to another note, that second note may be either a *tonic*, (34. & 91.) see Examples XXI. and XXII. (XX); a *tonic dominant*, (124.) see XXIII. and XXIV.; or a *sub dominant*, (124.) see XXV. and XXVI.; or, to express the rule more simply, that second note may be any one you please, except a *simple dominant*.

RULE II.

If a note of the fundamental bass be a tonic, and descend by a fifth or a third upon another note, this second note may be either a tonic, (34. & 91.) see Exam. XXVII. and XXVIII.; or a tonic dominant, or a simple dominant, yet in such a manner that the rule of art. 192. may be observed, (124.) see XXIX. XXX. XXXI. XXXII.; or a sub-dominant (124.), see XXXIII. and XXXIV.

The procedure of the bass *ut mi♭ sol ut, fa la ut mi*, from the tonic *ut* to the dominant *fa* (Ex. XXXV.), is excluded by art. 192.

RULE III.

If a note in the fundamental bass be a tonic, and rise by a second to another note, that note ought to be a tonic dominant, or a simple dominant (101. & 102.). See XXXVI. and XXXVII. (YY).

We must here advertise our readers, that the examples XXXVIII. XXXIX. XL. XLI. belong to the fourth rule above, art. 194.; and the examples XLII. XLIII. XLIV. to the fifth rule above, art. 195. See the articles 34, 35, 121, 123, 124.

REMARK I.

205 Perfect and imperfect cadences, what, and how employed.

196. The transition from a tonic dominant to a tonic is called an *absolute repose*, or a *perfect cadence* (73); and the transition from a sub-dominant to a tonic is called an *imperfect* or *irregular cadence* (73); the cadences are formed at the distance of four bars one from another, whilst the tonic then falls within the first time of the bar. See XLV. and XLVI.

REMARK II.

206 Syncopation only admissible in the fundamental bass by licence.

197. We must avoid as much as we can, syncopations in the fundamental bass; that, within the first time of which a bar is constituted, the ear may be entertained with a harmony different from that which it had before perceived in the last time of the preceding bar.

(UU) In this chord it is necessary that the *ut* and *fa* should be sharp at the same time; for the chord *re fa la ut♯*, in which *ut* would be sharp without the *fa*, is excluded by art. 179.

(XX) When the bass rises or descends from one tonic to another by the interval of a third, the mode is commonly changed; that is to say, from a major it becomes a minor. For instance, if I ascend from the tonic *ut* to the tonic *mi*, the major mode of *ut*, *ut mi sol ut*, will be changed into the minor mode of *mi*, *mi sol si mi*. For what remains, we must never ascend from one tonic to another, when there is no sound common to both their modes; for example, you cannot rise to the mode of *ut*, *ut mi sol ut*, from the minor mode of *mi♭*, *mi♭ sol♭ si♭ mi♭* (91.).

(YY) By this we may see, that all the intervals, viz. the third, the fifth, and second, may be admitted in the fundamental bass, except that of a second in descending. For what remains, it is very proper to remark, that the rules immediately given for the fundamental bass are not without exception, as approved compositions in music will certainly discover; but these exceptions being in reality licences, and for the most part in opposition to the great principle of connection, which prescribes that there should be at least one note in common between a preceding and a subsequent chord, it does not seem necessary to entertain initiates with a minute detail of these licences in an elementary work, where the first and most essential rules of the art alone ought to be expected.

Principles of Compoſition.

bar. Nevertheleſs, ſyncopation may be ſometimes admitted in the fundamental baſs, but it is by a licence (ZZ).

CHAP. VII. *Of the Rules which ought to be obſerved in the Treble with relation to the Fundamental Baſs.*

207 Definition of treble.

198. THE treble is nothing elſe but a modulation above the fundamental baſs, and whoſe notes are found in the chords of that baſs which correſponds with it, (189.) Thus in Ex. XVIII. the ſcale *ut re mi fa ſol la ſi ut*, is a treble with reſpect to the fundamental baſs *ut ſol ut fa ut re ſol ut.*

208 One note in the treble or baſs may anſwer to ſeveral of its correſpondent parts, and why.

199. We are juſt about to give the rules for the treble; but firſt we think it neceſſary to make the two following remarks.

1. It is obvious, that many notes of the treble may anſwer to one and the ſame note in the fundamental baſs, when theſe notes belong to the chord of the ſame note in the fundamental baſs. For example, this modulation *ut mi ſol mi ut*, may have for its fundamental baſs the note *ut* alone, becauſe the chord of that note comprehends the ſounds *ut*, *mi*, *ſol*, which are found in the treble.

2. In like manner, a ſingle note in the treble may, for the ſame reaſon, anſwer to ſeveral notes in the baſs. For inſtance, *ſol* alone may anſwer to theſe three notes in the baſs, *ut ſol ut* (AAA).

RULE I. *for the* TREBLE.

200. If the note which forms the ſeventh in a chord of the *ſimple dominant* is found in the treble, the note which precedes it muſt be the very ſame. This is what we call a *diſcord prepared* (122). For inſtance, let us ſuppoſe that the note of the fundamental baſe ſhall be *re*, bearing the chord of the ſimple dominant *re fa la ut*; and that this *ut*, which (art. 18. & 118.) is the diſſonance, ſhould be found in the treble; it is neceſſary that the note which goes before it in the treble ſhould likewiſe be an *ut*.

201. And it is requiſite to obſerve, that, according to the rules which we have given for the fundamental baſs, *ut* will always be found in the chord of that note in the fundamental baſs which precedes the ſimple dominant *re*. See XLVIII. XLIX. L. In the firſt example the diſſonance is *ut*, in the ſecond *ſol*, and in the third *mi*; and theſe notes are already in the preceding chord (BBB).

RULE II.

202. If a note of the fundamental baſs be a tonic dominant, or a ſimple dominant, and if the diſſonance be found in the treble, this diſſonance in the ſame treble ought to deſcend diatonically. But if the note of the baſs be a ſub-dominant, it ought to riſe diatonically. This diſſonance which riſes or deſcends diatonically, is what we have called a *diſſonance ſaved* or *reſolved* (129, 130.). See LII. LIII. LIV.

203. One

(ZZ) There are notes which may be found ſeveral times in the fundamental baſs in ſucceſſion with a different harmony. For inſtance, the tonic *ut*, after having carried the chord *ut mi ſol ut*, may be followed by another *ut* which carries the chord of the ſeventh, provided that this chord be the chord of the tonic dominant *ut mi ſol ſi♭*. See LXXII. In the ſame manner, the tonic *ut* may be followed by the ſame tonic *ut*, which may be rendered a *ſub-dominant*, by cauſing it to carry the chord *ut mi ſol la.* See LXXIII.

A dominant, whether tonic or ſimple, ſometimes deſcends or riſes upon one another by the interval of a tritone or falſe fifth. For example, the dominant *fa*, carrying the chord *fa la ut mi*, may be followed by another dominant *ſi*, carrying the chord *ſi re fa la*. This is a licence in which the muſician indulges himſelf, that he may not be obliged to depart from the ſcale in which he is; for inſtance, from the ſcale of *ut* to which *fa* and *ſi* belong. If one ſhould deſcend from *fa* to *ſi♭*, by the interval of a juſt fifth, he would then depart from that ſcale, becauſe *ſi♭* is no part of it.

(AAA) There are often in the treble ſeveral notes which may, if we chooſe, carry no chord, and be regarded merely as notes of paſſage, ſerving only to connect between themſelves the notes that do carry chords, and to form a more agreeable modulation. Theſe notes of paſſage are commonly quavers. See Exam. XLVII. in which this modulation *ut re mi fa ſol*, may be regarded as equivalent to this other, *ut mi ſol*, as *re* and *fa* are no more than notes of paſſage. So that the baſs of this modulation may be ſimply *ut ſol.*

When the notes are of equal duration, and arranged in a diatonic order, the notes which occupy the perfect part of each time, or thoſe which are accented, ought each of them to carry chords. Thoſe which occupy the imperfect part, or which are unaccented, are no more than more mere notes of paſſage. Sometimes, however, the note which occupies the imperfect part may be made to carry harmony; but the value of this note is then commonly increaſed by a point which is placed after it, which proportionably diminiſhes the continuance of the note that occupies the perfect time, and makes it paſs more ſwiftly.

When the notes do not move diatonically, they ought generally all of them to enter into the chord which is placed in the lower part correſpondent with theſe notes.

(BBB) There is, however, one caſe in which the ſeventh of a ſimple dominant may be found in a modulation without being prepared. It is when, having already employed that dominant in the fundamental baſs, its ſeventh is afterwards heard in the modulation, as long as this dominant may be retained. For inſtance, let us imagine this modulation,

	ut	*re*	*ut*	*ſi*	*ut*	*re*;
and this fundamental baſs,	*ut*	*re*^{7}		*ſol*^{7}	*ut*	*ſol*^{7}

(ſee Example LI.); the *re* of the fundamental baſs anſwers to the two notes *re ut* of the treble. The diſſonance *ut* has no need of preparation, becauſe the note *re*^{7} of the fundamental baſs having already been employed for the *re* which precedes *ut*, the diſſonance *ut* is afterwards preſented, below which the chord *re* may be preſerved, or *re fa la ut.*

203. One may likewise observe here, that, according to the rules for the fundamental bass which we have given, the note upon which the dissonance ought to descend or rise will always be found in the subsequent chord (CCC).

CHAP. VIII. *Of the Continued Bass, and its Rules.*

* See *Continued bass.*

209 Thorough-bass, what.

204. A CONTINUED* or thorough bass, is nothing else but a fundamental bass whose chords are *inverted.* We invert a chord when we change the order of the notes which compose it. For example, if instead of the chord *sol si re fa*, I should say *si re fa sol*, or *re fa sol si*, &c. the chord is inverted. Let us see then, in the first place, all the possible ways in which a chord may be inverted.

210 Chords inverted, how.

The ways in which a PERFECT CHORD *may be* INVERTED.

205. The perfect chord *ut mi sol ut* may be inverted in two different ways.

1. *Mi sol ut mi*, which we call a chord of the *sixth*, composed of a third, a sixth, and an octave and in this case the note *mi* is marked with a 6. (See LVI.)

2. *Sol ut mi sol*, which we call a *chord of the sixth and fourth*, composed of a fourth, a sixth, and an octave; and it is marked with a $^{6}_{4}$. (See LVII.)

The perfect minor chord is inverted in the same manner.

The ways in which the CHORD *of the* SEVENTH *may be* INVERTED.

206. In the chord of the tonic dominant, as *sol si re fa*, the third major *si* above the fundamental note *sol* is called a *sensible note* (77.); and the inverted chord *si re fa sol*, composed of a third, a false fifth, and sixth, is called the *chord of the false fifth*, and is marked with an 8 or a ♭5 (see LVIII. and LIX.)

The chord *re fa sol si*, composed of a third, a fourth, and a sixth, is called the *chord of the sensible sixth*, and marked with a 6 or a ✱6. In this chord thus figured, the third is minor, and the sixth major, as it is easy to be perceived. (See LX.)

The chord *fa sol si re*, composed of a second, a tritone, and a sixth, is called the *chord of the tritone*, and is marked thus 4+, thus ×4, or thus ✱4. (See LXI.)

207. In the chord of the simple dominant *re fa la ut*, we find,

1. *Fa la ut re*, a chord of the great sixth, which is composed of a third, a fifth, and a sixth, and which is figured with a $^{6}_{5}$. See LXIII. (DDD).

2. *La ut re fa*, a chord of the lesser sixth, which is figured with a 6. See LXIV. (EEE).

3. *Ut re fa la*, a chord of the second, composed of a second, a fourth, and a sixth, and which is marked with a 2. See LXII. (FFF).

The ways in which the CHORD *of the sub-*DOMINANT *may be inverted.*

208. The chord of the sub-dominant, as *fa la ut re*, may be inverted in three different manners; but the method of inverting it which is most in practice is the chord of the lesser sixth *la ut re fa*, which is marked with a 6, and the chord of the seventh *re fa la ut*. See LXIV.

RULES *for the* CONTINUED BASS.

200. The continued bass is a fundamental bass, whose chords are only inverted in order to render it more in the taste of singing, and suitable to the voice. See LXV. in which the fundamental bass which in itself is monotonic and little suited for singing, *ut sol ut sol ut sol ut*, produces, by inverting its chords, this continued bass highly proper to be sung, *ut si ut re mi fa mi*, &c. (GGG.)

The continued bass then is properly nothing else but

(CCC) When the treble syncopates in descending diatonically, it is common enough to make the second part of the syncope carry a discord, and the first a concord. See *Example* LV. where the first part of the syncopated note *sol* is in concord with the notes *ut mi sol ut*, which answer to it in the fundamental bass, and where the second part is a dissonance in the subsequent chord *la ut mi sol*. In the same manner, the first part of the syncopated note *fa* is in concord with the notes *re fa la ut*, which answer to it; and the second part is a dissonance in the subsequent chord *sol si re fa*, which answer to it, &c.

(DDD) We are obliged to mark likewise, in the continued bass, the chord of the sub-dominant with a $^{6}_{5}$, which in the fundamental bass is figured with a 6 alone; and this to distinguish it from the chords of the sixth and of the lesser sixth. (See Examples LVI. and LXIV.) For what remains, the chord of the great sixth in the fundamental bass carries always the sixth major, whereas in the continued bass it may carry the sixth minor. For instance, the chord of the seventh *ut mi sol si*, gives the chord of the great sixth *mi sol si ut*, thus improperly called, since the sixth from *mi* to *ut* is minor.

(EEE) M. Rameau has justly observed, that we ought rather to figure this lesser sixth with a $^{6}_{4}$, to distinguish it from the sensible sixth which arises from the chord of the tonic dominant, and from the sixth which arises from the perfect chord. In the mean time he figures in his works with a 6 alone, the lesser sixths which do not arise from the tonic dominant; that is to say, he figures them as those which arise from the perfect chord; and we have followed him in that, though we thought with him, that it would be better to mark this chord by a particular figure.

(FFF) The chord of the seventh *si re fa la* gives, when inverted, the chord *fa la si re*, composed of a third, a tritone, and a sixth. This chord is commonly marked with a 6, as if the tritone were a just fourth. It is his business who performs the accompaniment, to know whether the fourth above *fa* be a tritone or a fourth redundant. One may, as to what remains, figure this chord thus $\begin{smallmatrix}6\\4+\\3\end{smallmatrix}$.

(GGG) The continued bass is proportionably better adapted to singing, as the sounds which form it more scrupulously observe the diatonic order, because this order is the most agreeable of all. We must therefore endeavour to preserve it as much as possible. It is for this reason that the continued bass in Example LXV. is much more in the taste of singing, and more agreeable, than the fundamental bass which answers to it.

Principles of Composition.

but a treble with respect to the fundamental bass. Its rules immediately follow; which are properly no other than those already given for the treble.

Rule I.

210. Every note which carries the chord of the false fifth, and which of consequence must be what we have called a *sensible note*, ought (77) to rise diatonically upon the note which follows it. Thus in example LXV. the note *si*, carrying the chord of the false fifth marked with an 8, rises diatonically upon *ut* (hhh).

Rule II.

211. Every note carrying the chord of the tritone should descend diatonically upon the subsequent note. Thus in the same example LXV. *fa*, which carries the chord of the triton figured with a 4+, descends diatonically upon *mi*. (Art. 202.)

Rule III.

212. The chord of the second is commonly put in practice upon notes which are syncopated in descending, because these notes are dissonances which ought to be prepared and resolved (200, 202.) See the example LXVI. where the second *ut*, which is syncopated, and which descends afterwards upon *si*, carries the chord of the second (iii).

Chap. IX. *Of some Licences assumed in the Fundamental Bass.*

§ 1. *Of* Broken *and* Interrupted Cadences.

211 Broken cadence how executed.

213. The broken cadence is executed by means of a dominant which rises diatonically upon another, or upon a tonic by a licence. See, in the example LXXIV. *sol la*, (132, and 134).

212 Interrupted cadence how formed.

214. The interrupted cadence is formed by a dominant which descends by a third upon another (136). See, in the example LXXV, *sol mi* (lll).

These cadences ought not to be permitted but rare- [g] ly

(hhh) The continued bass being a kind of treble with relation to the fundamental bass, it ought to observe the same rules with respect to that bass as the treble. Thus a note, for instance *re*, carrying a chord of the seventh *re fa la ut*, to which the chord of the sub-dominant *fa la ut re* corresponds in the fundamental bass, ought to rise diatonically upon *mi*, (art. 129, n° 2. and art. 202.)

(iii) When there is a *repose* in the treble, the note of the continued bass ought to be the same with that of the fundamental bass, (see example LXVII.) In the closes which are found in the treble at *si* and *ut* (bars third and fourth), the notes in the fundamental and continued bass are the same, viz. *sol* for the first cadence, and *ut* for the second. This rule ought above all to be observed in final cadences which terminate a piece or a modulation.

It is necessary, as much as possible, to prevent coincidences of the same notes in the treble and continued bass, unless the motion of the continued bass should be contrary to that of the treble. For example, in the second note of the second bar in example LXVII. *mi* is found at the same time in the continued bass and in the treble: but the treble descends from *fa* to *mi*, whilst the bass rises from *re* to *mi*.

Two octaves, or two fifths, in succession, must likewise be shunned. For instance, in the treble sounds *sol mi*, the bass must be prevented from sounding *sol mi*, *ut la*, or *re si*; because in the first case there are two octaves in succession, *sol* against *sol*, and *mi* against *mi*; and because in the second case there are two fifths in succession, *ut* against *sol*, and *la* against *mi*, or *re* against *sol*, and *si* against *mi*. This rule, as well as the preceding, is founded upon this principle, that the continued bass ought not to be a copy of the treble, but to form a different melody.

Every time that several notes of the continued bass answer to one note alone of the fundamental, the composer satisfies himself with figuring the first of them. Nay, he does not even figure it if it be a tonic; and he draws above the others a line, continued from the note upon which the chord is formed. See example LXVIII. where the fundamental bass *ut* gives the continued bass *ut mi sol mi*: the two *mi*'s ought in this bass to carry the chord 6, and *sol* the chord $\substack{6\\4}$: but as these chords are comprehended in the perfect chord *ut mi sol ut*, which is the first of the continued bass, we place nothing above *ut*, only we draw a line over *ut mi sol mi*.

In like manner, in the second bar of the same example, the notes *fa* and *re* of the continued bass, rising from the note *sol* alone of the fundamental bass which carries the chord *sol si re fa*; we think it sufficient to figure *fa* with the number of the tritone 4x, and to draw a line above *fa* and *re*.

It should be remarked, that this *fa* ought naturally to descend to *mi*: but this note is considered as subsisting so long as the chord subsists; and when the chord changes, we ought necessarily to find the *mi*, as may be seen by that example.

In general, whilst the same chord subsists in passing through different notes, the chord is reckoned the same as if the first note of the chord had subsisted; in such a manner, that, if the first note of the chord is, for instance, the sensible note, we ought to find the tonic when the chord changes. See example LXIX. or this continued bass, *ut si sol si re ut*, is reckoned the same with this *ut si ut*. (Example LXX.)

If a single note of the continued bass answers to several notes of the fundamental bass, it is figured with the different chords which agree to it. For example, the note *sol* in a continued bass may answer to this fundamental bass *ut sol ut*, (see example LXXI.); in this case, we may regard the note *sol* as divided into three parts, of which the first carries the chord $\substack{6\\4}$, the second the chord 7, and the third the chord $\substack{6\\4}$.

We shall repeat here, with respect to the rules of the continued bass, what we have formerly said concerning the rules of the fundamental bass in the note upon the third rule, art. 193. The rules of the continued bass have exceptions, which practice and the perusal of good authors will teach. There are likewise several other rules which might require a considerable detail, and which will be found in the *Treatise of Harmony* by M. Rameau, and elsewhere. These rules, which are proper for a complete dissertation, did not appear to me indispensably necessary in an *elementary essay upon music*, such as the present. The books which we have quoted at the end of our *preliminary discourse* will more particularly instruct the reader concerning this practical detail.

(lll) One may sometimes, but very rarely, cause several tonics in succession to follow one another in ascending

Principles of Compoſition.

ly and with precaution.

§ 2. *Of* Supposition.

213 Chord by ſuppoſition, what. See *Suppoſition*.

215. When a dominant is preceded by a tonic in the fundamental baſs, we add ſometimes, in the continued baſs to the chord of that dominant, a new note which is a third or a fifth below; and the chord which reſults from it in this continued baſs is called *a chord by ſuppoſition.*

For example, let us ſuppoſe that in the fundamental baſs we have a dominant *ſol* carrying the chord of the ſeventh *ſol ſi re fa*; let us add to this chord the note *ut*, which is a fifth below this dominant, and we ſhall have the total chord *ut ſol ſi re fa*, or *ut re fa ſol ſi*, which is called *a chord by ſuppoſition* (MM).

Of the different kinds of chords by ſuppoſition.

214 Theſe different chords what, and how figured.

216. It is eaſy to perceive, that chords by ſuppoſition are of different kinds. For inſtance, the chord of the tonic *ſol ſi re fa* gives,

1. By adding the fifth *ut*, the chord *ut ſol ſi re fa*, called a *chord of the ſeventh redundant*, and compoſed of a fifth, ſeventh, ninth, and eleventh. It is figured with a ※7; ſee LXXVI. (NNN). This chord is not practiſed but upon the tonic. They ſometimes leave out the ſenſible note, for reaſons which we ſhall give in the note QQQ, upon the art. 219; it is then reduced to *ut fa ſol re*, and marked with $\frac{5}{4}$ or $\frac{5}{2}$.

2. By adding the third *mi*, we ſhall have the chord *mi ſol ſi re fa*, called a *chord of the ninth*, and compoſed of a third, fifth, ſeventh, and ninth. It is figured with a 9. This third may be added to every third of the dominant. See LXXVII. (OOO).

3. If to a chord of the ſimple dominant, as *re fa la ut*, we ſhould add the fifth *ſol*, we would have the chord *ſol re fa la ut*, called a *chord of the eleventh*, and which is figured with a $\frac{9}{4}$ or $\frac{4}{9}$. (See LXXVIII.)

Observe.

215 Occaſions when retrenchments of chords are proper.

217. When the dominant is not a tonic dominant, they often take away ſome notes from the chord. For example, let us ſuppoſe that there is in the fundamental baſs this ſimple dominant *mi*, carrying the chord *mi ſol ſi re*: if there ſhould be added the third *ut* beneath, we ſhall have this chord of the continued baſs *ut mi ſol ſi re*, but they ſuppreſs the ſeventh *ſi*, for reaſons which ſhall be explained in the note QQQ upon art. 219. In this ſtate the chord is ſimply compoſed of a third, fifth, and ninth, and is marked with a 9. See LXXIX. (PPP).

218.

ing or deſcending diatonically, as *ut mi ſol ut*, *re fa la re*, *ſi♭ re fa ſi♭*; but, beſides that this ſucceſſion is harſh, it is neceſſary, in order to render it practicable, that the fifth below the firſt tonic ſhould be found in the chord of the tonic following, as here *fa*, a fifth below the firſt tonic *ut*, is found in the chord *re fa la re*, and in the chord *ſi♭ re fa ſi♭* (37 and note G.)

(MMM) Though ſuppoſition be a kind of licence, yet it is in ſome meaſure founded on the experiment related in the note (F), where you may ſee that every principal or fundamental ſound cauſes its twelfth and ſeventeenth major in deſcending to vibrate, whilſt the twelfth and the ſeventeenth major aſcending reſound: which ſeems to authorize us in certain caſes to join with the fundamental harmony this twelfth and ſeventeenth in deſcending, or which is the ſame thing, the fifth or the third beneath the fundamental ſound.

Even without having recourſe to this experiment, we may remark, that the note added beneath the fundamental ſound, cauſes that very fundamental ſound to be heard. For inſtance, *ut* added beneath *ſol*, cauſes *ſol* to reſound. Thus *ſol* is found in ſome meaſure to be implied in *ut*.

If the third added beneath the fundamental ſound be minor, for example, if to the chord *ſol ſi re fa*, we add the third *mi*, the ſuppoſition is then no longer founded on the experiment, which only gives the ſeventeenth major, or, what is the ſame thing, the third major beneath the fundamental ſound. In this caſe the addition of the third minor muſt be conſidered as an extenſion of the rule, which in reality has no foundation in the chords emitted by a ſonorous body, but is authorized by the ſanction of the ear and by practical experiment.

(NNN) Many muſicians figure this chord with a ※$^{7}_{2}$; M. Rameau ſuppreſſes this 2, and merely marks it to be the ſeventh redundant by a 7※ or ※7. But it may be ſaid, how ſhall we diſtinguiſh this chord from the ſeventh major, which, as it would ſeem, ought to be marked with a 7※? M. Rameau anſwers, that there is no danger of miſtake, becauſe in the ſeventh major, as the ſeventh ought to be prepared, it is found in the preceding chord; and thus the ſharp ſubſiſting already in the preceding chord, it would be uſeleſs to repeat it.

7
※

Thus *re ſol*, according to M. Rameau, would indicate *re fa※ la ut*, *ſol ſi re fa※*. If we would change *fa※*

7
※ 7♮

of the ſecond chord into *fa*, it would then be neceſſary to write *re ſol*. In notes ſuch as *ut*, whoſe natural ſeventh is major, the figure 7 preceded or followed by a ſharp will ſufficiently ſerve to diſtinguiſh the chord of the ſeventh redundant *ut ſol ſi re fa*, from the ſimple chord of the ſeventh *ut mi ſol ſi*, which is marked with a 7 alone. All this appears juſt and well-founded.

(OOO) Suppoſition introduces into a chord diſſonances which were not in it before. For inſtance, if to the chord *mi ſol ſi re*, we ſhould add the note of ſuppoſition *ut* deſcending by a third, it is plain that, beſides the diſſonance between *mi* and *re* which was in the original chord, we have two new diſſonances, *ut ſi* and *ut re*; that is to ſay, the ſeventh and the ninth. Theſe diſſonances, like the others, ought to be prepared and reſolved. They are prepared by being ſyncopated, and reſolved by deſcending diatonically upon one of the conſonances of the ſubſequent chord. The ſenſible note alone can be reſolved in aſcending; but it is even neceſſary that this ſenſible note ſhould be in the chord of the tonic dominant. As to the diſſonances which are found in the primitive chord, they ſhould always follow the common rules. (See art. 202.)

(PPP) Several muſicians call this laſt chord the *chord of the ninth*; and that which, with M. Rameau, we have

Principles of Composition.

218. What is more, in the chord of the simple dominant, as *re fa la ut*, when the fifth *sol* is added they frequently obliterate the sounds *fa* and *la*, that too great a number of dissonances may be avoided, which reduces the chord to *sol ut re*. This last is composed only of the fourth and the fifth. It is called a *chord of the fourth*, and it is figured with a 4. (See LXXX.)

219. Sometimes they only remove the note *la*, and

216 then the chord ought to be figured with $\frac{7}{4}$ or $\frac{4}{7}$ (QQQ).

Chord of the fifth redundant what, and how figured.

220. Finally, in the minor mode, for example, in that of *la*, where the chord of the tonic dominant (109), is *mi sol※ si re*; if we add to this chord the third *ut* below, we shall have *ut mi sol※ si re*, called the *chord of the fifth redundant*, and composed of a third, a fifth redundant, a seventh, and a ninth. It is figured with a ※5, or a +5. See LXXXI. (RRR).

217 § 3. *Of the* CHORD *of the* DIMINISHED SEVENTH.

Chord of the flat seventh what, and how figured.

221. In the minor mode, for instance, in that of *la*, *mi* a fifth from *la* is the tonic dominant (109), and carries the chord *mi sol※ si re*, in which *sol* is the sensible note. For this chord they sometimes substitute that other *sol※ si re fa* (116), all composed of minor thirds; and which has for its fundamental sound the sensible note *sol※*. This chord is called a *chord of the flat, or diminished seventh*, and is figured with a $\not 7$ in the fundamental bass, (see LXXXII.): but it is

218 always considered as representing the chord of the tonic dominant.

Chords produced in the continued bass by this what, and how figured.

222. This chord in the fundamental bass produces in the continued bass the following chords:

1. The chord *si re fa sol※*, composed of a third, false fifth, and sixth major. They call it the *chord of the sixth sensible and false fifth*; and it is figured thus $※^{6}_{8}$, or $+^{6}_{8}$. (See LXXXIII).

2. The chord *re fa sol※ si*, composed of a third, a triton, and a sixth, they call it the *chord of the triton and third minor*; and they mark it thus $※\overset{4}{\flat}$. (See LXXXIV).

3. The chord *fa sol※ si re*, composed of a second redundant, a tritone, and a sixth. They call it the *chord of the second redundant*, and they figure it thus ※2, or +2. See LXXXV. (SSS).

219 Alterations by supposition, chords which they produce what, and how figured.

223. Besides, since the chord *sol※ si re fa*, represents the chord *mi sol※ si re*, it follows, that if we operate by supposition upon the first of these chords, it must be performed as one would perform it upon *mi sol※ si re*; that is to say, that it will be necessary to add to the chord *sol※ si re fa*, the notes *ut* or *la*, which are the third or fifth below *mi*, and which will produce,

1. By adding *ut*, the chord *ut sol※ si re fa*, composed of a fifth redundant, a seventh, a ninth, and eleventh, which is the octave of the fourth. It is called a *chord of the fifth redundant and fourth*, and thus marked $+^{5}_{4}$, or $※^{5}_{4}$. (See LXXXVI.)

2. By adding *la*, we shall have the chord *la sol※ si re fa*, composed of a seventh redundant, a ninth, an eleventh, and a thirteenth minor, which is the octave of the sixth minor. It is called the *chord of the seventh redundant and sixth minor*, and marked $\overset{+7}{\flat 6}$, or $\overset{※7}{\flat}$. (See LXXXVII.) It is of all chords the most harsh, and the most rarely practised (TTT).

[g 2] In

have simply called a *chord of the ninth*, they term a *chord of the ninth and seventh*. This last chord they mark with a $^{9}_{7}$; but the denomination and figure used by M. Rameau are more simple, and can lead to no error; because the chord of the ninth always includes the seventh, except in the cases of which we have already spoken.

(QQQ) They often remove some dissonances from chords of supposition, either to soften the harshness of the chord, or to remove discords which can neither be prepared nor resolved. For instance, let us suppose, that in the continued bass the note *ut* is preceded by the sensible note *si*, carrying the chord of the false fifth, and that we should choose to form upon this note *ut* the chord *ut mi sol si re*, we must obliterate the seventh *si*, because in retaining it we should destroy the effect of the sensible note $\overset{8}{si}$, which ought to rise to *ut*.

In the same manner, if to the harmony of a tonic dominant *sol si re fa*, one should add the note by supposition *ut*, it is usual to retrench from this chord the sensible note *si*; because, as the *re* ought to descend diatonically to *ut*, and the *si* to rise to it, the effect of the one would destroy that of the other. This above all takes place in the *suspense*, concerning which we shall presently treat.

(RRR) *Supposition* produces what we call *suspense*; and which is almost the same thing. Suspension consists in retaining as many as possible of the sounds in a preceding chord, that they may be heard in the chord which succeeds. For instance, if this fundamental bass be given *ut* $\overset{7}{sol}$ *ut*, and this continued bass above it *ut ut* $\overset{※7}{ut}$, it is a supposition; but if we have this fundamental bass *ut* $\overset{7}{sol}$ $\overset{7}{sol}$ *ut*, and this continued bass above it *ut* $\overset{7}{sol}$ *ut* $\overset{※7}{ut}$, it is a suspense; because the perfect chord of *ut*, which we naturally expect after *sol* in the continued bass, is *suspended* and *retarded* by the chord $\overset{※7}{ut}$, which is formed by retaining the sounds *sol si re fa* of the preceding chord to join them to the note *ut* in this manner, *ut sol si re fa;* but this chord $\overset{※7}{ut}$ does nothing in this case but *suspend* for a moment the perfect chord *ut mi sol ut*, which ought to follow it.

(SSS) The chord of the diminished seventh, such as *sol※ si re fa*, and the three derived from it, are termed *chords of substitution*. They are in general *harsh*, and proper for imitating melancholy objects.

(TTT) As the chord of the diminished seventh *sol※ si re fa*, and the chord of the tonic dominant *mi sol※ si, re*, only differ one from the other by the notes *mi* and *fa;* one may form a diatonic modulation of these two notes, and then the fundamental bass does nothing but pass from the tonic dominant to the sensible note, and from that note to the tonic dominant, till it arrives at the tonic. (See XCII.)

For the same reason, as the chord of the diminished seventh *sol※ si re fa*, and the chord *si re fa la*, which carries

Principles of Composition.

In the *Treatise of Harmony* by M. Rameau, and elsewhere, may be seen a much longer detail of the chords by supposition: But here we delineate the elements alone.

Chap. X. *Of some Licences used in the Treble and Continued Bass.*

220 Licence 1st.

224. Sometimes in a treble, the dissonance which ought to have been resolved by descending diatonically upon the succeeding note, instead of descending, on the contrary rises diatonically: but in that case, the note upon which it ought to have descended must be found in some of the other parts. This licence ought to be rarely practised.

In like manner, in a continued bass, the dissonance in a chord of the sub-dominant inverted, as *la* in the chord *la ut mi sol*, inverted from *ut mi sol la*, may sometimes descend diatonically instead of rising as it ought to do, art. 129. n° 2.; but in that case the note ought to be repeated in another part, that the dissonance may be there resolved in ascending.

221 Licence 2d.

225. Sometimes likewise, to render a continued bass more agreeable by causing it to proceed diatonically, they place between two sounds of that bass a note which belongs to the chord of neither. See example XCIV, in which the fundamental bass *sol ut* produces the continued bass *sol la si sol ut*, where *la* is added on account of the diatonic modulation. This *la* has a line drawn above it to shew its resolution by passing under the chord *sol si re fa*.

In the same manner, (see XCV), this fundamental bass *ut fa* may produce the continued bass *ut re mi ut fa*, where the note *re* which is added passes under the chord *ut mi sol ut*.

Chap. XI. *Containing the Method of finding the Fundamental Bass when the Continued Bass is figured.*

222 How to find the fundamental bass when the continued is figured.

226. To exercise yourself with greater ease in finding the fundamental bass, and to render it more familiar to you, it is necessary to observe how eminent masters, and above all how M. Rameau, has put the rules in practice. Now, as they never place any thing but the continued bass in their works, it becomes then necessary to know how to find the fundamental bass when the continued bass is figured. This problem may be easily solved by the following rules.

227. 1. Every note which has no figure in the continued bass, ought to be the same, and without a figure in the fundamental bass; it either is a tonic, or reckoned such, (uuu).

2. Every note which in the continued bass carries a 6, ought in the fundamental bass to give its third below not figured *, or its fifth below marked with a 7. We shall distinguish these two cases below. (See LVI and LXIV, and the note zzz.)

* See *Figured*.

3. Every note carrying $\frac{6}{4}$ gives in the fundamental bass its fifth below not figured. (See LVII.)

4. Every note figured with a 7 or a ♯, is the same in both basses, and with the same figure (xxx).

5. Every note figured with a 2 gives in the fundamental bass the diatonic note above figured with a 7. See LXII. (yyy).

6. Every note marked with a 4 gives in the fundamental bass the diatonic note above, figured with a 7. (See LXI.)

7. Every

carries the fifth *si* of the tonic dominant *mi*, only differs by the sensible note *sol*※, and the tonic *la*; one may sometimes, while the treble modulates *sol*※ *la sol*※ *la sol*※ *la*, ascend in the fundamental bass, from the sensible note to the third above, provided one descend at last from thence to the tonic dominant, and from thence to the tonic; (see XCIII.) As to what remains, this and the preceding examples are licences.

(uuu) I say a tonic, or *reckoned such*, because it may perhaps be a dominant from which the dissonance has been removed. But in that case one may know that it is a real dominant by the note which precedes it. For instance, if the note *sol*, carrying a perfect chord, is preceded by *re* a simple dominant, carrying the chord *re fa la ut*, that note *sol* is not a real tonic; because, in order to this, it would have been necessary that *re* should have been a tonic dominant, and should have carried the chord *re fa*※ *la ut*; and that a simple dominant, as *re*, carrying the chord *re fa la ut*, should only naturally descend to a dominant, (art. 194.)

(xxx) Sometimes a note which carries a 7 in the continued bass, gives in the fundamental bass its third above, figured with a 6. For example, this continued bass $\overset{7}{la}$ $\overset{8}{si}$ *ut* gives this fundamental bass $\overset{6}{ut}$ $\overset{7}{sol}$ *ut*; but in this case it is necessary that the note figured with a 6 should rise by a fifth, as we see here *ut* rise to *sol*.

(yyy) A note figured with a 2, gives likewise sometimes in the fundamental bass its fourth above, figured with a 6; but it is necessary in that case that the note figured with a 6, may even here rise to a fifth. (See note xxx).

These variations in the fundamental bass, as well in the chord concerning which we now treat, as in the chord figured with a 7, and in two others which shall afterwards be mentioned (art. 228 and 229), are caused by a deficiency in the signs proper for the chord of the sub-dominant, and for the different arrangements by which it is inverted.

M. l'Abbe Roussier, to redress this deficiency, had invented a new manner of figuring the continued bass. His method is most simple for those who know the fundamental bass. It consists in expressing each chord by only signifying the fundamental sound with that letter of the scale by which it is denominated, to which is joined a 7 or ♯, or a 6, in order to mark all the discords. Thus the fundamental chord of the seventh *re fa la ut* is expressed by a $\overset{7}{D}$; and the same chord, when it is inverted from that of the sub-dominat *fa la ut re*, is characterized by $\overset{6}{F}$; the chord of the second *ut re fa la*, inverted from the dominant *re fa la ut*, is likewise represented by $\overset{7}{D}$; and the same chord *ut re fa la* inverted from that of the sub-dominant *fa la ut re* is signified by $\overset{6}{F}$: the case is the same when the chords are differently inverted. By this means it would be impossible to mistake either with respect to the fundamental bass of a chord, or with respect to the note which forms its dissonance, or with respect to the nature and species of that discord.

Principles of Composition.

7. Every note figured with an 8 gives its third below figured with a 7. (See LVIII.)

8. Every note marked with a $\not{6}$ gives the fifth below marked with a 7; (see LX.) and it is plain by art. 187, that in the chord of the seventh, of which we treat in these three last articles, the third ought to be major, and the seventh minor, this chord of the seventh being the chord of the tonic dominant. (See art. 102.)

9. Every note marked with a 9 gives its third above figured with a 7. (See LXXVII and LXXIX.)

10. Every note marked with a $\frac{9}{4}$ gives the fifth above figured with a 7. (See LXXVIII.)

11. Every note marked with a ※5, or with a +5, gives the third above figured with a $\overset{7}{\text{※}}$. (See LXXXI.)

12. Every note marked with a ※7 gives a fifth above figured with a 7, or with a $\overset{7}{\text{※}}$. (See LXXVI.) It is the same case with the notes marked $\frac{7}{4}$, $\overset{5}{\underset{2}{4}}$, or $\frac{5}{2}$: which shews a retrenchment, either in the complete chord of the eleventh, or in that of the seventh redundant.

13. Every note marked with a 4 gives a fifth above figured with a 7, or a $\overset{7}{\text{※}}$. (See LXXX.)

14. Every note marked with a ※$\frac{6}{8}$ gives the third minor below, figured with a #. (See LXXXIII.)

15. Every note marked with a ※$\overset{4}{\flat}$ gives the tritone above, figured with a #. (See LXXXIV.)

16. Every note marked with a +2 gives the second redundant above, figured with a #. (See LXXXV.)

17. Every note marked with a ※$\frac{5}{4}$ gives the fifth redundant above, figured with a #. (See LXXXVI.)

18. Every note marked with a $\begin{matrix}\text{※}7\\ \flat 6\end{matrix}$ gives the seventh redundant above, figured with a #. See LXXXVII. (zzz).

REMARK.

223 A difficulty in finding the fundamental bass.

228. We have omitted two cases cases, which may cause some uncertainty.

The first is that where the note of the continued bass is figured with a 6. We now present the reason of the difficulty.

Suppose we should have the dominant $\overset{7}{re}$ in the fundamental bass, the note which answers to it in the continued bass may be *la* carrying the figure 6, (see LXIV.); that is to say, the chord *la ut re fa*: now if we should have the sub-dominant $\overset{6}{fa}$ in the fundamental bass, this sub-dominant might produce in the continued bass the same note *la* figured with a 6. When therefore one finds in the continued bass a note marked with a 6, it appears at first uncertain whether we should place in the fundamental bass the fifth below marked with a 7, or the third below marked with a 6.

224 Another.

229. The second case is that in which the continued bass is figured with a $\frac{6}{5}$. For instance, if there should be found $\overset{6}{\underset{}{\overset{5}{fa}}}$ in the continued bass, one may be ignorant whether he ought to insert in the fundamental bass *fa* marked with a 6, or *re* figured with a 7.

225 Solution.

230. You may easily extricate yourself from this little difficulty, in leaving for an instant this uncertain note in suspense, and in examining what is the succeeding note of the fundamental bass; for if that note be in the present case a fifth above *fa*, that is to say, if it is *ut*, in this case, and in this alone, he may place $\overset{6}{fa}$ in the fundamental bass. It is a consequence of this rule, that in the fundamental bass every sub-dominant ought to rise by a fifth (195).

CHAP. XII. *What is meant by being in a Mode or Tone.*

226 Method of determining the mode in which we are.

231. IN the first part of this treatise (chap. vi.), we have explained, how by the means of the note *ut*, and of its two fifths *sol* and *fa*, one in ascending, which is called a *tonic dominant*, the other in descending, which is called a *sub-dominant*, the scale *ut re mi fa sol la si ut* may be found; the different sounds which form this scale compose what we call the *major mode* of *ut*, because the third *mi* above *ut* is major. If therefore we would have a modulation in the major mode of *ut*, no other sounds must enter into it than those which compose this scale; in such a manner that if, for instance, I should find *fa*※ in this modulation, this *fa*※ discovers to me that I am not in the mode of *ut*, or at least that, if I have been in it, I am no longer so.

232. In the same manner, if I form this scale in ascending *la si ut*※ *re mi fa*※ *sol*※ *la*, which is exactly similar to the scale *ut re mi fa sol la si ut* of the major mode of *ut*, this scale, in which the third from *la* to *ut*※ is major, shall be in the major mode of *la*; and if I incline to be in the minor mode of *la*, I have nothing to

(zzz) We may only add, that here and in the preceding articles, we suppose, that the continued bass is figured in the manner of M. Rameau. For it is proper to observe, that there are not, perhaps, two musicians who characterize their chords with the same figures; which produces a great inconveniency to the person who plays the accompaniments, as may be seen in the article *Chiffrer*, in Vol. III. of the *Encyclopedie*; an admirable article, of which M. Rousseau of Geneva is the author: but here we do not treat of accompaniments. For every reason, then, we should advise initiates to prefer the continued basses of M. Rameau to all the others, as by them they will most successfully study the fundamental bass.

It is even necessary to advertise the reader, and I have already done it (note EEE), that M. Rameau only marks the lesser sixth by a 6 without a line, when this lesser sixth does not result from the chord of the tonic dominant; in such a manner that the 6 renders it uncertain whether in the fundamental bass we ought to choose the third or the fifth below: but it will be easy to see whether the third or the fifth is signified by that figure. This may be distinguished, 1. In observing which of the two notes is excluded by the rules of the fundamental bass. 2. If the two notes may with equal propriety be placed in the fundamental bass, the preference must be determined by the tone or mode of the treble in that particular passage. In the following chapter we shall give rules for determining the mode.

There is a chord of which we have not spoken in this enumeration, and which is called the *chord of the sixth redundant*. This chord is composed of a note, of its third major, of its redundant fourth or tritone, and its redundant sixth, as *fa la si re*※. It is marked with a 6※. It appears difficult to find a fundamental bass for this chord; nor is it indeed much in use amongst us. (See the note upon the art. 115.)

to do but to ſubſtitute for *ut* ſharp *ut* natural; ſo that the major third *la ut*※ may become minor *la ut;* I ſhall have then

la ſi ut re mi fa※ *ſol*※ *la,*

which is (85) the ſcale of the minor mode of *la* in aſcending; and the ſcale of the minor mode of *la* in deſcending ſhall be (90)

la ſol fa mi ut re ſi la,

in which the *ſol* and *fa* are no longer ſharp. For it is a ſingularity peculiar to the minor mode, that its ſcale is not the ſame in riſing as in deſcending (89).

227 Hence it appears what ſharps and flats ſhould be placed at the cleff in the major mode of *la*, and why they are omitted in the minor mode in deſcending.

233. This is the reaſon why, when we wiſh to begin a piece in the major mode of *la*, we place three ſharps at the cleff upon *fa*, *ut*, and *ſol;* and on the contrary, in the minor mode of *la*, we place none, becauſe the minor mode of *la*, in deſcending, has neither ſharps nor flats.

228 Modes 24 in the whole.

234. As the ſcale contains twelve ſounds, each diſtant from the other by the interval of a ſemitone, it is obvious that each of theſe ſounds can produce both a major and a minor mode, which conſtitute 24 modes upon the whole. Of theſe we ſhall immediately give a table, which may be very uſeful to diſcover the mode in which we are.

A TABLE of the DIFFERENT MODES.

Major Modes.

Maj. Mode.	
of *ut*	*ut re mi fa ſol la ſi ut.*
of *ſol*	*ſol la ſi ut re mi fa*※ *ſol.*

In riſing. *ſol la ſi*♭ *ut re mi fa*※ *ſol.*

Of *re*.

In deſcending. *re ut ſi*♭ *la ſol fa mi re.*
In riſing. *re mi fa ſol la ſi ut*※ *re* (BBBB).

235.

(AAAA) The major mode of *fa*※, of *ut*♭ or *re*※, and of *ſol*※ or *la*♭, are not much practiſed. In the opera of *Pyramus* and *Thiſbe*, p. 267, there is a paſſage in the ſcene, of which one part is in the major mode of *fa*※, and the other in the major mode of *ut*※, and there are ſix ſharps at the cleff.

When a piece begins upon *ut*※, there ought to be ſeven ſharps placed at the cleff: but it is more convenient only to place five flats, and to ſuppoſe the key *re*♭, which is almoſt the ſame thing with *ut*※. It is for this reaſon that we ſubſtitute here the mode of *re*♭ for that of *ut*※.

It is ſtill much more neceſſary to ſubſtitute the mode of *la*♭ for that of *ſol*※*;* for the ſcale of the major mode of *ſol* is *ſol*※, *la*※, *ſi*※, *ut*※, *re*※, *mi*※, *ſol*, *ſol*※,
in which you may ſee that there are at the ſame time both a *ſol* natural and a *ſol*※*:* it would then be neceeſary, even at the ſame time, that upon *ſol* there ſhould and ſhould not be a ſharp at the cleff; which is ſhocking and inconſiſtent. It is true that this inconvenience may be avoided by placing a ſharp upon *ſol* at the cleff, and by marking the note *ſol* with a natural through the courſe of the muſic wherever it ought to be natural; but this would become troubleſome, above all if there ſhould be occaſion to tranſpoſe. In the article 236, we ſhall give an account of tranſpoſition. One might likewiſe in this ſeries, inſtead of *ſol* natural, which is the note immediately before the laſt, ſubſtitute *fa*※※, that is to ſay, *fa* twice ſharp; which, however, is not abſolutely the ſame ſound with *ſol* natural, eſpecially upon inſtruments whoſe ſcales are fixed, or whoſe intervals are invariable. But in that caſe two ſharps may be placed at the cleff upon *fa*, which would produce another inconvenience. But by ſubſtituting *la*♭ for *ſol*※, the trouble is eluded.

(BBBB) We have already ſeen, that in each mode the *principal note* is called a *tonic;* that the fifth above that note

Principles of Composition.

235. These then are all the modes, as well major as minor. Those which are crowded with sharps and flats are little practised, as being extremely difficult in execution.

229 Modes crowded with sharps and flats little practised.

236. From thence it follows,

1. That when there are neither sharps nor flats at the cleff, it is a token that the piece begins in the major mode of *ut*, or in the minor mode of *la*.

230 Results.

2. That when there is one single sharp, it will always be placed upon *fa*, and that the piece begins in the major mode of *sol*, or the minor of *mi*, in such a manner that it may be sung as if there were no sharp, by singing *si* instead of *fa*※, and in singing the tune as if it had been in another cleff. For instance, let there be a sharp upon *fa* in the cleff of *sol* upon the first line; one may then sing the tune as if there were no sharp: And, instead of the cleff of *sol* upon the first line, let there be the cleff of *ut*; for the *fa*※, when changed into *si*, will require that the cleff of *sol* should be changed to the cleff of *ut*, as may be easily seen. This is what we call *transposition* (‡).

See *Transposition.*

237. It is evident, that when *fa*※ is changed into *si*, *sol* must be changed into *ut*, and *mi* into *la*. Thus by transposition, the air has the same melody as if it were in the major mode of *ut*, or in the minor mode of *la*. The major mode then of *sol*, and the minor of *mi*, are by transposition reduced to those of *ut* major, and of *la* minor. It is the same case with all the other modes, as any one may easily be convinced (cccc).

231 All the modes reducible to the major of *ut* and the minor of *la*.

CHAP.

note is called a *tonic dominant*, or the *dominant of the mode*, or simply a *dominant;* that the fifth beneath the tonic, or, what is the same thing, the fourth above that tonic, is called a *sub-dominant;* and in short, that the note which forms a semitone beneath the tonic, and which is a third major from the dominant, is called a *sensible note.* The other notes have likewise in every mode particular names which it is advantageous to know. Thus a note which is a tone immediately above the tonic, as *re* in the mode of *ut*, and *si* in that of *la*, is termed a *subtonic;* the following note, which is a third major or minor from the tonic, according as the chord is major or minor, such as *mi* in the major mode of *ut*, and *ut* in the minor mode of *la*, is called a *mediant;* in short, the note which is a tone above the dominant, such as *la* in the mode of *ut*, and *fa*※ in that of *la*, is called a *sub-dominant*.

(‡) Though our author's account of this delicate operation in music will be found extremely just and compendious; though it proceeds upon simple principles, and comprehends every possible contingency; yet as the manner of thinking upon which it depends may be less familiar to English readers, if not profoundly skilled in music, it has been thought proper to give a more familiar, though less comprehensive, explanation of the manner in which *transposition* may be executed.

It will easily occur to every reader, that if each of the intervals through the whole diatonic series were equal in a mathematical sense, it would be absolutely indifferent upon what note any air were begun, if within the compass of the gammut; because the same equal intervals must always have the same effects. But since, besides the natural semitones, there is another distinction of diatonic intervals into *greater* and *lesser tones;* and since these vary their positions in the series of an octave, according as the note from whence you begin is placed, that note is consequently the best key for any tune whose natural series is most exactly correspondent with the intervals which that melody or harmony requires. But in instruments whose scales are fixed, notwithstanding the temperament and other expedients of the same kind, such a series is far from being easily found, and is indeed in common practice almost totally neglected. All that can frequently be done is, to take care that the ear may not be sensibly shocked. This, however, would be the case, if, in transposing any tune, the situation of the semitones, whether natural or artificial, were not exactly correspondent in the series to which your air must be transposed, with their positions in the scale from which you transpose it. Suppose, for instance, your air should begin upon *ut* or C, requiring the natural diatonic series through the whole gammut, in which the distance between *mi* and *fa*, or E and F, as also that between *si* and *ut*, or B and C, is only a semitone. Again, suppose it necessary for your voice, or the instrument on which you play, that the same air should be transposed to *sol* or G, a fifth above its former key; then because in the first series the intervals between the third and the fourth, seventh and eighth notes, are no more than semitones, the same intervals must take the same places in the octave to which you transpose. Now, from *sol* or G, the note with which you propose to begin, the three tones immediately succeeding are full; but the fourth, *ut* or C, is only a semitone; it may therefore be kept in its place. But from *fa* or F, the seventh note above, to *sol* or G the eighth, the interval is a full tone, which must consequently be redressed by raising your *fa* a semitone higher. Thus the situations of the semitonic intervals in both octaves will be correspondent; and thus, by conforming the positions of the semitones in the octave to which you transpose, with those in the octave in which the original key of the tune is contained, you will perform your operation with as much success as the nature of fixed scales can admit: But the order in which you must proceed, and the intervals required in every mode, are minutely and ingeniously delineated by our author.

(cccc) Two sharps, *fa*※ and *ut*※, indicate the major mode of *re*, or the minor of *si;* and then, by transposition, the *ut*※ is changed into *si*, and of consequence, *re* into *ut*, and *si* into *la*.

Three sharps, *fa*※ *ut*※ *sol*※, indicate the major mode of *la*, or the minor of *fa*※*;* and it is then *sol*※, which must be changed into *si*, and of consequence *la* into *ut*, and *fa*※ into *la*.

Four sharps, *fa*※ *ut*※ *sol*※ *re*※, indicate the major mode of *mi*, or the minor of *ut*※*;* then the *re*※ is changed into *si*, and of consequence *mi* into *ut*, and *ut*※ into *la*.

Five sharps, *fa*※ *ut*※ *sol*※ *re*※ *la*※, indicate the major mode of *si*, or the minor of *sol*※*; la* then is changed into *si*, and of consequence *si* into *ut*, and *sol*※ into *la*.

Six sharps, *fa*※ *ut*※ *sol*※ *re*※ *la*※ *mi*※, indicate the major mode of *fa*※*; mi*※ then is changed into *si*, and of consequence *fa*※ into *ut*.

Six flats, *si*♭ *mi*♭ *la*♭ *re*♭ *sol*♭ *ut*♭, indicate the minor mode of *mi*♭*; ut* is changed into *fa*, and of consequence *mi*♭ into *la*.

Five

Principles of Composition.

CHAP. XIII. *To find the Fundamental Bass of a given Modulation.*

233 Method of finding a fundamental bass to a given air not difficult, and why.

238. As we have reduced to a very small number the rules of the fundamental bass, and those which in the treble ought to be observed with relation to this bass, it should no longer be difficult to find the fundamental bass of a given modulation, nay, frequently to find several; for every fundamental bass will be legitimate, when it is formed according to the rules which we have given (chap. VI.); and that, besides this, the dissonances which the modulation may form with this bass will both be prepared, if it is necessary that they should be so, and always resolved (DDDD).

239. It

Five flats, *si*♭ *mi*♭ *la*♭ *re*♭ *sol*♭, indicate the major mode of *re*♭, or the minor mode of *si*♭; then the *si*♭ is changed into *fa*, and of consequence the *re*♭ into *ut*, and the *si*♭ into *la*.

Four flats, *si*♭ *mi*♭ *la*♭ *re*♭, indicate the major mode of *la*♭, or the minor mode of *fa*; *re*♭ then is changed into *fa*, and of consequence *la*♭ into *ut*, and *fa* into *la*.

Three flats, *si*♭ *mi*♭ *la*♭, indicate the major mode of *mi*♭, or the minor of *ut*; the *la*♭ then is changed into *fa*, and of consequence *mi*♭ into *ut*, and the *sol* into *la*.

Two flats, *si*♭ *mi*♭, indicate the major mode of *si*♭, or the minor of *sol*; *mi*♭ then is changed into *fa*, and of consequence *si*♭ into *ut*, and the *fa* into *la*.

One flat, *si*♭, indicates the major mode of *fa*, or the minor mode of *re*, and *si*♭ is changed into *fa*; of consequence the *fa* is changed into *ut*, and the *re* into *la*.

All the major modes then may be reduced to that of *ut*, and the modes minor to that of *la* minor.

It only remains to remark, that many musicians, and amongst others the ancient musicians of France, as Lulli, Campra, &c. place one flat less in the minor mode: so that in the minor mode of *re*, they place neither sharp nor flat at the cleff; in the minor mode of *sol*, one flat only; in the minor mode of *ut*, two flats, &c.

This practice in itself is sufficiently indifferent, and scarcely merits the trouble of a dispute. Yet the method which we have here described, according to M. Rameau, has the advantage of reducing all the modes to two; and besides it is founded upon this simple and very general rule, That in the major mode, we must place as many sharps or flats at the cleff, as are contained in the diatonic scale of that mode in ascending; and in the minor mode, as many as are contained in that same scale in descending.

However this be, I here present you with a rule for transposition, which appears to me more simple than the rule in common use.

For the Sharps.

Suppose *sol*, *re*, *la*, *mi*, *si*, *fa*, and change *sol* into *ut* if there is one sharp at the cleff, *re* into *ut* if there are two sharps, *la* into *ut* if there are three, &c.

For the Flats.

Suppose *fa*, *si*, *mi*, *la*, *re*, *sol*, and change *fa* into *ut* if there is only one flat at the cleff, *si* into *ut* if there are two flats, *mi* into *ut* if there are three, &c.

(DDDD) We often say, *that we are upon a particular key*, instead of saying *that we are in a particular mode*. The following expressions therefore are synonimous; *such a piece is in* ut *major*, or *in the mode of* ut *major*, or *in the key of* ut *major*.

We have seen that the diatonic scale or gammut of the Greeks was *la si ut re mi fa sol la*, (art. 49.) A method has likewise been invented of representing each of the sounds in this scale by a letter of the alphabet; *la* by A, *si* by B, *ut* by C, &c. It is from hence that these forms of speaking proceed: Such a piece is upon A, *with* mi, la, *and its third minor*; or, simply, it is upon A, *with* mi, la, *and its minor*; such another piece upon C, *with* sol, ut, *and its third major*; or, simply, upon C, *with* sol, ut, *and its major*; to signify that the one is in the mode of *la minor*, or that the other is in that of *ut major*; this last manner of speaking is more concise, and on this account it begins to become general.

They likewise call the cleff of *ut fa* F, the cleff of *re sol* G, &c. to denominate the cleff of *fa*, the cleff of *sol*, &c.

They say likewise to take the A *mi la*, to give the A *mi la*; that is to say, to take the unison of a certain note called *la* in the harpsichord, which *la* is the same that occupies the fifth line, or the highest line in the first cleff of *fa*. This *la* divides in the middle the two octaves which subsist (note RR) between the *sol* which occupies the first line in the cleff of *sol* upon that same line, and that *sol* which occupies the first line in the cleff of *fa* upon the fourth; and as it possesses (if we may speak so) the middle station between the sharpest and lowest sounds, it has been chosen to be the sound with relation to which all the voices and instruments ought to be tuned in a concert (§).

(§) Thus far our author; and though the note is no more than an illustration of the technical phraseology in his native language, we did not think it consistent with the fidelity of a translation to omit it. We have little reason to envy, and still less to follow, the French in their abbreviations of speech; the native energy of our tongue supersedes this necessity in a manner so effectual, that, in proportion as we endeavour to become succinct, our style, without the smallest sacrifice of perspicuity, becomes more agreeable to the genius of our language: whereas, in French, laconic diction is equally ambiguous and disagreeable. Of this we cannot give a more flagrant instance than the note upon which these observations are made, in its original. We must, however, follow the author's example, in reciting a few technical phrases upon the same subject, which occur in our language, and which, if we are not mistaken, will be found equally concise, at the same time that they are more natural and intelligible. When we mean to express the fundamental note of that series within the diatonic octave which any piece of music demands, we call that note the *key*. When we intend to signify its mode, whether major or minor, we denominate the harmony *sharp* or *flat*. When in a concert we mean to try how instruments are in tune by that note upon which, according to the genius of each particular instrument, they may best agree in unison, we desire the musicians who join us to sound A.

234
Difficulty of aſſigning general rules for aſcertaining the mode of a melody whoſe fundamental baſs is ſought.

239. It is of the greateſt utility in ſearching for the fundamental baſs, to know what is the tone or mode of the melody to which that baſs ſhould correſpond. But it is difficult in this matter to aſſign general rules, and ſuch as are abſolutely without exception, in which nothing may be left that appears indifferent or diſcretionary; becauſe ſometimes we ſeem to have the free choice of referring a particular melody either to one mode or another. For example, this melody *ſol ut* may belong to all the modes, as well major as minor, in which *ſol* and *ut* are found together; and each of theſe two ſounds may even be conſidered as belonging to a different mode.

234
Reaſons why one may proceed without the knowledge of the mode, and how he may be preſerved from deviating in compoſition.

240. For what remains, one may ſometimes, as it ſhould ſeem, operate without the knowledge of the mode, for two reaſons: 1. Becauſe, ſince the ſame ſounds belong to ſeveral different modes, the mode is ſometimes conſiderably undetermined; above all, in the middle of a piece, and during the time of one or two bars. 2. Without giving ourſelves much trouble about the mode, it is often ſufficient to preſerve us from deviating in compoſition, if we obſerve in the ſimpleſt manner the rules above preſcribed (Ch. VI.) for the procedure of the fundamental baſs.

235
Knowledge of the mode in beginning a piece indiſpenſable, and why.

241. In the mean time, it is above all things neceſſary to know in what mode we operate at the beginning of the piece, becauſe it is indiſpenſible that the fundamental baſs ſhould begin in the ſame mode, and that the treble and baſs ſhould likewiſe end in it; nay, that they ſhould even terminate in its fundamental note, which in the mode of *ut* is *ut*, and *la* in that of *la*, &c. Beſides, in thoſe paſſages of the modulation where there is a cadence, it is generally neceſſary that the mode of the fundamental baſs ſhould be the ſame with that of the part to which it correſponds.

236
Inveſtigation of the mode continued.

242. To know upon what mode or in what key a piece commences, our inquiry may be entirely reduced to diſtinguiſh the major mode of *ut* from the minor of *la*. For we have already ſeen (art. 236. and 237.), that all the modes may be reduced to theſe two, at leaſt in the beginning of a piece. We ſhall now therefore give a detail of the different means by which theſe two modes may be diſtinguiſhed.

237
Means by which the modes may be determined.

1. From the principal and characteriſtical ſounds of the mode, which are *ut mi ſol* in the one, and *la ut mi* in the other; ſo that if a piece ſhould, for inſtance, begin thus, *la ut mi la*, it may be almoſt conſtantly concluded, that the tone or mode is in *la* minor, although the notes *la ut mi* belong to the mode of *ut*.

2. From the ſenſible note, which is *ſi* in the one, and *ſol*♯ in the other; ſo that if *ſol*♯ appears in the firſt bars of a piece, one may be certain that he is in the mode of *la*.

3. From the adjuncts of the mode, that is to ſay, the modes of its two fifths, which for *ut* are *fa* and *ſol*, and *re* and *mi* for *la*. For example, if after having begun a melody by ſome of the notes which are common to the modes of *ut*, and of *la*, (as *mi re mi fa mi re ut ſi ut*), I ſhould afterwards find the mode of *ſol*, which I aſcertain by the *fa*♯, or that of *fa* which I aſcertain by the *ſi*♭ or *ut*♮, I may conclude that I have begun in the mode of *ut*: but if I find the mode of *re*, or that of *mi*, which I aſcertain by *ſi*♭, *ut*♯, or *re*♯, &c. I conclude from thence that I have begun in the mode of *la*.

4. A mode is not for ordinary deſerted, eſpecially in the beginning of a piece; but that we may paſs into one or other of theſe modes which are moſt relative to it, which are the mode of its fifth above, and that of its third below, if the original mode be major, or of its third above if it be minor. Thus, for inſtance, the modes which are moſt intimately relative to the major mode of *ut*, are the major mode of *ſol*, and that of *la* minor. From the mode of *ut* we commonly paſs either into the one or the other of theſe modes; ſo that we may ſometimes judge of the principal mode in which we are, by the relative mode which follows it, or which goes before it, when theſe relative modes are deciſively marked. For what remains, beſides theſe two relative modes, there are likewiſe two others into which the principal mode may paſs, but leſs frequently, viz. the mode of its fifth below, and that of its third above, as *fa* and *mi* for the mode of *ut* (EEEE).

5. The modes may ſtill be likewiſe diſtinguiſhed by the cadences of the melody. Theſe cadences ought to occur at the end of every two, or at moſt of every four bars, as in the fundamental baſs: now the note of the fundamental baſs which is moſt ſuitable to theſe cloſes*, is always eaſy to be found. For the ſounds which occur in the treble may be conſulted M. Rameau, p. 54. of his *Nouveau Syſteme de Muſique theorique et pratique* (FFFF).

* See *Cadence*.

(h) When

(EEEE) It is certain that the minor mode of *mi* has an extremely natural connection with the mode of *ut*, as has been proved (art. 92.) both by arguments and by examples. It has likewiſe appeared in the note upon the art. 93. that the minor mode of *re* may be joined to the major mode of *ut*; and thus in a particular ſenſe, this mode may be conſidered as relative to the mode of *ut*: but it is ſtill leſs ſo than the major modes of *ſol* and *fa*, or than thoſe of *la* and *mi* minor; becauſe we cannot immediately, and without licence, paſs in a fundamental baſs from the perfect minor chord of *ut* to the perfect minor chord of *re*; and if you paſs immediately from the major mode of *ut*, to the minor mode of *re* in a fundamental baſs, it is by paſſing, for inſtance, from the tonic *ut*, or from *ut mi ſol ut*, to the tonic dominant of *re*, carrying the chord *la ut*♯ *mi ſol*, in which there are two ſounds, *mi ſol*, which are found in the preceding chord; or otherwiſe from *ut mi ſol ut* to *ſol ſi*♭ *re mi*, a chord of the ſub-dominant in the minor mode of *re*; which chord has likewiſe two ſounds, *ſol* and *mi*, in common with that which went immediately before it.

(FFFF) All theſe different manners of diſtinguiſhing the modes ought, if we may ſpeak ſo, to give mutual light and aſſiſtance one to the other. But it often happens, that one of theſe ſigns alone is not ſufficient to determine the mode, and may even lead to error. For example, if a piece of muſic begins with theſe three notes, *mi ut ſol*, we muſt not with too much precipitation conclude from thence that we are in the major mode of *ut*, although theſe three ſounds, *mi ut ſol*, be the principal and characteriſtical ſounds in the major mode of *ut*; we may be in the minor mode of *mi*, eſpecially if the note *mi* ſhould be long. You may ſee an example in the fourth act of *Zoroaſter*, where the firſt air ſung by the prieſts of Arimanes begins thus with two times, *ſol mi*♭ *ſi*♭, each of theſe notes being a crotchet. This air is in the minor mode of *ſol*, and not in the major mode of *mi*♭, as one would at firſt be tempted to believe it. Now we may be ſenſible that it is in *ſol* minor, by the relative modes which follow, and by the notes where the cadences fall.

Principles of Compoſition.

238
Having aſcertained the mode, the fundamental baſs not difficult.

When a perſon is once able to aſcertain the mode, and can render himſelf ſure of it by the different means which we have pointed out, the fundamental baſs will coſt little pains. For in each mode there are three fundamental ſounds.

1. The tonic of the mode, or its principal ſound, which carries always the perfect chord major or minor, according as the mode itſelf is major or minor.

Major mode of UT. *ut mi ſol ut.*
Minor mode of LA. *la ut mi la.*

2. The tonic dominant, which is a fifth above the tonic, and which, whether in the major or minor mode, always carries a chord of the ſeventh, compoſed of a third major followed by two thirds minor.

Tonic dominant.
Major mode of UT. *ſol ſi re fa.*
Tonic dominant.
Minor mode of LA. *mi ſol*※ *ſi re.*

3. The ſub-dominant, which is a fifth below the tonic, and which carries a chord compoſed of a third, fifth, and ſixth major, the third being either greater or leſſer, according as the mode is major or minor.

Sub-dominant.
Major mode of UT. *fa la ut re.*
Minor mode of LA. *re fa la ſi.*

Theſe three ſounds, the tonic, the tonic dominant, and the ſub-dominant, contain in their chords all the notes which enter into the ſcale of the mode; ſo that when a melody is given, it may almoſt always be found which of theſe three ſounds ſhould be placed in the fundamental baſs, under any particular note of the upper part. Yet it ſometimes happens that not one of theſe notes can be uſed. For example, let it be ſuppoſed that we are in the mode of *ut*, and that we find in the melody theſe two notes *la ſi* in ſucceſſion; if we confine ourſelves to place in the fundamental baſs one of the three ſounds *ut ſol fa*, we ſhall find nothing for the ſounds *la* and *ſi* but this fundamental baſs $\overset{6}{fa}\ \overset{7}{ſol}$; now ſuch a ſucceſſion as $\overset{6}{fa}$ to $\overset{7}{ſol}$ is prohibited by the fifth rule for the fundamental baſs, according to which every ſub-dominant, as *fa*, ſhould riſe by a fifth; ſo that $\overset{6}{fa}$ can only be followed by *ut* in the fundamental baſs, and not by $\overset{7}{ſol}$.

To remedy this, the chord of the ſub-dominant *fa la ut re* muſt be inverted into a fundamental chord of the ſeventh in this manner, *re fa la ut;* which has been called the *double employment* (art. 105.) becauſe it is a ſecondary manner of employing the chord of the ſub-dominant. By theſe means we give to the modulation *la ſi*, this fundamental baſs $\overset{7}{re}\ \overset{7}{ſol}$; which procedure is agreeable to rules.

Here then are four chords, *ut mi ſol ut, ſol ſi re fa, fa la ut re, re fa la ut*, which may be employed in the major mode of *ut*. We ſhall find in like manner, for the minor mode of *la*, four chords,

la ut mi la, mi ſol※ *ſi re,*
re fa la ſi, ſi re fa la.

And in this mode we ſometimes change the laſt of theſe chords into *ſi re fa*※ *la*, ſubſtituting the *fa*※ for *fa*♮. For inſtance, if we have this melody in the minor mode of *la, mi fa*※ *ſol*※ *la*, we would cauſe the firſt note *mi* to carry the perfect chord *la ut mi la*, the ſecond note *fa*※ to carry the chord of the ſeventh *ſi re fa*※ *la*, the third note *ſol*※ the chord of the tonic dominant *mi ſol*※ *ſi re*, and in ſhort, the laſt the perfect chord *la ut mi la*.

On the contrary, if this melody is given always in the minor mode *la la ſol*※ *la*, the ſecond *la* being ſyncopated, it might have the ſame baſs as the modulation *mi fa*※ *ſol*※ *la;* with this difference alone, that *fa*♮ might be ſubſtituted for *fa*※ in the chord *ſi re fa*※ *la*, the better to mark out the minor mode.

Beſides theſe chords which we have juſt mentioned, and which may be regarded as the principal chords of the mode, there are ſtill a great many others; for example, the ſeries of dominants,

7 7 7 7 7 7 7 7 7 7
ut la re ſol ut fa ſi mi la re ſol ut,

which are terminated equally in the tonic *ut*, either entirely belong, or at leaſt may be reckoned as belonging (GGGG) to the mode of *ut;* becauſe none of theſe dominants are tonic dominants except *ſol*, which is the tonic dominant of the mode of *ut;* and beſides, becauſe the chord of each of theſe dominants forms no other ſounds than ſuch as belong to the ſcale of *ut*.

But if I were to form this fundamental baſs,

7 7 7 7♭
ut la re ſol ut,

conſidering the laſt *ut* as a tonic dominant in this manner, *ut mi ſol ſi*♭; the mode would then be changed at the ſecond *ut*, and we ſhould enter into the mode of *fa;* becauſe the chord *ut mi ſol ſi*♭ indicates the tonic dominant of the mode of *fa;* beſides, it is evident that the mode is changed, becauſe *ſi*♭ does not belong to the ſcale of *ut*.

In the ſame manner, were I to form this fundamental baſs

7 7 7 6
ut la re ſol ut,

conſidering the laſt *ut* as a tonic dominant, in this manner, *ut mi ſol la;* this laſt *ut* would indicate the mode of *ſol*, of which *ut* is the *ſub-dominant*.

In like manner, ſtill, if in the firſt ſeries of dominants, I cauſed the firſt *re* to carry the third major, in this manner, *re fa*※ *la ut;* this *re* having become a tonic dominant, would ſignify to me the major mode of *ſol;* and the $\overset{7}{ſol}$ which ſhould follow it, carrying the chord $\overset{7}{ſi}$ *re fa*, would relapſe into the mode of *ut*, from whence we had departed.

Finally, in the ſame manner, if in this ſeries of dominants, one ſhould cauſe *ſi* to carry *fa*※ in this manner, *ſi re fa*※ *la;* this *fa* would ſhew that we had departed from the mode *ut*, to enter into that of *ſol*.

From

(GGGG) I have ſaid, *that they may be reckoned as belonging to this mode*, for two reaſons: 1. Becauſe, properly ſpeaking, there are only three chords which eſſentially and primitively belong to the mode of *ut*, viz. *ut* carrying the perfect chord, *fa* carrying that of the ſub-dominant, and *ſol* that of the tonic dominant, to which we may join the chord of the ſeventh, *re fa la ut* (art. 105.); but we here regard *as extended* the ſeries of dominants in queſtion, as belonging to the mode of *ut*, becauſe it preſerves in the ear the impreſſion of that mode. 2. In a ſeries of dominants, there are a great many of them which likewiſe belong to other modes; for inſtance, the ſimple dominant *la* belongs naturally to the mode of *ſol*, the ſimple dominant *ſi* to that of *la*, &c. Thus it is only improperly, and by way of extenſion, as I have already ſaid, that we regard here theſe dominants as belonging to the mode of *ut*.

Principles of Composition.

239 rule for discovering the changes of mode.

From hence it is easy to form this rule for discovering the changes of mode in the fundamental bass.

1. When we find a tonic in the fundamental bass, we are in the mode of that tonic; and the mode is major or minor, according as the perfect chord is major or minor.

2. When we find a sub-dominant, we are in the mode of the fifth above that sub-dominant; and the mode is major or minor, according as the third in the chord of the sub dominant is major or minor.

3. When we find a tonic dominant, we are in the mode of the fifth below that tonic dominant. As the tonic dominant carries always the third major, one cannot be secure by the assistance of this dominant alone, whether the mode be major or minor: but it is only necessary for the composer to cast his eye upon the following note, which must be the tonic of the mode in which he is; by the third of this tonic he will discover whether the mode be major or minor.

243. Every change of the mode supposes a cadence; and when the mode changes in the fundamental bass, it is almost always either after the tonic of the mode in which we have been, or after the tonic dominant of that mode, considered then as a tonic by favour of a close which ought necessarily to be found in that place: Whence it happens that cadences in a melody for the most part presage a change of mode which ought to follow them.

244. All these rules, joined with the table of modes which we have given (art. 234.), will serve to discover in what mode we are in the middle of a piece, especially in the most essential passages, as cadences (HHHH).

I here subjoin the soliloquy of *Armida*, with the continued and fundamental basses. The changes of the mode will be easily distinguished in the fundamental bass, by the rules which we have just given at the end of the article 242. This soliloquy will serve for a lesson to beginners. M. Rameau quotes it in his *New System of Music*, as an example of modulation highly just and extremely simple. (See Plate VI. and the following. (IIII).

Chap. XIV. *Of the Chromatic and Enharmonic.*

240 Chromatic, what.

245. We call that melody *chromatic* which is composed of several notes in succession, whether rising or descending by semitones. (See LXXXVIII. and LXXXIX.)

241 To an air descending by chromatic intervals, fundamental bass, what.

246. When an air is chromatic in descending, the most natural and ordinary fundamental bass is a concatenated series of tonic dominants; all of which follow one another in descending by a fifth, or which is the same thing, in rising by a fourth. See LXXXVIII. (LLLL).

242 Ascending, what.

247. When the air is chromatic in ascending, one may form a fundamental bass by a series of tonics and of tonic dominants, which succeed one another alternately by the interval of a third in descending, and of a fourth in ascending, (see LXXXIX.) There are many other ways of forming a chromatic air, whether in rising or descending; but these details in an elementary essay are by no means necessary.

243 Enharmonic little practised.

248. With respect to the enharmonic, it is very rarely put in practice; and we have explained its formation in the first book, to which we refer our readers. We shall content ourselves with saying, that, in the beautiful soliloquy of the fourth act of *Dardanus*, at the words *lieux funestes*, &c. "fatal places, &c." we find an example of the enharmonic; an example of the diatonic enharmonic

(HHHH) Two modes are so much more intimately relative as they contain a greater number of sounds common to both; for example, the minor mode of *ut* and the major of *sol*, or the major mode of *ut* and the minor of *la*: on the contrary, two modes are less intimately relative as the number of sounds which they contain as common to both is smaller; for instance, the major mode of *ut* and the minor of *si*, &c.

When you find yourself led away by the current of the modulation, that is to say, by the manner in which the fundamental bass is constituted, into a mode remote from that in which the piece was begun, you must continue in it but for a short time, because the ear is always impatient to return to the former mode.

(IIII) It is extremely proper to remark, that we have given the fundamental, the continued bass, and in general the modulation of this soliloquy, merely as a lesson in composition extremely suitable to *beginners*; not that we recommend the soliloquy in itself as a model of expression. Upon this last object what we have said may be seen in what we have written concerning the liberties to be taken in music, Vol. IV. p. 435. of our Literary Miscellany. It is precisely because this soliloquy is a proper lesson for initiates, that it would be a bad one for the mature and ingenious artist. The novice should learn tenaciously to observe his rules; the man of art and genius ought to know on what occasions and in what manner they may be violated when this expedient becomes necessary.

(LLLL) We may likewise give to a chromatic melody in descending, a fundamental bass, into which may enter chords of the seventh and of the diminished seventh, which may succeed one another by the intervals of a false fifth and a fifth redundant: thus in the Example XC. where the continued bass descends chromatically, it may easily be seen that the fundamental bass carries successively the chords of the seventh and of the seventh diminished, and that in this bass there is a false fifth from *re* to *sol*※, and a fifth redundant from *sol* ※ to *ut*.

The reason of this licence is, as it appears to me, because the chord of the diminished seventh may be considered as representing (art. 221.) the chord of the tonic dominant; in such a manner that this fundamental bass

7 7̸ 7 7 7 ※ (7)
la re sol※ *ut fa*※ *si mi la*

(see Example XCI.) may be considered as representing (art. 116.) that which is written below,

7 ※(7) 7 7 7 ※(7)
la re mi ut fa※ *si mi la.*

Now this last fundamental bass is formed according to the common rules, unless that there is a broken cadence ※(7) from *re* to *mi*, and an interrupted cadence from *mi* to *ut*, which are licenses (art. 213 and 214.)

enharmonic in the trio of the *Fatal Siſters*, in *Hippolitus* and *Aricia*, at the words, *Ou cours-tu malheureux*, "Whither, unhappy, doſt thou run;" and that there are no examples of the chromatic enharmonic, at leaſt in our French operas. M. Rameau had imitated an earthquake by this ſpecies of muſic, in the ſecond act of the *Gallant Indians;* but he informs us, that in 1735 he could not cauſe it to be executed by the band. The trio of the *Fatal Siſters* in *Hippolitus* has never been ſung in the opera as it is compoſed. But M. Rameau aſſerts, (and we have heard it elſewhere by people of taſte, before whom the piece was performed), that the trial had ſucceeded when made by able hands that were not mercenary, and that its effect was aſtoniſhing.

CHAP. XV. *Of Deſign, Imitation, and Fugue.*

See *Deſign.*

244 Deſign, what.

249. IN muſic, the name of *deſign*, or *ſubject*, is generally given to a particular air or melody, which the compoſer intends ſhould prevail through the piece; whether it is intended to expreſs the meaning of words to which it may be ſet, or merely inſpired by the impulſe of taſte and fancy. In this laſt caſe, deſign is diſtinguiſhed into *imitation* and *fugue*.

See *Imitation.*

245 Imitation, what.

* See *Air, Canon, Fugue.*

250. *Imitation* conſiſts in cauſing to be repeated the melody of one, or of ſeveral bars in one ſingle part, or in the whole harmony, and in any of the various modes that may be choſen. When all the parts abſolutely repeat the ſame air * or melody, and beginning one after the other, this is called a *canon*. *Fugue* conſiſts in alternately repeating that air in the treble, and in the baſs, or even in all the parts, if there are more than two.

246 Principal rules for compoſing in ſeveral parts.

251. Imitation and fugue are ſometimes conducted by rules merely deducible from taſte, which may be ſeen in the 332d and following pages of M. Rameau's *Treatiſe on Harmony;* where will likewiſe be found a detail of the rules for compoſition in ſeveral parts. The chief rules for compoſition in ſeveral parts are, that the diſcords ſhould be found, as much as poſſible, prepared and reſolved in the ſame part; that a diſcord ſhould not be heard at the ſame time in ſeveral parts, becauſe its harſhneſs would diſguſt the ear; and that in no particular part there ſhould be found two octaves or two fifths in ſucceſſion (MMMM) with reſpect to the baſs. Muſicians, however, do not heſitate ſometimes to violate this precept, when taſte or occaſion require. In muſic, as in all the other fine arts, it is the buſineſs of the artiſt to aſſign and to obſerve rules; the province of men who are adorned with taſte and genius is to find the exceptions.

CHAP. XVI. *Definitions of the Different Airs.*

252. WE ſhall finiſh this treatiſe by giving in a few words the characteriſtic diſtinctions of the different airs to which names have been given, as *chacoon, minuet, rigadoon*, &c.

The *chacoon* is a long piece of muſic, containing three times in each bar, of which the movement is regular, and the bars ſenſibly diſtinguiſhed. It conſiſts of ſeveral couplets, which are varied as much as poſſible. Formerly the baſs of the chacoon was a *conſtrained baſs*, or regulated by a rhythmus terminating in 4 bars, and proceeding again by the ſame number; at preſent compoſers of this ſpecies no longer confine themſelves to that practice. The chacoon begins, for the moſt part, not with the perfect time, which is ſtruck by the hand or foot, but with the imperfect, which paſſes while the hand or foot is elevated.

The *villanelle* is a chacoon a little more lively, with its movement ſomewhat more briſk than the ordinary chacoon.

The *paſſacaille* only differs from a chacoon as it is more ſlow, more tender, and beginning for ordinary with a perfect time.

The *minuet* is an air in triple time, whoſe movement is regular, and neither extremely briſk nor ſlow, conſiſting of two parts or ſtrains, which are each of them repeated; and for which reaſon they are called by the French *repriſes:* each ſtrain of the minuet begins with a time which is ſtruck, and ought to conſiſt of 4, of 8, or of 12 bars; ſo that the cadences may be eaſily diſtinguiſhed, and recur at the end of each 4 bars.

The *ſarabando* is properly a ſlow minuet; and the *courant* a very ſlow ſarabando: this laſt is no longer in uſe. The *paſſepied* is properly a very briſk minuet, which does not begin like the common minuet, with a ſtroke of the foot or hand; but in which each ſtrain begins in the laſt of the three times of which the bar conſiſts.

The *loure* is an air whoſe movement is ſlow, whoſe time is marked with $\frac{6}{4}$, and where two of the times in which the bar conſiſts are beaten; it generally begins with that in which the foot is raiſed. For ordinary the note in the middle of each time is ſhortened, and the firſt note of the ſame time pointed.

The *jig* is properly nothing elſe but a loure very briſk, and whoſe movement is extremely quick.

The *forlana* is a moderate movement, and in a mediocrity between the loure and the jig.

The *rigadoon* has two times in a bar, is compoſed of two ſtrains, each to be repeated, and each conſiſting of 4, of 8, or of 12 bars: its movement is lively; each ſtrain begins, not with a ſtroke of the foot, but at the laſt note of the ſecond time.

The *bourée* is almoſt the ſame thing with the rigadoon.

The *gavotte* has two times in each bar, is compoſed of two ſtrains, each to be repeated, and each conſiſting of 4, of 8, or of 12 bars: the movement is ſometimes ſlow, ſometimes briſk; but never extremely quick, nor very ſlow.

The *tambourin* has two ſtrains, each to be repeated, and each conſiſting of 4, of 8, or of 12 bars, &c. Two of the times that make up each bar are beaten, and are very lively; and each ſtrain generally begins in the ſecond time.

The *muſette* conſiſts of two or three times in each bar; its movement is neither very quick nor very ſlow; and for its baſs it has often no more than a ſingle note, which may be continued through the whole piece.

(MMMM) Yet there may be two fifths in ſucceſſion, provided the parts move in contrary directions, or, in other words, if the progreſs of one part be aſcending, and the other deſcending; but in this caſe they are not properly two fifths, they are a fifth and a twelfth; for example, if one of the parts in deſcending ſhould ſound *fa re*, and the other *ut la* in riſing, *ut* is the fifth of *fa*, and *la* the twelfth of *re*.

Glass MUSIC. See HARMONICA.

MUSK, a very strong-scented substance found under the belly of an East India animal. See MOSCHUS.

According to Tavernier, the best and greatest quantities of musk come from the kingdom of Boutan, from whence it is carried for sale to Patna, the chief town of Bengal. After killing the animal, the peasants cut off the bag, which is about the size of an egg, and is situated nearer the organs of generation than the navel. They next take out the musk, which has then the appearance of clotted blood. When they want to adulterate it, they put a mash of the animal's blood and liver into the place of the musk they had extracted. In two or three years this mixture produces certain small animals which eat the good musk; so that, when opened, a great consumption is perceived. Others, after extracting a portion of the musk, put in small pieces of lead to augment the weight. The merchants who transport the musk to foreign countries are less averse to this trick than the former; because in this case none of the animals abovementioned are produced. But the deceit is still worse to discover, when, of the skin taken from the belly of a young animal, they make little bags, which they sew so dextrously with threads of the same skin, that they resemble genuine bags. Those they fill with what they take out of the genuine bags, and some fraudulent mixture, which it is extremely difficult for the merchants to detect. When the bags are sewed immediately on their being cut, without allowing any part of the odour to dissipate in the air, after they have abstracted as much of the musk as they think proper, if a person applies one of these bags to his nose, blood will be drawn by the mere force of the odour, which must necessarily be weakened or diluted in order to render it agreeable without injuring the brain. Our author brought one of the animals with him to Paris, the odour of which was so strong, that it was impossible for him to keep it in his chamber. It made every head in the house giddy; and he was obliged to put it in a barn, where the servants at last cut away the bag: the skin, notwithstanding, always retained a portion of the odour. The largest musk-bag seldom exceeds the size of a hen's egg, and cannot furnish above half an ounce of musk: three or four of them are sometimes necessary to afford a single ounce. In one of his voyages to Patna, Tavernier purchased 1663 bags, which weighed 1557 ounces and a half; and the musk, when taken out of the bags, weighed 452 ounces.

Musk affords the strongest of all known odours. A small bit of it perfumes a large quantity of matter. The odour of a small particle extends through a considerable space. It is likewise so fixed and permanent, that at the end of several years it seems to have lost no part of its activity. When it comes to us it is dry, with a kind of unctuosity, of a dark reddish-brown or rusty blackish colour, in small round grains, with very few hard black clots, and perfectly free from any sandy or other visible foreign matter. If chewed, and rubbed with a knife on paper, it looks smooth, bright, yellowish, and free from bitterness. Laid on a red-hot iron, it catches flame, and burns almost entirely away, leaving only an exceeding small quantity of light greyish ashes: if any earthy substances have been mixed with the musk, the quantity of the residuum will readily discover them.

Musk has a bitterish subacrid taste; a fragrant smell, agreeable at a distance, but when smelt near to, so strong as to be disagreeable unless weakened by the admixture of other substances. If a small quantity be infused in spirit of wine in the cold for a few days, it imparts a deep, but not red tincture: this, though it discovers no great smell of the musk, is nevertheless strongly impregnated with its virtues; a single drop of it communicates to a whole quart of wine a rich musky flavour. The degree of flavour which a tincture drawn from a known quantity of musk communicates to vinous liquors, is perhaps one of the best criteria for judging of the goodness of this commodity. Neuman informs us, that spirit of wine dissolves ten parts out of thirty of musk, and that water takes up twelve; that water elevates its smell in distillation, whilst pure spirit brings over nothing.

Musk is a medicine of great esteem in the eastern countries; among us, it has been for some time pretty much out of use, even as a perfume, on a supposition of its occasioning vapours, &c. in weak females and persons of a sedentary life. It appears, however, from late experience, to be, when properly managed, a remedy of good service even against those disorders which it has been supposed to produce. Dr Wall has communicated (in the Philosoph. Transactions, n° 474.) an account of some extraordinary effects of musk in convulsive and other diseases, which have too often baffled the force of medicine. The doctor observes, that the smell of perfumes is often of disservice, where the substance, taken inwardly and in considerable quantity, produces the happiest effects; that two persons, labouring under a subsultus tendinum, extreme anxiety, and want of sleep, from the bite of a mad dog, by taking two doses of musk, each of which was sixteen grains, were perfectly relieved from their complaints. He likewise observes, that convulsive hickups, attended with the worst symptoms, were removed by a dose or two of ten grains; and that in some cases, where this medicine could not, on account of strong convulsions be administered to the patient by the mouth, it proved of service when injected as a glyster. He likewise adds, that under the quantity of six grains, he never found much effect from it; but that, taken to ten grains and upwards, it never fails to produce a mild diaphoresis, without at all heating or giving any uneasiness: that, on the contrary, it eases pain, raises the spirits; and that, after the sweat breaks out, the patient usually falls into a refreshing sleep: that he never met with any hysterical person, how averse soever to perfumes, but could take it, in the form of a bolus, without inconvenience. To this paper is annexed an account of some farther extraordinary effects of musk, observed by another gentleman. Repeated experience has since confirmed its efficacy in these disorders. The author of the New Dispensatory says, he has frequently given it with remarkable success; and sometimes increased the dose as far as twenty grains every four hours, with two or three spoonfuls of the musk julep between. The julep is the only officinal preparation of it.

MUSK-*Animal*. See MOSCHUS.

Musk-*Rat*, in zoology. See Castor.

MUSKET, a fire arm born on the ſhoulder, and uſed in war. See Gun, *par. ult.*

MUSKETOON, a kind of ſhort thick muſket, whoſe bore is the 38th part of its length: it carries five ounces of iron, or ſeven and an half of lead, with an equal quantity of powder. This is the ſhorteſt kind of blunderbuſſes.

MUSLIN, a fine ſort of cotton-cloth, which bears a downy knot on its ſurface. There are ſeveral ſorts of muſlins brought from the Eaſt Indies, and more particularly from Bengal; ſuch as doreas, betelles, mulmuls, tanjeebs, &c.

MUSONIUS, (Caius Rufus) a Stoic philoſopher of the ſecond century, was baniſhed into the iſland of Gyare, under the reign of Nero, for criticiſing the manners of that prince; but was recalled by the emperor Veſpaſian. He was the friend of Apollonius Tyanæus, and the letters that paſſed between them are ſtill extant.

MUSQUETOE. See Culex, in the Appendix.

MUSSULMAN, or Musulman, a title by which the Mahometans diſtinguiſh themſelves; ſignifying, in the Turkiſh language, "true believer, or orthodox." See Mahometanism.

In Arabic, the word is written *Moſlem*, *Moſleman*, or *Moſolman*. The appellation was firſt given to the Saracens; as is obſerved by Leunclavius.—There are two kinds of Muſſulmans, very averſe to each other; the one called *Sonnites*, and the other *Shiites*.—The Sonnites follow the interpretation of the Alcoran given by Omar; the Shiites are the followers of Ali. The ſubjects of the king of Perſia are Shiites; and thoſe of the grand ſignior, Sonnites. See Sonna, and Alcoran.

Some authors will have it, that the word Muſſulman ſignifies *ſaved*, that is, predeſtinated; and that the Mahometans give themſelves the appellation, as believing they are all predeſtinated to ſalvation.—Martinius is more particular as to the origin of the name; which he derives from the Arabic מסלם, *muſalem*, "ſaved, ſnatched out of danger:" the Mahometans, he obſerves, eſtabliſhing their religion by fire and ſword, maſſacred all thoſe who would not embrace it, and granted life to all that did, calling them *Muſſulmans*, q. d. *erepti è periculo;* whence the word, in courſe of time, became the diſtinguiſhing title of all thoſe of that ſect, who have affixed to it the ſignification of *true believer*.

MUST, Mustum, ſweet wine newly preſſed from the grape; or the new liquor preſſed from the fruit before it has worked or fermented. See Wine.

MUSTELA, in zoology, a genus of quadrupeds of the order of feræ. There are ſix erect, ſharp, diſtinct teeth in the upper jaw, and an equal number in the under jaw, but blunter and cloſer together, and two of them are ſituated a little farther within the mouth; and the tongue is ſmooth. There are 11 ſpecies, *viz.*

1. The lutris, or ſea-otter, hath palmated feet, and the tail about one-fourth of the length of the body; the hair thick, long, and exceſſively black and gloſſy: beneath that is a ſoft down; the colour ſometimes varies to ſilvery. The biggeſt of theſe animals weigh 70 or 80 pounds. They inhabit, in vaſt abundance, the coaſts of Kamtſchatka, and the parts of America oppoſite to it, diſcovered by the Ruſſians: it is alſo met with in a moſt remote part of the continent of America, along the rivers of Braſil and Paraguay, and in the Oroonoko. It is a harmleſs animal; very affectionate to its young, inſomuch that it will pine to death at the loſs of them, and die on the very ſpot where they have been taken from it. Before the young can ſwim, they carry them in their paws, lying in the water on their backs: they run very ſwiftly; ſwim often on their back, their ſides, and even in a perpendicular poſture: are very ſportive; embrace, and kiſs each other: they inhabit the ſhallows, or ſuch places as abound with ſea-weeds; feed on lobſters, and other ſhell-fiſh, as well as ſepiæ and common fiſhes: they breed but once a-year, and have but one young one at a time, ſuckle it for a year, and bring it on ſhore. They are dull-ſighted, but quick-ſcented: are hunted for their ſkins; which are of great value, being ſold to the Chineſe for 70 or 80 rubles a-piece; each ſkin weighs 3½ lib. The young are reckoned very delicate meat, ſcarce to be diſtinguiſhed from a ſucking lamb. The cry of this creature is nearly ſimilar to a young dog; and it is ſometimes interrupted by another cry ſimilar to that of the ſaki or fox-tailed monkey. It may be nouriſhed with the flour of manioc diluted in water.

2. The lutra, or otter, has palmated feet, the tail one half the length of the body; the whole colour is a deep brown, except two ſmall ſpots on each ſide of the noſe, and another below the chin; the legs are ſhort and thick, and looſely joined to the body: the length from the noſe to the tail is 23 inches. The otter inhabits all parts of Europe, the north and north-eaſt of Aſia, even as far as Kamtſchatka; it abounds in North America, particularly in Canada, from whence the moſt valuable furs of this kind are brought. He is a voracious animal, but fonder of fiſh than of fleſh: he doth not willingly quit the margins of rivers or lakes, and often depopulates fiſh-ponds; but if fiſh happens to fail, he makes excurſions on land, and preys on lambs and poultry. It is obſervable, that the otter always ſwims againſt the ſtream to meet its prey; and two of them, it is ſaid, will hunt a ſalmon in concert. One ſtations itſelf above, and the other below the place where the fiſh lies, and continue chaſing it inceſſantly, till the creature, quite wearied out, becomes their prey. Sometimes the otter preys in the ſea, but not far from ſhore. It hath been obſerved, however, in the Orkneys to bring in cod, congers, &c. Properly ſpeaking, he is not an amphibious animal; for, like other terreſtrial creatures, he requires the aid of frequent reſpiration. When in purſuit of a fiſh, if he chances to be entangled in a net, he drowns; and we perceive that he has not had time to cut a ſufficient quantity of the meſhes to effectuate his eſcape. For want of fiſhes, crabs, frogs, or other animal-food, he gnaws the young twigs, and eats the bark of aquatic trees; he likewiſe eats the young herbage in the ſpring. The female comes in ſeaſon in winter, brings forth in March, and the litter conſiſts of three or four. The young otters are leſs handſome than the old; and M. Buffon looks upon the otters in general to be very ſtupid animals. He will not allow them the capacity and inſtinct commonly aſcribed to them by other naturaliſts; ſuch

Plate CLXXXIV. fig. 4.

Mustela such as that of always ascending the rivers, in order to swim the more easily down the current, when loaded with his prey; of fitting up, and flooring his house to exclude the water; of hoarding a store of fishes in case of a scarcity; and lastly, of being easily tamed, of fishing for his master, and even bringing the fish into the kitchen. "All I know (says our author) is, that the otters dig no habitations for themselves; that they take possession of the first hole they find, under the roots of poplars or willows, in the clefts of rocks, and even in piles of floating wood; that they deposit their young on beds made of twigs and herbs; that we find, in their habitations, heads and bones of fishes; that they often change their places of abode; that they banish their young at the end of six weeks or two months; that those I endeavoured to tame attempted to bite, though they were only taking milk, and unable to eat fish; that, some days after, they became more gentle, perhaps because they were weak or sick; that, so far from being easily accustomed to a domestic life, all of them which I attempted to bring up died young; that the otter is naturally of a savage and cruel disposition; that when he gets into a fish-pond, he is equally destructive as the pole-cat in a hen-house; that he kills many more fishes than he can eat, and carries one off in his mouth."

On the other hand, Mr Pennant tells us, that the otter shows great sagacity in forming its habitation: it burrows underground on the banks of some river or lake: it always makes the entrance of its hole under water; working upwards to the surface of the earth, and forming, before it reaches the top, several holes or lodges, that, in case of high floods, it may have a retreat; for no animal affects lying drier at top: it makes a minute orifice for the admission of air. It is further observed, that this animal, the more effectually to conceal its retreat, contrives to make even this little air-hole in the middle of some thick bush. Our author also informs us, that the otter is capable of being tamed; that he will follow his master like a dog, and even fish for him, and return with his prey.

Though the otter does not cast his hair, his skin is browner, and sells dearer, in winter than in summer; and makes a very fine fur. His flesh has a disagreeable fishy taste. His retreats exhale a noxious odour from the remains of putrid fishes; and his own body has a bad smell. The dogs chace the otter spontaneously, and easily apprehend him when at a distance from water or from his hole. But, when seized, he defends himself; bites the dogs most cruelly, and sometimes with such force as to break their leg-bones, and never quits his hold but with life. The beaver, however, who is not a very strong animal, pursues the otters, and will not allow them to live on the same banks with himself.

Mr Pennant mentions an account of some Newfoundland animals, communicated to him by Mr Banks, which he supposes to have been of the otter kind. He observed, sitting on a rock near the mouth of a river, five animals shaped like Italian gre-hounds, bigger than a fox; of a shining black colour, with long legs, and a long taper tail. They often leaped into the water, and brought up trouts, which they gave to their young which were sitting by them. On perceiving him they all took to the water, and swam a little way from shore, keeping their heads out of the water, and looking at him. An old furrier said, that he remembered the skin of one sold for five guineas; and that the French often see them in Hare-bay. According to some authors, there are otters in Cayenne which weigh 90 and 100 pounds. They live in the great and unfrequented rivers, and their heads often appear above water. Their cry is heard at great distances; their hair is very soft, but shorter than that of the beaver, and generally of a brown colour. They live upon fish, and eat likewise the grains which fall into the water from the banks of the rivers. In Guiana, according to M. de la Borde, the otters are very numerous along the rivers and marshes where fishes abound. They sometimes appear in such numbers, and are so fierce, that they cannot be approached. They litter in holes which they dig in the banks; they are often tamed and brought up in houses.

3. The lutreola, or small otter, has hairy palmated feet, and a white mouth, the same form with an otter, but thrice as small. It inhabits Poland and the north of Europe; lives on fish, frogs, and water-insects: its fur is very valuable, next to the sable; is caught in Baskiria with dogs and traps; is exceedingly fœtid. This is the same animal with the minx of America, which, Mr Collinson tells us, frequents the water like the otter, and very much resembles it in shape and colour, but is less; it leaves its watery haunts to come and rob hen-roosts; it bites off the heads of the poultry, and sucks their blood; when vexed, it has a strong loathsome smell; its length from nose to tail 20 inches, the tail four: is of a shining dark-brown colour. M. Buffon mentions, from M. de la Borde, a kind of otter which he calls the *small fresh-water otter of Cayenne*, and which is only seven inches long from the end of the nose to the extremity of the body. The tail of this small otter has no hair: its length is six inches seven lines, and five lines thick at the origin, diminishing gradually to the extremity, which is white, though the rest of the tail is brown; and, in place of hair, it is covered with a rough granulated skin, like shagreen; it is flat below, and convex above. All the under part of the body and head, as well as the fore-part of the fore-legs, is white. The top and sides of the head and body are marked with large brownish-black spots, and the intervals are of a yellowish grey colour. The black spots correspond on each side of the body, and there is a white spot above each eye.

4. The barbata, or Guinea-weasel, is of a reddish colour; and the toes are not connected with a membrane: he is of a black colour, with coarse hair of the size of a martin; digs an habitation in the earth with his fore-feet, in which he has great strength, and which are much shorter than those behind. It inhabits Guinea, Brasil, and Guiana: when it rubs itself against trees, it leaves behind an unctuous matter that smells of musk. It is very fierce; and, if driven to necessity, will fly at man or beast: it is very destructive to poultry.

5. The gulo, or glutton, is of a dusky red colour, and blackish on the middle of the back: it is a most voracious animal; but very slow of foot, so is obliged to take its prey by surprise. In America it is called the *beaver-eater*; because it watches those animals as they come out of their houses, and sometimes breaks into their habitations and devours them. It often lurks on

trees, and falls on the quadrupeds that pass under; will fasten on a horse, elk, or stag, and continue eating a hole into its body, till the animal falls down with pain, or else will tear out its eyes: no force can disengage it; yet sometimes the deer, in their agony, have been known to destroy the glutton by running its head violently against a tree. This animal also devours the isatis, or white fox; searches for the traps laid for the sables and other animals, and is often beforehand with the huntsmen, who sustain great loss by the glutton. Authors have pretended, that it feeds so voraciously, that at length it is in danger of bursting; and that it is obliged to ease itself of its load, by squeezing it out between two trees: but this is not well authenticated. Mr Buffon acquaints us, that a glutton which he kept for 18 months at Paris, became so tame that it discovered no ferocity, and did not injure any person. "His voracity (says he) has been as much exaggerated as his cruelty. He indeed eat a great deal; but, when deprived of food, he was not importunate. He is two feet two inches long, from the point of the nose to the origin of the tail. The muzzle, and as far as the eye-brows, is black. The eyes are black and small. From the eye-brows to the ears, the hair is a mixture of white and brown. Below the under-jaw, as well as between the fore-feet, the hair is spotted with white. The length of the fore-legs is 11 inches, and that of the hind-legs one foot. The tail, including four inches of hair at its extremity, is eight inches long. The four legs, the tail, and the back, as well as the belly, are black. His fore-feet, from the heel to the extremity of the claws, are three inches nine lines in length: the five claws are very crooked and well separated. The middle claw is an inch and an half in length. He avoids water; and dreads horses, and men dressed in black. He walks by a kind of leap, and eats pretty voraciously. After taking a full meal, he covers himself in his cage with straw. When drinking, he laps like a dog. He utters no cry. After drinking, with his paws he throws the remainder of the water on his belly. He is almost perpetually in motion. If allowed, he would devour more than four pounds of flesh every day. He eats no bread; and devours his food so voraciously, and almost without chewing, that he is apt to choke himself."

The glutton is common in most of the northern regions of Europe, and even of Asia; but in Norway, according to Pontoppidan, he is chiefly confined to the diocese of Drontheim. The same author remarks, that the skin of the glutton is very valuable; that he is not shot with fire-arms, to prevent his skin from being damaged; and that the hair is soft, and of a black colour, shaded with brown and yellow. In Siberia the skin is sold for 4*s*. or 6*s*.; at Jakutsk for 12*s*.; and in Kamtschatka still dearer, because the women there dress their hair with its paws, which they esteem a great ornament: the fur is greatly esteemed in Europe; and those produced in the north of Europe and Asia are much preferable to the American kind. In its wild state, Mr Pennant informs us, that the glutton is vastly fierce; a terror both to the wolf and bear, which will not prey upon it when they find it dead; perhaps on account of its being so very fœtid that it smells like a pole-cat: it makes a strong resistance when attacked; will tear the stock from the gun, and pull the traps in which it is caught to pieces: notwithstanding which, it is capable of being tamed, and of learning several tricks. M. Buffon remarks, that though the glutton employs considerable art and address in seizing other animals, he seems to possess no other talents but those which relate to appetite. "It would (says he) appear, that the glutton even wants the common instinct of self-preservation. He allows himself to be approached by men, or comes up to them without betraying the smallest apprehension." This indifference, which seems to be the effect of imbecillity, proceeds perhaps from a different cause. It is certain that the glutton is not stupid, since he finds means to satisfy his appetite, which is always vehement and pressing. Neither is he deficient in courage, since he indiscriminately attacks all animals he meets with, and betrays no symptoms of fear at the approach of men. Hence, if he wants attention to himself, it proceeds not from indifference to his own preservation, but from the habit of security. As he lives in a country which is almost desart, he seldom sees man, who are his only enemies. Every time he tries his strength with other animals, he finds himself their superior. He goes about with perfect confidence; and never discovers the smallest mark of fear, which always supposes some experience of weakness. Of this we have an example in the lion, who never turns away from man, unless he has experienced the force of his arms: and the glutton, trailing along the snows of his desart climate, remains always in perfect safety, and reigns, like the lion, not so much by his own strength, as by the weakness of the animals around him.

6. The martes, or martin, is of a blackish yellow colour, with a pale throat, and the toes are not webbed. These animals are found in great numbers in all temperate countries, and even in warm regions, as in Madagascar and the Maldivia islands, and are never seen in high latitudes. The martin has a fine countenance, a lively eye, supple limbs, and a flexible body. His movements are all exceedingly nimble; he rather bounds and leaps than walks. He climbs rough walls with ease and alacrity; enters the pigeon or hen-houses, eats the eggs, pigeons, fowls, &c. and the female often kills great numbers, and transports them to her young. He likewise seizes mice, rats, moles, and birds in their nests. M. Buffon kept one of these animals for a considerable time. He tamed to a certain degree, but never formed any attachment, and continued always so wild, that it was necessary to chain him. He made war against the rats, and attacked the poultry whenever they came in his way. He often got loose, though chained by the middle of the body. At first he went to no great distance, and returned in a few hours; but without discovering any symptoms of joy, or affection to any particular person. He, however, called for victuals like a cat or a dog. Afterwards he made longer excursions; and at last he thought proper never to return. He was then about a year and a half old, seemingly the age at which nature assumes her full ascendency. He eat every thing presented to him, except sallad and herbs; was fond of honey, and preferred hemp-seed to every other grain. It was remarked that he drank very often; that he sometimes slept two days successively, and at other times would sleep none for two or three days; that, before sleep-

ing,

Mustela. ing, he folded himself in a round form, and covered his head with his tail; and that, while awake, his motions were so violent, so perpetual, and so incommodious, that, though he had not disturbed the fowls, it was necessary to chain him, to prevent him from breaking every thing. The same author informs us, that he has had in his possession several martins of a more advanced age, which had been taken in nets; but they continued to be totally savage, bit all who attempted to touch them, and would eat nothing but raw flesh.

Martins, it is said, go with young as long as cats. We meet therefore with young ones from spring to autumn; and therefore it is probable they bring forth more than once a-year. The younger females bring only three or four at a time; but the more aged produce six or seven. When about to bring forth, they take up their abode in magazines of hay, in holes of walls, which they stuff with straw and herbs; in clefts of rocks; or in the hollow trunks; and when disturbed, they remove their young, who seem very soon to arrive at maturity; for the one which M. Buffon brought up, had nearly attained its full growth in one year. The martin has an agreeable musky odour, which proceeds from a matter contained in two vesicles, one on each side of the extremity of the rectum. The skin is a valuable fur, and much used for linings to the gowns of magistrates.

Plate CLXXXV. fig. 1. 7. The putorius, pole-cat, or fitchet, has unconnected toes, is of a dirty yellow colour, with a white mouth and ears. He is a native of most parts of Europe; and has a great resemblance to the martin in temperament, manners, disposition, and figure. Like the latter, he approaches our habitations, mounts on the roofs, takes up his abode in hay-lofts, barns, and unfrequented places, from which he issues during the night only in quest of prey. He burrows under ground, forming a shallow retreat about two yards in length, generally terminating under the roots of some large tree. He makes greater havock among the poultry than the martin, cutting off the heads of all the fowls, and then carrying them off one by one to his magazine. If, as frequently happens, he cannot carry them off entire, on account of the smallness of the entry to his hole, he eats the brains, and takes only the heads along with him. He is likewise very fond of honey, attacks the hives in winter, and forces the bees to abandon them. The females come in season in the spring; and bring forth three, four, or five at a time, but does not lead them off till the end of summer. The pole-cat is excessively fetid; yet the skin is dressed with the hair on, and used as other furs, for tippets, &c. and is also sent abroad to line cloaths. This creature seems to be confined to the temperate climates; few or none being found in the northern regions, or in the torrid zone. In Europe, his territories seem to extend only from Poland to Italy. It is certain that he avoids the cold, for in winter he retires into the houses; and he is perhaps equally averse from great heat.

Fig. 2. 8. The furo, or ferret, has red eyes, and unconnected toes; the colour of the whole body is of a very pale yellow; the length from nose to tail is about 14 inches, the tail five. In its wild state it inhabits Africa; from whence it was originally brought into Spain, in order to free that country from multitudes of rabbits with which it was over-run; and from thence the rest of Europe was supplied with it. This creature is incapable of bearing the cold, and cannot subsist even in France unless in a domestic state. The ferret is not in our climates endowed with the same capacity of finding his subsistence as other wild animals, but must be carefully nourished within doors, and cannot exist in the fields; for those who are lost in the burrows of rabbits never multiply, but probably perish during the winter. Like other domestic animals, he varies in colour. The female ferret is less than the male; and when in season, we are assured, she is so extremely ardent, that she dies if her desires are not gratified. Ferrets are brought up in casks or boxes, where they are furnished with beds of hemp or flax. They sleep almost continually. Whenever they awake, they search eagerly for food; and brawn, bread, milk, &c. are commonly given them. They produce twice every year; and the female goes six weeks with young. Some of them devour their young as soon as they are brought forth, instantly come again in season, and have three litters, which generally consist of five or six, and sometimes of seven, eight, or nine. This animal is by nature a mortal enemy to the rabbit. Whenever a dead rabbit is for the first time presented to a young ferret, he flies upon it, and bites it with fury; but if it be alive, he seizes it by the throat or the nose, and sucks its blood. When let into the burrows of rabbits, he is muzzled, that he may not kill them in their holes, but only oblige them to come out, in order to be caught in the nets. If the ferret is let in without a muzzle, he is in danger of being lost: for, after sucking the blood of the rabbit, he falls asleep; and even smoking the hole is not a certain method of recalling him; because the holes have often several entries which communicate with each other, and the ferret retires into one of those when incommoded with the smoke. Boys likewise use the ferret for catching birds in the holes of walls, or of old trees. The ferret, tho' easily tamed, and rendered docile, is extremely irascible: his odour is always disagreeable; but when he is irritated, it becomes much more offensive. His eyes are lively, and his aspect is inflammatory; all his movements are nimble; and he is at the same time so vigorous, that he can easily master a rabbit, tho' at least four times larger than himself.

9. The zibellina, or sable, has divided toes: the body is of a dusky yellow colour, with a white forehead, and an ash-coloured throat. It is found in Tartary and the northern parts of Asia. The sables inhabit the banks of rivers, and the thickest parts of the woods. They leap with great agility from tree to tree; and avoid the rays of the sun, which are said in a short time to change the colour of their hair. They live in holes of the earth, or beneath the roots of trees: sometimes they will form nests in the trees, and skip with great agility from one to the other: they are very lively, and much in motion during the night. Mr Gmelin tells us, that after eating they generally sleep half an hour or an hour, when they may be pushed, shaken, and even pricked, without awaking. During the night they are excessively active and restless: a tame one kept by Mr Gmelin was accustomed to rise upon its hind-legs, on sight of a cat, in order to prepare for the combat. During summer the

the fables prey on ermines, weafels, and fquirrels, but efpecially on hares; in winter, on birds; in autumn, on hurtleberries, cranberries, and the berries of the fervice-tree: but during that feafon their fkins are at the worft; that diet caufing their fkins to itch, and to rub off their fur againft the trees: they bring forth at the end of March or beginning of April, and have from three to five at a time, which they fuckle for four or five weeks. Their chafe was, in the more barbarous times of the Ruffian empire, the employ, or rather the tafks, of the unhappy exiles into Siberia: as that country is now become more populous, the fables have in great meafure quitted it, and retired farther north and eaft, to live in defart forefts and mountains: they live near the banks of rivers, or in the little iflands in them: on this account they have, by fome, been fuppofed to be the Σαϐεριον of Ariftotle, (*Hift. An. lib.* viii. *c.* 5.) which he claffes with the animals converfant among waters.

At prefent the hunters of fables form themfelves into troops, from 5 to 40 each: the laft fubdivide into leffer parties, and each choofes a leader; but there is one that directs the whole: a fmall covered boat is provided for each party, loaden with provifions, a dog and net for every two men, and a veffel to bake their bread in: each party alfo has an interpreter for the country they penetrate into: every party then fets out according to the courfe their chief points out: they go againft the ftream of the rivers, drawing their boats up, till they arrive in the hunting country; there they ftop, build huts, and wait till the waters are frozen, and the feafon commences: before they begin the chafe, their leader affembles them, they unite in a prayer to the Almighty for fuccefs, and then feparate: the firft fable they take is called *God's fable*, and is dedicated to the church.

They then penetrate into the woods; mark the trees as they advance, that they may know their way back; and in their hunting-quarters form huts of trees, and bank up the fnow round them: near thefe they lay their traps; then advance farther, and lay more traps, ftill building new huts in every quarter, and return fucceffively to every old one to vifit the traps and take out the game to fkin it, which none but the chief of the party muft do: during this time they are fupplied with provifions by perfons who are employed to bring it on fledges, from the places on the road, where they are obliged to form magazines, by reafon of the impracticability of bringing quantities through the rough country they muft pafs. The traps are a fort of pitfall, with a loofe board placed over it, baited with fifh or flefh: when fables grow fcarce, the hunters trace them in the new-fallen fnow, to their holes; place their nets at the entrance; and fometimes wait, watching two or three days for the coming out of the animal: it has happened that thefe poor people have, by the failure of their provifions, been fo pinched with hunger, that, to prevent the cravings of appetite, they have been reduced to take two thin boards, one of which they apply to the pit of the ftomach, the other to the back, drawing them tight together by cords placed at the ends: fuch are the hardfhips our fellow-creatures undergo, to fupply the wantonnefs of luxury.

The feafon of chace being finifhed, the hunters reaffemble, make a report to their leader of the number of fables each has taken; make complaints of offenders againft their regulations; punifh delinquents; fhare the booty; then continue at the head-quarters till the rivers are clear of ice; return home, and give to every church the dedicated furs.

10. The vulgaris, or foumart (A), is the leaft of the weafel kind; the length of the head and body not exceeding fix, or at moft feven inches. The tail is only two inches and an half long, and ends in a point; the ears are large; and the lower parts of them are doubled in. The whole upper part of the body, the head, tail, legs, and feet, are of a very pale tawny brown. The whole under fide of the body from the chin to the tail is white; but beneath the corners of the mouth, on each jaw, is a fpot of brown. It is very deftructive to young birds, poultry, and young rabbits; and is befides a great devourer of eggs. It does not eat its prey on the place; but, after killing it by one bite near the head, carries it off to its young, or to its retreat. It preys alfo on moles, as appears by its being fometimes caught in the mole-traps. It is a remarkably active animal; and will run up the fides of walls with fuch eafe, that fcarce any place is fecure from it; and the body is fo fmall, that there is fcarce any hole but what is pervious to it. This fpecies is much more domeftic than any of the reft, and frequents out-houfes, barns, and granaries. It clears its haunts in a fhort time from mice and rats, being a much greater enemy to them than the cat itfelf. In fummer, however, they retire farther from houfes, efpecially into low grounds, about mills, along rivulets, concealing themfelves among brufh-wood, in order to furprife birds; and often take up their abode in old willows, where the female brings forth her young. She prepares for them a bed of ftraw, leaves, and other herbage, and litters in the fpring; bringing from three to five at a time. The young are born blind; but foon acquire fight, and ftrength fufficient to follow their mothers. Their motion confifts of unequal and precipitant leaps; and when they want to mount a tree, they make a fudden bound, by which they are at once elevated feveral feet high. They leap in the fame manner when they attempt to feize a bird.

Thefe creatures, as well as the pole-cat and ferret, have a difagreeable odour, which is ftronger in fummer than in winter; and when purfued or irritated, their fmell is felt at a confiderable diftance. They move always with caution and filence, and never cry but when they are hurt. Their cry is fharp, rough, and very expreffive of refentment. As their own odour is offenfive, they feem not to be fenfible of a bad fmell in other bodies. M. Buffon informs us, that a peafant in his neighbourhood took three new-littered weafels out of the carcafe of a wolf that had been hung up on a tree by the hind-feet. The wolf was almoft entirely putrefied, and the female weafel had made a neft of leaves and herbage for her young in the thorax of this putrid carcafe. The weafel may be perfectly tamed, and

(A) This animal is confounded by Linnæus with the ftoat or ermine. He feems unacquainted with our weafel in its brown colour; but defcribes it in its white ftate under the title of *fnoxucs*, or *muftela nivalis*. Mr Pennant met with it in that circumftance in the Ifle of Ilay.

and rendered as caressing and frolicksome as a dog or squirrel. The method of taming them is to stroke them often and gently over the back; and to threaten, and even to beat them when they bite. In the domestic state their odour is never offensive but when irritated. They are fed with milk, boiled flesh, and water.

Plate CLXXXV. fig. 3.

11. The candida, stoat, or ermine, is ten inches long from the nose to the origin of the tail; the tail itself is five inches and a half long. The colours bear so near a resemblance to those of the weasel, as to cause them to be confounded together by the generality of common observers; the weasel being usually mistaken for a small stoat: but these animals have evident and invariable specific differences, by which they may be easily known. First, by the size; the weasel being ever less than the stoat: secondly, the tail of the latter is always tipt with black, is longer in proportion to the bulk of the animal, and more hairy; whereas the tail of the weasel is shorter, and of the same colour with the body: thirdly, the edges of the ears and the ends of the toes in this animal are of a yellowish white. It may be added, that the stoat haunts woods, hedges, and meadows, especially where there are brooks whose sides are covered with small bushes; and sometimes (but less frequently than the weasel) inhabits barns, and other buildings.

In the most northern parts of Europe, these animals regularly change their colour in winter; and become totally white, except the end of the tail, which continues invariably black; and in that state are called *ermines:* we are informed that the same is observed in the Highlands of Scotland. The skins and tails are a very valuable article of commerce in Norway, Lapland, Russia, and other cold countries; where they are found in prodigious numbers. They are also very common in Kamtschatka and Siberia. In Siberia they burrow in the fields, and are taken in traps baited with flesh. In Norway they are either shot with blunt arrows, or taken in traps made of two flat stones, one being propped up with a stick, to which is fastened a baited string, which when the animals nibble, the stone falls down and crushes them to death. The Laplanders take them in the same manner, only instead of stones make use of two logs of wood. The stoat is sometimes found white in Great Britain, but not frequently: and then it is called a *white weasel.* That animal is also found white; but may be easily distinguished from the other in the ermine state, by the tail, which in the weasel is of a light tawny brown. With us the former is observed to begin to change its colour from brown to white in November, and to begin to resume the brown the beginning of March.

The natural history of this creature is much the same with that of the weasel; its food being birds, rabbits, mice, &c. its agility the same, and its scent equally fetid: it is much more common in England than that animal.

MUSTER, in a military sense, a review of troops under arms, to see if they be complete and in good order; to take an account of their numbers, the condition they are in, viewing their arms and accoutrements, &c.

Muster-*Master-general,* or *Commissary-general of the* Musters; one who takes account of every regiment, their number, horses, arms, &c. reviews them, sees the horses be well mounted, and all the men well armed and accoutred, &c.

Muster-*Rolls,* lists of soldiers in each company, troop, or regiment, by which they are paid, and the strength of the army is known.

MUTE, in a general sense, signifies a person that cannot speak, or has not the use of speech.

Mute, in law, a person that stands dumb or speechless, when he ought to answer, or to plead. See Arraignment.

Mute, in grammar, a letter which yields no sound without the addition of a vowel. The simple consonants are ordinarily distinguished into mutes and liquids, or semi-vowels. See the articles Consonant, Liquid, &c.

The mutes in the Greek alphabet are nine, three of which, *viz.* π, κ, τ, are termed *tenues;* three β, γ, δ, termed *mediæ,* and three φ χ, θ, termed *aspirates.* See the article Aspirate, &c.

The mutes of the Latin alphabet are also nine, *viz.* B, C, D, G, I, K, P, Q, T.

MUTILATION, the retrenching or cutting away any member of the body.

This word is also extended to statues and buildings, where any part is wanting, or the projecture of any member, as a corniche or an impost, is broken off. It is sometimes also used, in a more immediate manner, for castration.

MUTILLA, in zoology, a genus of animals belonging to the order of insecta hymenoptera. There are 10 species; the most remarkable of which is the occidentalis, or velvet-ant, an inhabitant of North America. It has six legs, with short crooked antennæ; the abdomen large, with a black list crossing the lower part of it, and another black spot at the joining of the thorax; excepting which, the whole body and head resembles crimson-velvet. The trunk or shell of the body is of such a strong and hard contexture, that, tho' trod upon by men and cattle, they receive no harm. They have a long sting in their tails, which causes inflammation and great pain, for half an hour, to those who are stung by them; which usually happens to negroes and others that go barefooted. They are mostly seen running very nimbly on sandy roads in the hottest summer-weather; and always single. What they feed on, in what manner they breed, and where they secure themselves in winter, is unknown.

Plate CLXXXII. fig. 3.

MUTINY, in a military sense, to rise against authority.—"Any officer or soldier who shall presume to use traiterous or disrespectful words against the sacred person of his majesty, or any of the royal family, is guilty of mutiny.

Articles of War.

"Any officer or soldier who shall behave himself with contempt or disrespect towards the general or other commander in chief of our forces, or shall speak words tending to their hurt or dishonour, is guilty of mutiny.

"Any officer or soldier who shall begin, excite, cause, or join in, any mutiny or sedition, in the troop, company, or regiment, to which he belongs, or in any other troop or company in our service, or on any party, post, detachment, or guard, on any pretence whatsoever, is guilty of mutiny.

"Any

" Any officer or ſoldier who, being preſent at any mutiny or ſedition, does not uſe his utmoſt endeavours to ſuppreſs the ſame, or coming to the knowledge of any mutiny, or intended mutiny, does not without delay give information to his commanding officer, is guilty of mutiny.

" Any officer or ſoldier, who ſhall ſtrike his ſuperior officer, or draw, or offer to draw, or ſhall lift up any weapon, or offer any violence againſt him, being in the execution of his office, on any pretence whatſoever, or ſhall diſobey any lawful command of his ſuperior officer, is guilty of mutiny."

MUTINY-*Act*. See MILITARY-*State*.

MUTIUS (Caius), ſurnamed *Codrus*, and afterwards *Scævola*, was one of the illuſtrious Roman family of the Mutians, and rendered his name famous in the war between Porſenna king of Tuſcany and the Romans. That prince reſolving to reſtore the family of Tarquin the Proud, went to beſiege Rome 507 B. C. Mutius reſolved to ſacrifice himſelf for the ſafety of his country; and boldly entering the enemy's camp, killed Porſenna's ſecretary, whom he took for Porſenna himſelf. Being ſeized and brought before Porſenna, he told him boldly, that 300 young men like himſelf had ſworn to murder him; *but ſince this hand has miſſed thee*, continued he, *it muſt be puniſhed;* then putting his right hand on the burning coals, he let it burn with ſuch a conſtancy as amazed the beholders. The king, amazed at the intrepidity of this young Roman, ordered that he ſhould have his freedom and return to Rome, and ſoon after concluded a peace with the Romans. From this action Mutius obtained the ſurname of *Scævola*, or " left-handed," which was enjoyed by his family.

MUTIUS *Scævola* (*Q.*), ſurnamed the *Augur*, was an excellent civilian, and inſtructed Cicero in the laws. He was made prætor in Aſia; was afterwards conſul, and performed very important ſervices for the republic.

He ought not to be confounded with Quintus Mutius Scævola, another excellent civilian, who was prætor in Aſia, tribune of the people, and at length conſul, 95 B. C. He governed Aſia with ſuch prudence and equity, that his example was propoſed to the governors who were ſent into the provinces. Cicero ſays, " that he was the moſt eloquent orator of all the civilians, and the moſt able civilian of all the orators." He was aſſaſſinated in the temple of Veſta, during the wars of Marius and Sylla, 82 B. C.

MUTTON, the common name of the fleſh of a ſheep after the animal has been killed. Mutton has been commonly preferred to all the fleſhes of quadrupeds. And indeed, beſides its being more perfect, it has the advantage over them of being more generally ſuited to different climates: whereas beef, *e. g.* requires a very nice intermediate ſtate, which it ſeems to enjoy chiefly in England; for although Scotland ſupplies what are reckoned the beſt cattle, it is in the rich Engliſh paſtures that they are brought to perfection. Now the ſheep can be brought almoſt to the ſame perfection in this bleak northern region as in the ſouthern countries.

MUTULE, in architecture, a kind of ſquare modillion ſet under the corniche of the Doric order.

MUZZLE *of a* GUN *or* MORTAR, the extremity at which the powder and ball is put in; and hence the muzzle-ring is the metalline circle or moulding that ſurrounds the mouth of the piece.

MYA, the GAPER, in zoology; a genus belonging to the order of vermes teſtacea, the characters of which are theſe. It has a bivalve ſhell gaping at one end; the hinge, for the moſt part, furniſhed with a thick, ſtrong, and broad tooth, not inſerted into the oppoſite valve. Its animal is an ASCIDIA. The moſt remarkable ſpecies are, Plate CLXXVI.

1. The declivis, or ſloping mya, with a brittle half-tranſparent ſhell, with a hinge ſlightly prominent near the open, and ſloping downwards. It is frequent about the Hebrides; the fiſh eaten by the gentry.

2. The mya pictorum, hath an oval brittle ſhell, with a ſingle longitudinal tooth like a lamina in one ſhell, and two in the other; the breadth is a little above two inches, the length one. It inhabits rivers; the ſhells are uſed to put water-colours in, whence the name. Otters feed on this and the other freſh-water ſhells.

3. The margaritifera, or pearl mya, hath a very thick, coarſe, opaque ſhell; often much decorticated; oblong, bending inward on one ſide, or arcuated; black on the outſide; uſual breadth from five to ſix inches, length two and a quarter. It inhabits great rivers, eſpecially thoſe which water the mountainous parts of Great Britain. See Plate CLXXVI. fig. 18.

This ſhell is noted for producing quantities of pearl. There have been regular fiſheries for the ſake of this precious article in ſeveral of our rivers. Sixteen have been found within one ſhell. They are the diſeaſe of the fiſh, analogous to the ſtone in the human body. On being ſqueezed, they will eject the pearl, and often caſt it ſpontaneouſly in the ſand of the ſtream. The Conway was noted for them in the days of Cambden. A notion alſo prevails, that Sir Richard Wynne of Gwydir, chamberlain to Catharine queen to Charles II. preſented her majeſty with a pearl (taken in this river) which is to this day honoured with a place in the regal crown. They are called by the Welſh *cregin diluw*, or " deluge ſhells," as if left there by the flood. The Irt in Cumberland was alſo productive of them. The famous circumnavigator, Sir John Hawkins, had a patent for fiſhing in that river. He had obſerved pearls plentiful in the Straits of Magellan, and flattered himſelf with being enriched by procuring them within his own iſland. In the laſt century, ſeveral of great ſize were gotten in the rivers of the counties of Tyrone and Donegal in Ireland. One that weighed 36 carats was valued at 40l.; but being foul, loſt much of its worth. Other ſingle pearls were ſold for 4l. 10s. and even for 10l. The laſt was ſold a ſecond time to Lady Glenlealy, who put it into a necklace, and refuſed 80l. for it from the ducheſs of Ormond.

Suetonius reports, that Cæſar was induced to undertake his Britiſh expedition for the ſake of our pearls; and that they were ſo large that it was neceſſary to uſe the hand to try the weight of a ſingle one. Mr Pennant ſuppoſes that Cæſar only heard this by report; and that the cryſtalline balls called *mineral pearl*, were miſtaken for them.

We

We believe that Cæſar was diſappointed of his hope: yet we are told that he brought home a buckler made with Britiſh pearl, which he dedicated to, and hung up in, the temple of Venus Genetrix: a proper offering to the goddeſs of beauty, who ſprung from the ſea. It may not be improper to mention, that notwithſtanding the claſſics honour our pearl with their notice, yet they report them to have been ſmall and ill-coloured, an imputation that in general they are ſtill liable to. Pliny ſays, that a red ſmall kind was found about the Thracian Boſphorus, in a ſhell called *mya;* but does not give it any mark to aſcertain the ſpecies.

MYAGRUM, Gold of pleasure; a genus of the ſiliculoſa order, belonging to the tetradyminaua claſs of plants. There are five ſpecies; but the only remarkable one is the ſativum, which grows naturally in corn-fields in the ſouth of France and Italy, and alſo in ſome parts of Britain. It is an annual plant, with an upright ſtalk a foot and an half high, ſending out two or four ſide-branches, which grow erect; the flowers grow in looſe ſpikes at the end of the branches, ſtanding upon ſhort footſtalks an inch long: they are compoſed of four ſmall yellowiſh petals, placed in form of a croſs; theſe are ſucceeded by oval capſules, which are bordered and crowned at the top with the ſtyle of the flower, having two cells filled with red ſeeds. This is cultivated in Germany for the ſake of the expreſſed oil of the ſeeds, which the inhabitants uſe for medicinal, culinary, and œconomical purpoſes. The ſeeds are a favourite food with geeſe. Horſes, goats, ſheep, and cows, eat the plant.

MYCENÆ, (Homer); a town of Argolis; formerly the capital, and the royal reſidence of Agamemnon, fifty ſtadia to the north of Argos, celebrated by the poets. After the war of Troy, on the extinction of Agamemnon's kingdom, it fell to ſuch decay, that in Strabo's time there was not ſo much as a trace of it remaining: but that, in the Macedonian war carried on by the Romans, there was ſomething of a town, is plain from the *Excerpta* of Polybius, to whom add Livy. It was famous for its breed of horſes. (Virgil, Horace).

MYCONE, an iſland of the Archipelago, ſituated in E. Long. 25. 51. N. Lat. 37. 28. It is about 36 miles in circuit; and has a town of the ſame name, containing about 3000 inhabitants. The people of this iſland are ſaid to be the beſt ſailors in the Archipelago, and have about 150 veſſels of different ſizes. The iſland yields a ſufficient quantity of barley for the inhabitants, and produces abundance of figs, and ſome olives; but there is a ſcarcity of water, eſpecially in ſummer, there being but one well on the iſland. There are a great number of churches and chapels, with ſomes monaſteries. The dreſs of the women in this iſland is very remarkable, and as different from that of the other iſlands as that of thoſe iſlanders is different from the dreſs of the other European ladies. Their heads are adorned with lively-coloured turbans; their garments are a ſhort white ſhift plaited before and behind, which reaches to their knees; they have white linen-drawers, and red, green, yellow, or blue ſtockings, with various coloured ſlippers. An ordinary ſuit for the better ſort will coſt 200 crowns.

MYGDONIA, (anc. geog.) a diſtrict of Macedonia, to the north of the Sinus Thermaicus, and eaſt of the river Axius, which ſeparates it from Bottiæis, and weſt of the river Strymon, (Pliny). Alſo a diſtrict of Meſopotamia, which took its name from that of Macedonia, running along the Euphrates, from Zeugma down to Thapſacus; extending a great way eaſt, becauſe Niſibis was reckoned to it.

MYLOGLOSSUM, in anatomy. See Anatomy, *Table of the Muſcles*.

MYLOHYOIDÆUS. *Ibid.*

MYOPIA, Short-sightedness, a ſpecies of viſion wherein objects are ſeen only at ſmall diſtances. See Medicine, n° 178.

MYOSOTIS, Scorpion-grass; a genus of the monogynia order, belonging to the pentandria claſs of plants. There are four ſpecies; of which the moſt remarkable is the ſcorpioides, or mouſe-ear. This is a native of Britain, growing naturally in dry fields, and on the margins of ſprings and rills. It hath naked ſeeds, and the points of the leaves callous. It varies conſiderably in different ſituations. In dry places the plant and flowers are ſmaller; in moiſt ones both are larger, and ſometimes hairy. The bloſſoms vary from a full blue to a very pale one, and ſometimes a yellow; and appear in a long ſpirally twiſted ſpike. When it grows in the water, and its taſte and ſmell is thereby rendered leſs obſervable, ſheep will ſometimes eat it; but it is generally fatal to them. Cows, horſes, ſwine, and goats, refuſe it.

MYRIAD, a term ſometimes uſed to denote ten thouſand.

MYRICA, Gale, or Sweet-willow, in botany; a genus of the tetrandria order, belonging to the diœcia claſs of plants.

Species. 1. The gale, or ſweet-willow, grows naturally in many places both of Scotland and England. It riſes near four feet high, with many ſhrubby ſtalks, which divide into ſeveral ſlender branches, garniſhed with ſtiff ſpear-ſhaped leaves of a light yellowiſh green, ſmooth, and a little ſawed at their points; and emit a fragrant odour when bruiſed. The female flowers or catkins are produced from the ſides of the branches, growing upon ſeparate plants from the female, which are ſucceeded by cluſters of ſmall berries, each having a ſingle ſeed. It flowers in July, and ripens in autumn. 2. The ceriſera, or candleberry gale, is a native of North America. It is a ſmall tree or ſhrub about twelve feet high, with crooked ſtems branching forth near the ground irregularly. The leaves are long, narrow, and ſharp-pointed. Some trees have moſt of their leaves ſerrated, others not. In May, the ſmall branches are alternately and thick ſet with oblong tufts of very ſmall flowers, reſembling in form and ſize the catkins of the hazel-tree, coloured with red and green. Theſe are ſucceeded by ſmall cluſters of blue berries cloſe connected, like bunches of grapes. The kernel is incloſed in an oblong, hard ſtone, incruſted over with an unctuous mealy ſubſtance, from which the wax is procured in the following manner: in November and December, when the berries are ripe, a man with his family will remove from home to ſome iſland or ſand-bank near the ſea, where theſe trees moſt abound, taking with them kettles to boil the berries in. He builds a hut with palmetto-leaves for the ſhelter of himſelf

Myrmecophaga. himſelf and family during his reſidence there, which is commonly for four or five weeks. The man cuts down the trees, while the children ſtrip off the berries into a porridge-pot; and having put water to them, they boil them till the oil floats, which is then ſkimmed off into another veſſel. This is repeated till no more oil appears. When cold, this hardens to the conſiſtence of wax, and is of a dirty green colour. Then they boil it again, and clarify it in braſs kettles; which gives it a tranſparent greenneſs. Theſe candles burn a long time, and yield a grateful ſmell. They uſually add a fourth part of tallow, which makes them burn clearer.

MYRMECOPHAGA, or ANT-BEAR, in zoology; a genus of quadrupeds, belonging to the order of bruta; the characters of which are theſe: There are no teeth in the mouth; the tongue is long and cylindrical: the head terminates in a long ſnout or muzzle; and the body is covered with pretty long hair. There are four ſpecies, viz. Plate CLXXXV.

1. The didactyla, or little ant-eater, hath a conic noſe bending a little down; ears ſmall, and hid in the fur; two hooked claws on the fore-feet, the exterior being much the largeſt; four on the hind-feet; the head, body, limbs, and upper part and ſides of the tail, covered with long ſoft ſilky hair, or rather wool, of a yellowiſh brown colour: from the noſe to the tail it meaſures ſeven inches and an half; the tail eight and an half; the laſt four inches of which on the under ſide are naked. It is thick at the baſe, and tapers to a point. In inhabits Guinea, climbs trees in queſt of a ſpecies of ants which build their neſts among the branches: has a prehenſible power with its tail.

2. The tridactyla, tamandua-guaca, or tamanoir, has three toes on the fore-feet, five on the hind-feet, and long hair on the tail. This animal is about four feet long, and the head and ſnout about 15 inches: it is a native of the Eaſt Indies, and feeds on ants, &c. in the ſame manner as the former.

3. The jubata, or great ant-eater, hath a long ſlender noſe, ſmall black eyes; ſhort round ears; a ſlender tongue two feet and an half long, which lies double in the mouth; the legs ſlender; four toes on the fore-feet, five on the hind-feet; the two middle claws on the fore-feet very large, ſtrong, and hooked; the hair on the upper part of the body is half a foot long, black mixed with grey; the fore-legs are whitiſh, marked above the feet with a black ſpot; the tail is clothed with very coarſe black hair a foot long: the length from the noſe to the tail about four feet; the tail, two feet and an half.

4. The tetradactyla, or middle ant-eater, has four toes on the fore-feet, and five on the hind, with a tail naked at the extremity; the length from the noſe to the tail is one foot ſeven inches, and the tail ten inches.

Theſe animals have many properties in common with each other, both in their ſtructure and manners. They all feed upon ants, and plunge their tongues into honey and other liquid or viſcid ſubſtances. They readily pick up crumbs of bread, or ſmall morſels of fleſh. They are eaſily tamed, and can ſubſiſt for a long time without food. They never ſwallow all the liquor which they take for drink; for a part of it falls back through their noſtrils. They run ſo ſlowly that a man may eaſily overtake them in an open field. Their fleſh, though its taſte be very diſagreeable, is eaten by the ſavages.—At a diſtance the great ant-eater has the appearance of a fox; and for this reaſon ſome travellers have given him the name of the *American fox*. He has ſtrength ſufficient to defend himſelf from a large dog, or even from the jaquar or braſilian cat. When attacked, he at firſt fights on end, and, like the bear, annoys his enemy with the claws of his fore-feet, which are very terrible weapons. He then lies down on his back, and uſes all the four feet; in which ſituation he is almoſt invincible; and continues the combat to the laſt extremity. Even when he kills his enemy, he quits him not for a long time after. He is enabled to reſiſt better than moſt other animals; becauſe he is covered with long buſhy hair; his ſkin is remarkably thick; his fleſh has little ſenſation; and his principle of life is very tenacious.

Myrmidons ‖ Myrrh.

MYRMIDONS, MYRMIDONES, in antiquity; a people of Theſſaly, fabled to have aroſe from ants or piſmires, upon a prayer put up for that purpoſe by king Æacus to Jupiter, after his kingdom had been diſpeopled by a ſevere peſtilence.—In Homer and Virgil, the Myrmidons are Achilles's ſoldiers.

MYROBALANS, a kind of medicinal fruit brought from the Indies, of which there are five kinds. 1. The citrine, of a yellowiſh red colour, hard, oblong, and the ſize of an olive. 2. The black, or Indian myrobalan, of the bigneſs of an acorn, wrinkled, and without a ſtone. 3. Chebulic myrobalans, which are of the ſize of a date, pointed at the end, and of a yellowiſh brown. 4. Emblic, which are round, rough, the ſize of a gall, and of a dark brown. 5. Balleric, which are hard, round, of the ſize of an ordinary prune, leſs angular than the reſt, and yellow. They are all ſlightly purgative and aſtringent. The word comes from the Greek μυρον, "ointment," and βαλανος, "acorn;" as being in the form of acorns, and uſed in medicine.

MYRON, an excellent Grecian ſtatuary, flouriſhed 442 B. C. The cow he repreſented in braſs was an admirable piece of workmanſhip, and was the occaſion of many fine epigrams in Greek.

MYRRH, in the materia medica, a concrete, gummy, reſinous juice, brought from the Eaſt Indies in globes or drops, of various colours and magnitudes. The beſt ſort is of a brown reddiſh or yellow colour, ſomewhat tranſparent; of a lightly pungent bitter taſte, with an aromatic flavour, though not ſufficient to prevent its proving nauſeous to the palate; and a ſtrong diſagreeable ſmell. The medical effects of this aromatic bitter are, to warm and ſtrengthen the viſcera, and diſſolve thick tenacious juices: it frequently occaſions a mild diaphoreſis, and promotes the fluid ſecretions in general. Hence it proves ſerviceable in languid caſes; diſeaſes ariſing from a ſimple inactivity; thoſe female diſorders which proceed from a cold, mucous, ſluggiſh indiſpoſition of the humours; ſuppreſſions of the uterine diſcharges; cachectic diſorders, where the lungs and thorax are oppreſſed by viſcid phlegm. Myrrh is likewiſe ſuppoſed in a peculiar manner to reſiſt putrefaction in all parts of the body; and in this light ſtands recommended in malignant, putrid, and peſtilential fevers, and in the ſmall-pox;

pox; in which laſt it is ſaid to accelerate the eruption.—Rectified ſpirit extracts the fine aromatic flavour and bitterneſs of this drug, and does not elevate any thing of either in evaporation: the gummy ſubſtance left by this menſtruum has a diſagreeable taſte, with ſcarce any thing of the peculiar flavour of the myrrh; and diſſolves in water, excepting ſome impurities which remain. In diſtillation with water, a conſiderable quantity of a ponderous eſſential oil ariſes, reſembling in flavour the original drug.

MYRTIFORM, in anatomy, an appellation given to ſeveral parts, from their reſembling myrtle-berries.

MYRTLE, in botany. See MYRTUS.

MYRTUS, in botany, the MYRTLE; a genus of the monogynia order, belonging to the icoſandria claſs of plants. The moſt remarkable ſpecies are, 1. The communis, or common myrtle-tree, riſes with a ſhrubby, upright, firm ſtem, branching numerouſly all around into a cloſe full head, riſing eight or ten feet high; very cloſely garniſhed with oval-lanceolate, entire, moſtly oppoſite leaves, from half an inch to an inch and a half long, and one broad, on ſhort footſtalks; and numerous, ſmall, pale flowers from the axillas, ſingly on each footſtalk, having diphyllous involucrums; each flower ſucceeded by a ſmall, oval, dark-purple berry.

The moſt material varieties are, Broad-leaved Roman myrtle, with oval, ſhining, green leaves, an inch and an half long, and one broad; and is remarkably floriferous. Gold-ſtriped broad-leaved Roman myrtle. Broad-leaved Dutch myrtle, with ſpear-ſhaped, ſharp-pointed, dark-green leaves, an inch long, and about three quarters of one broad. Double-flowered Dutch myrtle. Broad-leaved Jews myrtle, having the leaves placed by threes at each joint; by which particular circumſtance this ſpecies is in univerſal eſtimation among the Jews in their religious ceremonies, particularly in decorating their tabernacles; and for which purpoſe many gardeners about London cultivate this variety with particular care, to ſell to the above people, who are often obliged to purchaſe it at the rate of ſixpence or a ſhilling for a ſmall branch: for the true ſort, having the leaves exactly by threes, is very ſcarce, and is a curioſity; but by care in its propagation, taking only the perfectly ternate-leaved ſhoots for cuttings, it may be increaſed faſt enough; and is worth the attention of the curious, and particularly thoſe who raiſe myrtles for the London markets. Orange-leaved Spaniſh myrtle, with oval ſpear-ſhaped leaves, an inch and a half long or more, and one broad, in cluſters round the branches, and reſemble the ſhape and colour of orange-tree leaves. Gold-ſtriped-leaved orange myrtle. Common upright Italian myrtle, with its branches and leaves growing more erect, the leaves oval, lanceolate-ſhaped, acute-pointed, and near an inch long, and half a one broad. Silver-ſtriped upright Italian myrtle. White-berried upright Italian myrtle. Portugal acute-leaved myrtle, with ſpear-ſhaped, oval, acute-pointed leaves, about an inch long. Box-leaved myrtle, with weak branches, ſmall, oval, obtuſe, lucid-green, cloſely-placed leaves. Striped box-leaved myrtle. Roſemary leaved myrtle, hath erect branches, ſmall, narrow, lanceolate, acute-pointed, ſhining, green, very fragrant leaves. Silver-ſtriped roſemary-leaved myrtle. Thyme-leaved myrtle, with very ſmall cloſely-placed leaves. Nutmeg-myrtle, with erect branches and leaves; the leaves oval, acute-pointed, and finely ſcented like a nutmeg. Broad-leaved nutmeg-myrtle. Silver-ſtriped leaved ditto. Criſtated or cock's-comb myrtle, frequently called *bird's-neſt myrtle*, hath narrow, ſharp-pointed leaves, criſtated at intervals.

Theſe are the principal varieties of the *myrtus communis;* but of which ſorts there are ſeveral intermediate varieties of leſs note; and more may ſtill be obtained from ſeed, though the plants are rarely raiſed from ſeed in this country, but moſtly by ſlips and cuttings.

They are all beautiful ever-green ſhrubs of exceeding fragrance; exotics originally of the ſouthern parts of Europe, and of Aſia and Africa, and conſequently in this country require ſhelter of a green-houſe in winter: all of which, though rather of the ſmall-leaved kind, have their foliage cloſely placed, and remain all the year, and are very floriferous in ſummer; and when there is a collection of the different ſorts, they afford an agreeable ſource of variety with each other. They therefore claim univerſal eſteem as principal green-houſe plants, eſpecially as they are all ſo eaſily raiſed from cuttings, and of ſuch eaſy culture as to be attainable in every garden, where there is any ſort of green-houſe, or garden-frames furniſhed with glaſſes for protecting them in winter from froſt: but ſome of the broad-leaved ſorts are ſo hardy as to ſucceed in the full ground, againſt a ſouth wall and other warm expoſures, all the year, by only allowing them ſhelter of mats occaſionally in ſevere froſty weather: ſo that a few of theſe ſorts may alſo be exhibited in a warm ſituation in the ſhrubbery: obſerving, however, all the ſorts are principally to be conſidered as green-houſe plants, and a due portion of them muſt always remain in pots to move to that department in winter.

Stove-kinds.—There are ſeveral ſpecies of the ſtove-temperature, as being natives of the Indies: but there are not more than the four following ſorts commonly met with in the Britiſh gardens, all of which are beautiful ever-greens, with larger leaves than the *myrtus communis;* and are moſtly ſtrong aromatics.

2. The zelanica, or Ceylon white-berried myrtle, hath a ſhrubby upright ſtem, branching erectly ſix or eight feet high; oval, ſhining-green, oppoſite, very odoriferous leaves, on ſhort footſtalks; and all the branches terminated by pedunculi, each ſuſtaining many flowers; ſucceeded by ſnowy-white berries, but rarely in Britain.

3. The pimenta, pimento, or Jamaica all-ſpice-tree, riſes with an upright tree-ſtem, branching regularly 20 or 30 feet high, having a ſmooth brown bark; large, oblong-oval, ſtiff, ſhining, very odoriferous leaves, like thoſe of bay, placed alternate; and at the ſides and termination of the branches large looſe bunches of greeniſh flowers; ſucceeded by round, duſky, hard, ſpicey fruit, called *all-ſpice*, or *Jamaica-pepper.*—This ſpecies is an excellent aromatic; its leaves are remarkably fine-ſcented; and its fruit is that valuable ſpice, Jamaica pepper, or all-ſpice, ſo called, becauſe it is ſuppoſed to partake of the odour and taſte of moſt other ſpices. The tree grows in great abundance in the iſland of Jamaica, where its fruit is made a conſiderable branch of trade. It is generally gathered a little

Myrtus. before it acquires full growth, and dried in the ſun 10 or 12 days; and is then packed up ready for exportation to Europe.

4. The diœca, or diœcious American myrtle, riſes with an upright tree-ſtem, branching many feet high; oblong, thick, oppoſite, odoriferous leaves; and at the axillas and ends of the branches pedunculi dividing into trichotomous panicles of diœcious flowers; ſucceeded by ſmall, globular, ſpicey berries. Every part of the tree is a ſtrong aromatic.

5. The braſiliana, or Braſilian inodorus myrtle, riſes with a branching ſtem, having a whitiſh bark: broad, oval, ſhining, oppoſite, inodorous or ſcentleſs leaves, and naked pedunculi, ſuſtaining ſolitary flowers, with ciliated petals; ſucceeded by large oval fruit.

All theſe five ſpecies of myrtus are exotics of the ſhrub and tree kind; though in this country, as being confined in pots, the largeſt of them aſſume only the growth of moderate ſhrubs. The firſt ſpecies, common myrtle, is conſiderably the moſt noted ſpecies of this genus in this country; where in moſt of our green-houſe collections one or other of the varieties is found in tolerable plenty; but all the varieties of it highly merit notice. The other four ſpecies are rare in Britain: they, however, are retained in many curious gardens, in the ſtove-collection; more particularly the pimento, which is a very beautiful odoriferous evergreen, and exhibits a fine variety in the ſtove at all ſeaſons. In ſhort, all the ſpecies, both green-houſe and ſtove-kinds, have a pretty effect as ever-greens; and ſome of the ſorts flower very ornamentally, particularly of the common myrtle.

With reſpect to flowering, all the varieties of the *myrtus communis* flower here in July and Auguſt, moſt of which are very floriferous: the broad-leaved Roman kind, in particular, is often covered with flowers, which in ſome of the ſorts are ſucceeded here by berries ripening in winter. Some of the ſtove kinds alſo flower here, but are rarely ſucceeded by fruit in England.

The flowers, however, of moſt of the ſorts are ſmall, but numerous; and are all formed each of five oval petals, and many ſtamina.

As all the ſpecies require occaſional ſhelter here, they muſt be kept always in pots, for moving to the proper places of ſhelter, according to their nature; the *myrtus communis* and varieties to the green-houſe in winter; the others to the ſtove, to remain all the year: therefore let all the ſorts be potted in light rich earth, and, as they advance in growth, ſhift them into larger pots, managing the myrtles as other green-houſe ſhrubs, and the ſtove-kinds as other woody exotics of the ſtove.

But, as we before obſerved, the broad-leaved *myrtus communis*, being hardier than the ſmaller-leaved kinds, ſome of them may alſo be turned out into the full ground in a warm ſituation againſt a wall, &c. allowing them ſhelter of mats in froſty weather, and mulch the ground over their roots: they will frequently ſucceed tolerably, and effect a good variety in ſuch places. They may all be propagated by ſlips, cuttings, or layers.

The leaves and flowers of common upright myrtle have an aſtringent quality, and are uſed for cleanſing the ſkin, and ſtrengthening the fibres. From the flowers and young tops is drawn a diſtilled water that is deterſive, aſtringent, coſmetic, and uſed in gargles. A decoction of the flowers and leaves is applied in fomentations. The berries have a binding deterſive quality; and the chemical oil obtained from them is excellent for the hair, and uſed in pomatums and moſt other external beautifiers of the face and ſkin. As an internal medicine, theſe berries have little or no merit.

Myſia, Myſtery. MYSIA, (anc. geog.), a country of the Hither Aſia, which Strabo makes two-fold; the one called *Olympena*, near mount Olympus, whence its name; the other near the river Caicus and Pergamene, as far as Teuthrania, and down to the mouth of the Caicus; a part of which was afterwards called *Æolis*, from the Eolians, (Mela, Pliny); by which means this Myſia was greatly contracted in its limits.—There were alſo two other Myſias, called *Abrettene* and *Morene*; which ſee. Strabo mentions a ſmall diſtrict, called *Myſia Combuſta*, famous for generous wines; which, whether to be allotted to *Myſia* or *Lydia*, he is doubtful: it was in length 500 ſtadia, in breadth 400: and he obſerves, that it is a matter of difficulty to ſettle the limits of the Bithynians, Myſians, Phrygians, Mygdonians, and Trojans, being ſo intermixed and blended; which gave riſe to a proverb, denoting the difficulty of diſtinguiſhing things, though really diſtinct. *Myſi*, or *Myſii*, the people, were held in the utmoſt contempt; ſo that *Myſorum ultimus* denotes a perſon highly deſpicable, (Cicero): and becauſe the being made a property of is generally the conſequence of contempt, this gave riſe to another proverb, Μυσων λεια, (Ariſtotle). The name *Myſe* is ſaid to denote the beech-tree, which grows plentifully about Olympus; and hence the country took its name.

MYSTERY, ſomething ſecret or concealed, impoſſible or difficult to comprehend.

All religions, true or falſe, have their myſteries. The pagan religion was remarkably full of them. Ovid reckons it a great crime to divulge the myſtic rites of Ceres and Juno. The eleuſinia, or ſacred rites of Ceres, ſolemniſed at Eleuſis, were called, by way of eminence, *the myſteries*; and ſo ſuperſtitiouſly careful were they to conceal theſe ſacred rites, that if any perſon divulged any part of them, he was thought to have called down ſome divine judgment on his head, and it was accounted unſafe to abide under the ſame roof with him; and Horace declares, that he would not put to ſea in the ſame ſhip with one who revealed the myſteries of Ceres. The pagan myſteries, it is true, were generally myſteries of iniquity, and concealed only becauſe their being publiſhed would have rendered their religion ridiculous and odious. Thus the ſacred writings often ſpeak of the infamous myſteries of the pagan deities, in which the moſt ſhameful crimes were committed under the ſpecious veil of religion.

The whole religion of the Egyptians was myſterious from the beginning to the end, and both their doctrine and worſhip wrapped up in ſymbols and hieroglyphics.

The religion of the Jews is ſuppoſed to be full of myſteries. The whole nation, according to St Auguſtin, was a myſtery, as it repreſented or was a type of the people of Chriſt, and the Chriſtian religion. Whatever was commanded or forbidden them was figurative;

gurative; and their facrifices, priefthood, &c. included myfteries. The prophecies concerning Jefus Chrift in the Jewifh books, are likewife figurative and myfterious.

The Chriftian religion has alfo its myfteries: but in the fcripture-language the word *myftery* is ufed with fome latitude, and denotes whatever is not to be known without a divine revelation, and all the fecret things which God has difcovered by his minifters the prophets, by Jefus Chrift and his apoftles. The myfteries of the Chriftian church are, The incarnation of the Word; the hypoftatical union of the divine and human natures; the miraculous birth, death, and refurrection of the Son of God; the doctrine of the Trinity, &c.

St Paul often fpeaks of the myfteries of the Chriftian religion; as the myftery of the gofpel, the myftery of the crofs of Chrift, the myftery which was kept fecret fince the world began: and he calls the preachers of the gofpel, the ftewards of the myfteries of God.

MYSTICAL, fomething myfterious or allegorical. Some of the commentators on the facred writings, befides a literal, find alfo a myftical meaning. The fenfe of fcripture, fay they, is either that immediately fignified by the words and expreffions in the common ufe of language; or it is mediate, fublime, typical, and myftical. The literal fenfe they again divide into proper literal, which is contained in the words taken fimply and properly; and metaphorical literal, where the words are to be taken in a figurative and metaphorical fenfe. The myftical fenfe of fcripture they divide into three kinds: the firft correfponding to faith, and called *allegorical;* the fecond to hope, called *anagogical;* and the third to charity, called the *tropological fenfe.* And fometimes they take the fame word in fcripture in all the four fenfes: thus the word *Jerufalem,* literally fignifies the capital of Judæa; allegorically, the church militant; tropologically, a believer; and anagogically, heaven. So that paffage in Genefis, *let there be light, and there was light,* literally fignifies corporeal light; by an allegory, the Meffiah; in the tropological fenfe, grace; and anagogically, beatitude, or the light of glory.

MYSTICS, a religious fect, diftinguifhed by their profeffing a pure, fublime, and perfect devotion, with an entire difinterefted love of God, free from all felfifh confiderations, and by their afpiring to a ftate of paffive contemplation.

MYTHOLOGY. The word *mythology* is a Greek compound, that fignifies a *difcourfe on fables;* and comprehends, in a collective fenfe, all the fabulous and poetic hiftory of pagan antiquity. It follows therefore, that this fcience teaches the hiftory of the gods, demi-gods, and fabulous heroes of antiquity; the theology of the pagans, the principles of their religion, their myfteries, metamorphofes, oracles, &c. By this definition, it appears fufficiently what are the objects of which we are to treat in this article.

If we well confider the matter, we fhall find, that there were, in pagan antiquity, three different religions. *Firft,* That of the philofophers, who treated metaphyfically of the nature, the attributes, and of the works of the Supreme Being. They endeavoured to difcover the true God, and the manner in which he ought to be worfhipped. It is not wonderful, that thefe men of exalted genius fhould in fome degree ridicule, in their works, the two other pofitive religions, and thofe gods on whom they were founded; at the fame time that they outwardly profeffed the eftablifhed religion, in order to preferve the peace of fociety, and to avoid the perfecutions of the legiflature, and the infults of the populace. For in fact, was it poffible for them to believe the pagan fables? Muft they not forefee, that their religion would one day give place to another, while their own works would pafs with their names to the lateft pofterity? And could they fuffer the thought, that their reputation would be tarnifhed in the eyes of that pofterity, by having it imagined they believed fuch idle tales as were broached by the priefts of their times? Could Plato, Socrates, Seneca, and Cicero, be unconcerned for their fame among future generations and future philofophers? And what fhould we at this day have faid of thofe great men, had they been fo political, or hypocritical, as to have entirely concealed their fentiments with regard to thefe matters?

The fecond religion was that of paganifm, which was the eftablifhed religion of all the ancient nations except the Jews. This was the doctrine that was taught by the priefts, and protected by the fovereigns. Its dogmas were demonftratively falfe, but not always fo abfurd as may at firft appear; efpecially if we annex to the divinities, and to the religious ceremonies of the pagans, a fenfe that is frequently myftic, and always allegoric; if we remember, that the firft heathens deified thofe great men to whom the reft of mankind were indebted for any fignal benefits, as Jupiter, Apollo, Ceres, Bacchus, Hercules, Æfculapius, &c. in order to induce others, as well of the prefent as future ages, to reverence and to imitate them. Would not an ancient pagan, if he were to return upon the earth, have fpecious arguments, at leaft, to fupport his religion, when he faw weak mortals beatify or canonize, merely by their own authority, other weak mortals (frequently mere pedants), and place them in heaven, without the permiffion or approbation of the Supreme Being? Happy is it for mankind, when at different times fagacious pontiffs purge the kalendar, and the brains of the people, from a herd of pretended faints, and prevent them, at leaft after their death, from doing injury to fociety, by interrupting the induftry of the laborious inhabitants with keeping their feftivals.

The third religion was idolatry, or the religion of the populace. For the common people, born to be deceived in every thing, confounding in their imaginations the ftatues of the gods, the idols of their divinities, the emblems of their virtues and of religious worfhip, with the gods, divinities, virtues, and worfhip themfelves, adored thefe images, and proceeded to extravagancies the moft ridiculous, and frequently moft criminal, in their ceremonies, feafts, libations, facrifices, &c. It is to be feared, that, as long as there are upon the earth men of our limited capacities, this triple religion will conftantly fubfift under different forms; and we are much deceived, if it may not be found under the empire of Chriftianity itfelf, notwithftanding the purity of its doctrine. It will be eafily conceived, that it is not of the religion of philofophers, nor that of the populace, of which we are to treat in this article of Mythology: but of that which

Mythology. fubfifted under the authority of the magiftracy and the priefthood, and confequently of paganifm in general.

As far as we are able to judge by all the ancient authors we have read, the pagans adored the fovereign Lord of the univerfe under the name of *Fate* or *Deftiny*, which we muft not confound with Fortune, who was regarded as a fubaltern divinity. Jupiter himfelf, all the gods, every animated being, the heavens, the earth, the whole frame of nature, was fubfervient to Deftiny, and nothing could reverfe its decrees. This divinity was fo highly adorable, as to be above all rank; and was regarded as too fupreme to be reprefented under any fenfible image or ftatue, or to have any temple erected for its worfhip. We do not remember to have read, that ever any facrifice was offered to this Deftiny, or that any temple or city was ever dedicated to its name. We are almoft inclined to think, that the pagans were fenfible, that the temple and the worfhip of the God of gods ought to be in the heart of man. Mention is made, indeed, of a temple that was dedicated to the Unknown God; but we are ignorant whether or not Deftiny were thereby meant. We muft not confound this Deftiny, moreover, with the goddefs of chance, of which there are fome antique ftatues that reprefent her in a recumbent pofture, and playing with little bones; for this was nothing more than an invention of fome ftatuary.

After this general and philofophical idea of the Supreme Being, comes the pofitive religion of the pagans. This was entirely founded on fable, which took its rife either from ancient traditions, or hiftorical events, altered or augmented by the imaginations of the poets, by fuperftition, or by the credulity of the people; or elfe it confifted of allegoric or moral fictions. A crowd of writers, and among the reft *Noel le Comte*, (Natalis Comes), the abbots Bannier and Pluche, &c. have made many refearches into the origin of fable: and they think they have difcovered its fource, 1. In the vanity of mankind; 2. In the want of letters and characters; 3. In the delufive eloquence of orators; 4. In the relations of travellers; 5. In the fictions of poets, painters, ftatuaries, and dramatic writers; 6. In the diverfity and uniformity of names; 7. In the ignorance of true philofophy; 8. in the foundation of colonies, and the invention of arts; 9. In the defire of having gods for our anceftors; 10. In the imperfect or falfe interpretation of the holy fcriptures; 11. In the ignorance of ancient hiftory; 12. In a like ignorance of chronology; 13. In that of foreign languages; 14. In the tranflation of the religion of the Egyptians and Phœnicians into Greece; 15. In the ignorance of geography; and, 16. In the belief which the firft people had of the intercourfe of gods with men. It is certain, that all thefe matters taken together are fufficient to produce many thoufands of fables; are more than fufficient to enable us to deceive ourfelves and others, and to give rife to infinite reveries. But we fhould take care how we draw from thefe fources demonftrations that might be ufed, by infidels, as arguments to overthrow the hiftory of the Jews; a people the moft ftupid, moft credulous, and oftentatious of all others. In the mean time, the pagan philofophers themfelves afferted, that it was a god who invented the fable: fo much they were convinced of its ingenuity, and of its ftrong tendency to inftruct mankind in their duty.

Mythology therefore, when properly treated, begins with making learned refearches into the real origin of fable, of paganifm, and of that idolatry which was its confequence. It recurs for this purpofe even to the beginning of the world: and after finding that Laban, the father in-law of the patriarch Jacob, was a maker of idols, and that he had his little images, or houfehold gods, which he formed of baked earth, and which fhews that idolatry exifted in the greateft antiquity; it then explains cofmogony, and theogony, or the belief that the firft inhabitants of the earth entertained of the creation of the univerfe, and what the pagan theology taught of the genealogy of their falfe gods. It begins with the tradition of the Chaldeans, a people fo ancient, that Nimrod was their firft king; but at the fame time fo credulous and fuperftitious, that we may regard them as the authors of all thofe fables, and the propagators of all thofe vifions, that have fince blinded human reafon. According to this tradition, a monfter named *Oannes*, or *Oes*, half fifh and half man, fprang from the fea, before the chaos was completely difperfed, and gave laws to the Chaldeans. A woman called *Omorka*, reigned over all the earth. *Bel* cut her in two, and made of one moiety the heavens, and of the other the earth. They likewife invented the two primitive beings; of which the good one, who was named *Orafmafdes*, had the direction of heaven; and the other, called *Arimanius*, that of hell.

The fcience of mythology then teaches the theogony of the Phœnicians; concerning whom it draws great lights from Sanchoniathon, a prieft of Beryte, who lived before the Trojan wars, more than 400 years before Hefiod and Homer, and of whom Eufebius has preferved confiderable fragments. From thence it paffes to the theogony of the Egyptians; of whom *Thot* or *Thaut*, the founder of that nation, was likewife, they fay, their firft hiftorian; that Sanchoniathon even copied from him; and of whom we find many relations in the Greek hiftorians, efpecially in Herodotus, Diodorus Siculus, and in Eufebius of Cæfarea. It then examines the theogony of the Atlantides, who dwelt on the weftern part of Africa, and of whom Diodorus alone has preferved any account. From thence it proceeds to the theogony of the Greeks, which is far better known to us, as we find accounts of it, more or lefs particular, in numberlefs Greek and Latin writers. This theogony had the fame foundation as that of the Romans; the latter having only extended it, by addding to the Greek divinities certain gods or demigods, formed of their heroes, and certain fymbolic and allegoric divinities, which mythology explains at the fame time: and it is on this occafion that it enters into a particular explication of the cofmogony and theogony of Ovid; whofe book of metamorphofes contains as copious defcriptions as we could defire of the fables of the ancients: what was their belief concerning the habitations of the bleffed after their death, or of the Elyfian fields; as well as of their hell or Tartarus; of the dog Cerberus; of the ferryman Charon; of the furies; of the four rivers, Cocytus, Lethe, Phlegethon, and Styx, which water the Tartarian regions, &c.

Mythologifts then continue their refearches into the time, the epoch, and place, of the real origin of paganifm and idolatry; and they prove that the pagans began

 began by adoring the heavenly bodies, the ftars and planets. They next examine into the progrefs of idolatry: what were the temples of the pagans, their altars, their inclofures, their facred groves, their afylums, the idols and ftatues of their deities; in what manner they were reprefented; what were their facrifices, the victims that were offered; what the days of penitence and fupplication, the feafts or the gods of lectifternia, their invocations or incantations and exorcifms, the religious ceremonies obferved at laying the foundations of cities, &c.

Divination, or the prediction of future events, a weaknefs that has at all times poffeffed the human mind, forms alfo an important article of pagan theology. It is therefore in this place that mythology confiders the nature of oracles, and in what manner thefe oracles gave their anfwers; the ceremonies that were obferved in confulting them; the frantic emotions of the prieftefs Pythia on her tripod, and thofe of other priefts. See DIVINATION and ORACLES.—It then endeavours to inveftigate the hiftory of the Sibyls, and of their prophecies. See SIBYLS.—It next paffes to the examen of the nature of auguries, aufpices, harufpices, prodigies, &c.; of expiations and ablutions; of the magic and aftrology of the ancients, &c. See AUGURY, &c.—It then proceeds to the examination of the nature of the pagan divinities themfelves.

The celebrated treatife of Cicero *De natura Deorum*, will here furnifh great lights: but modern authors who have treated on thefe matters, have not been contented with this alone: they have, fo to fay, extracted the effence of all antiquity, of which they have formed fyftems; but unluckily thefe fcarce ever agree with each other. As philofophers, it is of very little importance for us to know what was the nature of thefe gods, feeing we know that they were merely fabulous: but as hiftorians and antiquaries, it concerns us to know what was the nature that was attributed to them in general; and, in particular, what were the origin, genealogy, rank, functions, authority, and operations, that were attributed to each divinity; and it is on thefe matters that we have ftill fome remarks to make.

The gods of the ancient Greeks and Romans were all either *Dii majorum gentium*, or *Dii minorum gentium;* that is, of the firft or fecond order. The former were alfo called *confentes*, *magni confultores*, &c. According to Ennius, they were 12 in number, and are included in thefe verfes:

Juno, Vefta, Minerva, Ceres, Diana, Venus, Mars,
Mercurius, Jovis, Neptunus, Vulcanus, Apollo.

To thefe were added eight others, under the title of *Selecti*, which were Sol, Luna, Tellus, Genius, Janus, Saturnus, Liber, and Pluto. The fecond order, or *minorum gentium*, were called *Adfcriptitii*, *Medioximi*, *Minufcularii*, *Putatitii*, *Indigetes*, *Semones*, *&c.* the principal of which were Æfculapius, Bacchus, Caftor, Fauna, Hercules, the Lares or Penates, Pollux, Quirinus. See thefe under their feveral articles, &c.

According to the fecond divifion, all their divinities were claffed into, 1. Celeftial gods; 2. Terreftrial gods; 3. Sea gods; and, 4. The infernal deities, or *inferi*. The celeftial gods were Jupiter, Juno, Apollo, Aurora, Cupid, Cybele, the Graces, Hebe, Iris, Luna, Mars, Mercury, Minerva, Nemefis, Saturn, Themis, Venus, &c. The terreftrial gods were Æolus, Aftræa, Ceres, Diana, the Fauni, Feronia, Flora, Janus, Momus, the Mufes, Pales, Pan, Pomona, Priapus, the Satyrs, Silenus, the god Terminus, Vefta or Rhea, Vulcan, &c. The fea-gods were Neptune, Amphitrite, Thetis, Canopus, Glaucus, Ino, the Nereids, Nereus, Oceanus, Palæmon, Triton, &c. The infernal gods were Pluto, Proferpine, Charon, Minos, Æacus, Rhadamanthus, the Furies, Death, Night, the Fates, Plutus, &c. See thefe articles.

The third divifion ranged the divinities according as they prefided, 1. Over the pregnancy of women, (*Prægnantium;*) 2. At parturitions (*Parturientium;*) 3. At births, (*Nafcentium;*) 4. At adulteries; 5. At marriages: to which they added, 7. Dii morales, or moral gods; and, 7. Funeral gods. The gods of pregnancy were Pilumnus, Intercidona, and Deverra: the gods of parturition, Juno, Lucina, Diana, Egerio, Profa, Poftverta, Menagenata, Latona, the gods that were called *Nixi*, or of *labour*, &c. The gods of birth were Janus, Opis, Nafcion, Cunina, Carmenta, Vaginianus, Levana, Rumia, Potina, Educa, Offilago, Carnea, Nundina, Statilinus, Fabulinus, Paventia, &c. The gods of adultery were Juventus, Agenoria, Strenua, Stimula, Horta, Quies, Murcia, Adeona, Abeona, Voluptas, Orbona, Pellonia, Numeria, Camoena, Sentia, Angerona, Heres, Martea, Laverna, the god Averruncus, Confus, Catius, Volumnus and Volumna, Honorius, Aius Locutius, &c. The nuptial gods were Diana, Domiduca, Domitius, Hymenæus or Hymen, Jugatinus, Jupiter perfectus, Juno perfecta, Juno cinxia, Juno unxia, Lucina, Manturna, Mutinus, Dea Mater prima, Suada, Thalaffius, Venus, &c. The moral gods were called *Virtus*, *Honor*, *Fides*, *Spes*, *Juftitia*, *Pietas*, *Mifericordia*, *Clementia*, *Pudicitia*, *Veritas*, *Mens*, *Concordia*, *Pax*, *Salus*, *Felicitas*, *Libertas*, *Pecunia*, *Rifus*, *Invidia*, *Contumelia*, *Impudentia*, *Calumnia*, *Fraus*, *Difcordia*, *Furor*, *Fama*, *Fortuna*, with all their epithets good or bad, *Febris*, *Pavor* and *Palor*, *Paupertas*, *Neceffitas*, *Tempeftas*, *Silentium*, *&c.* The funeral gods were Pluto, Libitina, Nænia, Death, the Fates, &c.

Hefiod indeed pretends, that all thefe gods derived their origin from chaos; but we have already pointed out more juft fources. It is almoft incredible to what a prodigious number the fuperftition and weaknefs of the Greeks and Romans multiplied thefe divinities; there have been 30,000 of them enumerated. It will not be expected that we fhould here attempt to defcribe them, nor will it be remarkable if we have forgotten to mention even fome of the firft rank: although, vaft as this company of gods is, mythology does not omit to trace the hiftory of the greateft part of them, as is taught by paganifm; and they who are defirous of particular information in thefe matters may confult with advantage the theogony of Hefiod, the catalogue of Apollodorus, the metamorphofes of Ovid, the fables of Hygina, Lylii Gregorii Gyraldi Syntagma de diis Gentilium, the mythology of Natalis Comes, the books of Gerard Voffius de idolatria Gentilium, Johannis Boccatii Genealogia deorum, the Pantheon of Pompey, the hiftory of heaven by Abbé Pluche, the hiftoric explanation of fables by Abbé Banier, and Bryant's Mythology.

 There were ftill many other diftinctions, of which the pagans made ufe to mark the rank, the functions, and nature of their feveral divinities. For example, the goddefs Vefta, or the mother of all the gods, was adored by all people in general. Mars, Bellona, Victoria, Fortunata, &c. affifted all parties. The topical gods, on the contrary, were adored in particular countries only; as Aftarte in Syria, Derceto and Semiramis among the Affyrians, Ifis and Ofiris by the Egyptians, Quirinus at Rome, &c. The title *Semones*, which was given to a certain clafs of divinities, was doubtlefs derived from *Semi-homines*, that is, *demi-men*; and fignified the fame as *femi-dii*, or *demi-gods*. Thefe were monarchs and illuftrious heroes, or thofe great men who were the founders of cities and nations, that were deified by way of apotheofis. Pythagoras had taught the Chaldeans the doctrine of tranfmigration; and that, after their death, thofe who were virtuous would be elevated to the rank of divinities. This doctrine was adopted by all the pagan world. The apotheofis, after they had erected temples and altars to the new gods, was celebrated with much folemnity. In the laft ceremony, an eagle was fixed on the catafalk, or funeral pile, on which was placed the image of the hero; and when the pile began to burn, the eagle was let loofe, who, mounting into the air with the flames, feemed to carry the foul of the departed hero up to heaven.

Mythology informs us alfo who thofe perfons were that antiquity regarded as the children of the gods, fuch as Thefeus, Hippolytus, Paris, &c. what the pagans believed with regard to the nature of their genii and demons, of their dryades, hamadryades, nymphs, tritons, firens, fauns, fylvans, centaurs, and other fubaltern divinities; and in this manner it explains all the fyftems of the pofitive religion of the Greeks and Romans. They who are defirous of extending their knowledge of paganifm ftill further, of knowing the dogmas of each particular people, what were their gods, and the various manners in which they were worfhipped, fuch as Apis, Ifis, Ofiris, &c. the adoration of crocodiles and onions, &c. among the Egyptians, muft ftudy the differents theogonies of thefe people; and notwithftanding all the informations which ancient and modern authors afford, this ftudy is yet boundlefs, and attended with many difficulties and uncertainties: though it appears demonftrative, that the origin of paganifm, and of idolatry in general, was derived from the Chaldeans, from whom the Egyptians drew that doctrine which they after tranfmitted to all other nations; and confequently that the primordial divinities were the fame, under different denominations, among all the idolatrous nations of the earth.

The nature of this work will not permit us to defcend to further particulars. But to give our readers an idea of the manner in which mythology treats its fubjects, and of the method that fhould be obferved in ftudying fable, or the hiftory of the gods of antiquity, we fhall here give, by way of example, a curfory defcription of Parnaffus and its inhabitants.

Parnaffus was a mountain of Phocis, that had two fummits, one of which was called *Tithoreus*, and the other *Hyampeus*. Others fay, that one of thefe hills was named *Helicon*, and the other *Cytheron*; and that it is an error to imagine, that Helicon was a mountain of Bœotia. However that be, this double hill was confecrated to Apollo and the mufes, who there held their ufual refidence. According to fable, there had been a remarkable combat on this hill, between Helicon and Çytheron. Whoever flept on Parnaffus, when he waked, became a poet. Apollo had there a temple. There alfo was the fountain Caftalia, into which Apollo had metamorphofed a nymph that he loved, and had given to its waters the power of making all who drank of them poets. At the foot of Parnaffus flowed the river Hippocrene, that had the fame virtue; and the fource of which was opened by a ftroke of the foot of the horfe Pegafus. This river nourifhed a great number of fwans, that were regarded as facred. Pegafus was a winged horfe, that belonged to Apollo, and grazed on the fummit of Parnaffus. He fprang from the blood of Medufa, when Perfeus cut off her head, which was placed among the ftars. Such was the delicious abode of Apollo, the fon of Jupiter and Latona, who was born, with his twin fifter Diana, in the ifland Delos. He killed the Cyclops, who forged the thunderbolts with which Jupiter had overthrown his fon Æfculapius; but for that prefumption he was forced to leave heaven, and became an inhabitant of the earth. He guarded the oxen of Admetus; he aided Neptune to build the walls of Troy, and Alcotheus in forming the labyrinth. He killed the dragon or ferpent Python. He invented mufic and phyfic; and was honoured as the god of poets and phyficians. He was reprefented as a young man without a beard, his head furrounded with rays, and bearing in his hand a bow, or a lyre. As the ancients denoted the fun by the name of *Apollo*, they fometimes reprefented him alfo as feated in a chariot, drawn by two white horfes, preceded by Aurora and the ftar Venus: Phaëton his fon, being defirous of conducting thefe horfes, was thrown into the fea. Apollo was alfo called *Phœbus*, *Titan*, and *Sol*. He is known to have had amours with Arfinoe, Corycia, Melœne, Cyrene, Mantho, Sinope, Calliope, and others; by whom he had Delphe, Naxe, Niletus, Arabe, Garamas, Sirus, Linus, Orpheus, and other children. He had peculiar honours paid him in the Pythian games at Delphos, and in the fecular games at Rome.

The mufes were the companions of Apollo in his rural abode. They were likewife called the *learned fifters*; as alfo the *Camœnion*, *Heliconian*, *Parnaffian*, *Aonian*, *Pierian*, *Pegafian*, *Aganippian*, *Thefpian*, *Libethrian*, and *Caftalian fifters*. They were the daughters of Jupiter and Mnemofyne, and were regarded as the goddeffes of fciences and arts in general. There were nine of thofe mufes; to whom they attributed; 1. To Clio, hiftory; 2. To Melpomene, tragedy; 3. To Thalia, comedy; 4. To Euterpe, flutes and otherp neumatic inftruments of mufic; 5. To Terpfichore, the harp and the dance; 6. To Erato, the lyre and the lute; 7. To Calliope, heroic verfe; 8. To Urania, aftronomy; and 9. To Polyhymnia, rhetoric and eloquence. The Graces alfo fometimes quitted Venus to pay their court to Apollo.

Such was the idea they entertained of Parnaffus and its inhabitants. There is no doubt but that, under thefe fabulous reprefentations, thefe fenfible images, were

were concealed allegoric and moral meanings; nor can it be denied but that their method of cultivating the arts and fciences, by this manner of expreffing their ideas, was as ingenious and pleafing as it is poffible to imagine. Every other fubject that paganifm embraced, it treated with the fame genius, and in a manner equally pleafing; and though that religion was altogether fallacious, yet we muft allow that it was extremely well calculated to promote the polite arts, by thofe refined, noble, graceful, brilliant images, by thofe charming fubjects, which it conftantly prefented, and which it ftill offers to the poet, painter, fculptor, and every other artift.

But this was not a power fufficiently ftrong to fecure paganifm againft that viciffitude, that decline and diffolution, which finally attends all the productions of this world. This religion, which had fubfifted near 5000 years, and almoft from the origin of the human race, gradually declined in proportion as the lights of Chriftianity and philofophy illumined the minds of mankind. For though the pagan religion, and the fables on which it is was founded, were pleafing and favourable to the polite arts, they were not however calculated to fatisfy the minds of philofophers, nor to promote the real good of mankind, by fecuring their temporal and eternal happinefs. It is even furprifing that fo great a genius as the emperor Julian fhould attempt to revive the embers of paganifm, which infenfibly declined, and had received a mortal blow at the beginning of the fourth century by the emperor Conftantine the great. Julian employed all the refources of his imagination, of his eloquence, of his power, and even of his own fatal example, to revive it; but in vain. The period of paganifm was arrived, and nothing could fave it from diftruction. The furious Theodofius, to whom bigotted priefts and hiftorians have affigned the name of *great*, totally overthrew it toward the clofe of the fame century, deftroyed thofe temples and altars which yet fubfifted, difperfed its colleges, and exterminated its priefts. From that dire epoch, nothing of paganifm has remained, except fome ruins difperfed in the remote parts of the earth, and among people wretched and almoft unknown; where this religion, once fo flourifhing and univerfal, is now degenerated into grofs and difguftful idolatry.

MYTULUS, the Muscle, in ichthyology; a genus of animals, belonging to the order of vermes teftacea. The animal is an afcidia: the fhell bivalve; often affixed to fome fubftance by a beard; the hinge without a tooth, marked by a longitudinal hollow line. The moft remarkable fpecies are, 1. The rugofus, or rugged mufcle, with a brittle fhell, very rugged, and in fhape very irregular; ufually oblong, and round at the ends. Its length is near an inch; the colour whitifh. It is always found lodged in limeftone; the outfide appears honey-combed; but the apertures are too fmall for the fhell to pafs through, without breaking into the cell they are lodged in. Multitudes are found in the fame ftone; but each has a feparate apartment, with a different external fpiracle. 2. The edulus, or edible mufcle, has a ftrong fhell, flightly incurvated on one fide, and angulated on the other. The end near the hinge is pointed; the other rounded. When the epidermis is taken off, it is of a deep blue colour. It is found in immenfe beds, both in deep water, and above low-water mark. The fineft mufcles are thofe called *Hambleton hookers*, from a village called *Humbleton* in that county. They are taken out of the fea, and placed in the river Wier, within reach of the tide, where they grow very fat and delicious. 3. The incurvatus, or crooked mufcle, is very crooked on one fide near the end; then greatly dilated, and covered with a thick rough epidermis. Within it has a violet tinge. It is found on the coaft of Anglefea, near Prieftholme; ufually an inch and an half long. 4. The pellucidus, or pellucid mufcle, hath a delicate tranfparent fhell, moft elegantly rayed lengthwife with purple and blue; like the former in fhape, but more oval; commonly fhorter than two inches. It is found in Anglefea, fometimes in oyfter-beds, fometimes in trowling over flutchy bottoms. 5. The umbilicatus, or umbilicated mufcle, is nearly of an oval form, the length fometimes five inches. It is a rare and new fpecies; fometimes dredged up off Prieftholme ifland, Anglefea; difcovered by the reverend Mr Hugh Davies. 6. The curtus, or fhort mufcle, with a fhort, ventricofe, obtufe fhell, of a dirty yellow colour, length about an inch. 7. The modiolus, or great mufcle, with a ftrong fhell, blunted at the upper end; one fide angulated near the middle; from thence dilating towards the end, which is rounded. It is the greateft of Britifh mufcles, being from fix to feven inches in length; it lies at great depths; often feizes the baits of ground-lines, and is taken up with the hooks. 8. The cygneus, or fwan mufcle, with a thin brittle fhell, very broad and convex, marked with concentric ftriæ; attenuated towards one end, dilated towards the other; decorticated about the hinge; the colour a dull green; the length fix inches, breadth three and a half; inhabits frefh waters. 9. The anatinus, or duck mufcle, hath a fhell more oblong and lefs convex than the laft; is very brittle and femitranfparent; the fpace round the hinges like the laft; the length about five inches, breadth two and a quarter; inhabits frefh waters. Crows feed on thefe mufcles, and alfo on different fhell-fifh. It is diverting to obferve, that when the fhell is too hard for their bills, they fly with it to a great height, drop the fhell on a rock, and pick out the meat when the fhell is fractured by the fall.

The common fea or edible mufcle has, from its being always found faftened to the rocks, been fuppofed by many wholly incapable of progreffive motion; but this is an erroneous opinion. It is a common practice in France, at fuch feafons of the year as do not afford fun enough to make falt, to throw the common fea-mufcles, which the fifhermen catch about the coafts, into the brine-pits. They have an opinion that this renders their flefh the more tender and delicate, as the rain which falls at thefe feafons makes the water of the pits much lefs falt than the common fea-water. The mufcles are on this occafion thrown carelefsly in, in feveral different parts of the pits; yet, at whatever diftances they have been thrown in, the fifhermen when they go to take them out, always find them in a clufter together; and as there is no current of water in thefe places, nor any other power of motion which can have brought the mufcles together, it feems

feems very evident that they muft voluntarily have marched from the places where they were at firft, to have met thus together. This progreffive motion is wholly performed by means of what we call the *tongue* of the mufcle, from its fhape; but, from its ufe in this cafe, appears rather to merit the name of a *leg*, or an *arm*, as by laying hold of any diftant fubftance, and then forcibly contracting itfelf again, it draws along the whole body of the fifh; the fame part, when it has moved the animal to a proper place, ferves alfo to fix it there, being the organ by which it fpins the threads which we call its *beard*, by which it is held to a rock, or to another mufcle. The motion of the mufcle, by means of this part, is juft the fame with that of a man laid flat on his belly, who would draw himfelf along by laying hold of any thing with one hand, and then drawing himfelf to it.

Mufcles are well known to have a power of faftening themfelves either to ftones, or to one another's fhells, in a very ftrong and firm manner; but the method of doing this was not well underftood till the obfervations of Mr Reamur explained it.

Every one who opens and examines a common mufcle, will find, that in the middle of the fifh there is placed a little blackifh or brownifh body refembling a tongue. This in large mufcles is near half an inch long, and a little more than a fixth of an inch in breadth, and is narrower at the origin than at the extremity: from the root of this tongue, or that part of it which is faftened to the body of the fifh, there are produced a great number of threads, which, when fixed to any folid fubftance, hold the mufcle firmly in its place: thefe threads are ufually from an inch to two inches in length, and in thicknefs from that of a hair to that of a hog's briftle. They iffue out of the fhell in that part where it naturally opens, and fix themfelves to any thing that lies in their way, to ftones, to fragments of fhells, or, which is the moft common cafe, to the fhells of other mufcles; whence it happens that there are ufually fuch large parcels of mufcles found together. Thefe threads are expanded on every fide, and are ufually very numerous, 150 having been found iffuing from one fhell: they ferve the office of fo many cables; and, each pulling in its proper direction, they keep the mufcle fixed againft any force that can be offered from whatever part it come. The filaments are well known to all who eat mufcles, who ever carefully feparate them under the name of the beard; and Mr Reaumur has found, that while the animal is living in the fea, if they are all torn away by any accident, the creature has a power of fubftituting others in their room: he found, that if a quantity of mufcles were detached from one another and put into a veffel of any kind, and in that plunged into the fea, they in a little time faftened themfelves both to the fides of the veffel, and to one another's fhells; the extremity of each thread feemed in this cafe to ferve in the manner of a hand to feize upon any thing that it would fix to, and the other part which was flenderer and fmaller to do the office of an arm in conducting it.

To know the manner of the mufcles performing this operation, this diligent obferver put fome mufcles into a veffel in his chamber, and covered them with fea-water; he there faw that they foon began to open their fhells, and each put forth that little body before defcribed by its refemblauce to a tongue, and at the root of which thefe threads grow; they extended and fhortened this part feveral times, and thruft it out every way, often giving it not lefs than two inches in length, and trying before, behind, and on every fide with it, what were the proper places to fix their threads at: at the end of thefe trials they let it remain fixed for fome time on the fpot which they chofe for that purpofe, and then drawing it back into the fhell with great quicknefs, it was eafy to fee that they were then faftened by one of thefe threads to the fpot where it had before touched and remained fixed for a few minutes; and in repeating this workmanfhip the threads are increafed in number one at every time, and being fixed in different places they fuftain the fifh at reft againft any common force.

The feveral threads were found to be very different from one another; the new formed ones being ever whiter, more gloffy, and more tranfparent than the others: and it appeared on a clofe examination, that it was not, as might have been moft naturally fuppofed, the office of the tongue to convey the old threads one by one to the new places where they were now to be fixed, but that thefe in reality were now become ufelefs; and that every thread we fee now formed, is a new one made at this time; and in fine, that nature has given to fome fea-fifhes, as well as to many land-infects, a power of fpinning thofe threads for their neceffary ufes; and that mufcles and the like fifh are under water, what caterpillars and fpiders are at land. To be well affured of this, however, Mr Reaumur cut off the beard or old threads of a mufcle as clofe as he could, without injuring the part; and the proof of the opinion of their fpinning new ones at pleafure was now brought to this eafy trial, whether thefe mufcles, fo deprived of their old ones, could fix themfelves as foon as others which were poffeffed of theirs, and could throw out their threads to as confiderable diftances. The experiment proved the truth of the conjecture; for thofe whofe beards or old threads were cut off, fixed themfelves as foon as thofe in which they were left, and fpread their threads to as great a diftance every way.

When the mechanifm of this manufacture was thus far underftood, it became a natural defire to inquire into the nature of the part by which it was performed: this has hitherto been mentioned under the name of the tongue, from its fhape; but it is truly the arm of the fifh; and whenever it happens to be loofened from its company, or fixed in a wrong place, it ferves the animal to drag its whole body fhell and all along, and to perform its feveral motions. It fixes itfelf to fome folid body; and then ftrongly contracting its length, the whole fifh muft neceffarily follow it, and be pulled toward the place where it is fixed. This is an ufe, however, that this part is fo rarely put to, that it is not properly to be efteemed a leg or an arm, for this; but, according to its more frequent employment, may much better be denominated the organ by which the threads are fpun.

Though this body is flat in the manner of a tongue for the greater part of its length, it is however rounded or cylindric about the bafe or infertion, and it is much fmaller there than in any other part: there are feveral

ſeveral muſcular ligaments faſtened to it about the root or baſe, which hold it firmly againſt the middle of the back of the ſhell; of theſe ligaments there are four which are particularly obſervable, and which ſerve to move the body in any direction. There runs all along this body a ſlit or crack, which pierces very deeply into its ſubſtance, and divides it as it were into two longitudinal ſections; this is properly a canal, and along this is thrown the liquor which ſerves to form the threads; and it is in this canal or ſlit that theſe threads are moulded into their form. Externally, this appears only a ſmall crack or ſlit, becauſe the two fleſhy ſections of the parts almoſt meet and cover it, but it is rounded and deep within, and is ſurrounded with circular fibres. This canal is carried regularly on from the tip of the tongue, as it is called, to its baſe, where it becomes cylindric; the cylinder in this part being no other than a cloſe tube or pipe, in which this open canal terminates. The cylindric tube contains a round olong body, of the nature of the threads, except that it is much larger; and from the extremity of this all the threads are produced, this ſerving as a great cable to which all the other little cordages diſperſed towards different parts are fixed. The tube or pipe in which this large thread is lodged, ſeems the reſervoir of the liquor of which the other threads are formed; all its internal ſurface being furniſhed with glands for its ſecretion.

The muſcle, like many other ſea-fiſhes, abounds in this liquor; and if at any time one touch with a finger the baſe of this ſpinning organ, one draws away with it a viſcous liquor in form of ſeveral threads, like thoſe of the caterpillar, ſpider, and the other ſpinning land-animals. The threads fix themſelves with equal eaſe to the moſt ſmooth and gloſſy, as to rougher bodies; if the muſcles are kept in glaſs-jars of ſea-water, they as firmly faſten themſelves to the glaſs as to any other body.

Muſcles, be they ever ſo young, have this property of ſpinning; and by this means they faſten themſelves in vaſt numbers to any thing which they find in the ſea. Mr Reaumur has ſeen them when as ſmall as millet ſeeds, ſpin plentifully; tho' their threads, proportioned to their own weight, are much finer and ſmaller than thoſe of larger muſcles.

It is a queſtion yet undetermined, whether the muſcle has a power of breaking or otherwiſe getting rid of its threads, in order to its removing from the place where it is once fixed; but it appears probable that they have not, and that they muſt remain where they have once faſtened themſelves, tho' their deſtruction be the conſequence of it. Mr Reaumur tried this experiment in his jars: when they had well fixed themſelves to the ſides of them, he poured off part of the ſalt-water, ſo that it became the intereſt of the fiſh to leave their hold and go lower down, but they ſeemed to have no power to effect this.

The common muſcle affords the curious obſerver a very pleaſing object of examination by the microſcope. The tranſparent membrane, which immediately appears on opening the ſhell, ſhews the circulation of the blood for a long time together through an amazing number of veſſels. And Mr Lewenhoek, in ſeveral which he diſſected, diſcovered numbers of eggs or embryo muſcles in the ovarium, appearing as plainly as if he had ſeen them by the naked eye, and all lying with their ſharp ends faſtened to the ſtring of veſſels by which they receive nouriſhment. The minute eggs, or embryos, are by the parent placed in due order, and in a very cloſe arrangement on the outſide of the ſhell, where, by means of a gluey matter, they adhere very faſt, and continually increaſe in ſize and ſtrength, till becoming perfect muſcles, they fall off and ſhift for themſelves, leaving the holes where they were placed, behind them.

This abundance of muſcle-ſhells very plainly ſhew when examined by the microſcope, and ſometimes they are in the number of 2000 or 3000 on one ſhell: but it is not certain that theſe have been all fixed there by the muſcle within; for theſe fiſh uſually lying in great numbers near one another, the embryos of one are often affixed to the ſhell of another. The fringed edge of the muſcle, which Lewenhoek calls the *beard*, has in every the minuteſt part of it ſuch variety of motions as is inconceivable; for being compoſed of longiſh fibres, each fibre has on both ſides a vaſt many moving particles.

From the common muſcles abundance of ſmall pearls, called *ſeed-pearls*, were, till of late, procured for medical purpoſes; but they are now diſuſed ſince it became generally known, that the cheaper teſtaceous powders were equally efficacious with theſe. Pearls are alſo found in the two laſt ſpecies.—Muſcles ſometimes diſagree with thoſe who eat them, bringing on ſwellings, difficulty of breathing, blotches, and ſometimes even death. The cure is oil mixed with ſalt water.

MYUS, (anc. geog.), one of the twelve towns of Ionia; ſeated on the Meander, at the diſtance of 30 ſtadia from the ſea. In Strabo's time it was incorporated with the Mileſians, on account of the paucity of its inhabitants, from its being formerly overwhelmed with water; for which reaſon the Ionians conſigned its ſuffrage and religious ceremonies to the people of Miletus. Artaxerxes allotted this town to Themiſtocles, in order to furniſh his table with proviſions. The town now lies in ruins.

MYXINE, the HAG; a genus of inſects belonging to the order of vermes inteſtini. It hath a ſlender body. carinated beneath; mouth at the extremity, cirrated; the two jaws pinnated; an adipoſe or rayleſs fin round the tail and under the belly. The only remarkable ſpecies is the glutinoſa, about eight inches long. It inhabits the ocean; enters the mouths of fiſh when on the hooks of lines that remain a tide under water, and totally devours the whole, except ſkin and bones. The Scarborough fiſhermen often take it in the robbed fiſh, on drawing up their lines. Linnæus attributes to it the property of turning water into glue.

N.

N Nabonassar.

N, A liquid consonant, and the 13th letter of the Greek, Latin, English, &c. alphabets.

The *n* is a nasal consonant: its sound is that of a *d*, passed through the nose; so that when the nose is stopped by a cold, or the like, it is usual to pronounce *d* for *n*. M. l'Abbé de Dangeau observes, that in the French, the *n* is frequently a mere nasal vowel, without any thing of the consonant in it. He calls it the Sclavonic vowel. The Hebrews call their *n nun*, which signifies child, as being supposed the offspring of *m*; partly on account of the resemblance of sound, and partly on that of the figure. Thus from the *m*, by omitting the last column, is formed *n*; and thus from the capital N, by omitting the first column, is formed the Greek minuscule ν. Hence for *biennies*, &c. the Latins frequently use *bimus*, &c. and the same people convert the Greek ν, at the end of a word into an *m*, as φαρμακον, *pharmacum*, &c. See M.

N before *p*, *b*, and *m*, the Latins change into *m*, and frequently into *l* and *r*; as in *in-ludo*, *illudo*; *in-rigo*, *irrigo*, &c.: in which they agree with the Hebrews, who, in lieu of *nun*, frequently double the following consonants; and the Greeks do the same; as when for *Manlius*, they write Μαλλιος, *&c.* The Greeks also, before κ, γ, χ, ν, changed the ν into γ: in which they were followed by the ancient Romans; who, for *Angulus*, wrote *Aggulus*; for *anceps*, *ag-ceps*, *&c.*

The Latins retrench the *n* from Greek nouns ending in ων; as Λεων, *Leo*; Δρακων, *Draco*: on the contrary, the Greeks add it to the Latin ones ending in ο; as Κατων, Νερων, for *Cato*, *Nero*.

N, among the ancients, was a numeral letter, signifying 900; according to the verse in Baronius,

N, quoque nongentos numero designat habendos.

And when a line was struck over it, $\bar{N}$, nine thousand. Among the ancient lawyers *N. L.* stood for *non liquet*, i. e. the cause is not clear enough to pass sentence upon. N, or N°, in commerce, *&c.* is used as an abbreviation of *numero*, number.

NABIS, tyrant of Sparta, reigned about 204 B. C.; and is reported to have exceeded all other tyrants so far, that, upon comparison, he left the epithets of *gracious* and *merciful* to Dionysius and Phalaris. He is said to have contrived an instrument of torture in the form of a statue of a beautiful woman, whose rich dress concealed a number of iron spikes in her bosom and arms. When any one therefore opposed his demands, he would say, "If I have not talents enough to prevail with you, perhaps my woman Apega may persuade you." The statue then appeared; which Nabis taking by the hand, led up to the person, who, being embraced by it, was thus tortured into compliance. He reigned 14 years, and was slain in battle.

NABOB, a viceroy, or governor of one of the provinces of the Mogul's empire.

NABONASSAR, first king of the Chaldæans, or Babylonians; memorable for the Jewish æra which bears his name, which is generally fixed in 3257, beginning on Wednesday February 26th in the 3967th of the Julian period, 747 years before Christ. The Babylonians revolting from the Medes, who had overthrown the Assyrian monarchy, did, under Nabonassar, found a dominion, which was much increased under Nebuchadnezzar. It is probable, that this Nabonassar is that Baladan in the second of Kings xx. 12. father of Merodach, who sent ambassadors to Hezekiah. See 2 Chron. xxxii.

Nabopolassar Nævius.

NABOPOLASSAR, king of Babylon: he joined with Astyages the Mede, to destroy the empire of Assyria; which having accomplished, they founded the two empires of the Medes under Astyages, and the Chaldeans under Nabopolassar, 627 B. C.

NABUCHADNEZZAR, or NABUCHODONOSOR II. king of Assyria, son of Nabopolassar, and styled the *Great*, was associated by his father in the empire, 667 B. C. and the following year he took Jehoiakim king of Judah prisoner, and proposed to carry him and his subjects in captivity into Babylon; but upon his submission, and promising to hold his kingdom under Nabuchodonosor, he was permitted to remain at Jerusalem. In 603 B. C. Jehoiakim attempted to shake off the Assyrian yoke, but without success; and this revolt brought on the general captivity. Nabuchadnezzar having subdued the Ethiopians, Arabians, Idumæans, Philistines, Syrians, Persians, Medes, Assyrians, and almost all Asia; being puffed up with pride, caused a golden statue to be set up, and commanded all to worship it; which Daniel's companions refusing to do, they were cast into the fiery furnace. But as he was admiring his own magnificence, by divine sentence, he was driven from men, and did eat grass as oxen, that is, he imagined himself to be one. At the end of seven years his reason returned to him, and he was restored to his throne and glory. He died 562 B. C. in the 43d year of his reign; in the 5th of which happened that eclipse of the sun mentioned by Ptolemy, which is the surest foundation of the chronology of his reign.

NADIR, in astronomy, that point of the heavens which is diametrically opposite to the zenith, or point directly over our heads.

NAERDEN, a strong town of the United Provinces in Holland, seated at the head of the canals of the province. The foundations of it were laid by William of Bavaria, in 1350. It was taken by the Spaniards in 1572, and by the French in 1672; but it was retaken by the prince of Orange the next year. It stands at the south end of the Zuyder-Zee, in E. Long. 5. 3. N. Lat. 51. 22.

NÆVIUS (Cneius), a famous poet of Campania, was bred a soldier, but quitted the profession of arms, in order to apply himself to poetry, which he prosecuted with great diligence; and composed a history in verse, and a great number of comedies. But it is said, that

that his firſt performance of this laſt kind ſo diſpleaſed Metellus, on account of the ſatyrical ſtrokes it contained, that he procured his being baniſhed from the city; on which he retired to Utica in Africa, where he at length died, 202 B. C. We have only ſome fragments left of his works.

NÆVUS, a mole on the ſkin, generally called a *mother's mark;* alſo the tumour known by the name of a *wen.*

All preternatural tumours on the ſkin, in the form of a wart or tubercle, are called *excreſcences;* by the Greeks they are called *acrothymia;* and when they are born with a perſon, they are called *nævi materni*, or *marks from the mother.* A large tumour depending from the ſkin is denominated *ſarcoma.* Theſe appear on any part of the body: ſome of them differ in their colour from the reſt of the ſkin; whilſt others are red, black, &c. Their ſhapes are various; ſome reſembling ſtrawberries, others grapes, &c. Heiſter adviſes their removal by means of a ligature, a cautery, or a knife, as circumſtances beſt ſuit.

As to the tumour called a *wen*, its different ſpecies are diſtinguiſhed by their contents. They are encyſted tumours; the matter contained in the firſt three following is inſpiſſated lymph, and that in the fourth is only fat. Monſ. Littre is the firſt who hath particularly deſcribed the fourth kind; and to the following purpoſe he ſpeaks of them all. A wen is ſaid to be of three ſorts, according to the kind of matter it contains: thoſe whoſe contents reſemble boiled rice, or curds, or a bread-poultice, is called *atheroma;* if it reſembles honey, it is named *meliceris;* and if it is like ſuet, it is denominated *ſteatoma:* but there is a fourth ſort, which may be called *lipome*, becauſe of its fat contents reſembling greaſe. He ſays that he hath ſeen one on the ſhoulders of a man, which was a thin bag, of a tender texture, full of a ſoft fat, and that it had all the qualities of common greaſe. And though the fat in the lipome reſembles that in the ſteatoma, yet they cannot be the ſame: for the matter of the ſteatoma is not inflammable, nor does it melt; or if it does, it is with great difficulty and imperfectly; whereas it is the contrary with the lipome. When the man who had the above-named lipome was fatigued, or had drank freely of ſtrong liquors, his lipome was inflamed for ſome days after, and its contents rarefying increaſed the ſize of the tumour.

The lipome ſeems to be no other than an enlargement of one or more of the cells of the adipoſe membrane, which is filled only with its natural contents. Its ſoftneſs and largeneſs diſtinguiſh it in general from the other ſpecies, though ſometimes the fatty contents will be ſo hard as to deceive. As this kind of wen does not run between the muſcles, nor is poſſeſſed of any conſiderable blood-veſſels, it may always be cut off with eaſe and ſafety.

As to the other kind of wens, their extirpation may or may not be attempted, according as their ſituation is with reſpect to adjacent veſſels, the wounding of which would endanger the patient's life.

NAGERA, or NAGARA, a town of Spain, in Old Caſtile, and the territory of Rioja, with the title of a duchy and fortreſs; famous for a battle fought in its neighbourhood in 1369. It is ſituated in a fertile country, on a brook called *Naſerilla.* W. Long. 2. 20. N. Lat. 42. 25.

NAGRACUT, a town of India, the capital of a kingdom of the ſame name in the dominions of the Great Mogul, with a rich temple to which the Indians go in pilgrimage. It is ſeated on the river Ravi. E. Long. 78. 10. N. Lat. 33. 12.

NAHUM, or the *Prophecy of* NAHUM, a canonical book of the Old Teſtament.

NAHUM, the ſeventh of the 12 leſſer prophets, was a native of Elkoſhai, a little village of Galilee. The ſubject of his prophecy is the deſtruction of Nineveh, which he deſcribes in the moſt lively and pathetic manner; his ſtyle is bold and figurative, and cannot be exceeded by the moſt perfect maſters of oratory. This prophecy was verified at the ſiege of that city by Aſtyages, in the year of the world 3378, 622 years before Chriſt.

NAIADES, in pagan mythology, the nymphs of rivers and fountains, who were adored by the pagans as a kind of inferior deities, and were repreſented as young and beautiful virgins.

NAIANT, in heraldry, a term uſed in blazoning fiſhes, when borne in an horizontal poſture, as if ſwimming.

NAIL, UNGUIS, in anatomy. See there, n° 80.

NAILS, in building, &c. ſmall ſpikes of iron, braſs, &c. which being drove into wood, ſerve to bind ſeveral pieces together, or to faſten ſomething upon them.

NAIL, is alſo a meaſure of length, containing the 16th part of a yard.

NAILING *of Cannon.* When circumſtances make it neceſſary to abandon cannon, or when the enemy's artillery are ſeized, and it is not however poſſible to take them away, it is proper to nail them up, in order to render them uſeleſs; which is done by driving a large nail or iron ſpike into the vent of a piece of artillery, to render it unſerviceable. There are various contrivances to force the nail out, as alſo ſundry machines invented for that purpoſe, but they have never been found of general uſe; ſo that the beſt method is to drill a new vent.

One Gaſper Vimercalus was the firſt who invented the nailing of cannon. He was a native of Bremen, and made uſe of his invention firſt in nailing up the artillery of Sigiſmund Malateſta.

NAIN (Lewis Sebaſtian de), one of the moſt learned and judicious critics and hiſtorians France has produced, was born in 1637. He was remarkable for his humility and piety, and died in 1698. His principal works are, 1. Memoirs on the eccleſiaſtical hiſtory of the ſix firſt ages of the church, 16 vols 4to. 2. The hiſtory of the emperors, 6 vols 4to.

NAIRN, a county of Scotland, comprehending the weſt part of Murray. It is bounded on the north by Murray frith, on the weſt and ſouth by Inverneſs, and on the eaſt by Elgin. The length of it amounts to 20 miles, and the breadth to 14. The air is temperate and ſalubrious, and the winters are remarkably mild. The face of the country is rough and mountainous; yet there are ſome fruitful ſtraths, or valleys, which produce good crops of oats and barley; but in general the country is much better adapted for paſturage. Here are alſo large woods of fir, and other trees, that afford ſhelter to the game, of which there is great plenty. A ſtrath is a long, narrow valley, with a ri-

ver running through the bottom. Of thefe, the moft remarkable in this county, are Strath-nairn, on the river of that name, in the fouth-weft part of the fhire; and on the fouth-eaft fide, Strath-erin, on both fides of Findhorne river. Nairn is well watered with ftreams, rivulets, and lakes, abounding with fifh. In the fouthern part there is a fmall lake, called *Moy*, furrounding an ifland, on which there is a caftle belonging to the laird of M'Intofh: but the greater part of the fhire is peopled by the Frafers, a warlike Highland clan, whofe chief, the Lord Lovat, loft his life on a fcaffold, for having been concerned in the late rebellion. Here is a great number of villages; but no towns of note, except Nairn, fuppofed to be the *Tuæfis* of Ptolemy, fituated at the mouth of the river which bears the fame name; a royal borough, which gave a title of *lord* to an ancient family, forfeited in the rebellion of 1715. The harbour, which opened in the Murray frith, is now choaked up with fand; and the commerce of the town is too inconfiderable to deferve notice. The people in general fubfift by feeding fheep and black cattle. About four miles from Nairn ftands the caftle of Calder, on the river of that name, belonging to a branch of the family of Campbell. In this neighbourhood we find a quarry of free-ftone, and many figns of copper. About fix miles to the north-weft of Nairn, a new fort hath been lately built by order of the government, at a place called *Ardefeer*, a fmall ifthmus upon the Murray frith, which it is intended to command.

NAISSANT, in heraldry, is applied to any animal iffuing out of the midft of fome ordinary, and fhewing only his head, fhoulders, fore-feet, and legs, with the tip of his tail; the reft of his body being hid in the fhield, or fome charge upon it: in which it differs from *iffuant*, which denotes a living creature arifing out of the bottom of any ordinary or charge.

NAKED SEEDS, in botany, thofe that are not inclofed in any pod or cafe.

NAME, denotes a word whereby men have agreed to exprefs fome idea; or which ferves to denote or fignify a thing or fubject fpoken of. See WORD.

This the grammarians ufually call a *noun*, *nomen*, though their noun is not of quite fo much extent as our name. See NOUN.

Seneca, Lib. II. *de Beneficiis*, obferves, that there are a great number of things which have no name; and which, therefore, we are forced to call by other borrowed names. *Ingens eft*, fays he, *rerum copia fine nomine, quas cum propriis appellationibus fignare non poffumus, alienis accommodatis utimur:* which may fhew why, in the courfe of this dictionary, we frequently give divers fenfes to the fame word.

Names are diftinguifhed into *proper* and *appellative*.

Proper NAMES, are thofe which reprefent fome individual thing or perfon, fo as to diftinguifh it from all other things of the fame fpecies; as, *Socrates*, which reprefents a certain philofopher.

Apellative or *General* NAMES, are thofe which fignify common ideas; or which are common to feveral individuals of the fame fpecies; as, *horfe*, *animal*, *man*, *oak*, &c.

Proper names are either called *Chriftian*, as being given at baptifm; or furnames: The firft impofed for diftinction of perfons, anfwering to the Roman *prenomen*: The fecond, for the diftinction of families, anfwering to the *nomen* of the Romans, and the *patronymicum* of the Greeks.

Originally every perfon had but one name; as among the Jews, *Adam*, &c. among the Egyptians, *Bufiris*; among the Chaldees, *Ninus*; the Medes, *Aftyages*; the Greeks, *Diomedes*; the Romans, *Romulus*; the Gauls, *Divitiacus*; the Germans, *Ariovifius*; the Britains, *Caffibelan*; the Englifh, *Hengift*, &c. And thus of other nations, except the favages of Mount Atlas, whom Pliny and Marcellinus reprefent as *anonyme*, "namelefs"

The Jews gave the name at the circumcifion, *viz.* eight days after the birth: the Romans, to females the fame day, to males the ninth; at which time they held a feaft, called *nominalia*.

Since Chriftianity has obtained, moft nations have followed the Jews, baptizing and giving the name on the eighth day after the birth; except our Englifh anceftors, who, till of late, baptized and gave the name on the birth-day.

The firft impofition of names was founded on different views, among different people; the moft common was to mark the good wifhes of the parents, or to entitle the children to the good fortune a happy name feemed to promife. Hence, *Victor*, *Caftor*, *Fauftus*, *Statorius*, *Probus*, &c.

Accordingly, we find fuch names, by Cicero called *bona nomina*, and by Tacitus *faufta nomina*, were firft enrolled and ranged in the Roman mufters; firft called to ferve at the facrifices, in the foundation of colonies, &c.—And, on the contray, Livy calls Atrius Umber, *abominandi omnis nomen:* and Plautus, on occafion of a perfon named *Lyco*, i. e. "greedy wolf," fays;

Vofmet nunc facite conjecturam cæterum
Quid id fit hominis, cui Lyco *nomen fiet.*

Hence, Plato recommends it to men to be careful in giving happy names; and the Pythagoreans taught exprefsly, that the minds, actions, and fucceffes of men, were according to their names, genius, and fate. Thus Panormitan, *ex bono nomine oritur bona præfumptio*; and the common proverb, *Bonum nomen bonum omen:* and hence the foundation of the onomomantia. See ONOMOMANTIA.

Hence Camden takes it for granted, that the names, in all nations aud languages, are fignificative, and not fimple founds for mere diftinction fake. This holds not only among the Jews, Greeks, Latins. &c. but even the Turks; among whom, Abdalla fignifies *God's fervant*; Soliman, *peaceable*; Mahomet, *glorified*, &c. And the favages of Hifpaniola, and throughout America, who, in their languages, name their children, *Gliftering Light*, *Sun Bright*, *Fine Gold*, &c.; and they of Congo, by the names of precious ftones, flowers, &c.

To fuppofe names given without any meaning, however by the alteration of languages their fignification may be loft, that learned author thinks is to reproach our anceftors; and that contrary to the fenfe of all ancient writers. Porphyry notes, that the barbarous *names*, as he calls them, were very emphatical, and very concife: and accordingly, it was efteemed a duty to be φερωνυμοι, or *fui nominis homines:* as Severus, Probus,

Probus, and Aurelius, are called *ſui nominis imperatores.*

It was the uſual way of giving names, to wiſh the children might diſcharge their names.—Thus when Gunthram king of France named Clotharius at the font, he ſaid, *Creſcat puer, & hujus ſit homines executor.*

The ancient Britons, Camden ſays, generally took their names from colours, becauſe they painted themſelves; which names are now loſt, or remain hid among the Welſh. When they were ſubdued by the Romans, they took Roman names, ſome of which ſtill remain, corrupted; though the greateſt part became extinct upon the admiſſion of the Engliſh Saxons, who introduced the German names, as *Cridda, Penda, Oſwald, Edward,* &c.—The Danes, too, brought with them their names; as *Suayne, Harold, Knute,* &c. The Normans, at the Conqueſt, brought in other German names, as originally uſing the German tongue; ſuch as *Robert, William, Richard, Henry, Hugh,* &c. after the ſame manner as the Greek names: *Aſpaſius, Boethius, Symmachus,* &c. were introduced into Italy upon the diviſion of the empire. After the Conqueſt, our nation, which had ever been averſe to foreign names, as deeming them unlucky, began to take Hebrew names; as *Matthew, David, Sampſon,* &c. The various names anciently or at preſent obtaining among us, from what language or people ſoever borrowed, are explained by Camden in his Remains. As to the period when names began to be multiplied, and ſurnames introduced, &c. ſee SURNAME.

Of late years it has obtained among us to give ſurnames for Chriſtian names; which ſome diſlike, on account of the confuſion it may introduce. Camden relates it as an opinion, that the practice firſt began in the reign of Edward VI. by ſuch as would be godfathers, when they were more than half fathers. Upon which ſome were perſuaded to change their names at confirmation; which, it ſeems, is uſual in other countries.—Thus, two ſons of Henry II. of France, chriſtened *Alexander* and *Hercules,* changed them at confirmation into *Henry* and *Francis.* In monaſteries, the religious aſſume new names at their admittance, to ſhew they are about to lead a new life, and have renounced the world, their family, and even their name: *v. g.* ſiſter Mary *of the Incarnation,* brother Henry *of the holy Sacrament,* &c. The popes alſo changed their name at their exaltation to the pontificate; a cuſtom firſt introduced by Pope Sergius, whoſe name till then, as Platina informs us, was *Swineſnout.* But Onuphrius refers it to John XII or XIII.; and at the ſame time adds a different reaſon for it from that of Platina, viz. that it was done in imitation of St Peter and St Paul, who were firſt called *Simon* and *Saul.*

Among the ancients, thoſe deified by the Heathen conſecrations, had new names given them; as Romulus was called *Quirinus;* Melicertes, *Portunus* or *Portumnus,* &c.

New names were alſo given in adoptions, and ſometimes by teſtament: thus L. Æmilius, adopted by Scipio, took the name of *Scipio Africanus;* and thus Auguſtus, who at firſt was called *C. Octavius Thurinus,* being adopted by the teſtament of Julius Cæſar into his name and family, took the name of *Caius Julius Cæſar Octavianus.*

Names were alſo changed at enfranchiſements into new cities. Thus Lucumo, at his firſt being made free of Rome, took the name *Lucius Tarquinius Priſcus,* &c.; and ſlaves, when made free, uſually aſſumed their maſters names. Thoſe called to the equeſtrian order, if they had baſe names, were always new named, *nomine ingenuorum veterumque Romanorum.* And among the primitive Chriſtians, it was the practice to change the names of the catechumens: Thus the renegado Lucianus, till his baptiſm, was called *Lucius.*

NAMUR, a province of the Netherlands, lying between the rivers Sambre and Maeſe; bounded on the north by Brabant, on the eaſt and ſouth by the biſhopric of Liege, and on the weſt by Hainault. It is pretty fertile; has ſeveral foreſts, marble quarries, and mines of iron, lead, and pit-coal; and is about 30 miles long, and 20 broad. Namur is the capital town.

NAMUR, a large, rich, and very ſtrong town of the Netherlands, capital of the county of Namur, with a ſtrong caſtle, ſeveral forts, and a biſhop's ſee. The moſt conſiderable forts are, Fort-William, Fort-Maeſe, Fort Coquelet, and Fort-Eſpinor. The caſtle is built in the middle of the town, on a craggy rock. It was beſieged by king William in 1695, who took it in the ſight of an army of 100,000 French, though there were 60,000 men in garriſon. Namur is now a barrier-town, and has a Dutch garriſon. It was ceded to the houſe of Auſtria in 1713, but taken by the French in 1746; and reſtored by the treaty of Aix-la-Chapelle. It is ſituated between two mountains, at the confluence of the rivers Maeſe and Sambre, in E. Long. 4. 57. N. Lat. 50. 25.

NANCI, a town of France, and capital of Lorrain, is ſituated on the river Meuſe, in the centre of the province. It is divided into the Old and New Towns, The firſt, though irregularly built, is very populous, and contains the ducal palace: the ſtreets of the New Town are as ſtraight as a line, adorned with handſome buildings, and a very fine ſquare. The primatial church is a magnificent ſtructure, and in that of the Cordeliers are the tombs of the ancient dukes. The two towns are ſeparated by a canal; and the new town was very well fortified, but the king of France has demoliſhed the fortifications. It has been taken and retaken ſeveral times; particularly by the French, to whom it was ceded in 1736, to enjoy it after the death of Staniſlaus.

NANKING, a city of China, and capital of the province of Kiang-nan. It is the largeſt in China, being 17 miles in circumference, and about three miles diſtant from the great river Yang-tiſe Chiang, from which there are canals cut, ſo large that veſſels may enter the town. This place is greatly fallen from its ancient ſplendour, for it had a magnificent palace, which is quite deſtroyed, as well as many ancient monuments, and a third part of the city itſelf is deſolate. The ſtreets are narrow, but handſome and well paved, and on each ſide are ſhops neatly furniſhed. The public buildings are mean, except a few temples, the city-gates, and a tower of porcelain 200 feet high. They have ſeveral manufactures of ſilk and wool. The number of the inhabitants are ſaid to be 1,000,000, without

without comprehending the garrifon of 40,000 men. E. Long. 119. 25. N. Lat. 32. 46.

NANSIO, an ifland of the Archipelago, a little to the north of the ifland of Santorino, 16 miles in circumference; but has no harbour. The mountains are nothing but bare rocks, and there are not fprings fufficient to water the fields. There are a vaft number of partridges, whofe eggs they deftroy every year to preferve the corn, and yet vaft numbers of them are always produced. The ruins of the temple of Apollo are yet to be feen, and confift chiefly of marble columns. E. Long. 26. 20. N. Lat. 36. 15.

NANTES, an ancient, rich, and very confiderable town of France, in Bretagne, with a bifhop's fee, an univerfity, and a mint. It is one of the moft confiderable places in the kingdom; contains the richeft merchants; and was formerly the refidence of the dukes of Bretagne, where they built a very ftrong caftle on the fide of the river, and which is ftrongly fortified. There are feveral parifhes, and a great many religious houfes, and the cathedral contains the tombs of the ancient dukes. There are feveral fine bridges over the river Loire, which is navigable. The fuburbs are fo large, on account of the number of people that come from all parts to fettle here, that they exceed the city. The Spaniards trade here with wine, fine wool, iron, filk, oil, oranges, and lemons; and they carry back cloth, ftuffs, corn, and hard-ware. The Dutch fend falt fifh, and all forts of fpices; and in return have wine and brandy. The Swedes bring copper; and the Englifh, lead, tin, and pit-coal. It was in this place that Henry IV. promulgated the famous edict in 1598, called the *Edict of Nantes*, and which was revoked in 1685. The territory of Nantes lies on both fides the Loire, and feeds a great number of cattle. Large veffels can come no higher than Port Launai, which is 12 miles from Nantes. W. Long. 1. 31. N. Lat. 47. 13.

NANTUEIL (Robert), the celebrated defigner and engraver to the cabinet of Lewis XIV. was born at Rheims in 1630. Though his father was but a petty fhopkeeper, he gave his fon a liberal education; who, having a tafte for drawing, cultivated it with fuch fuccefs, that he became the admiration of the whole town: but marrying young, and not being able to maintain his family, he took a journey to Paris, where he made his talents known by a ftratagem.—Seeing feveral abbés at the door of an eating-houfe, he afked the miftrefs for an ecclefiaftic of Rheims, whofe name he had forgot, but that fhe might eafily know him by a picture of him which he fhewed: the abbés crowding round, were fo charmed with it, that he feized the opportunity of offering to draw any of their pictures for a fmall matter. Cuftomers came fo faft that he foon raifed his price, and brought his family to Paris, where his reputation was quickly eftablifhed. He applied himfelf particularly to taking portraits in crayons, which he afterward engraved for the ufe of academical thefes; and in this way he did the portrait of the king, and afterward engraved it as big as the life; a thing never before attempted. The king was fo pleafed with it, that he created the place of defigner and engraver to the cabinet for him, with a penfion of 1000 livres. He died in 1678; and an entire collection of his prints amounts to upwards of 240.

NAPÆA, in botany; a genus of the polyginia order, belonging to the monadelphia clafs of plants. There are two fpecies; both of them with perennial roots, compofed of many thick flefhy fibres, which ftrike deep into the ground, and are connected at the top into large heads; the ftalks grow to feven or eight feet high, producing white flowers, tubulous at bottom, but fpreading open at top, and dividing into five obtufe fegments. Both thefe plants are natives of Virginia and other parts of North America: from the bark of fome of the Indian kinds a fort of fine hemp might be procured, capable of being woven into very ftrong cloth. They are eafily propagated by feed, which will thrive in any fituation.

NAPHTHA, in natural hiftory, a fluid mineral body, of a thin confiftence, bright and pellucid, of a ftrong fmell, very readily inflammable, and, when pure, burning away without leaving any refiduum.

The naphtha is found in confiderable quantities floating on the water of certain fprings, principally breaking out at the fides of hills in Perfia, Tartary, and fome parts of the empire of China; where, if a lighted candle be held near the furface, it takes fire and overfpreads the furface of the water for a great extent with a ftrong white flame, and emits a very difagreeable fmell. The genuine naphtha is very rare in Europe; it is not known to be any where naturally produced here, and what we fee of it is generally fophifticated. Diftilled by the retort, it yields an oil fomewhat thinner than it was originally, and of a weaker fmell. The fubftance remaining at the bottom of the retort, has much the refemblance of amber; and Dr Hill thinks it highly probable, that the origin of all the amber is from the fame fort of principle; nay, he tells us that he has fucceeded fo far in an attempt to make amber by this fluid and an acid drawn from the crude pyrites, that he has produced a friable, fomewhat pellucid matter, having all the properties of amber except the hardnefs and clearnefs, and yielding a true falt and oil of amber on diftillation. The medicinal virtues of the naphtha are the fame with that of the common petroleum, but in a lower degree. It is ufed externally on many occafions in Perfia; and is taken inwardly, a few drops for a dofe, in colics. The principal ufe of it, however, is for burning in lamps; and for this it is extremely well adapted.

NAPHTHALI, or NEPHTHALI, (Jofh. xix.) one of the tribes of Ifrael; having Zabulon on the fouth, Afher on the weft, the Jordan on the eaft, and on the north Antilibanus.

NAPIER. See NEPER.

NAPLES, a kingdom of Italy, comprehending the ancient countries of Samnium, Campania, Apulia, and Magna Græcia. It is bounded on all fides by the Mediterranean and Adriatic, except on the north-eaft, where it terminates on the Ecclefiaftical ftate. Its greateft length from fouth-eaft to north-weft is about 280 Englifh miles; and its breath from north-eaft to fouth-weft, from 96 to 120.

The ancient hiftory of this country falls under the articles ROME and ITALY; the prefent ftate of it, as well as of the reft of Italy, is owing to the conquefts of Charlemagne. When that monarch put an end to the kingdom of the Lombards, he obliged the dukes of Friuli, Spoleto, and Benevento, to acknowledge

1 Extent of the duchy of Beneven-

ledge him as king of Italy; but allowed them to exercife the fame power and authority which they had enjoyed before his conqueft. Of thefe three dukedoms Benevento was by far the moft powerful and extenfive, as it comprehended almoft all the prefent kingdom of Naples; that part of Farther Calabria beyond the rivers Savuto and Peto, a few maritime cities in Hither Calabria, with the city of Acripoli, and the promontory in its neighbourhood called *Capo di Licofa;* and laftly, the dukedoms of Gaeta, Naples, and Amalfi, which were very inconfiderable, and extended along the fhore only about 100 miles, and were interrupted by the Gaftaldate or county of Capua.

2 Arechis duke of Benevento revolts from Charlemagne.

This flourifhing and extenfive dukedom was at this time governed by Arechis, who had married one of the daughters of the laft king of the Lombards, and had fubmitted, and taken the oath of allegiance to the emperor Charles. However, a few years after, he renounced his allegiance to the Franks, declared himfelf an independent fovereign, and was acknowledged as fuch by all the inhabitants of his duchy. To ftrengthen himfelf againft Pepin king of Italy, who refided at Ravenna, he enlarged and fortified the city of Benevento, and likewife built Salerno on the fea-coaft, furrounding it with a very ftrong and high wall. He engaged in feveral wars with the Greeks, whom he fometimes obliged to give him hoftages; but having invaded the territories of the pope, whom Pepin could not affift, Charlemagne was prevailed on to return to Italy. Arechis, unable to oppofe fuch a formidable enemy, fent his eldeft fon, Romuald, to Rome, with an offer of fubmiffion: but, at the inftigation of the pope, Charles refufed the offer, and detained his fon prifoner; after which he ravaged the country, and made himfelf mafter of Capua. Other deputies, however, proved more fuccefsful; and, in the year 787, a peace was concluded on thefe conditions: That Arechis and the Beneventans fhould renew their allegiance to the Franks; that he fhould pay a yearly tribute to Pepin; deliver up all his treafure; and give his fon Grimoald and his daughter Adelgifa, with twelve others, as hoftages for his fidelity: however, after many intreaties, Adelgifa was reftored to her father.

3 Submits.

4 Revolts a fecond time.

Charles had no fooner left Italy, than Arechis forgot all his engagements, and began to negociate with Irene, emprefs of Conftantinople, and her fon Conftantine, for expelling the Franks out of Italy. For himfelf, he defired the honour of patriciate, and the dukedom of Naples with all its dependencies; and, in return, promifed to acknowledge the Greek emperor as his fovereign, and to live after the manner of the Greeks. He required, however, to be fupported by a Greek army; and that his brother-in-law Adalgifus, fon to Defiderius the laft king of the Lombards, fhould be fent over into Italy, to raife a party among his countrymen. Thefe conditions were readily accepted, on condition that prince Romuald fhould be fent as an hoftage; ambaffadors were fent to Naples with the enfigns of the patrician order, namely the mantle of cloth of gold, the fword, the comb, and the fandals: but before the ceremony could be performed, prince Romuald died, and foon after him his father; whofe death was fuppofed to have been haftened by that of his fon.

After the death of Arechis, the Beneventans fent a moft fubmiffive embaffy to Charlemagne, intreating him to fend them Grimoald, the late king's fon, and only lawful heir to his crown; threatening at the fame time to revolt if their prince was denied them. Charles readily granted their requeft, and allowed Grimoald to depart, after he had agreed to the following conditions, viz. That he fhould oblige the Lombards to fhave their beards; that, in writings, and on money, the name of the king fhould be put before that of the prince; and that he fhould caufe the walls of Salerno, Acerenza, and Confia, to be entirely demolifhed.—The new king was received by his fubjects with the utmoft joy; and for fome time continued faithful to his engagements, excepting only the laft article, which he either neglected or eluded. So far, however, was he from affifting the Greeks, that he gave notice of their machinations to Pepin king of Italy; raifed an army to oppofe his uncle Adalgifus; and being joined by Hildebrand duke of Spoleto, and Vinigife the general of Pepin, he attacked the Greeks in Calabria foon after they had landed, entirely defeated and took his uncle prifoner, and, as is faid, put him to a cruel death. Yet in a fhort time Grimoald contracted an alliance with the Greek emperor by marrying his niece Wanzia; and in the fifth year of his reign, a war broke out between him and Pepin, which continued for twelve years; at the end of which time a truce was concluded. Grimoald furvived this pacification only three years, and was fucceeded by his treafurer Grimoald II. who fubmitted to Charlemagne after the death of Pepin, and from this time the Beneventans were looked upon as tributaries of the weftern emperors. As yet, however, the city of Naples did not own allegiance to the dukes of Benevento, but was held by the eaftern emperors; and frequent wars took place between the Beneventans and Neapolitans. This happened to be the cafe when Grimoald II. afcended the throne. He concluded a peace with them: which however, was of no long continuance; for Theodore, governor of Naples, having granted protections to Dauferius a noble Beneventan, who had been concerned in a confpiracy againft his prince, Grimoald marched againft the city of Naples, and invefted it by fea and land. Theodore ftill refufed to deliver up the traitor, and a general engagement both by land and fea was the confequence; in which the Neapolitans were defeated with fo great flaughter, that the fea was ftained with their blood for more than feven days. Theodore then confented to deliver up Dauferius, with 8000 crowns for the expences of the war; and Grimoald not only pardoned Dauferius, but received him into favour: the traitor, however, reflecting on the heinoufnefs of his crime, was feized with remorfe; and went a pilgrimage to the holy land, carrying a large ftone in his mouth, by way of penance, which he never took out but at his meals.

5 Grimoald continues for fome time faithful to the Franks.

6 Is murdered, and fucceeded by Sico.

In the year 821, Grimoald was murdered by Radelchis count of Confia, and Sico gaftald of Acerenta, the latter of whom fucceeded to the dukedom of Benevento. Radelchis being foon after feized with remorfe, became a monk; while Sico affociated his fon Sicardo with him in the government; and both, being of an ambitions and reftlefs difpofition, fought a pretence for attacking the Neapolitans. This was

Naples.

ſoon found, and the city was inveſted by ſea and land. The walls were furiouſly battered; and part of them being beat down, Sico prepared for a general aſſault. Stephen, at that time duke of Naples, pretended to ſubmit; but, that he might prevent the city from being pillaged, intreated Sico to put off his entry till the morning, and in the mean time ſent out his mother and his two children as hoſtages. Sico conſented to his requeſt; but next morning found the breach built up, and the Neapolitans prepared for their defence. Exaſperated at their prefidy, he renewed his attacks with vigour, but without any ſucceſs; the beſieged defending themſelves with the utmoſt obſtinacy. At laſt, perceiving that they ſhould not be able to hold out much longer, they conſented to a peace on the following conditions, viz. That the Neapolitans ſhould pay an annual tribute to the princes of Benevento, and conſent to the tranſporting of the body of St Januarius from his church without the walls of Naples to Benevento. Theſe conditions being ratified, Sico returned with great honour to Benevento; but ſoon after renewed the war, under pretence that the Neapolitans had neglected to pay the ſtipulated ſum; and hoſtilities continued till his death, which happened in 833.

7 Naples beſieged by Sico.

8 And by his ſucceſſor Sicardo.

Sico was ſucceeded in the government of Benevento by his ſon Sicardo, who had married the daughter of Dauferius; and being influenced by the evil counſels of Roffrid his wife's brother, oppreſſed his ſubjects to ſuch a degree that they conſpired againſt his life. He beſieged Naples with a powerful army, and took poſſeſſion of Acerra and Atella, both of which he fortified. But Bonus, the Neapolitan duke, defended himſelf ſo vigorouſly, that the Beneventans were obliged to retire, and even to abandon Acerra and Atella, the fortifications of which were immediately demoliſhed. At laſt Sicardo agreed to a peace for five years, on the interceſſion of Lothaire, emperor and king of Italy; but his chief motive was thought to have been the fear of the Saracens, whom the duke of Naples had called over from Africa to his aſſiſtance: for no ſooner were they ſent back, than Sicardo attempted to delay the concluſion of the treaty; but the emperor interpoſing his authority, a peace was concluded in the year 836, after the war had continued, with very little intermiſſion, for 16 years.

9 The Saracens called in by the duke of Naples.

Soon after the concluſion of this peace, the Saracens landed at Brindiſi; and having made themſelves maſters of the place, ravaged all the neighbouring country. Sicardo marched againſt them with a numerous army; but the Saracens having dug a great number of ditches which they ſlightly covered over, found means to draw the Beneventans in among them, whereby they were repulſed with great loſs. However, Sicardo, having reinforced his army, marched again to attack them; but the Saracens, deſpairing of ſucceſs, pillaged and burnt Brindiſi, and then retired with their booty, and a great many captives, to Sicily. Sicardo then, without any apparent provocation, attacked the city of Amalfi, levelled its walls with the ground, carried off all its wealth, and the body of its tutelar ſaint Triphomen. A great many of the inhabitants were tranſported to Salerno; and by promoting alliances between the inhabitants of both places, he endeavoured to unite Amalfi to his own principality as firmly as poſſible.

Naples.

During all theſe tranſactions, Sicardo had tyrannized over his ſubjects in ſuch a manner, that at laſt he became intolerable. Among other acts of injuſtice, he impriſoned his own brother Siconolphus; compelled him to turn prieſt; and afterwards ſent him bound to Tarento, where he cauſed him to be ſhut up in an old tower that had been built for a ciſtern. By ſuch acts of tyranny his nobles were provoked to conſpire againſt him; and in the year 839 he was murdered in his tent.

10 Sicardo murdered by Radelchis, which brings on a civil war.

On the death of Sicardo, Radelchis, his ſecretary or treaſurer, was unanimouſly elected prince of Benevento; but Siconolphus, the laſt king's brother, having regained his liberty, formed a great party againſt the new prince. Radelchis did not fail to oppoſe him with a formidable army; and a moſt ruinous civil war enſued. Both parties by turns called in the Saracens; and theſe treacherous allies acted ſometimes againſt one, and ſometimes againſt the other; or turned their arms againſt both, as ſeemed moſt ſuitable to their own intereſt. Thus the war continued with the utmoſt animoſity for 12 years, during which time the principality was almoſt entirely ruined; till at laſt the emperor Lewis interpoſed, and obliged the competitors to agree to a partition of the principality: by this treaty, Radelchis promiſed to acknowledge Siconolphus and his ſucceſſors as lawful princes of the principality of Salerno, which was declared to contain Tarento, Latiniano, Caſſano, Coſſenzo, Laino, Lucania, Conſia, Montella, Rota, Salerno, Sarno, Ciraterium, Furculo, Capua, Feano, Sora, and the half of the Gaſtaldate of Acerenza, where it joins Latiano and Conſia. The boundary betwixt Benevento and Capua was fixed at St Angelo ad Cerros; Alli Peregrini was made the boundary betwixt Benevento and Salerno, and Staffilo betwixt Benevento and Conſia. The monaſteries of Monte Caſſino and St Vincent were declared to be immediately under the protection of the emperor: both princes ſtipulated that no hoſtilities ſhould be committed by either, againſt the ſubjects of each other; and promiſed to join their forces, in order to drive out the Saracens. Soon after this pacification, however, both Radelchis and Siconolphus died; the former appointing his ſon Radelgarius, or Radelcar, to ſucceed him; and the latter leaving an infant ſon, Sico, to the care of his godfather, Peter.

11 The principality divided.

12 Unſucceſsful war with the Saracens.

The war with the Saracens proved very unſucceſsful; neither the united efforts of the princes, nor the aſſiſtance of the emperor Lewis himſelf, being able to expel the infidels; and, in 854, Arechis, the ſon and ſucceſſor of Radelchis, was obliged to pay them an annual ſubſidy. Two years after, Lando, count of Capua, revolted from the prince of Salerno, and could not be reduced. In the mean time, Sico, the lawful prince of Salerno, had been poiſoned by count Lando, and the principality uſurped by Ademarius, the ſon of Peter above-mentioned; but, in 861, Ademarius himſelf was ſeized and impriſoned by Guaferius, the ſon of Dauferius formerly mentioned. This was occaſioned by his cruelty and rapacioufneſs, which entirely alienated the hearts of his ſubjects from him, and encouraged Guaferius to become the head of the conſpirators. The Saracens in the mean time committed terrible

Naples. terrible ravages throughout the Beneventan territories which at laft obliged Adelgife to enter into an alliance with Guaferius, and both together fent a moft humble embaffy to the emperor Lewis, requefting him to take them under his protection. About the fame time an embaffy arrived from Conftantinople, propofing a junction of the forces of the eaftern and weftern empires againft the infidels; upon which Lewis gave orders for affembling a formidable army. But in the mean time Adelgife fell off from his alliance, and made peace with the Saracens; nay, according to fome, he encouraged them in their incurfions, and it was at his defire that they invaded the duchy of Capua, and afterwards that of Naples, which they ravaged in a moft barbarous manner. The Neapolitans, in conjunction with the duke of Spoleto and the count of Marfi, endeavoured to oppofe them; but being defeated, the Saracens continued their ravages with redoubled fury, and retired to Bari, which was their capital city, with an immenfe booty.

In 866, Lewis arrived at Sora with his army; and having marched to Capua, was there joined by Landulph, the bifhop and count, with a body of Capuans: but Landulph foon after perfuading his countrymen to defert, Lewis marched againft that city, which he took after a fiege of three months, and almoft totally deftroyed. In the end of the year he was joined by Guaferius with his quota of troops, having ordered the eyes of Ademarius to be put out in his abfence. Lewis confirmed him in the principality, and marched with his army to Benevento, where Adelgife received him with great refpect. Having reduced fome inconfiderable places belonging to the Saracens, Lewis foon after invefted Bari; but as the Saracens received continual fupplies from their countrymen fettled in Sicily, and befides were protected by the Neapolitans, he could not reduce the place till the year 871, tho' he had received confiderable affiftance from his brother

13 They are at laft expelled.

Lotharius, and the Greek emperor had fent him a fleet of 200 fail. The expulfion of the Saracens was completed the fame year by the taking of Tarento; after which the emperor returned with great glory to Benevento, refolving next to carry his arms into Sicily, and expel the infidels from thence alfo. But his future fchemes of conqueft were fruftrated by a quarrel between him and Adelgife. The latter, pretending to have been infulted by the emprefs, and oppreffed by the French, feized the emperor himfelf, and kept him prifoner for 40 days. His imprifonment would probably have been of much longer continuance, had not

14 But foon return.

a body of Saracens arrived from Africa, who, being joined by fuch of their countrymen as had concealed themfelves in Italy, laid fiege to Salerno with an army of 30,000 men, ravaging the neighbouring country at the fame time with the utmoft barbarity. By this new invafion Adelgife was fo much alarmed, that he fet the emperor at liberty, but firft obliged him to fwear that he would not revenge the infult that had been offered him, and that he would never return to Benevento. Lewis having then joined his forces to thofe of the prince of Salerno, foon obliged the Saracens to raife the fiege of Salerno; but tho' they were prevented from taking that city, they entirely deftroyed the inhabitants of Calabria, leaving it, according to the expreffion of one of the hiftorians of that time, "as defolate as it was at the flood." Naples.

In the year 873, Lewis being abfolved from his oath by the pope, went to Benevento, and was reconciled to Adelgife; but foon after this reconciliation he died, and the Saracens continued their ravages to fuch a degree that the inhabitants of Bari were conftrained to deliver up their city to the Greeks. At the fame time the Salernitans, Neapolitans, Cajetans, and Amalfitans, having made peace with the Saracens, were compelled to agree to their propofal of invading the territories of the Roman pontiff. His holinefs exerted himfelf to the utmoft, both with fpiritual and temporal weapons, in order to defend his right; but was at 15 The pope becomes their tributary.

laft reduced to the neceffity of becoming a tributary to the infidels, and promifing to pay them a large fum annually.

In the mean time all Italy was thrown into the greateft confufion by the death of Charles the Bald, who died of poifon at Pavia, as he was coming to the pope's affiftance. Sergius duke of Naples continued a firm friend to the infidels; nor could he be detached from their interefts even by the thunder of a papal excommunication: but unluckily happening to fall into the hands of his brother Athanafius bifhop of Naples, the zeal of that prelate prompted him to put out his eyes, and fend him a clofe prifoner to Rome; for which the higheft encomiums were beftowed on him by the holy father.

In 878, Adelgife was murdered by two of his nephews; one of whom, by name *Gaideris*, feized the principality. About the fame time Landulph bifhop of Capua dying, a civil war enfued among his children, though their father's dominions had been divided among them according to his will. The princes of Salerno and Benevento, the duke of Spoleto, and Gregory the Greek governor of Bari and Otranto, took different fides in the quarrel, as they thought moft proper; and to complete the confufion, the new bifhop was expelled, and his brother, though a layman, chofen to that office, and even confecrated by the pope, who wrote to Guaferius, forbidding him to attack Capua under pain of excommunication. But though Guaferius was, in general, obedient to the pope's commands, he proved refractory in this particular, and laid fiege to Capua for two years fucceffively.

Thus the Capuan territories were reduced to the moft miferable fituation; being obliged to maintain at the fame time the armies of the prince of Benevento and the duke of Spoleto. The Saracens in the mean time took the opportunity of ftrengthening themfelves in Italy; and Athanafius, notwithftanding the great commendations he had received from the pope for putting out his brother's eyes, confented to enter into an alliance with them, in conjunction with whom he ravaged the territories of the pope, as well as thofe of Benevento and Spoleto, plundering all the churches, monafteries, towns, and villages, through which they paffed. At the fame time the prince of Salerno was obliged to grant them a fettlement in the neighbourhood of his capital; the duke of Geeta invited them to his affiftance, being oppreffed by the count of Capua; and even the pope himfelf was obliged to make peace with them, and to grant them a fettlement on the north fide of the Garigliano, where they fortified themfelves, and continued for more than 40 years.

Naples.

To put a ſtop to the confuſion which reigned in Italy, the pope now thought proper to reſtore the biſhop of Capua, who had been expelled, but allowed his brother to reſide in the city, and govern one half of the dioceſe; but notwithſtanding this partition, the civil diſſenſions continued with the utmoſt violence, the neareſt relations murdering or baniſhing each other, according as the fortune of the one or the other prevailed.—Athanaſius, notwithſtanding all the pope's remonſtrances, continued his alliance with the Saracens; in conjunction with whom he ravaged the territory of Benevento, and fomented the diviſions in Capua, in hopes of being able to make a conqueſt of it. At laſt his holineſs thought proper to iſſue a ſentence of excommunication againſt him: but this attached him to the Saracens more than ever; inſomuch that he ſent to Suchaim, king of the Saracens in Sicily, deſiring him to come over and command a great body of his countrymen who had ſettled at the foot of Mount Veſuvius. Suchaim accepted the invitation, and immediately turned his arms againſt Athanaſius; allowing his troops to live at diſcretion in the territory of Naples, where they raviſhed the women, and plundered the inhabitants. Theſe calamities were, by the ſuperſtitious Neapolitans, imagined to be a conſequence of the ſentence of excommunication; and therefore they uſed their utmoſt endeavours to perſuade the prelate to conclude a league with ſome Chriſtian prince, and renounce all connection with the infidels. In this they at laſt proved ſucceſsful, and Athanaſius concluded an alliance with Guaimarius prince of Salerno; in conſequence of which the Saracens were obliged to quit the Neapolitan territories, and retire to Agropoli. Athanaſius then directed his force againſt Capua, of which he made himſelf maſter in the year 882. The Saracens, however, ſtill continued their incurſions, and ravaged ſeveral provinces in ſuch a manner, that they became entirely deſolate.

Theſe confuſions continued for a long time; during which the Greeks found an opportunity of making themſelves maſters of Benevento, and had well nigh

16 become maſters alſo of Salerno; but in this they failed through the treachery of the biſhop, and in the year 896 they were totally expelled by the biſhop, four years after they had become maſters of it. In 915 the Saracens received ſuch an overthrow at Carigliano, that ſcarce one of them remained; however, a new body ſoon arrived from Africa, and infeſted the ſea-coaſts for ſome time longer. A war alſo enſued between Landulph and the Greeks; which concluded diſadvantageouſly for the former, who was obliged to ſubmit to the emperor of Conſtantinople in 943.

The Saracens almoſt entirely cut off.

In 961, Otho the Great, king of Germany, invaded Italy with a powerful army againſt Berengarius III. and, marching to Rome, received the imperial crown from the hands of the pope. In 964, he erected Capua into a principality, received homage from the other princes of Lombardy, and formed a deſign of recovering Puglia and Calabria from the Greeks. But in this laſt ſcheme he failed; and after various hoſtilities a treaty was concluded, and the young princeſs Theophania married to Otho's ſon, afterwards emperor.

All this time the Saracens continued their incurſions; and the Greeks had gained ground ſo much, that they were now in poſſeſſion of two thirds of the preſent kingdom of Naples; but in the year 1002 or 1003, the Normans firſt began to be remarkable in Italy. They had, about a century before, embraced Chriſtianity, and become very zealous in all the ſuperſtitions which were then practiſed. They were particularly zealous in viſiting ſacred places, eſpecially Rome, and the holy ſepulchre at Jeruſalem; and being naturally of a very martial diſpoſition, they forced through great bodies of Greeks and Saracens who oppoſed their paſſage. About this time, 40, or, as others write, 100, of theſe Normans, returning from Jeruſalem by ſea, landed at Salerno in the habit of pilgrims, where they were honourably received by Guaimarius. During their reſidence at Salerno, a great body of Saracens landed, and inveſted the city. Guaimarius, not being in a condition to oppoſe the invaders by force, was preparing to pay them a large ſum of money which they demanded, when the Normans propoſed to attack them; and, having got arms and horſes from the prince, they engaged the infidels with ſuch fury and bravery, that they entirely defeated them, and obliged them to fly to their ſhips. By this complete victory Guaimarius was filled with ſuch admiration of the valour of theſe ſtrangers, that he intreated them to remain in his country; offering them lands, and the moſt honourable employments: but not being able to prevail with them to ſtay in Italy, or even accept of his preſents; at their departure he ſent ſome ambaſſadors with them to Normandy, in veſſels loaded with exquiſite fruits, rich furniture for horſes, &c. in order to allure the valiant Normans to leave their own country. This kind invitation encouraged a Norman chief, named *Oſmond Drengot*, to ſettle in Italy about the year 1015; having killed another lord in a duel, which obliged him to leave his own country, in order to avoid the reſentment of his ſovereign, Robert duke of Normandy. In the mean time the city of Bari had revolted from the Greeks, and choſen one Mello for their leader, whoſe wife and children happened ſoon after to fall into the hands of their enemies, and were ſent priſoners to Conſtantinople. No ſooner, therefore, did Mello hear of the arrival of theſe adventurers, than he engaged them to aſſiſt him, and having drawn together a conſiderable army, defeated the Greeks with great ſlaughter, and obliged them to abandon their camp. In this engagement the Normans diſtinguiſhed themſelves by their bravery; and the news of their ſucceſs ſoon brought from Normandy an innumerable multitude of their countrymen, with their wives and children. By this reinforcement, Mello gained two other victories, took a great many towns, and obliged the Greeks to abandon a large territory; but, in 1019 they were utterly defeated, and every thing recovered by the Greeks. The Greek general, Bajanus, continued to go on with ſuch ſurpriſing ſucceſs, that he almoſt entirely re-eſtabliſhed the affairs of his countrymen in Italy, and made a diſtinct province of the weſtern part of Puglia, which he called *Capatanata*, and which to this day retains the name of *Capitanata*. His great progreſs at laſt alarmed the emperors of Germany; and, in 1027, Pandulphus prince of Capua made himſelf maſter of Naples; but was obliged, three years afterwards, to leave it, by the Normans, who built the city

Naples.

17 The Normans firſt known in Italy.

18 They return and defeat the Greeks.

19 But are at laſt defeated by them.

Naples. city of Averfa, which was now erected into a county. In confequence of this piece of good fortune, great numbers of Norman adventurers migrated into Italy; among whom were William, Drogo, and Umbert, three of the fons of Tancred duke of Hautville; from whofe pofterity thofe princes were defcended, who firft conquered the Ifland of Sicily from the Saracens, and formed the prefent kingdom of Naples.

In 1040, the Greek emperor Michael Paleologus, in order to fecure the affection of his fickle fubjects, undertook the conqueft of Italy from the Saracens, and for that purpofe fent a general named *Michael Maniacus* into Sicily. This commander, hearing of the great reputation of the Normans, fent to Guiamarius, prince of Salerno, intreating him to grant him fome of thofe warriors. His requeft was moft willingly hearkened to by the prince of Salerno, who, to encourage the Normans to engage in the expedition, promifed them fome additional rewards befides the emperor's pay. William, Drogo, and Umbert, accordingly marched from Salerno with 300 of their countrymen; and paffing over into Sicily, diftinguifhed themfelves moft remarkably in the conqueft of that ifland. Maniacus acknowledged, that the recovery of Meffina was chiefly owing to their valour; and William with his Normans gained a complete victory over the Saracens before Syracufe, where he killed the governor of the city in fingle combat. Maniacus made himfelf mafter of Syracufe, and almoft entirely reduced the whole ifland; but, being accufed of treafon, was next year carried prifoner to Conftantinople. His fucceffor Doceanus. being a man of no abilities, quickly loft the whole ifland except Meffina, and treated his Norman auxiliaries with the utmoft contempt. He would not allow them any fhare of the booty; and even caufed one Ardoin, a noble Lombard, and affociate and interpreter of the Normans, to be whipped round the camp, becaufe he refufed to part with the horfe of a Saracen whom he had flain in fingle combat. The confequences of this tyrannical behaviour were very fatal to the Greeks. Ardoin foon after obtained leave to return to Italy under pretence of a vow, and all the Normans embarked at night along with him; but inftead of going to Rome, Ardoin went immediately to Averfa, where he perfuaded count Rainulphus, fovereign of that province, to join with him in the defign he had formed of attacking the Greek provinces in Italy, which, he fhewed him, would be an eafy conqueft, as the inhabitants fubmitted with great reluctance to the Greeks, and the provinces were at that time almoft entirely defencelefs. Rainulphus approved of the fcheme, and raifed 300 foldiers, whom he fent under 12 officers, to join the other Normans under the fons of Tancred; and made an agreement with Ardoin, that the conquefts fhould be equally divided among the chief leaders. Their firft enterprife was the reduction of Melphis, one of the ftrongeft cities in Puglia, which prefently furrendered; and they increafed its fortifications fo much, that it thenceforth became impregnable. Soon after this they made themfelves mafters of Venofa, Afcoli, and Lavello, with very little oppofition. Doceanus alarmed with the rapidity of their conquefts, immediately left Sicily, and marched with his army into Puglia, where he attacked the invaders near the river Olivento; but, after a fierce engagement, he was obliged to retire with confiderable lofs. The Greeks were foon after defeated a fecond time at Cannæ; and in a third engagement, which happened near the river Ofanto, the army of Doceanus was entirely routed, and he himfelf obliged to fly to Bari. On this bad fuccefs Doceanus was ordered to return to his command in Sicily, and another general was fent with an army into Puglia. This new commander, however, had no better fuccefs than his predeceffor; for his army was entirely defeated in an engagement with the Normans, and he himfelf taken prifoner. Atenulphus, brother to one of the princes of Benevento, on whom the Normans had conferred the chief command, fet at liberty the captive general without confulting them, on receiving from him a confiderable fum of money. With this the Normans were fo much difpleafed, that they deprived Atenulphus of his command, and beftowed it on Argyrus fon to the late Mello, who had efcaped from Conftantinople, and now affumed the title of *duke and prince of Italy*. Before this time alfo Maniacus, whom we have formerly mentioned, had returned to Italy; and to ftrike the greater terror into the revolted cities, had executed a number of people of all ages and fexes with great inhumanity. Soon after this Maniacus openly rebelled againft the Greek emperor Conftantinus, and prevailed upon his own army to proclaim him emperor, beginning hoftilities immediately againft the Greek cities. Argyrus at the fame time took Giovennazzo and befieged Trani, and foon after befieged Maniacus himfelf in Tarento; but he, being afraid of falling into the hands of the Normans, fled to Otranto, and from thence to Bulgaria, where, being entirely defeated by one of the emperor's generals, he was taken prifoner, and had his head ftruck off.

20 The Normans pafs over into Sicily.

21 Their conquefts.

The Normans having now conquered the greateft part of Puglia, proceeded to make a divifion of their conqueft; in which, after each commander had got his proper fhare, the city of Melfis was left common to all, and appropriated as a place for affembling to confult about the moft important affairs of the nation. Argyrus alone was neglected in this divifion; but he, having gained the favour of the emperor by expelling the rebel Maniacus from Italy, was by him created duke of Bari, on purpofe to check the power of the Normans, with the title of *prince and duke of Puglia*. The Normans, however were too powerful to be much awed by Argyrus, and behaved with great infolence to the neighbouring princes; but as they could not be expelled by force, and were confirmed in their conquefts by Henry II. emperor of Germany in 1047, the Greek emperor attempted to get rid of them, by fending Argyrus with large fums of money to bribe them to enter into his fervice againft the Perfians. But they, perceiving the fnare, replied, that they were refolved not to leave Italy unlefs they were expelled by force; upon which Argyrus made ufe of the fame money in bribing the Puglians to affaffinate thefe invaders. This brought on a maffacre, in which greater numbers of Normans perifhed than had fallen in all the late wars. Argyrus attempted to take advantage of the confufion produced by this maffacre, but was defeated; after which he had recourfe to Pope Leo, befeeching him to deliver Italy from thefe cruel tyrants: but this fcheme proved ftill more unfuccefsful than the others had been; for

22 Great numbers of them maffacred.

Naples.

for the pope himself was defeated and taken prisoner, and, in consequence of the respect shewed him by the Normans, granted them, as a fief of the holy see, all the conquests they had made or should make in Calabria and Sicily.

23 They are confirmed by the pope in all their conquests.

Soon after this, the Norman power became extremely formidable; the famous Robert Guiscard ascended the throne in 1056. He made great progress in the conquest of Calabria, and reduced most of the cities which held for the Greeks in these parts. About the same time the counts of Capua were expelled from their territory; and the abbot Desiderius mentions his having seen the children of Landulphus V. the last count, going about as vagabonds, and begging for their support. The pope, alarmed by these conquests, excommunicated the Normans in wholesale, pretending that they had seized some of the territories belonging to the church; but, by the pretended submission of Robert, he not only was persuaded to take off the sentence of excommunication, but to invest him with the provinces of Apulia, Calabria, and Sicily. After this, he continued the war against the Greeks with great success. In 1071, in conjunction with his brother Roger, he conquered the island of Sicily, and gave the investiture of the whole island to him with the title of *count*, reserving to himself only the half of Palermo, Messina, and the valley of Demona. The like success attended his arms against Salerno in 1074; but after this, having unadvisedly taken some places from the pope, he again fell under the sentence of excommunication; yet he was reconciled to him in 1080, and received a second time the investiture of all his dominions. The next year he undertook an expedition against the Greeks; and though the emperor was assisted by a Venetian fleet, Robert made himself master of the island of Corfu, reduced Durazzo, and great part of Romania; insomuch that by the success of his arms, and his near approach to Constantinople, he struck an universal terror among the Greeks. But while Robert was thus extending his conquests, he was alarmed by the news of a formidable rebellion in Italy, and that the emperor Henry had taken the city of Rome, and closely shut up the pope in the castle of St Angelo. Robert therefore, leaving the command of the army to his son Boemund, returned to Italy, where he immediately dispersed the rebels, and released the pope, while his son gained a considerable victory over the Greeks. After this Robert made great preparations for another expedition into Greece, in order to second his son Boemund. Alexius, being assisted by the Venetian fleet, endeavoured to oppose his passage; but was entirely defeated, with the loss of a great many galleys. But a final stop was now put to his enterprises by his death, which happened in the island of Corfu in 1085.

24 Sicily conquered by Robert Guiscard.

Tho' the power of the Normans was thus thoroughly established in Italy and Sicily; yet by reason of the civil dissensions which took place among themselves, and the general confusion which reigned in Italy in those ages they were obliged, notwithstanding all their valour, to submit to the emperor in 1195. By him the Sicilians were treated with so great cruelty, that the empress Constantia was induced to conspire against him in 1197, took him prisoner, and released him only on condition of his sending off his army immediately for the Holy Land. This was complied with; but the emperor did not long survive the reconciliation, being poisoned, as was supposed, by order of the empress.

25 And by the emperor of Germany.

In 1254 the pope claimed the kingdom as a fief devolved on the church in consequence of a sentence of deposition pronounced against king Frederic at the council of Lyons; and, in 1263, the kingdom was, in consequence of this right, conferred on Charles count of Anjou. After much contention and bloodshed, the French thus became masters of Sicily and Naples. Their government was insupportably tyrannical; and at the same time the haughtiness of their king so provoked the pope, that he resolved to humble him. Charles had resolved on an expedition against Constantinople; and for this purpose had fitted out a fleet of 100 galleys, 30 large ships, 200 transports, besides many other smaller vessels, on board of which he intended to embark 10,000 horse, and a numerous army of foot.—This formidable armament greatly alarmed the emperor Michael Paleologus; for which reason he entered into a negociation with John di Procida, a noble Salernitan, lord of the isle of Procida in the bay of Naples, who had formed a scheme for a general revolt in the Island of Sicily. John, though a nobleman, was also a physician, and had been counsellor to two former princes, and even to king Charles himself; but being stripped of his estate by the king under pretence of treason, and his wife being debauched by the French, he retired to Constantia queen of Arragon, where he was created a baron of the kingdom of Valencia, by her husband king Peter, and Lord of Luxen, Benizzano, and Palma. As he was greatly exasperated against the French, he employed many spies both in Puglia and Sicily; and being informed that the Sicilians were totally disaffected to the French, he came to the island in disguise, and concerted a plan with the most powerful of the malcontents for a revolution in favour of Constantia, though she derived her right only as being the daughter of a former usurper named *Manfred*. Procida then set out for Constantinople, where, in some private conferences with the emperor, he persuaded him, that the most probable means of defeating Charles's scheme was by assisting the Spaniards and Sicilian malcontents. Paleologus accordingly granted him a large sum of money, and on his departure sent one of his secretaries along with him, who, landing in Sicily, had a conference with the chief conspirator. John, having received letters from them, disguised himself in the habit of a Franciscan, and went to Suriano in the neighbourhood of Rome. As he well knew the enmity which subsisted between the pope and king Charles, he disclosed his design to his holiness; who readily entered into his measures, wrote to Peter to hasten his armament, promising him the investiture of the island as soon as he had taken possession of it; and, by refusing the assistance he had promised to Charles, obliged him for the present to delay his expedition. In the beginning of the year 1280, Procida returned to Arragon; and by shewing the letters from the pope and Sicilian barons, prevailed on Peter to embark in his design, by assuring him of the assistance of Paleologus. The king of Arragon accordingly prepared a formidable fleet under pretence of invading Africa, and is even said to have received 20,000 ducats

26 The French become masters of Sicily and Naples.

cats from Charles in order to aſſiſt him in his preparations.

But while John went on thus ſucceſsfully with his ſcheme, all his meaſures were in danger of being broke by the death of pope Nicholas. The new pope, Martin IV. was entirely in the intereſt of Charles, on whom, in 1281, he conferred the ſenatorial dignity of Rome. Procida, however, ſtill reſolved to proſecute his ſcheme; and, leaving Italy, had another conference with the conſpirators in Sicily; after which, he again went to Conſtantinople, and obtained from Paleologus 30,000 ounces of gold, with which he immediately returned to Arragon. The death of Nicholas had damped the ardour of Peter; but, being urged with great earneſtneſs by John, he again renewed his preparations; which alarmed the pope and the king of France. In conſequence of this they ſent a meſſage to him, deſiring to know againſt what Saracens he deſigned to employ his armament. In this particular Peter refuſed to ſatisfy them; upon which they earneſtly counſelled Charles to guard againſt an invaſion: but he neglected their advice, being wholly intent on his eaſtern expedition, and encouraged by a revolt which had happened in Greece; and to facilitate his expedition, he prevailed on the pope to excommunicate the Greeks, on pretence that they had broken ſome of the articles of union concluded at the council of Lyons a few years before. Peter in the mean time continued his preparations with great diligence; intending to put to ſea the following ſummer. Procida had returned to
27
Palermo, to wait for a favourable opportunity of putting his deſign in execution, which was ſoon afforded

They are maſſacred.

him by the French. On Eaſter Monday, March 30th, 1282, the chief conſpirators had aſſembled at Palermo; and, after dinner, both the Palermitans and French went in a grand proceſſion to the church of Monreale, about three miles without the city. While they were ſporting in the fields, a bride happened to paſs by with her train; who being obſerved by one Drochettus, a Frenchman, he ran to her, and began to uſe her in a rude manner, under pretence of ſearching for concealed arms. A young Sicilian, exaſperated at this affront, ſtabbed him with his own ſword; and a tumult enſuing, 200 French were immediately murdered. The enraged populace then ran to the city, crying out "Let the French die, Let the French die;" and, without diſtinction of ſex or age, ſlaughtered all of that nation they could find, even ſuch as had fled to the churches. The conſpirators then left Palermo, and excited the inhabitants to murder the French all over the iſland, excepting in Meſſina, which city at firſt refuſed to be concerned in the revolt. But, being invited by the Palermitans to throw off the French yoke, a few weeks after, the citizens in a tumultuous manner deſtroyed ſome of the French; and pulling down the arms of king Charles, and erecting thoſe of the city, choſe one Baldwin for their governor, who ſaved the remaining French from the fury of the populace, and allowed them to tranſport themſelves, with their wives and children, to Italy. Eight thouſand perſons are ſaid to have been murdered on this occaſion.

Immediately after this maſſacre, the Sicilians offered their allegiance to the king of Arragon; who accepted of the invitation, and landed with his forces at Trapani. From thence he went to Palermo, where he was crowned king of Sicily with great ſolemnity, and Charles left the iſland with precipitation. The day after he landed his army in Italy, the Arragonian fleet arrived, took 29 of his galleys, and the next day burnt 80 tranſports in preſence of his army. Soon after this Charles ſent an embaſſy to Peter, accuſing him of perfidy, in invading his dominions in time of peace; and, according to ſome, challenged him at the ſame time to decide the matter by ſingle combat. Others ſay, that the challenge was given by Peter. Certain it is, however, that a challege was given, and to appearance accepted: but Peter determined to employ much more effectual means in ſupport of his pretenſions than truſting to a duel; and therefore puſhed on his operations moſt vigorouſly, while his adverſary trifled away his time: and thus he at laſt became maſter of the conteſted kingdom; which, however, he did not long enjoy, dying about the end of the year 1285.

By his will, Peter left the kingdom of Arragon to his eldeſt ſon Alphonſus, and Sicily to Don James his other ſon, who was alſo to ſucceed to the kingdom of Arragon in caſe Alphonſus ſhould die without male iſſue. Accordingly, Don James was ſolemnly crowned at Palermo the 2d of February 1286. In 1205, however, he deſerted them, and tamely reſigned up his right to Charles, ſon to him above-mentioned, in a manner perhaps unparalleled. On his reſignation the 28
Sicilians conferred the crown upon his brother Don Frederic: after which the war continued with great violence till the year 1303, when a peace was concluded, and the kingdoms of Naples and Sicily formally disjoined; Frederic being allowed to keep the latter, under the name of *Trinacria*, and Charles being confirmed in the poſſeſſion of the former, which he quietly enjoyed till his death in 1309.

The kingdoms of Naples and Sicily disjoined.

Naples continued to be governed by its own kings till the beginning of the 16th century, when the kings of France and Spain contended for the ſovereignty of this country. Frederic, at that time king of Naples, reſigned the ſovereignty to Lewis XII. on being created duke of Anjou, and receiving an annual penſion of 30,000 ducats. But, in 1504, the French were en- 29
tirely defeated by the Spaniards, and obliged to evacuate the kingdom; and the following year Lewis renounced all pretenſions to the crown, which from that time hath remained almoſt conſtantly in the hands of the Spaniards.

The Spaniards become maſters of Naples.

The government of the Spaniards proved no leſs oppreſſive to the Neapolitans than that of others had been. The kings of Spain ſet no bounds to their exactions, and of conſequence the people were loaded with all manner of taxes; even the moſt indiſpenſible neceſſaries of life not being exempted. In 1647, a new tax was laid on fruit; which the people looked upon as the moſt grievous oppreſſion; the chief part of their ſubſiſtence, during the ſummer-months, being fruit, which in the kingdom of Naples is very plentiful and delicious. The edict for collecting the new duty was 30
no ſooner publiſhed, than the people began to murmur in a tumultuous manner; and when the viceroy came abroad, they ſurrounded his coach, bawling out to have their grievances redreſſed. They were encouraged in their ſedition, by the news that the citizens of Palermo had actually revolted on account of the impoſition of new duties. The viceroy therefore, apprehenſive

A general revolt.

Naples. henfive of greater diforders, began to think of taking off the tax; but thofe who farmed the tax having bribed fome of his favourites, he was by their means perfuaded not to abolifh it. The indignation of the people, who had fufpected his intention, was now greatly increafed; efpecially as they were privately excited by feveral malcontents. The farmers of the revenue, and all thofe concerned in raifing the taxes, had incurred the hatred and deteftation of the people, particularly of Tommafo Aniello, commonly called *Maffaniello of Amalfi*, a fifherman, whofe wife, having been difcovered in fmuggling a fmall quantity of meal, was imprifoned, and condemned to pay a fine of 100 ducats.

31 Account of Maffaniello.

Maffaniello, a few years before, had come to Naples from Amalfi, where his father had been a fifherman. At this time he was about 24 years of age, and the father of four children. He was of a middling ftature, and an agreeable afpect; was diftinguifhed for his boldnefs, activity, and integrity; and had a great influence with his companions, by whom he was beloved and efteemed. As he was obliged even to fell his furniture to pay the heavy fine, he had conceived an implacable hatred againft the farmers of the taxes, and was alfo moved with compaffion for the miferable ftate of the city and kingdom. He therefore formed a defign, with fome of his companions, to raife a tumult in the market-place on the feftival-day of the Carmelites, ufually celebrated about the middle of July, when between 500 and 600 youths entertain the people by a mock-fight; one half of them in the character of Turks, defending a wooden-caftle, which is attacked and ftormed by the other half in the character of Chriftians. Maffaniello being appointed captain of one of thefe parties, and one Pione, who was privy to his defign, commanding the other, for feveral weeks before the feftival they were very diligent in reviewing and training their followers, who were armed with fticks and reeds: but a fmall and unforefeen accident tempted them to begin their enterprife without waiting for the feftival.

On the 7th of July a difpute happening in the market-place betwixt the tax-gatherers and fome gardeners of Pozzuolo who had brought fome figs into the city, whether the buyer or feller fhould pay the duty; after the tumult had continued feveral hours, Maffaniello, who was prefent with his company, excited the mob to pillage the office built in the market for receiving the duty, and to drive away the officers with ftones. The elect of the people, who, by deciding againft the gardeners, had increafed the tumult, run to the palace, and informed the viceroy, who moft imprudently neglected all means of putting a ftop to the commotion. Maffaniello, in the mean time, being joined by great numbers of people, ordered his young troop to fet fire to all the offices for the taxes through the city; which command being executed with difpatch, he then conducted them directly to the palace, where the viceroy, inftead of ordering his Spanifh and German guards to difperfe them, encouraged their infolence by timidly granting their demands. As they rufhed into the palace in a furious manner, he efcaped by a private door, and endeavoured to fave himfelf in *Caftel del Ovo;* but being overtaken by the rioters in the ftreets, he was trampled upon by them, and pulled by the hair and whifkers. However, by throwing fome handfuls of gold among them, he again efcaped, and took fanctuary in a convent of Minims, where, being joined by the archbifhop of Naples, cardinal Filomarini, and feveral nobles, by their advice he figned a billet, by which he abolifhed all taxes upon provifions. As a means to quell the tumult, he likewife defired the cardinal to offer Maffaniello a penfion of 2400 crowns, who generoufly rejected the bribe; and declared, that if the viceroy would keep his word, he would find them obedient fubjects.

It was now expected that the tumult would ceafe: but Maffaniello, upon his return to the market-place, being joined by feveral malcontents, among whom were Genuino and one Peronne, who had formerly been a captain of the Sbirri, he was advifed by them to order the houfes of thofe concerned in raifing the tax to be burned; which were accordingly in a few days reduced to afhes, with all their rich furniture. Maffaniello being now abfolute mafter of the whole city, and being joined by great numbers of people of defperate fortunes, he required the viceroy, who had retired to the *Caftel Nuovo*, to abolifh all the taxes, and to deliver up the writ of exemption granted by Charles V. This new demand greatly embarraffed the viceroy; but to appeafe the people, he drew up a falfe deed in letters of gold, and fent it to them by their favourite the duke of Matalone, who had before been in confinement. The fraud, however, being difcovered, the duke was pulled from his horfe and maltreated by the mob, and at length committed as a prifoner to Peronne. This accident, to the great joy of the viceroy, enraged the people againft the nobility, feveral of whom they killed, burnt the houfes of others, and threatened to extirpate them all. Maffaniello, in the mean time, tattered and half naked, commanded his followers, who were now well armed, and were reckoned about 100,000 men, with a moft abfolute fway. He eat and flept little, gave his orders with great precifion and judgment, appeared full of moderation, without ambition and interefted views. But the duke of Matalone having procured his liberty by bribing Peronne, the viceroy imitated his example, and fecretly corrupted Genuino to betray his chief. A confpiracy was accordingly formed againft Maffaniello by Matalone and Peronne; the duke, who was equally exafperated againft the viceroy, propofing, that after his death his brother D. Jofeph fhould head the rebels.

Maffaniello in the mean time, by means of the cardinal archbifhop, was negociating a general peace and accommodation; but while both parties were affembling in the convent of the Carmelites, the banditti hired by Matalone made an unfuccefsful attempt upon Maffaniello's life. His followers immediately killed 150 of them. Peronne and D Jofeph being difcovered to be concerned in the confpiracy, were likewife put to death, and the duke with great difficulty efcaped. Maffaniello by this confpiracy was rendered more fufpicious and fevere. He began to abufe his power by putting feveral perfons to death upon flight pretences; and, to force the viceroy to an accommodation, he cut off all communication with the caftles, which were unprovided with provifion and ammunition. The viceroy likewife being afraid left the French fhould take advantage of the commotion, earneftly defired to agree to a treaty; which was accordingly concluded on

Naples. on the fifth day of the inſurrection, by the mediation of the archbiſhop. By the treaty it was ſtipulated,
32 A treaty concluded between Maſſanielio and the viceroy. that all duties impoſed ſince the time of Charles V. ſhould be aboliſhed; that the writ of exemption granted by that emperor ſhould be delivered to the people; that for the future no new taxes ſhould be impoſed; that the vote of the elect of the people ſhould be equal to the votes of the nobility; that an act of oblivion ſhould be granted for all that was paſt; and that the people ſhould continue in arms under Maſſaniello till the ratification of the treaty by the king.

By this treaty, no leſs than 10,000 perſons, who fattened upon the blood of the public, were ruined. The people, when it was ſolemnly publiſhed, manifeſted an extreme joy, believing they had now recovered all their ancient rights and privileges. Maſſaniello, at the deſire of the viceroy, went to the palace to viſit him, accompanied by the archbiſhop, who was obliged to threaten him with excommunication, before he would conſent to lay aſide his rags and aſſume a magnificent dreſs. He was received by the duke with the greateſt demonſtrations of reſpect and friendſhip, while the ducheſs entertained his wife, and preſented her with a robe of cloth of ſilver, and ſome jewels. The viceroy,
33 Maſſaniello appointed captain-general. to preſerve ſome ſhadow of authority, appointed him captain-general; and at his departure made him a preſent of a golden chain of great value, which with great difficulty he was prevailed upon to accept; but yielded at length to the intreaties of the cardinal. Next day, in conſequence of the commiſſion granted him by the viceroy, he began to exerciſe all the functions of ſovereign authority; and having cauſed a ſcaffold to be erected in one of the ſtreets, and ſeveral gibbets, he judged all crimes, whether civil or military, in the laſt reſort; and ordered the guilty to be immediately put to death, which was the puniſhment he aſſigned to all offences. Though he neglected all forms of law, and even frequently judged by phyſiognomy, yet he is ſaid not to have overlooked any criminal, or puniſhed any innocent perſon.

His grandeur and proſperity was of very ſhort continuance: for his mind becoming diſtracted and deliri-
34 Is aſſaſſinated. ous for two or three days, he committed a great many mad and extravagant actions; and on the 18th of July was aſſaſſinated with the conſent of the viceroy.

The tumult did not end with the death of Maſſaniello: on the contrary, the people now expelled the Spaniards from moſt of the cities throughout the kingdom; and this general inſurrection being the ſubject of diſcourſe at Rome, the duke of Guiſe, who happened then to be at the pope's court, took the opportunity, at the inſtigation of his holineſs, to offer his ſervice to the Neapolitans againſt the Spaniards. The duke was prompted by his ambition to engage in this enterpriſe, eſpecially as he himſelf had ſome diſtant pretenſions to the crown. The Spaniards in the mean time made a vigorous attack on the city; but were repulſed by the people, who now formally renounced their allegiance to them. In a ſhort time, however, their city being ſurpriſed by the new viceroy the count d'Oniate, and the duke of Guiſe himſelf taken priſon-
35 The people return to their allegiance. er, the people returned to their allegiance: and thus all the attempts of the French on Naples were fruſtrated. Since that time the Spaniards continued in peaceable poſſeſſion of the kingdom till the year 1707, when it was taken from them by prince Eugene. It was formally ceded to the emperor by the treaty of Raſtadt in 1713; but was recovered by the Spaniards in 1734, and the king of Spain's eldeſt ſon is now the king of Naples and Sicily. For a particular account of theſe revolutions, ſee the articles SPAIN and SICILY.

The climate of Naples is extremely hot, eſpecially in July, Auguſt, and September. In winter there is ſeldom any ice or ſnow, except on the mountains. On account of its fertility, it is juſtly termed an earthly paradiſe; for it abounds with all ſorts of grain, the fineſt fruit and garden-productions of every kind, with rice, flax, oil, and wine, in the greateſt plenty and perfection. It affords alſo ſaffron, manna, alum, vitriol, ſulphur, rock-cryſtal, marble, and ſeveral ſorts of minerals, together with fine wool, and ſilk. The horſes of this country are famous, and the flocks and herds very numerous. Beſides theſe products, of which a conſiderable part is exported, there are manufactures of ſnuff, ſoap, and glaſs-ware. Waiſtcoats, caps, ſtockings, and gloves, are alſo made of the hair or filaments of a ſhell-fiſh, which are warmer than thoſe of wool, and of a beautiful gloſſy green. In this kingdom likewiſe is found that called the *Phrygian ſtone*, or *pietra fungifera*, which, being laid in a damp ſhady place, will yield muſhrooms, ſometimes of a very large ſize, eſpecially if the ſtone is ſprinkled with hot water. See AGARICUS. 36 Climate, produce, &c. of Naples.

As to the mountains of this country, the principal are thoſe of the Apennine, which traverſe it from ſouth to north; and Mount Veſuvius, which, as is well known, is a noted volcano, five Italian miles from Naples. The ſide of this mountain next the ſea yields wine, particularly the two famed wines called *Vino Greco* and *Lachrymæ Chriſti*. One of the greateſt inconveniencies to which this kingdom is expoſed is earthquakes, which the eruptions of Mount Veſuvius contribute, in ſome meaſure, to prevent. Another inconveniency, which, however, is common to it with other hot countries, is the great number of reptiles and inſects, of which ſome are very poiſonous.

With reſpect to religion, it is on a very bad footing here. The number of convents and monaſteries is aſtoniſhing. It is ſaid, the clergy and convents poſſeſs two-thirds of the whole kingdom: nay, ſome maintain, that were the kingdom divided into five parts, four would be found in the hands of the church. Notwithſtanding this power and influence of the clergy, they have not been able hitherto to get the inquiſition eſtabliſhed here. In the year 1731, meaſures were taken for leſſening the number of convents; and, lately, the order of Jeſuits hath been ſuppreſſed. The papal bulls cannot be made public without the king's permiſſion; nor are proteſtants compelled to kneel in the churches, or at the meeting the hoſt; and in Lent they can very eaſily procure fleſh-meat. In the year 1740, the Jews were allowed to ſettle in the kingdom, during the term of 50 years, and ſeveral privileges were granted them during that period; at the expiration of which, the grant was to be ſuppoſed to be renewed, unleſs they were expreſsly ordered to quit the country. 37 Religion.

The revenue of the kingdom is generally computed at 3,000,000 of crowns; but, as Mr Addiſon obſerves, there is no country in Europe which pays 38 Revenue, &c.

Naples.

greater taxes, and where, at the same time, the public is less the better for them, most of them going to the enriching of the private persons to whom they are mortgaged.

The military force of this kingdom is said to consist of about 30,000 men, of which the Swiss regiments are the best. As to the marine, it consists only of a few galleys. The only order here is that of St Januarius, which was instituted by Don Carlos, in the year 1738.

The king of Naples, or of the two Sicilies, is an hereditary monarch. The high colleges are the council of state, the privy-council, the treasury, the Sicily-council, the council of war, &c. This kingdom is a papal fief; and the king, in acknowledgment of the pope's feudal right, sends him every year a white palfry, and a purse of 6000 ducats. The title of the king's eldest son is *prince of Calabria*. The number both of the high and low nobility in the kingdom of Naples is very great; but their incomes in general are very slender. The higher nobles consist of princes, dukes, marquisses, and barons. The general assembly of the states, consisting of the nobility and commons, is summoned, every two years, to meet at the capital, to deliberate on the customary free gift to the crown.

The inhabitants of this country bear but an indifferent character among other nations; but if they are really as defective in this respect as they are represented, it is undoubtedly, in some measure at least, owing to the oppression and slavery under which they groan, both from their civil and ecclesiastic governors. The kingdom is divided into twelve provinces or jurisdictions.

Naples, anciently *Parthenope*, afterwards *Neapolis*, the capital of the kingdom of that name in Italy, lying in the province called *Terra di Lavora*, which is the richest and best inhabited of the whole kingdom, and comprehends a part of the ancient Campania Felix, or the Happy. This city is said to be the first for strength and neatness, and the third for bigness, in all Italy. It is most advantageously situated, having a delicious country on one side, and a noble bay of the Mediterranean on the other, with an excellent harbour. The circumference, including the suburbs, is said not to be less than 18 Italian miles, and the number of the inhabitants therein above 400,000. The houses are of stone, flat-roofed, and generally lofty and uniform; but many of them have balconies, with lattice-windows. The streets are well paved; but they are not lighted at night, and in the day-time are disfigured, in many places, by stalls, on which provisions are exposed to sale. Here are a great number of fine churches, convents, fountains, and palaces of the nobility, many of whom constantly reside here. It is usual to walk on the tops of the houses in the evenings, to breathe the sweet cool air, after a hot sultry day. The climate here is so mild and warm, even in the winter, that plenty of green pease, artichokes, asparagus, and other vegetables, may be had so early as the beginning of the new year, and even all the winter. This city swarms with monks and nuns of all sorts, to such a degree, that there are no less than 19 convents of the Dominicans alone, 18 of the Franciscans, 8 of the Augustines, and in proportion of the rest. The magnificence of many of the churches exceeds imagination. In a cloyster of the Carthusian monastery is a crucifix, said to be done by Michael Angelo, of inimitable workmanship. The fortifications of Naples are very strong, both towards the land and the sea, there being no less than five castles: yet the city is far from being secure from a bombardment; for the sea is so deep, that a large vessel may come up to the very mole, and there is nothing to prevent an enemy's approaches on that side, but a few galleys, the mole, and two small castles. Pictures, statues, and antiquities, are not so common in Naples, as might be expected in so great and ancient a city, many of the most valuable pieces having been sent to Spain by the viceroys. The bay is one of the finest in the world, being almost of a round figure, of about 30 miles in the diameter, and three parts of it sheltered with a noble circuit of woods and mountains. The city stands in the bosom of this bay, in as pleasant a situation, perhaps, as in the world. Mr Keysler says, they reckon about 18000 donne libere, or courtezans, in the city. Though the common people are generally so lazy as to prefer beggary or robbing to labour; yet there are some flourishing manufactures here, and a brisk trade. The city is supplied with a vast quantity of water, by means of a very costly aqueduct, from the foot of Mount Vesuvius. Mr Addison says, it is incredible how great a multitude of retainers to the law there are in Naples, who find continual employment from the fiery temper of the inhabitants. There are five piazzas or squares in the city, appropriated to the nobility, viz. those called *Capuana*, *Nido*, *Montagna*, *Porto*, and *Porta Nova*. Of all the palaces, that of the king is not only the most magnificent, but also in the best style of architecture. The cathedral, though Gothic, is a very grand splendid edifice. It is here that the head and blood of St Januarius, the tutelary saint of Naples, are kept, the latter in two glass or crystal vials. The pretended liquefaction of the dried blood, as soon as brought near the head of the saint, is a thing well known; Mr Addison says, it is one of the most bungling tricks he ever saw *. The harbour is spacious, and kept in good repair. It is fortified with a mole, which runs above a quarter of a mile into the sea, and at the extremity has a high lantern to direct ships safely into the harbour. Luxury here is restrained by severe sumptuary laws, and the women are more closely confined than in any other city of Italy. Here is an university and two academies of wits, the one called *Gli Ardenti*, and the other *Gli Otiosi*. The nunnery for ladies of quality is said to be the largest in the whole world, containing no less than 350 nuns, besides servants. The Mount of Piety, or the office for advancing money to the poor, on pledges, at a low interest, or without any, has an income of upwards of 50000 ducats. The arsenal is said to contain arms for 50000 men. The walls of the city consist of hard black quarry stones, called *piperno*.—Instead of ice, vast quantities of snow are used for cooling their liquors, not so much as water being drank without it; so that, it is said, a scarcity of it would as soon occasion a mutiny as a dearth of corn or provisions. Certain persons, who farm the monopoly of it from the government, supply the city all the year round from

* See *Chemistry*, nº 237.

from a mountain about 18 miles off, at so much the pound. Naples stands 110 miles south-east from Rome, 164 north-east from Palermo in Sicily, 217 south-east from Florence, and 300 from Venice. E. Long. 14. 20. N. Lat. 40. 55.

NARBO, (anc. geog.) a town of the Volcæ Tectosages, called also *Narbo Martius*, from the Legio Martia, the colony led thither 59 years before the consulate of Cæsar, (Velleius); increased with a colony of the Decumani or tenth legion by Cæsar. An ancient trading town on the Atax, which discharges itself into the sea through the Lacus Rubresus, or Rubrensis. Capital of the Gallia Narbonensis; surnamed *Colonia Julia Paterna*, from Julius Cæsar, the father of Augustus by adoption. Now called *Narbonne*, a city of Languedoc.

NARBONNE, an ancient and large city of France, in Lower Languedoc, with an archbiship's see, and famous for its honey. It is seated on a canal cut from the river Aude, which being but three miles from the sea, vessels come up it laden with merchandise, which renders it a place of great trade. It is very ancient, being built in the time of the Romans; and the ruins of a capitol, an amphitheatre, and several other buildings, still remain. It is divided into the city and the town, which are joined together by a bridge, with houses on each side, in which the richest merchants live. There are several churches and convents, and the metropolitan church has a handsome steeple. E. Long. 2. 6. N. Lat. 43. 11.

NARCISSUS, in fabulous history, the son of the river Cephissus and Liriope, the daughter of Oceanus, was a youth of great beauty. Tiresias foretold that he should live till he saw himself. He despised all the nymphs of the country; and made Echo languish till she became a mere sound, by refusing to return her passion: but one day coming weary and fatigued from the chace, he stopped on the bank of a fountain to quench his thirst; when, seeing his own form in the water, he became so in love with the shadowy image, that he languished till he died. On which the gods, being moved at his death, changed him into the flower which bears his name.

NARCISSUS, a genus of the monogynia order, belonging to the hexandria class of plants. The most remarkable species are,

1. The bastard narcissus, or common yellow English daffodil, grows wild in great plenty in many of our woods and coppices, and under hedges in several parts of England. In the counties round London the herbfolks bring prodigious quantities in the spring of the year, when in bloom, root and all, and sell them about the streets. Its commonness renders it of but little esteem with many; considered, however, as an early and elegant flower, of exceeding hardiness and easy culture, it merits a place in every garden.

2. The bicolor, or two-coloured incomparable narcissus, hath a large, oblong, bulbous root; crowned with long, narrow, dark-green leaves, 12 or 14 inches long; an upright flower-stalk, about 15 inches high, terminated by an uniflorous spatha, protruding one large flower with white petals, and a bell-shaped, spreading, golden nectarium, waved on the margin, and equal in length with the corolla; flowering in April. The varieties are, common single-flowered—semi-double-flowered, with the interior petals some white, and some yellow——with sulphur-coloured flowers.

3. The poeticus, poetic daffodil, or common white narcissus, is well known. Of this there are varieties with purple-cupped flowers—yellow-cupped flowers—double-flowered: all of them with entire white petals. It is the ancient celebrated narcissus of the Greek and Roman poets, which they so greatly extol for its extreme beauty and fragrance.

4. The bulbocodium, hath a small bulbous root, crowned with several narrow, subulate, rush-like leaves, six or eight inches long; amidst them a slender, taper flower-stalk, six inches high, terminated by an uniflorous spatha, protruding one yellow flower, having the nectarium much larger than the petals, and very broad and spreading at the brim; flowering in April. From the large spreading nectarium of this species, which being three or four times longer than the petals, narrow at bottom, and widening gradually to the brim, so as to resemble the shape of some old-fashioned hoop-petticoats, it obtained the name *hoop-petticoat narcissus*.

5. The serotinus, or late-flowering small autumnal narcissus, hath a small bulbous root; crowned with a few narrow leaves; amidst them a jointed flower-stalk, eight or nine inches high, trrminated by an uniflorous spatha, protruding one white flower, having a short, six-parted, yellow nectarium; flowering in autumn.

6. The tazetta, or multiflorous daffodil, commonly called *polyanthus narcissus*, hath a very large, roundish, bulbous root; long, narrow, plane leaves; an upright flower-stalk, rising from 10 or 12 inches to a foot and a half high; terminated by a multiflorous spatha, protruding many large, spreading, white and yellow flowers, in a cluster, having bell-shaped nectariums shorter than the corolla; flowering in February, March, and April, and is very fragrant. The varieties of this are very numerous, consisting of about eight or nine principal sorts, each of which having many intermediate varieties; amounting in the whole greatly above an hundred in the Dutch florists catalogues, each variety distinguished by a name according to the fancy of the first raiser of it. They are all very pretty flowers, and make a charming appearance in the flower-borders, &c. they are also finely adapted for blowing in glasses of water, or in pots, to ornament rooms in winter.

7. The jonquilla, or jonquil, sometimes called *rush-leaved daffodil*, hath an oblong, bulbous, brown root; sending up several long, semi-taper, rush-like, bright-green leaves; amidst them an upright green flower-stalk, a foot or 15 inches high; terminated by a multiflorous spatha, protruding many yellow flowers, often expanded like a radius, each having a hemispherical, crenated nectarium, shorter than the petals; flowering in April, and mostly of a fine fragrance. The varieties are, Jonquil minor with single flowers—jonquil major with single flowers—starry flowered—yellow and white flowered—white-flowered—semi-double-flowered—double-flowered—and large double inodorous jonquil: all of them multiflorous, the singles in particular; but sometimes the doubles produce only two or three flowers from a spatha, and the singles commonly six or eight. All the sorts have so fine a

fhape, fo foft a colour, and fo fweet a fcent, that they are fome of the moft agreeable fpring-flowers.

8. The calathinus, or multiflorous yellow narciffus, hath a large bulbous root; crowned with long, narrow, plane leaves; and amidft them an erect, robuft flower-ftalk, terminated by a multiflorous fpatha, protruding many large, entire, yellow flowers having a bell-fhaped, flightly crenated nectarium, equal in length with the petals.

9. The odorus, odoriferous or fweet-fcented ftarry yellow narciffus, hath a bulbous root; narrow leaves; erect flower-ftalk, a foot or more high, terminated by a fub-multiflorous fpatha, protruding fometimes but one, and fometimes feveral entirely yellow flowers, having a companulated, fix-parted, fmooth nectarium, half the length of the petals.

10. The triandrus, or triandrous rufh-leaved white narciffus, hath a bulbous root; very narrow, rufh-like leaves; erect flower-ftalk, terminated by an uniflorous fpatha, protruding one fnowy-white flower, having a bell-fhaped, crenated nectarium, half the length of the petals, and with moftly triandrous or three ftamina.

11. The trilobus, or trilobate yellow narciffus, hath a bulbous root; narrow rufh-like leaves; erect flower-ftalks, terminated by a fub-multiflorous fpatha, protruding fometimes but one or two, and fometimes feveral, yellow flowers, having a bell-fhaped, three-lobed nectarium, half the length of the petals.

12. The minor, or yellow winter daffodil, hath a fmall bulbous root; plane leaves, eight or ten inches long, and more than half a one broad; an erect flower-ftalk, terminated by an uniflorous fpatha, portruding one nodding yellow flower, with fpear-fhaped petals, having an obconic, fix-parted, waved nectarium, equal to the length of the corolla; flowering in winter, or very early in fpring.

All thefe 12 fpecies of narciffus are of the bulbous-rooted tribe, and univerfally perennial in root, but annual in leaf and flower-ftalk; all of them rifing annually in fpring, immediately from the crown of the bulb, firft the leaves, and in the midft of them the flower-ftalk, one only from each root, entirely naked or leaflefs, each terminated by a fpatha or fheath, which opens on one fide to protrude the flowers, and then withers; the flowers, as before obferved, are all hexapetalous, each furnifhed with a nectarium in the centre, and are univerfally hermaphrodite: they are large and confpicuous, appearing moftly in the fpring-feafon, generally from March or April until June, fucceeded by ripe feed in July; then the leaves and flower-ftalks decay, and the roots defift from growing for fome time; at which period of reft is the only proper time to take up or tranfplant the roots from one place to another, or to feparate the offsets; for they all multiply abundantly by offset young bulbs from the main root, infomuch that a fingle bulb will in one or two years be increafed into a large clufter of feveral bulbs, clofely placed together, and which every fecond or third year fhould be taken up at the above period in order to be feparated; and each offset fo feparated commences a diftinct plant, which being planted again in autumn, produces flowers the following fummer, alike in every refpect to thofe of their refpective parent-bulbs. All the fpecies are fo hardy that they profper in any common foil of a garden: obferving, however, to allow the finer forts of *polyanthos narciffus*, in particular, principally a warm dry fituation; all the others may be planted any where in the open dry borders and flower-beds.

NARCOTICS, in medicine, foporiferous drugs, which bring on a ftupefaction. Among narcotics the moft eminent are thofe ufually prepared for medicinal ufes of the whole poppy, efpecially opium; as alfo all thofe prepared of mandragoras, hyofciamus, ftramonium, and datura.

NARDO, a pretty populous town in the kingdom of Naples, and in the Terra d'Otranto, with the title of a duchy and a bifhop's fee. E. Long. 18. 27. N. Lat. 43. 28.

NARRATION, in oratory, poetry, and hiftory, a recital or rehearfal of a fact as it happened, or when it is fuppofed to have happened. See ORATORY, n° 26. 123.

Concerning NARRATION *and Defcription*, we have the following rules and obfervations in the Elements of Criticifm.

1. The firft rule is, That in hiftory the reflections ought to be chafte and folid; for while the mind is intent upon truth, it is little difpofed to the operations of the imagination. Strada's Belgic hiftory is full of poetical images, which, being difcordant with the fubject, are unpleafant; and they have a ftill worfe effect, by giving an air of fiction to a genuine hiftory. Such flowers ought to be fcattered with a fparing hand, even in epic poetry; and at no rate are they proper, till the reader be warmed, and by an enlivened imagination be prepared to relifh them: in that ftate of mind, they are agreeable; but while we are fedate and attentive to an hiftorical chain of facts, we reject with difdain every fiction.

2. Vida, following Horace, recommends a modeft commencement of an epic poem; giving for a reafon, That the writer ought to hufband his fire. Befides, bold thoughts and figures are never relifhed till the mind be heated and thoroughly engaged, which is not the reader's cafe at the commencement. Homer introduces not a fingle fimile in the firft book of the Iliad, nor in the firft book of the Odyffey. On the other hand, Shakefpeare begins one of his plays with a fentiment too bold for the moft heated imagination:

Bedford. Hung be the heav'ns with black, yield day
to night!
Comets, importing change of times and ftates,
Brandifh your cryftal treffes in the fky,
And with them fcourge the bad revolting ftars,
That have confented unto Henry's death!
Henry the Fifth, too famous to live long!
England ne'er loft a king of fo much worth.

Firft part Henry VI.

The paffage with which Strada begins his hiftory, is too poetical for a fubject of that kind; and at any rate too high for the beginning of a grave performance.

3. A third rule or obfervation is, That where the fubject is intended for entertainment folely, not for inftruction, a thing ought to be defcribed as it appears, not as it is in reality. In running, for example, the impulfe upon the ground is proportioned in fome de-

gree to the celerity of motion; though in appearance it is otherwife, for a perfon in fwift motion feems to fkim the ground, and fcarcely to touch it. Virgil, with great tafte, defcribes quick running according to appearance; and raifes an image far more lively, than by adhering fcrupuloufly to truth:

Hos fuper advenit Volfca de gente Camilla,
Agmen agens equitum et florentes ære catervas,
Bellatrix: non illa colo calathifve Minervæ
Fœmineas affueta manus; fed prælia virgo
Dura pati, curfuque pedum prævertere ventos.
Illa vel intactæ fegetis per fumma volaret
Gramina: nec teneras curfu læfiffet ariftas:
Vel mare per medium, fluctu fufpenfa tumenti,
Ferret iter; celeres nec tingeret æquore plantas.

Æneid. vii. 803.

4. In narration as well as in defcription, objects ought to be painted fo accurately as to form in the mind of the reader diftinct and lively images. Every ufelefs circumftance ought indeed to be fuppreffed, becaufe every fuch circumftance loads the narration; but if a circumftance be neceffary, however flight, it cannot be defcribed too minutely. The force of language confifts in raifing complete images; which have the effect to tranfport the reader as by magic into the very place of the important action, and to convert him as it were into a fpectator, beholding every thing that paffes. The narrative in an epic poem ought to rival a picture in the livelinefs and accuracy of its reprefentations: no circumftance muft be omitted that tends to make a complete image; becaufe an imperfect image, as well as any other imperfect conception, is cold and uninterefting. We fhall illuftrate this rule by feveral examples, giving the firft place to a beautiful paffage from Virgil:

Qualis *populeâ* mœrens Philomela fub umbrâ
Amiffos queritur fœtus, quos durus *arator*
Obfervans nido *implumes* detraxit.

Georg. lib. 4. *l.* 511.

The poplar, plowman, and unfledged young, though not effential in the defcription, tend to make a complete image, and upon that account are an embellifhment.

Again:

Hic viridem Æneas *frondenti ex ilice* metam
Conftituit, fignum nautis. *Æneid.* v. 129.

Horace addreffing to fortune:

Te pauper ambit follicita prece
Ruris colonus: te dominam æquoris,
Quicumque Bithynâ laceffit
Carpathium pelagus carinâ.

Carm. lib. 1. *ode* 35.

—— Illum ex mœnibus hofticis
Matrona bellantis tyranni
Profpiciens, et adulta virgo,
Sufpiret: Eheu, ne rudis agminum
Sponfus laceffat regius afperum
Tactu leonem, quem cruenta
Per medias rapit ira cædes.

Carm. lib. 3. *ode* 2.

Shakefpear fays, "You may as well go about to turn the fun to ice by fanning in his face with a *peacock's* feather." The peacock's feather, not to mention the beauty of the object, completes the image: an accurate image cannot be formed of that fanciful operation, without conceiving a particular feather; and one is at a lofs when this is neglected in the defcription. Again, "The rogues flighted me into the river with as little remorfe, as they would have drown'd a bitch's blind puppies, fifteen i' th' litter."

Old Lady. You would not be a queen?
Anne. No, not for all the riches under heaven.
Old Lady. 'Tis ftrange: a three-pence bow'd would hire me, old as I am, to queen it.

Henry VIII. act. 2. *fc.* 5.

In the following paffage, the action, with all its material circumftances, is reprefented fo much to the life, that it would fcarce appear more diftinct to a real fpectator; and it is the manner of defcription that contributes greatly to the fublimity of the paffage.

He fpake; and to confirm his words, out-flew
Millions of flaming fwords, drawn from the thighs
Of mighty cherubim; the fudden blaze
Far round illumin'd hell: highly they rag'd
Againft the Higheft, and fierce with grafped arms,
Clafh'd on their founding fhields the din of war,
Hurling defiance toward the vault of heav'n.

Milton, b. 1.

The following paffage from Shakefpeare falls not much fhort of that now mentioned in particularity of defcription:

O you hard hearts! you cruel men of Rome!
Knew you not Pompey? Many a time and oft
Have you climb'd up to walls and battlements,
To tow'rs and windows, yea, to chimney-tops,
Your infants in your arms; and there have fat
The live-long day with patient expectation
To fee great Pompey pafs the ftreets of Rome;
And when you faw his chariot but appear,
Have you not made an univerfal fhout,
That Tyber trembled underneath his banks,
To hear the replication of your founds,
Made in his concave fhores?

Julius Cæfar, act 1. *fc.* 1.

The following paffage is fcarce inferior to either of thofe mentioned:

"Far before the reft, the fon of Offian comes; bright in the fmiles of youth, fair as the firft beams of the fun. His long hair waves on his back: his dark brow is half beneath his helmet. The fword hangs loofe on the hero's fide; and his fpear glitters as he moves. I fled from his terrible eye, King of high Temora." *Fingal.*

The Henriade of Voltaire errs greatly againft the foregoing rule: every incident is touched in a fummary way, without ever defcending to circumftances. This manner is good in a general hiftory, the purpofe of which is to record important tranfactions: but in a fable it is cold and uninterefting; becaufe it is impracticable to form diftinct images of perfons or things reprefented in a manner fo fuperficial.

It is obferved above, that every ufelefs circumftance ought to be fuppreffed. The crowding fuch circumftances is, on the one hand, not lefs to be avoided, than the concifenefs for which Voltaire is blamed, on the other. In the Æneid, Barce, the nurfe of Sichæus,

Narration. chæus, whom we never hear of before nor after, is introduced for a purpose not more important than to call Anna to her sister Dido: and that it might not be thought unjust in Dido, even in this trivial circumstance, to prefer her husband's nurse before her own, the poet takes care to inform his reader, that Dido's nurse was dead. To this may be opposed a beautiful passage in the same book, where, after Dido's last speech, the poet, without detaining his readers by describing the manner of her death, hastens to the lamentation of her attendants:

Dixerat: atque illam media inter talia ferro
Collapsam aspiciunt comites, ensemque cruore
Spumantem, sparsasque manus. It clamor ad alta
Atria, concussam bacchatur fama per urbem;
Lamentis gemituque et fœmineo ululatu
Tecta fremunt, resonat magnis plangoribus æther.
Lib. 4. l. 663.

As an appendix to the foregoing rule, may be added the following observation, That to make a sudden and strong impression, some single circumstance, happily selected, has more power than the most laboured description. Macbeth, mentioning to his lady some voices he heard while he was murdering the King, says,

There's one did laugh in sleep, and one cry'd Murder!
They wak'd each other; and I stood and heard them;
But they did say their prayers, and address them
Again to sleep.
Lady. There are two lodg'd together.
Macbeth. One cry'd, God bless us! and, Amen! the other;
As they had seen me with these hangman's hands.
Listening their fear, I could not say, Amen,
When they did say, God bless us.
Lady. Consider it not so deeply.
Macbeth. But wherefore could not I pronounce Amen?
I had most need of blessing, and Amen
Stuck in my throat.
Lady. These deeds must not be thought
After these ways; so, it will make us mad.
Macbeth. Methought, I heard a voice cry, Sleep no more!
Macbeth doth murder sleep, &c. *Act* 2. *sc.* 3.

Describing prince Henry:

I saw young Harry, with his beaver on,
His cuisses on his thighs, gallantly arm'd,
Rise from the ground like feather'd Mercury;
And vaulted with such ease into his seat,
As if an angel dropt down from the clouds,
To turn and wind a fiery Pegasus,
And witch the world with noble horsemanship.
First part Henry IV. *act* 4. *sc.* 2.

King Henry. Lord Cardinal, if thou think'st on Heaven's bliss,
Hold up thy hand, make signal of thy hope.
He dies, and makes no sign!
Second part Henry VI. *act* 3. *sc.* 10.

The same author, speaking ludicrously of an army debilitated with diseases, says,

" Half of them dare not shake the snow from off their cassocks, lest they shake themselves to pieces."

" I have seen the walls of Balclutha, but they were desolate. The flames had resounded in the halls: and the voice of the people is heard no more. The stream of Clutha was removed from its place by the fall of the walls. The thistle shook there its lonely head: the moss whistled to the wind. The fox looked out from the windows: and the rank grass of the wall waved round his head. Desolate is the dwelling of Morna: silence is in the house of her fathers." *Fingal.*

To draw a character is the master-stroke of description. In this Tacitus excels: his portraits are natural and lively, not a feature wanting or misplaced. Shakespeare, however, exceeds Tacitus in liveliness; some characteristical circumstance being generally invented or laid hold of, which paints more to the life than many words. The following instances will explain our meaning, and at the same time prove our observation to be just.

Why should a man, whose blood is warm within,
Sit like his grandsire cut in alabaster?
Sleep when he wakes, and creep into the jaundice,
By being peevish? I tell thee what, Anthonio,
(I love thee, and it is my love that speaks),
There are a sort of men, whose visages
Do cream and mantle like a standing pond;
And do a wilful stillness entertain,
With purpose to be dress'd in an opinion
Of wisdom, gravity, profound conceit;
As who should say, I am Sir Oracle,
And when I ope my lips, let no dog bark!
O my Anthonio! I do know of those,
That therefore only are reputed wise,
For saying nothing.
Merchant of Venice, *act.* 1. *sc.* 2.

Again:

" Gratiano speaks an infinite deal of nothing, more than any man in all Venice: his reasons are two grains of wheat hid in two bushels of chaff; you shall seek all day ere you find them; and when you have them, they are not worth the search." *Ibid.*

In the following passage, a character is completed by a single stroke:

Shallow. O the mad days that I have spent; and to see how many of mine old acquaintance are dead.

Silence. We shall all follow, cousin.

Shallow. Certain, 'tis certain, very sure, very sure; Death (as the Psalmist saith) is certain to all: all shall die. How a good yoke of bullocks at Stamford fair?

Slender. Truly, cousin, I was not there.

Shallow. Death is certain. Is old *Double* of your town living yet?

Silence. Dead, Sir.

Shallow. Dead! see, see; he drew a good bow: and dead. He shot a fine shoot. How a score of ewes now?

Silence. Thereafter as they be. A score of good ewes may be worth ten pounds.

Shallow. And is old *Double* dead?
Second part Henry IV. *act.* 3. *sc.* 3.

Describing a jealous husband:

" Neither press, coffer, chest, trunk, well, vault, but he hath an abstract for the remembrance of such places, and goes to them by his note. There is no hiding you in the house." *Merry Wives of Windsor*, *act* 4. *sc.* 3.

Congreve

Narration. Congreve has an inimitable ftroke of this kind in his comedy of *Love for Love:*

Ben Legend. Well, father, and how do all at home? how does brother Dick, and brother Val?

Sir Sampfon. Dick, body o' me, Dick has been dead thefe two years. I writ you word when you were at Leghorn.

Ben. Mefs, that's true; marry, I had forgot. Dick's dead, as you fay. *Act* 3. *fc.* 6.

Falftaff fpeaking of Ancient Piftol:

" He's no fwaggerer, hoftefs; a tame cheater i'faith; you may ftroak him as gently as a puppy-greyhound; he will not fwagger with a Barbary hen, if her feathers turn back in any fhew of refiftance."

Second part Henry IV. *act* 2. *fc.* 9.

Offian among his other excellencies is eminently fuccefsful in drawing characters; and he never fails to delight his reader with the beautiful attitudes of his heroes. Take the following inftances:

" O Ofcar! bend the ftrong in arm; but fpare the feeble hand. Be thou a ftream of many tides againft the foes of thy people; but like the gale that moves the grafs to thofe who afk thine aid.—So Tremor lived; fuch Trathal was; and fuch has Fingal been. My arm was the fupport of the injured; and the weak refted behind the lightning of my fteel."

" We heard the voice of joy on the coaft, and we thought that the mighty Cathmor came. Cathmor the friend of ftrangers! the brother of red-haired Cairbar! But their fouls were not the fame; for the light of heaven was in the bofom of Cathmor. His towers rofe on the banks of Atha: feven paths led to his halls: feven chiefs ftood on thefe paths, and called the ftranger to the feaft. But Cathmor dwelt in the wood to avoid the voice of praife."

" Dermid and Ofcar were one: they reaped the battle together. Their friendfhip was ftrong as their fteel; and death walked between them to the field. They rufh on the foe like two rocks falling from the brow of Ardven. Their fwords are ftained with the blood of the valiant: warriors faint at their name. Who is equal to Ofcar but Dermid? who to Dermid but Ofcar?"

" Son of Comhal, replied the chief, the ftrength of Morni's arm has failed: I attempt to draw the fword of my youth, but it remains in its place: I throw the fpear, but it falls fhort of the mark: and I feel the weight of my fhield. We decay like the grafs of the mountain, and our ftrength returns no more. I have a fon, O Fingal! his foul has delighted in the actions of Morni's youth; but his fword has not been fitted againft the foe, neither has his fame begun. I come with him to battle, to direct his arm. His renown will be a fun to my foul, in the dark hour of my departure. O that the name of *Morni* were forgot among the people! that the heroes would only fay, *Behold the father of Gaul.*"

Some writers, through heat of imagination, fall into contradiction; fome are guilty of downright abfurdities; and fome even rave like madmen. Againft fuch capital errors one cannot be more effectually warned than by collecting inftances; and the firft fhall be of a contradiction, the moft venial of all. Virgil fpeaking of Neptune, Narration.

Interea magno mifcere murmure pontum,
Emiffamque hyemem fenfit Neptunus, et imis
Stagna refufa vadis: *graviter commotus*, et alto
Profpiciens, fummâ *placidum* caput extulit undâ.

Æneid. i. 128.

Again:

When firft young Maro, in his boundlefs mind,
A work t'outlaft *immortal* Rome defigned.

Effay on Criticifm, l. 30.

The following examples are of abfurdities.

" Alii pulfis e tormento catenis difcerpti fectique, dimidiato corpore pugnabant fibi fuperftites, ac peremptæ partes ultores." *Strada, dec.* 2. *l.* 2.

Il povér huomo, che non fen' era accorto,
Andava combattendo, ed era morto. *Berni.*

He fled, but flying, left his life behind.

Iliad xi. 443.

Full through his neck the weighty falchion fped:
Along the pavement roll'd the mutt'ring head.

Odyffey xxii. 365.

The laft article is of raving like one mad. Cleopatra fpeaking to the afpic,

——————Welcome, thou kind deceiver,
Thou beft of thieves; who, with an eafy key,
Doft open life, and unpèrceiv'd by us
Even fteal us from ourfelves; difcharging fo
Death's dreadful office, better than himfelf;
Touching our limbs fo gently into flumber,
That Death ftands by, deceiv'd by his own image,
And thinks himfelf but fleep.

Dryden, All for Love, act 5.

Having difcuffed what obfervations occurred upon the thoughts or things expreffed, we proceed to what more peculiarly concern the language or verbal drefs. As words are intimately connected with the ideas they reprefent, the emotions raifed by the found and by the fenfe ought to be concordant. An elevated fubject requires an elevated ftyle; what is familiar, ought to be familiarly expreffed: a fubject that is ferious and important, ought to be clothed in plain nervous language: a defcription, on the other hand, addreffed to the imagination, is fufceptible of the higheft ornaments that founding words and figurative expreffion can beftow upon it.

We fhall give a few examples of the foregoing rules. A poet of any genius is not apt to drefs a high fubject in low words; and yet blemifhes of that kind are found even in claffical works. Horace, obferving that men are fatisfied with themfelves, but feldom with their condition, introduces Jupiter indulging to each his own choice:

Jam faciam quod vultis: eris tu, qui modo miles,
Mercator: tu, confultus modo, rufticus: hinc vos,
Vos hinc mutatis difcedite partibus: eia.
Quid ftatis? nolint: atqui licet effe beatis.
Quid caufæ eft, merito quin illis *Jupiter ambas*
Iratas buccas inflet? neque fe fore pofthac
Tam facilem dicat, votis ut præbeat aurem?

Sat. lib. 1. *fat.* 1. *l.* 16.

Jupiter in wrath puffing up both cheeks, is a low and even ludicrous expreffion, far from fuitable to the gravity

vity and importance of the fubject: every one muft feel the difcordance. The following couplet, finking far below the fubject, is no lefs ludicrous:

Not one looks backward, onward ftill he goes,
Yet ne'er looks forward farther than his nofe.
Effay on Man, ep. iv. 223.

On the other hand, to raife the expreffion above the tone of the fubject, is a fault than which none is more common. Take the following inftances:

Orcan le plus fidéle à ferver fes deffeins,
Ne fous le ciel brûlant des plus noirs Affricains.
Bajazet, act 3. *fc.* 8.

Les ombres par trois fois ont obfcurci les cieux
Depuis que le fommeil n'eft entré dans vos yeux;
Et le jour a trois fois chaffé la nuit obfcure
Depuis que votre corps languit fans nourriture.
Phedra, act 1. *fc.* 3.

Affueris. Ce mortel, qui montra tant de zéle pour moi, Vit-il encore?
Afaph.———Il voit l'aftre qui vous éclaire.
Efther, act 2. *fc.* 3.

Oui, c'eft Agamemnon, c'eft ton roi qui t'eveille;
Viens, reconnois la voix qui frappe ton oreille.
Iphigenie.

No jocund health that Denmark drinks to-day,
But the great cannon to the clouds fhall tell;
And the king's rowfe the heav'n fhall bruit again,
Refpeaking earthly thunder.
Hamlet, act 1. *fc.* 2.

————————In the inner room
I fpy a winking lamp, that weakly ftrikes
The ambient air, fcarce kindling into light.
Southerne, Fate of Capua, act 3.

In the funeral orations of the bifhop of Meaux, the following paffages are raifed far above the tone of the fubject:

" L'Ocean etonné de fe voir traverfé tant de fois, en des appareils fi divers, et pour des caufes fi differentes, &c." - *p.* 6.

" Grande reine, je fatisfais à vos plus tendres defirs, quand je célébre ce monarque; et fon cœur qui n'a jamais vêcu que pour lui, fe eveille, tout poudre qu'il eft, et devient fenfible, même fous ce drap mortuaire, au nom d'un epoux fi cher." *p.* 32.

The following paffage, intended, one would imagine, as a receipt to boil water, is altogether burlefque by the laboured elevation of the diction:

A maffy caldron of ftupendous frame
They brought, and plac'd it o'er the rifing flame:
Then heap the lighted wood; the flame divides
Beneath the vafe, and climbs around the fides:
In its wide womb they pour the rufhing ftream:
The boiling water bubbles to the brim.
Iliad. xviii. 405.

In a paffage at the beginning of the 4th book of Telemachus, one feels a fudden bound upward without preparation, which accords not with the fubject:

" Calypfo, qui avoit été jufqu' à ce moment immobile et tranfportée de plaifir en écoutant les avantures de Télémaque, l'interrompit pour lui faire prendre quelque repôs. Il eft tems, lui dit-elle, que vous alliez goûter la douceur du fommeil aprés tant de travaux. Vous n'avez rien à craindre ici; tout vous eft favorable. Abandonnez vous donc à la joye. Goutez la paix, et tous les autres dons des dieux dont vous allez être comblé. Demain, *quand l'Aurore avec fes doigts de rôfes entr'ouvira les portes dorées de l'Orient, et que le chevaux du foleil fortans de l'onde amére répandront les flames du jour, pour chaffer devant eux toutes les etoiles du ciel,* nous reprendrons, mon cher Télémaque, l'hiftoire de vos malheurs."

This obvioufly is copied from a fimilar paffage in the Æneid, which ought not to have been copied, becaufe it lies open to the fame cenfure; but the force of authority is great:

At regina gravi jamdudum faucia cura
Vulnus alit venis, et cæco carpitur igni.
Multa viri virtus animo, multufque recurfat
Gentis honos: hærent infixi pectore vultus,
Verbaque: nec placidam membris dat cura quietem
Poftera Phœbea luftrabat lampade terras,
Humentemque Aurora polo dimoverat umbram;
Cum fic unanimem alloquitur malefana fororem.
Lib. iv. 1

The language of Homer is fuited to his fubject, not lefs accurately than the actions and fentiments of his heroes are to their characters. Virgil, in that particular, falls fhort of perfection: his language is ftately throughout: and though he defcends at times to the fimpleft branches of cookery, roafting and boiling for example, yet he never relaxes a moment from the high tone. In adjufting his language to his fubject, no writer equals Swift. We can recollect but one exception. which at the fame time is far from being grofs: The Journal of a modern Lady is compofed in a ftyle blending fprightlinefs with familiarity, perfectly fuited to the fubject: in one paffage, however, the poet, deviating from that ftyle, takes a tone above his fubject. The paffage we have in view begins *l.* 116. *But let me now a while furvey, &c.* and ends at *l.* 135.

It is proper to be obferved upon this head, that writers of inferior rank are continually upon the ftretch to enliven and enforce their fubject by exaggeration and fuperlatives. This unluckily has an effect contrary to what is intended: the reader, difgufted with language that fwells above the fubject, is led by contraft to think more meanly of the fubject than it may poffibly deferve. A man of prudence, befide, will be no lefs careful to hufband his ftrength in writing than in walking: a writer too liberal of fuperlatives, exhaufts his whole ftock upon ordinary incidents, and referves no fhare to exprefs, with greater energy, matters of importance.

Many writers of that kind abound fo in epithets, as if poetry confifted entirely in high-founding words. Take the following inftance:

When black-brow'd night her dufky mantle fpread,
And wrapt in folemn gloom the fable fky;
When foothing fleep her opiate dews had fhed,
And feal'd in filken flumbers ev'ry eye:
My wakeful thought admits no balmy reft,
Nor the fweet blifs of foft oblivion fhare:
But watchful wo diftracts my aching breaft,
My heart the fubject of corroding care:
From haunts of men with wandring fteps and flow
I folitary fteal, and foothe my penfive wo.

Here every fubftantive is faithfully attended by fome tumid

Narration. tumid epithet.

We proceed to a fecond remark, not lefs important than the former. No perfon of reflection but muft be fenfible, that an incident makes a ftronger impreffion on an eye-witnefs, than when heard at fecond-hand. Writers of genius, fenfible that the eye is the beft avenue to the heart, reprefent every thing as paffing in our fight; and, from readers or hearers, transform us as it were into fpectators: a fkilful writer conceals himfelf, and prefents his perfonages: in a word, every thing becomes dramatic as much as poffible. Plutarch, *de gloria Athenienfium*, obferves, that Thucydides makes his reader a fpectator, and infpires him with the fame paffions as if he were an eye-witnefs.

In the fine arts, it is a rule, to put the capital objects in the ftrongeft point of view; and even to prefent them oftener than once, where it can be done. In hiftory-painting, the principal figure is placed in the front, and in the beft light: an equeftrian ftatue is placed in a centre of ftreets, that it may be feen from many places at once. In no compofition is there greater opportunity for this rule than in writing:

———Sequitur pulcherrimus Aftur,
Aftur equo fidens et verficoloribus armis.
Æneid. x. 180.

———Full many a lady
I've ey'd with beft regard, and many a time
Th' harmony of their tongues hath into bondage
Brought my too diligent ear: for feveral virtues
Have I lik'd feveral women; never any
With fo full foul, but fome defect in her
Did quarrel with the nobleft grace fhe ow'd,
And put it to the foil. But you, O you,
So perfect, and fo peerlefs, are created
Of every creature's beft. *Tempeft, act* 3. *fc.* 1.

Orlando.——— Whate'er you are
That, in the defart inacceffible,
Under the fhade of melancholy boughs,
Lofe and neglect the creeping hours of time;
If ever you have look'd on better days;
If ever been where bells have knoll'd to church;
If ever fat at any good man's feaft;
If ever from your eye-lids wip'd a tear,
And know what 'tis to pity, and be pity'd;
Let gentlenefs my ftrong inforcement be,
In the which hope I blufh, and hide my fword.

Duke fen. True is it that we have feen better days;
And have with holy bell been knoll'd to church;
And fat at good mens feafts; and wip'd our eyes
Of drops that facred pity had engender'd:
And therefore fit you down in gentlenefs,
And take upon command what help we have,
That to your wanting may be miniftred.
As you like it.

With the converfing I forgot all time;
All feafons and their change, all pleafe alike.
Sweet is the breath of morn, her rifing fweet,
With charm of earlieft birds; pleafant the fun
When firft on this delightful land he fpreads
His orient beams, on herbs, tree, fruit, and flow'r
Gliftering with dew; fragrant the fertile earth
After foft fhow'rs; and fweet the coming on
Of grateful ev'ning mild, the filent night
With this her folemn bird, and this fair moon,
And thefe the gems of heav'n, her ftarry train:
But neither breath of morn, when fhe afcends
With charm of earlieft birds, nor rifing fun
On this delightful land, nor herb, fruit, flow'r,
Gliftering with dew, nor fragrance after fhowr's,
Nor grateful ev'ning mild, nor filent night,
With this her folemn bird, nor walk by moon,
Or glittering ftar-light, without thee is fweet.
Paradife Loft, book 4. *l* 634.

"What mean ye, that ye ufe this proverb, The fathers have eaten four grapes, and the childrens teeth are fet on edge? As I live, faith the Lord God, ye fhall not have occafion to ufe this proverb in Ifrael. If a man keep my judgments to deal truly, he is juft, he fhall furely live. But if he be a robber, a fhedder of blood; if he have eaten upon the mountains, and defiled his neighbour's wife; if he have oppreffed the poor and needy, have fpoiled by violence, have not reftored the pledge, have lift up his eyes to idols, have given forth upon ufury, and have taken increafe: fhall he live? he fhall not live: he fhall furely die; and his blood fhall be upon him. Now, lo, if he beget a fon, that feeth all his father's fins, and confidereth, and doeth not fuch like; that hath not eaten upon the mountains, hath not lift up his eyes to idols, nor defiled his neighbour's wife, hath not oppreffed any, nor withheld the pledge, neither hath fpoiled by violence, but hath given his bread to the hungry, and covered the naked with a garment; that hath not received ufury nor increafe, that hath executed my judgments, and walked in my ftatutes: he fhall not die for the iniquity of his father; he fhall furely live. The foul that finneth, it fhall die; the fon fhall not bear the iniquity of the father, neither fhall the father bear the iniquity of the fon; the righteoufnefs of the righteous fhall be upon him, and the wickednefs of the wicked fhall be upon him. Have I any pleafure that the wicked fhould die, faith the Lord God; and not that he fhould return from his ways, and live?" *Ezekiel* xviii.

A concife comprehenfive ftyle is a great ornament in narration; and a fuperfluity of unneceffary words, not lefs than of circumftances, a great nuifance. A judicious felection of the ftriking circumftances, clothed in a nervous ftyle, is delightful. In this ftyle, Tacitus excels all writers, ancient and modern. Inftances are numberlefs: take the following fpecimen.

"Crebra hinc prælia, et fæpius in modum latrocinii: per faltus, per paludes; ut cuique fors aut virtus: temerè, provifo, ob iram, ob prædam, juffu, et aliquando ignaris ducibus." *Annal. lib.* 12. § 39.

After Tacitus, Offian in that refpect juftly merits the place of diftinction. One cannot go wrong for examples in any part of the book.

If a concife or nervous ftyle be a beauty, tautology muft be a blemifh; and yet writers, fettered by verfe, are not fufficiently careful to avoid this flovenly practice: they may be pitied, but they cannot be juftified. Take for a fpecimen the following inftances, from the beft poet, for verfification at leaft, that England has to boaft of.

High on his helm celeftial lightnings play,
His beamy fhield emits a living ray;
The unweary'd blaze inceffant ftreams fupplies,
Like the red ftar that fires th' autumnal fkies.
Iliad v. 5.

Strength

Strength and omnipotence inveſt thy throne.

Or beat the pinions of the weſtern gale,
All were in vain —— *Ibid.* xix. 604.

The humid ſweat from ev'ry pore deſcends.
Ibid. xxiii. 829.

We cloſe this article with a curious inquiry. An object, however ugly to the ſight, is far from being ſo when repreſented by colours or by words. What is the cauſe of this difference? With reſpect to painting, the cauſe is obvious: a good picture, whatever the ſubject be, is agreeable by the pleaſure we take in imitation; and this pleaſure overbalancing the diſagreeableneſs of the ſubject, makes the picture upon the whole agreeable. With reſpect to the deſcription of an ugly object, the cauſe follows. To connect individuals in the ſocial ſtate, no particular contributes more than language, by the power it poſſeſſes of an expeditious communication of thought, and a lively repreſentation of tranſactions. But nature hath not been ſatisfied to recommend language by its utility merely: independent of utility, it is made ſuſceptible of many beauties, which are directly felt, without any intervening reflection. And this unfolds the myſtery; for the pleaſure of language is ſo great, as in a lively deſcription to overbalance the diſagreeableneſs of the image raiſed by it. This, however, is no encouragement to chooſe a diſagreeable ſubject; for the pleaſure is incomparably greater where the ſubject and the deſcription are both of them agreeable.

The following deſcription is upon the whole agreeable, though the ſubject deſcribed is in itſelf diſmal:

Nine times the ſpace that meaſures day and night
To mortal men, he with his horrid crew
Lay vanquiſh'd, rolling in the fiery gulf,
Confounded though immortal! but his doom
Reſerv'd him to more wrath; for now the thought
Both of loſt happineſs and laſting pain
Torments him; round he throws his baleful eyes
That witneſs'd huge affliction and diſmay,
Mix'd with obdurate pride and ſtedfaſt hate:
At once as far as angels ken he views
The diſmal ſituation waſte and wild:
A dungeon horrible, on all ſides round
As one great furnace flamed; yet from thoſe flames
No light, but rather darkneſs viſible
Serv'd only to diſcover ſights of wo,
Regions of ſorrow, doleful ſhades, where peace
And reſt can never dwell, hope never comes
That comes to all; but torture without end
Still urges, and a fiery deluge, fed
With ever-burning ſulphur unconſum'd!
Such place eternal juſtice had prepar'd
For thoſe rebellious. *Paradiſe loſt, book.* 1. *l.* 50.

An unmanly depreſſion of ſpirits in time of danger is not an agreeable ſight; and yet a fine deſcription or repreſentation of it will be reliſhed:

K. Richard. What muſt the King do now! muſt he ſubmit?
The king ſhall do it: muſt he be depos'd?
The king ſhall be contented: muſt he loſe
The name of king? o' God's name, let it go;
I'll give my jewels for a ſet of beads;
My gorgeous palace, for a hermitage;
My gay apparel, for an almſman's gown;
My figur'd goblets, for a diſh of wood;
My ſceptre, for a palmer's walking-ſtaff;
My ſubjects, for a pair of carved ſaints;
And my large kingdom, for a little grave;
A little, little grave;——an obſcure grave.
Or I'll be bury'd in the king's highway;
Some way of common tread, where ſubjects feet
May hourly trample on their ſovereign's head;
For on my heart they tread now, whilſt I live;
And, bury'd once, why not upon my head?
Richard II. act. 3. *ſc.* 6.

Objects that ſtrike terror in a ſpectator, have in poetry and painting a fine effect. The picture, by raiſing a ſlight emotion of terror, agitates the mind; and in that condition every beauty makes a deep impreſſion. May not contraſt heighten the pleaſure, by oppoſing our preſent ſecurity to the danger of encountering the object repreſented?

—————The other ſhape,
If ſhape it might be call'd, that ſhape had none
Diſtinguiſhable in member, joint, or limb;
Or ſubſtance might be call'd that ſhadow ſeem'd,
For each ſeem'd either; black it ſtood as night,
Fierce as ten furies, terrible as hell,
And ſhook a dreadful dart. *Par. loſt, b.* 2. *l.* 666.

————— Now ſtorming fury roſe,
And clamour ſuch as heard in heaven till now
Was never: arms on clamour claſhing bray'd
Horrible diſcord, and the madding wheels
Of brazen chariots rag'd; dire was the noiſe
Of conflict; overhead the diſmal hiſs
Of fiery darts in flaming vollies flew,
And flying vaulted either hoſt with fire.
So under fiery cope together ruſh'd
Both battles main, with ruinous aſſault
And inextinguiſhable rage: all heaven
Reſounded, and had earth been then, all earth
Had to her centre ſhook. *Ibid. book* 6. *l.* 207.

Ghoſt. ————— But that I am forbid
To tell the ſecrets of my priſon-houſe,
I could a tale unfold, whoſe lighteſt word
Would harrow up thy ſoul, freeze thy young blood,
Make thy two eyes, like ſtars, ſtart from their ſpheres,
Thy knotty and combined locks to part,
And each particular hair to ſtand on end,
Like quills upon the fretful porcupine:
But this eternal blazon muſt not be
To ears of fleſh and blood. *Hamlet, act* 1. *ſc.* 8.

Gratiano.

Gratiano. Poor Desdemona! I'm glad thy father's dead:
Thy match was mortal to him; and pure grief
Shore his old thread in twain. Did he live now,
This sight would make him do a desp'rate turn:
Yea, curse his better angel from his side,
And fall to reprobation. *Othello, act* 5. *sc.* 8.

Objects of horror must be excepted from the foregoing theory; for no description, however lively, is sufficient to overbalance the disgust raised even by the idea of such objects. Every thing horrible ought therefore to be avoided in a description.

NARWAL, in ichthyology. See MONODON.

NASSAU-SIEGEN, a small principality of Germany in the Westerwalde, is in general a mountainous woody country, with some arable and pasture ground, and a good breed of cattle. Its manufactures are chiefly those of iron and steel, having an iron mine in the neighbourhood of Siegen. Count John the Younger, in 1626, embraced the Roman Catholic religion, and endeavoured to introduce it into the country; but the principality, upon the extinction of the line of Nassau Siegen in 1743, falling to the line of Nassau-Dietz, and therein to the prince of Orange, hereditary stadtholder of the United Provinces, the Protestants were delivered from their apprehensions of Popish tyranny and bigotry. The prince, on account of these territories, has a seat and voice at the diets of the empire and circle in the college of princes. His assessment in the matricula for Nassau-Siegen is 773 florins monthly; and towards the maintenance of the chamber judicatory, 50 rix-dollars six kruitzers and a half, each term. The revenue of this principality is estimated at 100,000 rix-dollars.

NASSAU-*Dillenbourg*, a principality of Germany, situated near the former. It has not much arable land, but plenty of wood, good quarries of stone, some silver and vitriol, copper and lead, with store of iron, for the working and smelting of which there are many forges and founderies in the country; and by these, and the sale of their iron, the inhabitants chiefly subsist. Calvinism is the religion of the principality, which contains five towns and two boroughs, and belongs entirely to William V. prince of Orange, and hereditary stadtholder of the United Provinces, whose father succeeded to a part of it in 1739, on the death of prince Christian, and to the rest in 1743, on the death of prince William Hyacynth of Siegen. The prince, on account of this principality also and Dietz, has a seat and voice in the college of princes, at the diets of the empire and circle. His assessment in the matricula, for Nassau-Dillenbourg, is 102 florins monthly; and to the chamber-judicatory, 50 rix-dollars six and a half kruitzers, each term. His revenue from this principality is computed at above 130,000 florins.

NASSAU-*Hadamar*, a county of Germany, which, till the year 1711, had princes of its own; but now belongs wholly to William V. prince of Orange.

NATES, in anatomy, a term expressing those two fleshy exterior parts of the body vulgarly called the *buttocks*.

NATION, a collective term, used for a considerable number of people inhabiting a certain extent of land, confined within fixed limits, and under the same government.

NATIONAL DEBT; the money owing by government.

In order to take a clear and comprehensive view of the nature of this national debt, it must first be premised, that after the Revolution, when new connections with Europe introduced a new system of foreign politics, the expences of the nation, not only in settling the new establishment, but in maintaining long wars, as principals, on the continent, for the security of the Dutch barrier, reducing the French monarchy, settling the Spanish succession, supporting the house of Austria, maintaining the liberties of the Germanic body, and other purposes, increased to an unusual degree: insomuch, that it was not thought adviseable to raise all the expences of any one year by taxes to be levied within that year, lest the unaccustomed weight of them should create murmurs among the people. It was therefore the policy of the times to anticipate the revenues of their posterity, by borrowing immense sums for the current service of the state, and to lay no more taxes upon the subject than would suffice to pay the annual interest of the sums so borrowed: by this means converting the principal debt into a new species of property, transferable from one man to another at any time and in any quantity. A system which seems to have had its original in the state of Florence, A. D. 1344: which government then owed about 60,000 l. Sterling; and being unable to pay it, formed the principal into an aggregate sum, called metaphorically a *mount* or *bank*, the shares whereof were transferable like our stocks, with interest at 5 *per cent.* the prices varying according to the exigencies of the state. This laid the foundation of what is called the *national debt:* for a few long annuities created in the reign of Charles II. will hardly deserve that name. And the example then set has been so closely followed during the long wars in the reign of queen Anne, and since, that the capital of the national debt, (funded and unfunded) amounted in January 1771 to above 140,000,000 l.; to pay the interest of which, and the charges of management, amounting annually to upwards of four millions and an half, the extraordinary revenues elsewhere enumerated † (excepting only the land-tax and annual malt-tax) are in the first place mortgaged and made perpetual by parliament. Perpetual we say; but still redeemable by the same authority that imposed them: which, if it at any time can pay off the capital, will abolish those taxes which are raised to discharge the interest.

Blackst. Comment.

† See Revenue.

By this means the quantity of property in the kingdom is greatly increased in idea, compared with former times; yet, if we coolly consider it, not at all increased in reality. We may boast of large fortunes, and quantities of money in the funds. But where does this money exist? It exists only in name, in paper, in public faith, in parliamentary security: and that is undoubtedly sufficient for the creditors of the public to rely on. But then what is the pledge which the public faith has pawned for the security of these debts? The land, the trade, and the personal industry of the subject; from which the money must arise that supplies the several taxes. In these therefore, and these only,

only, the property of the public creditors does really and intrinfically exift: and of courfe the land, the trade, and the perfonal induftry of individuals, are diminifhed in their true value juft fo much as they are pledged to anfwer. If A's income amounts to 100 l. *per annum;* and he is fo far indebted to B, that he pays him 50 l. *per annum* for his intereft; one half of the value of A's property is transferred to B the creditor. The creditor's property exifts in the demand which he has upon the debtor, and no where elfe; and the debtor is only a truftee to his creditor for one half of the value of his income. In fhort, the property of a creditor of the public confifts in a certain portion of the national taxes: by how much therefore he is the richer, by fo much the nation, which pays thefe taxes, is the poorer.

The only advantage, that can refult to a nation from public debts, is the increafe of circulation, by multiplying the cafh of the kingdom, and creating a new fpecies of currency, affignable at any time and in any quantity; always therefore ready to be employed in any beneficial undertaking, by means of this its transferable quality; and yet producing fome profit even when it lies idle and unemployed. A certain proportion of debt feems to be highly ufeful to a trading people; but what that proportion is, it is not for us to determine. This much is indifputably certain, that the prefent magnitude of our national encumbrances very far exceeds all calculations of commercial benefit, and is productive of the greateft inconveniencies. For, firft, the enormous taxes, that are raifed upon the neceffaries of life for the payment of the intereft of this debt, are a hurt both to trade and manufactures, by raifing the price as well of the artificer's fubfiftence as of the raw material, and of courfe, in a much greater proportion, the price of the commodity itfelf. Nay, the very increafe of paper-circulation itfelf, when extended beyond what is requifite for commerce or foreign exchange, has a natural tendency to increafe the price of provifions as well as of all other merchandife. For as its effect is to multiply the cafh of the kingdom, and this to fuch an extent, that much muft remain unemployed, that cafh (which is the univerfal meafure of the refpective values of all other commodities) muft neceffarily fink in its own value, and every thing grow comparatively dearer. Secondly, if part of this debt be owing to foreigners, either they draw out of the kingdom annually a confiderable quantity of fpecie for the intereft; or elfe it is made an argument to grant them unreafonable privileges in order to induce them to refide here. Thirdly, if the whole be owing to fubjects only, it is then charging the active and induftrious fubject, who pays his fhare of the taxes to maintain the indolent and idle creditor who receives them. Laftly, and principally, it weakens the internal ftrength of a ftate, by anticipating thofe refources which fhould be referved to defend it in cafe of neceffity. The intereft we now pay for our debts would be nearly fufficient to maintain any war that any national motives could require. And if our anceftors in king William's time had annually paid, fo long as their exigencies lafted, even a lefs fum than we now annually raife upon their accounts, they would in the time of war have borne no greater burdens than they have bequeathed to and fettled upon their pofterity in time of peace; and might have been eafed the inftant the exigence was over. See FUNDS.

NATIVITY, or NATAL DAY, the day of a perfon's birth. The word *nativity* is chiefly ufed in fpeaking of the faints; as, the nativity of St John the Baptift, &c. But when we fay *the* Nativity, it is underftood of that of Jefus Chrift, or the feaft of Chriftmas.

NATOLIA, the modern name of the Leffer Afia, being the moft wefterly part of Turkey in Afia, and confifting of a large peninfula, which extends from the river Euphrates, as far as the Archipelago, the feas of Marmora, the ftraits of Galipoli and of Conftantinople, which feparate it from Europe on the weft. It is bounded on the north by the Black fea, and on the fouth by the Mediterranean fea.

NATRUM, the nitre of the ancients, in natural hiftory, is a genuine, pure, and native falt, extremely different from our nitre, and indeed from all the other native falts; it being a fixed alkali, plainly of the nature of thofe made by fire from vegetables, yet capable of a regular cryftallization, which thofe falts are not. It is found on the furface of the earth, or at very fmall depths within it; and is naturally formed into thin and flat cakes or crufts, which are of a fpungy or cavernous fubftance, very light and friable, and, when pure, of a pale brownifh white; but as its fpungy texture renders it very fubject to be fouled by earth received into its pores, it is often met with of a deep dirty brown, and not unfrequently reddifh.

Natrum, whether native or purified, diffolves in a very fmall quantity of water; and this folution is, in many parts of Afia, ufed for wafhing; where it is alfo made into foap, by mixing it with oil. Natrum reduced to powder, and mixed with fand or flints, or with any other ftone of which cryftal is the bafis, make them readily run into glafs. Gold heated red-hot, and fprinkled with a fmall quantity of this falt, melts immediately; filver ignited and fprinkled with it, melts in the fame manner; as does alfo iron, copper, and the regulus of antimony, which melt much more eafily than they otherwife would do. Mercury will not be mixed with it by any art, and indeed will not amalgamate with metals if only a little of this falt be added. It is found in great abundance in many parts of Afia, where the natives fweep it up from the furface of the ground, and call it *foap-earth.* The earlieft account we have of it is in the fcriptures, where we find that the falt called *nitre* in thofe times would ferment with vinegar, and had an abfterfive quality, fo that it was ufed in baths and in wafhing things. Solomon compares the finging of fongs with a heavy heart, to the contrariety of vinegar and nitre; and Jeremiah fays, that if the finner wafh himfelf with nitre, his fin is not cleanfed off. Thefe are properties that perfectly agree with this falt, but not at all with our faltpetre.

NATTER-JACK, in zoology, a fpecies of RANA.

NATURAL, in general, fomething that relates to nature. See NATURE.

NATURAL *Children,* are thofe born out of lawful wedlock. See BASTARD.

NATURAL *Functions,* are thofe actions whereby the aliments are changed and affimilated fo as to become

Natural. come a part of the body.

Natural, in heraldry, is used where animals, fruits, flowers, &c. are blazoned with the colours they naturally have, though different from the common colours of heraldry: and this is to prevent the armories being accused of falsity, when blazoned with the names of colours unknown in heraldry.

Natural *Note*, in music, is used in opposition to flat and sharp notes, which are called *artificial notes*. See Note, Scale, &c.

Natural is also used for something coming immediately out of the hands of nature: in which sense it stands opposed to *factitious* or artificial, which signifies something wrought by art. See Artificial.

Bishop Wilkins observes, that there appears a world of difference between natural and artificial things, when viewed with microscopes. The first ever appear adorned with all imaginable elegance and beauty; the latter, though the most curious in their kind, infinitely rude and unhewn: the finest needle appears a rough bar of iron; and the most accurate engraving or embossment as if done with a mattock or trowel.

NATURAL HISTORY.

Natural history, is that science which not only gives complete descriptions of natural productions in general, but also teaches the method of arranging them into classes, orders, genera, and species. This definition includes zoology, botany, mineralogy, &c. But as a science so various and comprehensive could neither with propriety nor advantage be completely discussed under the general title, we have to refer the reader to the article Kingdoms *(in Natural History)*, where he will be directed to the different articles which constitute either the branches or the objects of the science, and which are all treated under their respective names.—In the present article it is proposed to give a general and philosophical view of the subject: To set forth, in a summary way, whatever curious, worthy to be known, or not obvious to every observer, occurs in the three kingdoms of nature: with their constitution, laws, and œconomy; or, in other words, that all-wise disposition of the Creator in relation to natural things, by which they are fitted to produce general ends and reciprocal uses.

Sect. I. *Of the Terraqueous Globe in general, and its changes.*

The world, or the terraqueous globe, which we inhabit, is every-where surrounded with elements, and contains in its superficies the three Kingdoms *of Nature*, as they are called: the fossil, which constitutes the crust of the earth; the vegetable, which adorns the face of it, and draws the greatest part of its nourishment from the fossil kingdom; and the animal, which is sustained by the vegetable kingdom. Thus these three kingdoms cover, adorn, and vary the superficies of our earth.

As to the strata of the earth and mountains, as far as we have hitherto been able to discover, the upper parts consist of rag-stone; the next of slate; the third of marble filled with petrifactions; the fourth again, of slate; and lastly, the lowest of free-stone. The habitable part of the earth, though it is scooped into various inequalities, yet is every-where high in comparison with the water; and the farther it is from the sea, it is generally higher. Thus the waters in the lower places are not at rest, unless some obstacle confines them, and by that means form lakes and marshes.

The sea surrounds the continent, and takes up the greatest part of the earth's superficies, as geography informs us. Nay, that it once spread over much the greatest part, we may be convinced by its yearly decrease, by the rubbish left by the tides, by shells, strata, and other circumstances.

The sea-shores are usually full of dead testaceous animals, wrack, and such like bodies, which are yearly thrown out of the sea. They are also covered with sand of various kinds, stones, and heaps of other things not very common. It happens, moreover, that while the more rapid rivers rush through narrow valleys, they wear away the sides; and thus the friable and soft earth falls in, and its ruins are carried to distant and winding shores; whence it is certain, that the continent gains no small increase, as the sea subsides.

The clouds collected from exhalations, chiefly from the sea, but likewise from other waters, and moist grounds, and condensed in the lower regions of the atmosphere, supply the earth with rain; but since they are attracted by the mountainous parts of the earth, it necessarily follows, that those parts must have, as is fit, a larger share of water than the rest. Springs, which generally rush out at the foot of mountains, take their rise from this very rain-water and vapours condensed, that trickle through the holes and interstices of loose bodies, and are received into caverns.

These afford a pure water purged by straining; and rarely dry up in summer, or freeze in winter, so that animals never want a wholesome and refreshing liquor.

The chief sources of rivers are fountains and rills growing by gradual supplies into still larger and larger streams; till at last, after the conflux of a vast number of them, they find no stop, but falling into the sea with much rapidity, they there deposit the united stores they have gathered, along with foreign matter, and such earthy substances as they tore off in their way. Thus the water returns in a circle whence it first drew its origin, that it may act over the same scene again.

Marshes arising from water retained in low grounds are filled with mossy tumps, which are brought down by the water from the higher parts, or are produced by putrified plants.

We often see new meadows arise from marshes dried up. This happens sooner when the *sphagnum* (a kind of moss) has laid a foundation; for this in process of time changes into a very porous mould, till almost the whole marsh is filled with it. After that the rush strikes root, and along with the cotton-grasses constitutes a turf, raised in such a manner, that the roots get continually higher, and thus lay a more firm foundation for other plants, till the whole marsh is changed into a fine and delightful meadow; especially if the water happens to work itself a new passage.

Hillocks,

Of the Terraqueous globe.

Hillocks, that abound in low grounds, occasion the earth to increase yearly, more than the countryman would wish, and seem to do hurt: but in this the great industry of nature deserves to be taken notice of. For by this means the barren spots become sooner rich meadow and pasture land. These hillocks are formed by the ant, by stones and roots, and the trampling of cattle: but the principal cause is the force of the winter-cold, which in the spring raises the roots of plants so high above the ground, that being exposed to the air, they grow, and perish; after which the golden maidenhairs fill the vacant places.

Mountains, hills, valleys, and all the inequalities of the earth, though some think they take away much from its beauty, are so far from producing such an effect, that on the contrary they give a more pleasing aspect, as well as great advantages. For thus the terrestrial superficies is larger; different kinds of plants thrive better, and are more easily watered; and the rain-waters run in continual streams into the sea; not to mention many other uses in relation to winds, heat, and cold. Alps are the highest mountains, that reach to the second region of the air, where trees cannot grow erect. The higher these Alps are, the the colder they are *cæteris paribus*. Hence the Alps in Sweden, Siberia, Swisserland, Peru, Brasil, Armenia, Asia, Africa, are perpetually covered with snow, which becomes almost as hard as ice. But if by chance the summer-heats be greater than ordinary, some part of these stores melts, and runs through rivers into the lower regions, which by this means are much refreshed.

It is scarcely to be doubted, but that the rocks and stones dispersed over the globe were formed originally in, and from, the earth; but when torrents of rain have softened, as they easily do, the soluble earth, and carried it down into the lower parts, we imagine it happens, that these solid and heavy bodies, being laid bare, stick out above the surface. We might also take notice of the wonderful effect of the tide, such as we see happen from time to time on the sea-shore, which being daily and nightly assaulted with repeated blows, at length gives way, and breaks off. Hence we see in most places the rubbish of the sea, and shores.

The winter by its frost prepares the earth and mould, which thence are broken into very minute particles, and thus, being put into a mouldering state, become more fit for the nourishment of plants; nay, by its snow it covers the seeds, and roots of plants, and thus by cold defends them from the force of cold. We must add also, that the piercing frost of the winter purifies the atmosphere and putrid waters, and makes them more wholesome for animals.

The perpetual succession of heat and cold with us renders the summers more pleasing: and tho' the winter deprives us of many plants and animals, yet the perpetual summer within the tropics is not much more agreeable, as it often destroys men and other animals by its immoderate heat; though it must be confessed, that those regions abound with exquisite fruits. Our winters, though very troublesome to a great part of the globe on account of their vehement and intense cold, yet are less hurtful to the inhabitants of the northern parts, as experience testifies. Hence it happens, that we may live very conveniently on every part of the earth, as every different country has different advantages from nature.

Of the Seasons.

The seasons, like every thing else, have their vicissitudes; their beginnings, their progress, and their end.

The age of man begins from the cradle; pleasing childhood succeeds; then active youth; afterwards manhood, firm, severe, and intent upon self-preservation; lastly, old age creeps on, debilitates, and at length totally destroys our tottering bodies.

The seasons of the year proceed in the same way. Spring, the jovial, playful infancy of all living creatures, represents childhood and youth; for then plants spread forth their luxuriant flowers, fishes exult, birds sing, every part of nature is intent upon generation. The summer, like middle age, exhibits plants, and trees every-where cloathed with green; it gives vigour to animals, and plumps them up; fruits then ripen, meadows look cheerful, every thing is full of life. On the contrary, autumn is gloomy; for then the leaves of trees begin to fall, plants to wither, insects to grow torpid, and many animals to retire to their winter-quarters.

The day proceeds with just such steps, as the year. The morning makes every thing alert, and fit for business: the sun pours forth his ruddy rays; the flowers, which had as it were slept all night, awake and expand themselves again; the birds with their sonorous voices and various notes make the woods ring, meet together in flocks, and sacrifice to Venus. Noon tempts animals into the fields and pastures; the heat puts them upon indulging their ease, and even necessity obliges them to it. Evening follows, and makes every thing more sluggish; flowers shut up*, and animals retire to their lurking places. Thus the spring, the morning, and youth, are proper for generation; the summer, noon, and manhood, are proper for preservation; and autumn, evening, and old age, are not unfitly likened to destruction.

* See Vigils *of Plants*.

In order to perpetuate the established course of nature, in a continued series, the Divine Wisdom has thought fit that all living creatures should constantly be employed in *producing* individuals; that all natural things should contribute and lend a helping hand towards *preserving* every species; and lastly, that the *death* and *destruction* of one thing should always be subservient to the production of another. Hence the objects of our present inquiry fall to be considered in a threefold view, that of *propagation*, *preservation*, and *death* or *destruction*.

Sect. II. *The Fossil Kingdom*.

I. Propagation.

It is agreed on all hands, that stones are not organical bodies, like plants and animals; and therefore it is as clear that they are not produced from an egg, like the tribes of the other kingdoms. Hence the variety of fossils is proportionate to the different combinations of coalescent particles, and hence the species in the fossil kingdom are not so distinct as in the other two. Hence also the laws of generation in relation

relation to fossils have been in all ages extremely difficult to explain; and lastly, hence have arisen so many different opinions about them, that it would be endless to enumerate them all. We therefore for the present will content ourselves with giving a very few observations on this subject.

That clay is the sediment of the sea is sufficiently proved by observation, for which reason it is generally found in great plenty along the coasts.

The journals of seamen clearly evince, that a very minute sand covers the bottom of the sea; nor can it be doubted, but that it is daily crystallised out of the water.

It is now acknowledged by all, that testaceous bodies and petrifactions resembling plants were once real animals or vegetables; and it seems likely that shells, being of a calcareous nature, have changed the adjacent clay, sand, or mould, into the same kind of substance. Hence we may be certain that marble may generated from petrifactions; and therefore it is frequently seen full of them.

Rag-stone, the common matter of our rocks, appears to be formed from a sandy kind of clay; but this happens more frequently where the earth is impregnated with iron.

Free-stone is a product of sand; and the deeper the bed where it is found, the more compact it becomes; and the more dense the sand, the more easily it concretes. But if an alkaline clay chances to be mixed with the sand, the free-stone is generated more readily, as in the free-stone called *cos friatilis, particulis argillo-glarensis*.

The flint is almost the only kind of stone, certainly the most common stone, in chalky mountains. It seems therefore to be produced from chalk. Whether it can be reduced again to chalk, is left to others to inquire.

Stalactites, or drop-stone, is composed of calcareous particles, adhering to a dry, and generally a vegetable body.

Incrustations *(Syst. Nat.* 32. 5, 6, 7, 8.) are often generated, where a vitriolic water connects clayey and earthy particles together.

Slate, by the vegetables that are often inclosed in it, seems to take its origin from a marshy mould.

Metals vary according to the nature of the matrix in which they adhere; *e. g.* the pyrites cupri Fahlunensis contains frequently sulphur, arsenic, iron, copper, a little gold, vitriol, alum, sometimes lead-ore, silver, and zinc. Thus gold, copper, iron, zinc, arsenic, pyrites, vitriol, come out of the same vein. That very rich iron-ore at Normark in Vermilandia, where it was cut transversly by a vein of clay, was changed into pure silver. The number therefore of species and varieties of fossils, each serving for different purposes according to their different natures, will be in proportion as the different kinds of earths and stones are variously combined.

II. Preservation.

As fossils are destitute of life and organisation, are hard, and not obnoxious to putrefaction; so they last longer than any other kind of bodies. How far the air contributes to this duration, it is easy to perceive; since air hardens many stones upon the superficies of the earth, and makes them more solid, compact, and able to resist the injuries of time. Thus it is known from vulgar observation, that lime, that has been long exposed to the air, becomes hardened. The chalky marl which they use in Flanders for building houses, as long as it continues in the quarry is friable, but when dug up and exposed to the air it grows gradually harder.

However ignorant we may be of the cause why large rocks are every-where to be seen split, whence vast fragments are frequently torn off; yet this we may observe, that fissures are closed up by water, which gets between them, and is detained there, and are consolidated by crystal and spar. Hence we scarcely ever find any crystal, but in those stones which have retained for some time in its chinks water loaded with stony particles. In the same manner crystals fill the cavities in mines, and concrete into quartz or a debased crystal.

It is manifest that stones are not only generated, augmented, and changed perpetually, from incrustatations brought upon moss, but are also increased by crystal, and spar. Not to mention that the adjacent earth, especially if it be impregnated with iron particles, is commonly changed into a solid stone.

It is said, that the marble quarries in Italy, from whence fragments are cut, grow up again. Ores grow by little and little, whenever the mineral particles, conveyed by the means of water through the clefts of mountains, are retained there; so that, adhering to the homogeneous matter a long while, at last they take its nature, and are changed into a similar substance.

II. Destruction.

Fossils, although they are the hardest of bodies, yet are found subject to the laws of destruction, as well as all other created substances. For they are dissolved in various ways by the elements exerting their force upon them; as by water, air, and the solar rays; as also by the rapidity of rivers, violence of cataracts, and eddies, which continually beat upon, and at last reduce to powder the hardest rocks. The agitations of the sea, and lakes, and the vehemency of the waves, excited by turbulent winds, pulverise stones, as evidently appears by their roundness along the shore. Nay, as the poet says,

> The hardest stone insensibly gives way
> To the soft drops that frequent on it play.

So that we ought not to wonder, that these very hard bodies moulder away into powder, and are obnoxious like others to the consuming tooth of time.

Sand is formed of free-stone, which is destroyed partly by frost, making it friable; partly by the agitation of water and waves, which easily wear away, dissolve, and reduce into minute particles, what the frost had made friable.

Chalk is formed of rough marble, which the air, the sun, and the winds, have dissolved.

The slate-earth, or humus schisti, (Syst. Nat. 512.) owes its origin to slate, showers, air, and snow melted.

Ochre is formed of metals dissolved, whose fæces present the very same colours which we always find the

the ore tinged with when expoſed to the air. Vitriol in the ſame manner mixes with water from ore deſtroyed.

The muria ſaxatilis, *(Syſ. Nat.* 14. 6.) a kind of talky ſtone, yielding ſalt in the parts that are turned to the ſun, is diſſolved into ſand, which falls by little and little upon the earth, till the whole is conſumed; not to mention other kinds of foſſils. Laſtly, from theſe there ariſe new foſſils, as we mentioned before; ſo that the deſtruction of one thing ſerves for the generation of another.

Teſtaceous worms ought not to be paſſed over on this occaſion, for they eat away the hardeſt rocks. That ſpecies of ſhell-fiſh called the *razor-ſhell* bores through ſtones in Italy, and hides itſelf within them; ſo that the people who eat them are obliged to break the ſtones before they can come at them. The cochlea, *(Faun. Suec.* 1299.) a kind of ſnail that lives on craggy rocks, eats and bores through the chalky hills, as worms do through wood. This is made evident by the obſervations of the celebrated de Geer.

Sect. III. *The Vegetable Kingdom.*

I. Propagation.

Anatomy abundantly proves, that all plants are organic and living bodies; and that all organic bodies are propagated from an egg has been ſufficiently demonſtrated by the induſtry of the moderns. We therefore the rather, according to the opinion of the ſkilful, reject the equivocal generation of plants; and the more ſo, as it is certain that every living thing is produced from an egg. Now the ſeeds of vegetables are called *eggs;* theſe are different in every different plant, that the means being the ſame, each may multiply its ſpecies, and produce an offspring like its parent. We do not deny, that very many plants puſh forth from their roots freſh offsets for two or more years. Nay, not a few plants may be propagated by branches, buds, ſuckers, and leaves, fixed in the ground, as likewiſe many trees. Hence their ſtems being divided into branches, may be looked on as roots above ground; for in the ſame way the roots creep under ground, and divide into branches. And there is the more reaſon for thinking ſo, becauſe we know that a tree will grow in an inverted ſituation, viz. the roots being placed upwards, and the head downwards, and buried in the ground; for then the branches will become roots, and the roots will produce leaves and flowers. The lime-tree will ſerve for an example, on which gardeners have chiefly made the experiment. Yet this by no means overturns the doctrine, that all vegetables are propagated by ſeeds; ſince it is clear that in each of the foregoing inſtances nothing vegetates but what was the part of a plant, formerly produced from ſeed; ſo that, accurately ſpeaking, without ſeed no new plant is produced.

Thus again plants produce ſeeds; but they are entirely unfit for propagation, unleſs fecundation precedes, which is performed by an intercourſe between different ſexes, as experience teſtifies. Plants therefore muſt be provided with organs of generation; in which reſpect they hold an analogy with animals. Since in every plant the flower always precedes the fruit, and the fecundated ſeeds viſibly ariſe from the fruit; it is evident that the organs of generation are contained in the flower, which organs are called *antheræ* and *ſtigmata*, and that the impregnation is accompliſhed within the flower. This impregnation is performed by means of the duſt of the antheræ falling upon the moiſt ſtigmata, where the duſt adheres, is burſt, and ſends forth a very ſubtle matter, which is abſorbed by the ſtyle, and is conveyed down to the rudiments of the ſeed, and thus renders it fertile. When this operation is over, the organs of generation wither and fall, nay a change in the whole flower enſues. We muſt however obſerve, that in the vegetable kingdom one and the ſame flower does not always contain the organs of generation of both ſexes, but oftentimes the male organs are on one plant, and the female on another. But that the buſineſs of impregnation may go on ſucceſsfully, and that no plant may be deprived of the neceſſary duſt, the whole moſt elegant apparatus of the antheræ and ſtigmata in every flower is contrived with wonderful wiſdom.

For in moſt flowers the ſtamina ſurround the piſtils, and are of about the ſame height: but there are many plants in which the piſtil is longer than the ſtamina; and in theſe it is wonderful to obſerve, that the Creator has made the flowers recline, in order that the duſt may more eaſily fall into the ſtigma; *e.g.* in the campanula, cowſlip, &c. This curious phenomenon did not eſcape the poetical eye of Milton, who deſcribes it in the following enlivened imagery:

> With cowſlips wan, that hang the penſive head.

But when the fecundation is completed, the flowers riſe again, that the ripe ſeeds may not fall out before they are diſperſed by the winds. In other flowers, on the contrary, the piſtil is ſhorter, and there the flowers preſerve an erect ſituation; nay, when the flowering comes on, they become erect, though before they were drooping, or immerſed under water. Laſtly, whenever the male flowers are placed below the female ones, the leaves are exceedingly ſmall and narrow, that they may not hinder the duſt from flying upwards like ſmoke; as we ſee in the pine, fir, yew, ſea-grape, juniper, cypreſs, &c. And when in one and the ſame ſpecies one plant is male and the other female, and conſequently may be far from one another, there the duſt, without which there is no impregnation, is carried in abundance by the help of the wind from the male to the female; as in the whole dioicous claſs. Again, a more difficult impregnation is compenſated by the longevity of the individuals, and the continuation of life by buds, ſuckers, and roots; ſo that we may obſerve every thing moſt wiſely diſpoſed in this affair. Moreover, we cannot without admiration obſerve that moſt flowers expand themſelves when the ſun ſhines forth; whereas when clouds, rain, or the evening comes on, they cloſe up, leſt the genital duſt ſhould be coagulated, or rendered uſeleſs, ſo that it cannot be conveyed to the ſtigmata. But what is ſtill more remarkable and wonderful, when the fecundation is over, the flowers, neither upon ſhowers, nor evening coming on, cloſe themſelves up. Hence when rain falls in the flowering time, the huſbandman and gardener foretel a ſcarcity of fruits. To mention only one particular more: The organs of generation, which in the animal kingdom are by nature generally removed from ſight, in the vegetable are expoſed to the eyes

Vid. a Treatiſe publiſhed in *Amœn. Acad.* vol. entitled, *Sponſalia Plantarum.*

eyes of all; and that when their nuptials are celebrated, it is wonderful what delight they afford to the spectator by their most beautiful colours and delicious odours. At this time bees, flies, and other insects, suck honey out of their nectaries, not to mention the humming bird; and that from their effête dust the bees gather wax.

2. As to the dissemination of seeds after they come to maturity, it being absolutely necessary, since without it no crop could follow, the Author of nature has wisely provided for this affair in numberless ways. The stalks and stems favour this purpose; for these raise the fruit above the ground, that the winds, shaking them to and fro, may disperse far off the ripe seeds. Most of the pericarpies are shut at top, that the seeds may not fall before they are shook out by stormy winds. Wings are given to many seeds, by the help of which they fly far from the mother-plant, and oftentimes spread over a whole country. These wings consist either of a down, as in most of the composite-flowered plants; or of a membrane, as in the birch, alder, ash, &c. Hence woods, which happen to be consumed by fire or any other accident, will soon be restored again by new plants disseminated by this means. Many kinds of fruits are endued with a remarkable elasticity, by the force of which the ripe pericarpies throw the seeds to a great distance; as the wood-sorrel, the spurge, the phyllanthus, the dittany. Other seeds or pericarpies are rough, or provided with hooks; so that they are apt to stick to animals that pass by them, and by this means are carried to their holes, where they are both sown and manured by nature's wonderful care: and therefore the plants of these seeds grow where others will not; as hounds-tongue, agrimony, &c.

Berries and other pericarpies are by nature allotted for aliment to animals; but with this condition, that while they eat the pulp they shall sow the seeds: for when they feed upon it, they either disperse them at the same time; or, if they swallow them, they are returned with interest, for they always come out unhurt. It is not therefore surprising, that, if a field be manured with recent mud or dung not quite rotten, various other plants, injurious to the farmer, should come up along with the grain that is sowed. Many have believed that barley or rye has been changed into oats, although all such kinds of metamorphoses are repugnant to the laws of generation; not considering that there is another cause of this phenomenon, *viz.* that the ground perhaps has been manured with horse-dung, in which the seeds of oats, coming entire from the horse, lie hid and produce that grain. The misletoe always grows upon other trees, because the thrush that eats the seeds of it, casts them forth with its dung; and as bird-catchers make their bird-lime of this same plant, and daub the branches of trees with it, in order to catch the thrush, the proverb hence took its rise;

> The thrush, when he befouls the bough,
> Sows for himself the seeds of wo.

It is not to be doubted, but that the greatest part of the junipers also, that fill our woods, are sown by thrushes, and other birds, in the same manner; as the berries, being heavy, cannot be dispersed far by the winds. The cross-bill that lives on the fir-cones, and the hawfinch that feeds on the pine-cones, at the same time sow many of their seeds; especially when they carry the cone to a stone, or trunk of a tree, that they may more easily strip it of its scales. Swine likewise, by turning up the earth, and moles by throwing up hillocks, prepare the ground for seeds in the same manner as the ploughman does.

We pass over many other things which might be mentioned concerning the sea, lakes, and rivers, by the help of which oftentimes seeds are conveyed unhurt to distant countries. A variety of other ways in which nature provides for the dissemination of plants, has been pointed out by Linnæus in an *Oration concerning the augmentation of the habitable earth.* As there is something very ingenious and quite new in the treatise here referred to, we shall, for the sake of those who cannot read the original, add a short abstract of it. His design is to shew that there was only one pair of all living things, created at the beginning. According to the account of Moses, says the author, we are sure that this was the case in the human species; and by the same account we are informed that this first pair was placed in Eden, and that Adam gave names to all the animals. In order therefore that Adam might be enabled to do this, it was necessary that all the species of animals should be in in paradise; which could not happen unless also all the species of vegetables had been there likewise. This he proves from the nature of their food; particularly in relation to insects, most of which live upon one plant only. Now had the world been formed in its present state, it could not have happened that all the species of animals should have been there. They must have been dispersed over all the globe, as we find they are at present; which he thinks improbable for other reasons which we shall pass over for sake of brevity. To solve all the phenomena, then, he lays down as a principle, That at the beginning all the earth was covered with the sea, unless one island large enough to contain all animals and vegetables. This principle he endeavours to establish by several phenomena, which make it probable, that the earth has been and is still gaining upon the sea, and does not forget to mention fossile shells and plants every where found, which he says cannot be accounted for by the deluge. He then undertakes to shew how all vegetables and animals might in this island have a soil and climate proper for each, only by supposing it to be placed under the equator, and crowned with a very high mountain. For it is well known that the same plants are found on the Swiss, the Pyrenean, the Scots Alps, on Olympus, Lebanon, Ida, as on the Lapland and Greenland Alps. And Tournefort found at the bottom of mount Ararat the common plants of Armenia, a little way up those of Italy, higher those which grow about Paris, afterwards the Swedish plants, and lastly on the top the Lapland Alpine plants; and I myself, adds the author, from the plants growing on the Dalecarlian Alps could collect how much lower they were than the Alps of Lapland. He then proceeds to shew how from one plant of each species the immense number of individuals now existing might arise. He gives some instances of the surprising fertility of certain plants; *v. g.* the elecampane, one plant of which produced 3000 seeds; of spelt, 2000; of the sun-flower, 4000; of the poppy, 3200; of tobacco, 40,320. But supposing any annual plant producing yearly only two seeds,

Vegetable Kingdom.

feeds, even of this, after 20 years, there would be 1,048,576 individuals. For they would increafe yearly in a duple proportion, *viz.* 2, 4, 8, 16, 32, &c. He then gives fome inftances of plants brought from America, that are now become common over many parts of Europe. Laftly, he enters upon a detail of the feveral methods which nature has taken to propagate vegetables, which is extremely curious, but too long to infert in this place.

II. Preservation.

1. The great Author and Parent of all things decreed, that the whole earth fhould be covered with plants, and that no place fhould be void, none barren. But fince all countries have not the fame changes of feafons, and every foil is not equally fit for every plant; he therefore, that no place fhould be without fome, gave to every one of them fuch a nature, as might be chiefly adapted to the climate: fo that fome of them can bear an intenfe cold, others an equal degree of heat; fome delight in dry ground, others in moift, &c. Hence the fame plants grow only where there are the fame feafons of the year, and the fame foil.

The Alpine plants live only in high and cold fituations; and therefore often on the Alps of Armenia, Switzerland, the Pyreneans, &c. whofe tops are equally covered with eternal fnows as thofe of the Lapland Alps, plants of the fame kind are found, and it would be in vain to feek for them any where elfe. It is remarkable, in relation to the Alpine plants, that they blow, and ripen their feeds very early, left the winter fhould fteal upon them on a fudden, and deftroy them.

Our northern plants, altho' they are extremely rare every where elfe, yet are found in Siberia, and about Hudfon's bay; as the arbutus, bramble, winter-green, &c.

Plants impatient of cold live within the torrid zones; hence both the Indies, though at fuch a diftance from one another, have plants in common. The Cape of Good Hope, we know not from what caufe, produces plants peculiar to itfelf; as all the mefembryanthema, and almoft all the fpecies of aloes. Graffes, the moft common of all plants, can bear almoft any temperature of air: in which the good providence of the Creator particularly appears; for all over the globe they, above all plants, are neceffary for the nourifhment of cattle; and the fame thing is feen in relation to our moft common grains.

Thus neither the fcorching fun, nor the pinching cold, hinders any country from having its vegetables. Nor is there any foil which does not bring forth many kinds of plants. The pond-weeds, the water-lily, lobelia, inhabit the waters. The fluviales, fuci, confervæ, cover the bottoms of rivers, and fea. The fphagna † fill the marfhes. The brya ‡ clothe the plains. The drieft woods, and places fcarce ever illuminated by the rays of the fun, are adorned with the hypna. Nay, ftones and the trunks of trees are not excepted, for thefe are covered with various kinds of liverwort.

† A kind of mofs.

‡ Another kind of mofs.

The defart, and moft fandy places, have their peculiar trees and plants; and as rivers or brooks are very feldom found there, we cannot without wonder obferve that many of them diftil water, and by that means afford the greateft comfort both to man and beafts that travel there. Thus the tillandfia *, which is a parafitical plant, and grows on the tops of trees in the defarts of America, has its leaves turned at the bafe into the fhape of a pitcher, with the extremity expanded; in thefe the rain is collected, and preferved for thirfty men, birds, and beafts.

* A kind of miffletoe.

The water-tree in Ceylon produces cylindrical bladders, covered with a lid; into thefe is fecreted a moft pure and refrefhing water, that taftes like nectar to men and other animals. There is a kind of cuckow-pint in New France, that, if you break a branch of it, will afford you a pint of excellent water. How wife, how beautiful, is the agreement between the plants of every country, and its inhabitants, and other circumftances!

2. Plants oftentimes by their very ftructure contribute remarkably both to their own prefervation and that of others. But the wifdom of the Creator appears no where more, than in the manner of growth of trees. For as their roots defcend deeper than thofe of other plants provifion is thereby made, that they fhall not rob them too much of nourifhment; and what is ftill more, a ftem not above a fpan in diameter often fhoots up its branches very high; thefe bear perhaps many thoufand buds, each of which is a plant, with its leaves, flowers, and ftipulæ. Now if all thefe grew upon the plain, they would take up a thoufand times as much fpace as the tree does; and in this cafe there would fcarcely be room in all the earth for fo many plants, as at prefent the trees alone afford. Befides, plants that fhoot up in this way are more eafily preferved from cattle by a natural defence; and farther, their leaves falling in autumn cover the plants growing about againft the rigour of the winter, and in the fummer they afford a pleafing fhade, not only to animals, but to plants, againft the intenfe heat of the fun. We may add, that trees, like all other vegetables, imbibe the water from the earth, which water does not circulate again to the root, as the ancients imagined; but being difperfed, like fmall rain, by the tranfpiration of the leaves, moiftens the plants that grow around. Again, many trees bear flefhy fruits of the berry or apple kind, which, being fecure from the attack of cattle, grow ripe for the ufe of man and other animals, while their feeds are difperfed up and down after digeftion. Laftly, the particular ftructure of trees contributes very much to the propagation of infects; for thefe chiefly lay their eggs upon the leaves, where they are fecure from the reach of cattle.

Ever-green trees and fhrubs in the northern parts are chiefly found in the moft barren woods, that they may be a fhelter to animals in the winter. They lofe their leaves only every third year, as their feeds are fufficiently guarded by the moffes, and do not want any other covering. The palms in the hot countries perpetually keep their leaves, for there the feeds ftand in no need of any fhelter whatever.

Many plants and fhrubs are armed with thorns, *e.g.* the buckthorn, floe, carduus, cotton-thiftle, &c. that they may keep off the animals, which otherwife would deftroy their fruit. Thefe at the fame time cover many other plants, efpecially of the annual kind, under their branches. Nay, it has frequently been obferved upon commons where furze grows, that wherever there was a bufh left untouched for years by the commoners, fome tree has fprung up, being fecured by the prickles of that fhrub from the bite of cattle. So that while the adjacent grounds are robbed of all plants by the voracity

voracity of animals, some may be preserved to ripen flowers and fruit, and stock the parts about with seeds, which otherwise would be quite extirpated.

All herbs cover the ground with their leaves, and by their shade hinder it from being totally deprived of that moisture which is necessary to their nourishment. They are moreover an ornament to the earth, especially as leaves have a more agreeable verdure on the upper than the under side.

The mosses which adorn the most barren places, at the same time preserve the lesser plants when they begin to shoot, from cold and drought: As we find by experience in our gardens, that plants are preserved in the same way. They also hinder the fermenting earth from forcing the roots of plants upwards in the spring; as we see happen annually to trunks of trees, and other things put into the ground. Hence very few mosses grow in the warmer climates, as not being so necessary to that end in those places.

The English sea mat-weed, or marran, will bear no soil but pure sand, which nature has allotted to it. Sand, the produce of the sea, is blown by winds oftentimes to very remote parts, and deluges, as it were, woods and fields. But where this grass grows, it frequently fixes the sand, gathers it into hillocks, and thrives so much, that, by means of this alone, at last an entire hill of sand is raised. Thus the sand is kept in bounds, other plants are preserved free from it, the ground is increased, and the sea is repelled by this wonderful disposition of nature.

How solicitous nature is about the preservation of grasses is abundantly evident from hence, that the more the leaves of the perennial grasses are eat, the more they creep by the roots, and send forth offsets. For the Author of nature intended that vegetables of this kind, which have very slender and erect leaves, should be copious, and very thick-set, covering the ground like a carpet; and thus afford food sufficient for so vast a quantity of grazing animals. But what chiefly increases our wonder is, that although the grasses are the principal food of such animals, yet they are forbid as it were to touch the flower and seed-bearing stems, that so the seeds may ripen and be sown.

The caterpillar or grub of the moth, although it feeds upon grasses, to the great destruction of them in meadows, yet it seems to be formed in order to keep a due proportion between these and other plants: for grasses, when left to grow freely, increase to that degree, that they exclude all other plants; which would consequently be extirpated, unless this insect sometimes prepared a place for them. Hence always more species of plants appear in those places where this caterpillar has laid waste the pastures the preceding year, than at any other time.

III. Destruction.

Daily experience teaches us, that all plants, as well as all other living things, must submit to death.

They spring up, they grow, they flourish, they ripen their fruit, they wither, and at last, having finished their course, they die, and return to the dust again, from whence they first took their rise. Thus all black mould, which every where covers the earth, for the greatest part is owing to dead vegetables. For all roots descend into the sand by their branches, and after a plant has lost its stem the root remains; but this too rots at last, and changes into mould. By this means this kind of earth is mixed with sand, by the contrivance of nature, nearly in the same way as dung thrown upon fields is wrought into the earth by the industry of the husbandman. The earth thus prepared offers again to plants from its bosom, what it has received from them. For when seeds are committed to the earth, they draw to themselves, accommodate to their nature, and turn into plants, the more subtile parts of this mould by the co-operation of the sun, air, clouds, rains, and winds; so that the tallest tree is, properly speaking, nothing but mould wonderfully compounded with air and water, and modified by a virtue communicated to a small seed by the Creator. From these plants, when they die, just the same kind of mould is formed as gave birth to them originally; but in such a manner, that it is in greater quantity than before. Vegetables therefore increase the black mould, whence fertility remains continually uninterrupted. Whereas the earth could not make good its annual consumption, unless it were constantly recruited by new supplies.

The crustaceous liverworts are the first foundation of vegetation; and therefore are plants of the utmost consequence in the œconomy of nature, tho' so despised by us. When rocks first emerge out of the sea, they are so polished by the force of the waves, that scarce any herb can find a fixed habitation upon them; as we may observe every where near the sea. But the very minute crustaceous liverworts begin soon to cover these dry rocks, although they have no other nourishment but that small quantity of mould and imperceptible particles which the rain and air bring thither. These liverworts dying at last turn into a very fine earth; on this earth the imbricated liverworts find a bed to strike their roots in. These also die after a time, and turn to mould; and then the various kinds of mosses, *e.g.* the hypna, the brya, polytrica, find a proper place and nourishment. Lastly, these dying in their turn, and rotting, afford such plenty of new-formed mould, that herbs and shrubs easily root and live upon it.

That trees, when they are dry or are cut down, may not remain useless to the world, and lie as it were melancholy spectacles, nature hastens on their destruction in a singular way: first the liverworts begin to strike root in them; afterwards the moisture is drawn out of them; whence putrefaction follows. Then the mushroom kinds find a fit place for nourishment on them, and corrupt them still more. The beetle called the *dermestes*, next makes himself a way between the bark and the wood. The musk-beetle, the copper talc-beetle, and the caterpillar or cossus 812 (*S. N.*) bores an infinite number of holes through the trunk. Lastly, the woodpeckers come, and, while they are seeking for insects, wear away the tree already corrupted; till the whole passes into earth. Such industry does nature use to destroy the trunk of a tree! Nay, trees immersed in water would scarcely ever be destroyed, were it not for the worm that eats ships, which performs this work; as the sailor knows by sad experience.

Thistles, as the most useful of plants, are armed, and guarded by nature herself. Suppose there were a

heap of clay, on which for many years no plant has ſprung up; let the ſeeds of the thiſtle blow there, and grow, the thiſtles by their leaves attract the moiſture out of the air, ſend it into the clay by means of their roots, will thrive themſelves, and afford a ſhade. Let now other plants come hither, and they will ſoon cover the ground. *St Bielke.*

All ſucculent plants make ground fine, of a good quality, and in great plenty; as ſedum, craſſula, aloe, algæ. But dry plants make it more barren, as heath, pines, moſs; and therefore nature has placed the ſucculent plants on rocks, and the drieſt hills.

Sect. IV. *The Animal Kingdom.*

I. Propagation.

1. The generation of animals holds the firſt place among all things that raiſe our admiration when we conſider the works of the Creator; and chiefly that appointment, by which he has regulated the conception of the fœtus, and its excluſion, that it ſhould be adapted to the diſpoſition and way of living of each animal, is moſt worthy of our attention.

We find no ſpecies of animals exempt from the ſtings of love, which is put into them to the end that the Creator's mandate may be executed, *Increaſe and multiply;* and that thus the egg, in which is contained the rudiment of the fœtus, may be fecundated; for without ſecundation all eggs are unfit to produce an offspring.

Foxes and wolves, ſtruck with theſe ſtings, every where howl in the woods; crowds of dogs follow the female; bulls ſhew a terrible countenance, and very different from that of oxen. Stags every year have new horns, which they loſe after rutting time. Birds look more beautiful than ordinary, and warble all day long through laſciviouſneſs. Thus ſmall birds labour to outſing one another, and cocks to outcrow. Peacocks ſpread forth again their gay and glorious trains. Fiſhes gather together, and exult in the water; and graſhoppers chirp, and pipe, as it were, amongſt the herbs. The ants gather again into colonies, and repair to their citadels. We paſs over many other particulars, which this ſubject affords, to avoid prolixity.

2. The ſecundated egg requires a certain and proportionate degree of heat for the expanſion of the ſtamina of the embryo. That this may be obtained, nature operates in different manners; and therefore we find in different claſſes of animals a different way of excluding the fœtus.

The females of quadrupeds have an uterus, contrived for eaſy geſtation, temperate and cheriſhing warmth, and proper nouriſhment of the fœtus, as moſt of them live upon the earth, and are there fed.

Birds, in order to get ſubſiſtence, and for other reaſons, are under a neceſſity of ſhifting place; and that not upon their feet, but wings. Geſtation therefore would be burthenſome to them. For this reaſon they lay eggs, covered with a hard ſhell. Theſe they ſit upon by a natural inſtinct, and cheriſh till the young one comes forth.

The oſtrich and caſſowary are almoſt the only birds that do not obſerve this law; theſe commit their eggs to the ſand, where the intenſe heat of the ſun excludes the fœtus.

Fiſhes inhabit cold waters, and moſt of them have cold blood; whence it happens that they have not heat ſufficient to produce the fœtus. The all-wiſe Creator therefore has ordained, that moſt of them ſhould lay their eggs upon the ſhore; where, by means of the ſolar rays, the water is warmer, and alſo fitter for that purpoſe; becauſe it is there leſs impregnated with ſalt, and conſequently milder; and alſo becauſe water-inſects abound more there, which afford the young fry nouriſhment.

Salmons in the like manner, when they are about to lay their eggs, are led by inſtinct to go up the ſtream, where the water is freſh and more pure.

The butterfly-fiſh is an exception, for that brings forth its fœtus alives.

The fiſhes of the ocean, which cannot reach the ſhores by reaſon of the diſtance, are alſo exempt from this law. The Author of nature has given to this kind eggs that ſwim; ſo that they are hatched amidſt the ſwimming fucus, called *ſargazo**. * *Flor. Zeyl.* 389.

The cetaceous fiſh have warm blood; and therefore they bring forth their young alive, and ſuckle them with their teats.

Many amphibious animals bring forth live fœtuſes, as the viper and the toad, &c. But the ſpecies that lay eggs, lay them in places where the heat of the ſun ſupplies the warmth of the parent.

Thus the reſt of the frog kind, and the lizard kind, lay their eggs in warm waters; the common ſnake in dunghills, and ſuch like warm places; and give them up to nature, as a provident nurſe, to take care of them. The crocodile and ſea-tortoiſes go aſhore to lay their eggs under the ſand, where the heat of the ſun hatches them.

Moſt of the inſect kind neither bear young nor hatch eggs: yet their tribes are the moſt numerous of all living creatures; inſomuch, that if the bulk of their bodies were proportionate to their quantity, they would ſcarce leave room for any other kinds of animals. Let us ſee therefore with what wiſdom the Creator has managed about the propagation of theſe minute creatures. The females by natural inſtinct meet and copulate with the males; and afterwards lay their eggs: but not indiſcriminately in every place. For they all know how to chooſe ſuch places as may ſupply their offspring in its tender age with nouriſhment, and other things neceſſary to ſatisfy their natural wants: for the mother, ſoon after ſhe has laid her eggs, dies; and were ſhe to live, ſhe would not have it in her power to take care of her young.

Butterflies, moths, ſome beetles, weevils, bugs, cuckow-ſpit inſects, gall-inſects, tree-bugs, &c. lay their eggs on the leaves of plants, and every different tribe chooſes its own ſpecies of plant. Nay, there is ſcarce any plant which does not afford nouriſhment to ſome inſect; and ſtill more, there is ſcarcely any part of a plant which is not preferred by ſome of them. Thus one inſect feeds upon the flower; another upon the trunk; another upon the root; and another upon the leaves. But we cannot help wondering particularly, when we ſee how the leaves of ſome trees and plants, after eggs have been let into them, grow into galls; and form dwellings, as it were, for the young ones, where they may conveniently live. Thus when the gall inſect has fixed her eggs in the leaves of an oak, the wound

wound of the leaf fwells, and a knob like an apple arifes, which includes and nourifhes the embryo.

When the tree-bug has depofited its eggs in the boughs of the fir-tree, excrefcences arife fhaped like pearls. When another fpecies of the tree-bug has depofited its eggs in the moufe-ear chickweed or the fpeedwell, the leaves contract in a wonderful manner into the fhape of a head. The water-fpider, excludes eggs either on the extremities of the juniper, which from thence forms a lodging, that looks like the arrow-headed grafs; or on the leaves of the poplar, from whence a red globe is produced. The tree-loufe lays its eggs on the leaves of the black poplar, which upon that turn into a kind of inflated bag; and fo in other inftances. Nor is it upon plants only that infects live and lay their eggs. The gnats commit theirs to ftagnating waters. The water-infect called *monoculus* often increafes fo immenfely on pools, that the red legions of them have the appearance of blood. Others lay their eggs in other places: *e.g.* the beetle, in dunghills; the dermeftes, in fkins; the flefh-fly, in putrified flefh; the cheefe-maggot, in the cracks of cheefe, from whence the caterpillars iffuing forth, oftentimes confume the whole cheefe, and deceive many people, who fancy the worms are produced from the particles of the cheefe itfelf, by a generation called *equivocal*, which is extremely abfurd. Others exclude their eggs upon certain animals. The mill-beetle lays it eggs between the fcales of fifhes; the fpecies of gad-fly, on the back of cattle; the fpecies 1025 (*S. N.*) on the back of the rein-deer; the fpecies 1026, in the nofes of fheep. The fpecies 1028 lodges during the winter in the inteftinal tube, or the throat of horfes, nor can it be driven out till the fummer comes on. Nay, infects themfelves are often furrounded with the eggs of other infects, infomuch that there is fcarcely an animal to be found which does not feed its proper infect, not to fay any more of all the other places where they depofit their eggs. Almoft all the eggs of infects, when laid, are ordained to undergo, by a wonderful law of nature, various metamorphofes, *e.g.* the egg of the butterfly, being laid in the cabbage, firft of all becomes a caterpillar, that feeds upon grafs, crawls, and has 16 feet. This afterwards changes into a nymph, that has no feet, is fmooth, and eats nothing; and laftly, this burfts into a butterfly that flies, has variety of colours, is rough, and lives upon honey. What can be more worthy of admiration than that one and the fame animal fhould appear on the ftage of life under fo many characters, as if it were three diftinct animals. Linnæus, (*Amœn. Academ.* tom. ii.) in a treatife on the wonders relating to infects, fays, "As furprifing as thefe transformations may feem, yet much the fame happens when a chicken is hatched; the only difference is, that this chicken breaks all three coats at once, the butterfly one after another."

The laws of generation of worms are ftill very obfcure; as we find they are fometimes produced by eggs, fometimes by offsets juft in the fame manner as happens to trees. It has been obferved with the greateft admiration, that the polypus or hydra (S. N. 221.) lets down fhoots and live branches, by which it is multiplied. Nay more, if it be cut into many parts, each fegment, put into the water, grows into a perfect animal; fo that the parts which were torn off are reftored from one fcrap.

3. The multiplication of animals is not tied down to the fame rules in all; for fome have a remarkable power of propagating, others are confined within narrower limits in this refpect. Yet in general we find, that nature obferves this order, that the leaft animals, and thofe which are ufeful and ferve for nourifhment to the greateft number of other animals, are endued with a greater power of propagating than others.

Mites, and many other infects, will multiply to a thoufand within the compafs of a very few days; while the elephant fcarcely produces one young in two years.

The hawk kind generally lay not above two eggs, at moft four; while the poultry kind rifes to 50.

The diver, or loon, which is eaten by few animals, lays alfo two eggs; but the duck kind, the moorgame, partridges, &c. and fmall birds, lay a very large number.

If you fuppofe two pigeons to hatch nine times a-year, they may produce in four years 14760 young. They are endued with this remarkable fertility, that they may ferve for food, not only to man, but to hawks and other birds of prey. Nature has made harmlefs and efculent animals fruitful. She has forbid the bird kind to fall fhort of the number of eggs allotted to each fpecies: and therefore, if the eggs which they intend to fit upon be taken away a certain number of times, they prefently lay others in their room; as may be feen in the fwallow, duck, and fmall birds.

II. Preservation.

1. Prefervation follows generation; this appears chiefly in the tender age, while the young are unable to provide for their own fupport. For then the parents, though otherwife ever fo fierce in their difpofition, are affected with a wonderful tendernefs or fenfe of love towards their progeny, and fpare no pains to provide for, guard, and preferve them; and that not by an imaginary law, but one given by the Lord of nature himfelf.

Quadrupeds give fuck to their tender young, and fupport them by a liquor perfectly eafy of digeftion, till their ftomachs are able to digeft, and their teeth are fit to chew, more folid food. Nay, their love toward them is fo great, that they endeavour to repel with the utmoft force every thing which threatens danger or deftruction to them. The ewe, which brings forth two lambs at a time, will not admit one to her teats unlefs the other be prefent and fuck alfo; left one fhould famifh, while the other grows fat.

Birds build their nefts in the moft artificial manner, and line them as foft as poffible, for fear the eggs fhould get any damage. Nor do they build promifcuoufly in any place, but there only where they may quietly lie concealed and be fafe from the attacks of their enemies.

The hanging-bird makes its neft of the fibres of withered plants, and the down of the poplar feeds, and fixes it upon the bough of fome tree hanging over the water, that it may be out of reach.

The diver places its fwimming neft upon the water itfelf, amongft the rufhes. We defignedly pafs over many inftances of the like kind.

Again,

Again, birds fit on their eggs with fo much patience, that many of them choofe to perifh with hunger, rather than expofe the eggs to danger by going to feek for food.

The male rooks and crows, at the time of incubation, bring food to the females.

Pigeons, fmall birds, and other birds which pair, fit by turns; but where polygamy prevails, the males fcarcely take any care of the young.

Moft of the duck kind pluck off their feathers in great quantity, and cover their eggs with them, left they fhould be damaged by the cold when they quit their nefts for the fake of food; and when the young are hatched, who knows not how folicitous they are in providing for them till they are able to fly and fhift for themfelves?

Young pigeons would not be able to make ufe of hard feeds for nourifhment, unlefs the parents were to prepare them in their crops, and thence feed them.

The owl called the *eagle-owl* makes its neft on the higheft precipices of mountains, and in the warmeft fpot, facing the fun; that the dead bodies brought there may by the heat melt into a foft pulp, and become fit nourifhment for the young.

As an exception indeed to this foftering care of animals, may be mentioned the cuckow, which lays its eggs in the neft of other fmall birds, generally the wag-tail, yellow-hammer, or white-throat, and leaves the incubation or prefervation of the young to them. This cuftom of the cuckow is fo extraordinary, and out of the common courfe of nature, that it would not be credible were it not for the teftimony of the moft knowing and curious natural-hiftorians, fuch as Ray, Willoughby, Gefner, Aldrovandus, Ariftotle, &c. But this feeming want of inftinct is accounted for from the ftructure and fituation of its ftomach, which difqualifies it for incubation ‡; and its inftinctive care is ftill confpicuous in providing a proper, though a foreign, nidus for its eggs.

‡ See the article *Cuculus*.

Amphibious animals, fifhes, and infects, which cannot come under the care of their parents, yet owe this to them, that they are put in places where they eafily find nourifhment.

2. As foon as animals come to maturity, and want no longer the care of their parents, they attend with the utmoft labour and induftry, according to the law and œconomy appointed for every fpecies, to the prefervation of their lives. But that fo great a number of them, which occur every-where, may be fupported, and a certain and fixed order may be kept up amongft them, behold the wonderful difpofition of the Creator, in affigning to each fpecies certain kinds of food, and in putting limits to their appetites. So that fome live on particular fpecies of plants, which particular regions and foils only produce: fome on particular animalcula; others on carcafes; and fome even on mud and dung. For this reafon, Providence has ordained that fome fhould fwim in certain regions of the watery element; others fhould fly: fome fhould inhabit the torrid, the frigid, or the temperate zones; and others fhould frequent defarts, mountains, woods, pools, or meadows, according as the food proper to their nature is found in fufficient quantity. By this means there is no terreftrial tract, no fea, no river, no country, but what contains and nourifhes various kinds of animals. Hence alfo an animal of one kind cannot rob thofe of another kind of its aliment; which, if it happened, would endanger their lives or health: and thus the world at all times affords nourifhment to fo many and fo large inhabitants, at the fame time that nothing which it produces is ufelefs or fuperfluous.

It will not be here amifs to produce fome inftances by which it will appear how providentially the Creator has furnifhed every animal with fuch cloathing as is proper for the country where they live, and alfo how excellently the ftructure of their bodies is adapted to their particular way of life; fo that they feem to be deftined folely to the places where they are found.

Monkeys, elephants, and rhinocerofes, feed upon vegetables that grow in hot countries, and therefore therein they have their allotted places. When the fun darts forth its moft fervid rays, thefe animals are of fuch a nature and difpofition, that it does them no manner of hurt; nay, with the reft of the inhabitants of thofe parts, they go naked; whereas, were they covered with hairy fkins, they muft perifh with heat.

On the contrary, the place of rein-deer is fixed in the coldeft part of Lapland, becaufe their chief food is the liverwort, which grows no-where fo abundantly as there; and where, as the cold is moft intenfe, the rein-deer are cloathed, like the other northern animals, with fkins filled with the denfeft hair, by the help of which they eafily defy the keennefs of the winter. In like manner the rough-legged partridge paffes its life in the very Lapland Alps, feeding upon the feeds of the dwarf birch; and, that they may run up and down fafely amidft the fnow, their feet are feathered.

The camel frequents the fandy and burning defarts, in order to get the barren camel's-hay. How wifely has the Creator contrived for him! he is obliged to go through the defarts, where oftentimes no water is found for many miles about. All other animals would perifh with thirft in fuch a journey: but the camel can undergo it without fuffering; for his belly is full of cells, where he referves water for many days. It is reported by travellers, that the Arabians, when in travelling they want water, are forced to kill their camels, and take water out of their bellies that is perfectly good to drink, and not at all corrupted.

The pelican likewife lives in defart and dry places; and is obliged to build her neft far from the fea, in order to procure a greater fhare of heat to her eggs. She is therefore forced to bring water from afar for herfelf and her young; for which reafon Providence has furnifhed her with an inftrument moft adapted to this purpofe: She has a very large bag under her throat, which fhe fills with a quantity of water fufficient for many days; and this fhe pours into the neft, to refrefh her young, and teach them to fwim.

The wild beafts, lions, and tygers, come to this neft to quench their thirft, but do no hurt to the young.

Oxen delight in low grounds, becaufe there the food moft palatable to them grows.

Sheep

Sheep prefer naked hills, where they find a particular kind of grafs called the *feftuca*, which they love above all things.

Goats climb up the precipices of mountains, that they may browfe on the tender fhrubs; and in order to fit them for it, they have feet made for jumping.

Horfes chiefly refort to woods, and feed upon leafy plants.

Nay, fo various is the appetite of animals, that there is fcarcely any plant which is not chofen by fome, and left untouched by others. The horfe gives up the water-hemlock to the goat. The cow gives up the long-leaved water-hemlock to the fheep. The goat gives up the monks-hood to the horfe, &c.; for that which certain animals grow fat upon, others abhor as poifon. Hence no plant is abfolutely poifonous, but only refpectively. Thus the fpurge, that is noxious to man, is a moft wholefome nourifhment to the caterpillar. That animals may not deftroy themfelves for want of knowing this law, each of them is guarded by fuch a delicacy of tafte and fmell, that they can eafily diftinguifh what is pernicious from what is wholefome; and when it happens that different animals live upon the fame plants, ftill one kind always leaves fomething for the other, as the mouths of all are not equally adapted to lay hold of the grafs; by which means there is fufficient food for all. To this may be referred an œconomical experiment well known to the Dutch, that when eight cows have been in a pafture, and can no longer get nourifhment, two horfes will do very well there for fome days; and when nothing is left for the horfes, four fheep will live upon it.

Swine get provifion by turning up the earth; for there they find the fucculent roots, which to them are very delicious.

The leaves and fruits of trees are intended as food for fome animals, as the floth, the fquirrel; and thefe laft have feet given them fit for climbing.

Befides myriads of fifhes, the caftor, the fea-calf, and others, inhabit the water, that they may there be fed; and their hinder-feet are fit for fwimming, and perfectly adapted to their manner of life.

The whole order of the goofe-kind, as ducks, merganfer, &c. pafs their lives in water, as feeding upon water-infects, fifhes, and their eggs. Who does not fee, that attends ever fo little, how exactly the wonderful formation of their beaks, their necks, their feet, and their feathers, fuits their kind of life; which obfervation ought to be extended to all other birds.

The way of living of the fea-fwallow deferves to be particularly taken notice of; for as he cannot fo commodioufly plunge into the water, and catch fifh, as other aquatic birds, the Creator has appointed the fea-gull to be his caterer in the following manner. When this laft is purfued by the former, he is forced to throw up part of his prey, which the other catches; but in the autumn, when the fifhes hide themfelves in deep places, the merganfer fupplies the gull with food, as being able to plunge deeper into the fea. The chief granary of fmall birds is the knot-grafs, that bears heavy feeds, like thofe of the black bindweed. It is a very common plant, not eafily deftroyed, either by the road fide by trampling upon it, or anywhere elfe; and is extremely plentiful after harveft in fields, to which it gives a reddifh hue by its numerous feeds. Thefe fall upon the ground, and are gathered all the year round by the fmall birds. To which we may add, that many fmall birds feed upon the feeds of plantain, particularly linnets. It is generally known that the goldfinch lives upon the feed of thiftles, from which he has its name in Latin and French. Thus bouutiful nature feeds the fowls of the air.

The Creator has taken no lefs care of fome amphibious animals, as the fnake and frog kind; which, as they have neither wings to fly, nor feet to run fwiftly and commodioufly, would fcarcly have any means of taken their prey, were it not that fome animals run, as it were of their own accord, into their mouths. When the rattle-fnake, a native of America, with open jaws fixes his eyes on a bird, fly, or fquirrel, fitting on a tree, they fly down his throat, being rendered ftupid, and giving themfelves up as deftitute of all refuge. How dreadful this ferpent is to other animals will appear by an account we have in a treatife entitled, *Radix Senega*. Where the author (*Amœn. Academ.* tom. 2) fays, one of thefe terrible ferpents got clandeftinely into the houfe of governor Blake at Carolina; where it would have long lain concealed, had it not been that all the domeftic animals, as dogs, hogs, turkeys and fowls, admonifhed the family by their unufual cries, equally fhewing their horror and confternation, their hair, briftles, and crefts, ftanding up an end. On the other hand, we cannot but adore the Creator's great goodnefs towards man, when we confider the rattle which terminates this ferpent's tail: for by means of that we have an opportunity of guarding againft this dreadful enemy; the found warning us to fly; which if we were not to do, and we fhould be wounded by him, the whole body would be turned into a putrid corruption in fix hours, nay fometimes in half an hour.

The limits of this article will not permit us to produce more examples of this kind. But whoever will be at the pains to take ever fo flight a view of the wonderful works of the Author of nature, will readily fee how wifely the plan, order, and fitnefs of things with divine ends, are difpofed.

3. We cannot without the utmoft admiration behold how providently the Creator has acted as to the prefervation of thofe animals which, at a certain time of the year, are by the rigour of the feafon excluded from the neceffaries of life. Thus the bear in the autumn creeps into the mofs which he has gathered, and there lies all winter; fubfifting upon no other nourifhment but his fat, collected during the fummer in the cellulous membrane, and which without doubt, during his faft, circulates through his veffels, and fupplies the place of food; to which perhaps is added that fat juice which he fucks out of the bottom of his feet.

Thehedge-hog, badger, and mole, in the fame manner fill their winter-quarters with vegetables, and fleep during the frofts. The bat feems cold and quite dead all the winter. Moft of the amphibious animals get into dens, or to the bottom of lakes and pools.

In the autumn, as the cold approaches, and infects difappear, fwallows migrate into other climes in fearch of food and a temperature of air more friendly to their

their conſtitution: though the later hatches, or thoſe young birds which are incapable of diſtant flights, ſeek for an aſylum againſt the violence of the cold in the bottom of lakes amongſt the reeds and ruſhes; from whence, by the wonderful appointment of nature, they come forth again. See the article HIRUNDO. The periſtaltic motion of the bowels ceaſes in all theſe animals while they are obliged to faſt; whence the appetite is diminiſhed, and ſo they ſuffer the leſs from hunger. To this head may be referred the obſervation of the celebrated Liſter concerning thoſe animals, That their blood, when let into a baſon, does not coagulate, as that of all other animals; and ſo is no leſs fit for circulation than before.

The moor-fowls work themſelves out-walks under the very ſnow. They moult in the ſummer; ſo that about the month of Auguſt they cannot fly, and are therefore obliged to run into the woods; but then the moor-berries and bilberries are ripe, from whence they are abundantly ſupplied with food. Whereas the young do not moult the firſt ſummer; and therefore, though they cannot run ſo well, are able to eſcape danger by flight.

The reſt of the birds who feed upon inſects migrate every year to foreign regions, in order to ſeek for food in a milder climate; while all the northern parts, where they live well in the ſummer, are covered with ſnow.

By theſe migrations, birds alſo become uſeful to many different countries, and are diſtributed over almoſt all the globe. And it muſt excite our admiration that all of them exactly obſerve the times of coming and going, and that they do not miſtake their way.

Inſects in the winter generally lie hid within their caſes, and are nouriſhed by the ſurrounding liquor like the fœtus of other animals; from whence, at the approach of ſpring, they awake, and fly forth, to the aſtoniſhment of every one.

However, all animals which lie hid in winter do not obſerve theſe laws of faſting. Some provide ſtore-houſes in ſummer and autumn, from which they take what is neceſſary; as mice, jays, ſquirrels, bees.

III. DESTRUCTION.

1. WE have obſerved above, that all animals do not live upon vegetables, but that there are ſome which feed upon certain animalcula. Nay, there are ſome which ſubſiſt only by rapine, and daily deſtroy numbers of the peaceable kind.

Theſe animals are deſtroyed, but in ſuch a manner that the weaker generally are infeſted by the ſtronger in a continued ſeries. Thus the tree-louſe lives upon plants. The fly called *muſca aphidivora* lives upon the tree-louſe; the hornet and waſp-fly, upon the muſca aphidivora; the dragon-fly, upon the hornet and waſp fly; the ſpider, on the dragon-fly; the ſmall birds on the ſpider; and laſtly, the hawk kind on the ſmall birds.

In like manner, the monoculus delights in putrid waters, the knat eats the monoculus, the frog eats the knat, the pike eats the frog, the ſea-calf eats the pike.

The bat and goat-ſucker make their excurſions only at night, that they may catch the moths, which at that time fly about in vaſt quantities.

The woodpecker pulls out the inſects which lie hid in the trunks of trees.

The ſwallow purſues thoſe which fly about in the open air.

The mole purſues worms. The large fiſhes devour the ſmall. Nay, we ſcarcely know an animal which has not ſome enemy to contend with.

Amongſt quadrupeds wild beaſts are moſt remarkably pernicious and dangerous to others, as the hawk kind among birds. But that they may not, by too atrocious a butchery, deſtroy whole ſpecies, even theſe are circumſcribed within certain bounds. Firſt, as to the moſt fierce of all, it deſerves to be noted how few they are in proportion to other animals. Secondly, the number of them is not equal in all countries. Thus France and England breed no wolves, and the northern countries no tigers or lions. Thirdly, theſe fierce animals ſometimes fall upon and deſtroy one another. Thus the wolf devours the fox. The dog infeſts both the wolf and fox; nay, wolves in a body will ſometimes venture to ſurround a bear. The tiger often kills its own male whelps. Dogs are ſometimes ſeized with madneſs, and deſtroy their fellows, or with the mange deſtroy themſelves.

Laſtly, wild beaſts ſeldom arrive at ſo great an age as animals which live on vegetables. For they are ſubject, from their alkaline diet, to various diſeaſes, which bring them ſooner to an end.

But although all animals are infeſted by their peculiar enemies, yet they are often able to elude their violence by ſtratagems and force. Thus the hare often confounds the dog by her windings.

When the bear attacks ſheep and cattle, theſe draw up together for mutual defence. Horſes join heads together, and fight with their heels. Oxen join tails, and fight with their horns.

Swine get together in herds, and boldly oppoſe themſelves to any attack, ſo that they are not eaſily overcome; and it is worth while to obſerve, that all of them place their young, as leſs able to defend themſelves, in the middle, that they may remain ſafe during the battle.

Birds, by their different ways of flying, oftentimes eſcape the hawk. If the pigeon had the ſame way of flying as the hawk, ſhe would hardly ever eſcape his claws.

It deſerves alſo to be remarked, how much ſome animals conſult their ſafety by night. When horſes ſleep in woods, one by turn remains awake, and, as it were, keeps watch. When monkeys in Braſil ſleep upon trees, one of them keeps awake, in order to give the ſign when the tiger creeps towards them; and in caſe the guard ſhould be caught aſleep, the reſt tear him to pieces. Hence the hunting of rapacious animals is not always ſucceſsful, and they are often obliged to labour for a whole day to no purpoſe. For this reaſon the Creator has given them ſuch a nature, that they can bear faſting a long time. Thus the lion lurks in his den many days without famiſhing; and the wolf, when he has once well ſatisfied his hunger, can faſt many weeks without any difficulty.

If we conſider the end for which it pleaſed the Supreme Being to conſtitute ſuch an order of nature, that ſome animals ſhould be, as it were, created only to be miſerably butchered by others, it ſeems that his Pro-

Animal Kingdom.

Providence not only aimed at fuftaining, but alfo keeping a juft proportion amongft all the fpecies; and fo prevent any one of them from increafing too much, to the detriment of men and other animals. For if it be true, as it is moft affuredly, that the furface of the earth can fupport only a certain number of inhabitants, they muft all perifh if the fame number were doubled or tripled.

There are fome viviparous flies which bring forth 2000 young. Thefe in a little time would fill the air, and like clouds intercept the rays of the fun, unlefs they were devoured by birds, fpiders, and many other animals.

Storks and falcons free Egypt from frogs, which, after the inundation of the Nile, cover all the country. The fame birds alfo clear Paleftine of mice. Bellonius on this fubject fays as follows: "The ftorks come to Egypt in fuch abundance, that the fields and meadows are white with them. Yet the Egyptians are not difpleafed with this fight; as frogs are generated in fuch numbers there, that did not the ftorks devour them, they would over-run every thing. Befides, they alfo catch and eat ferpents. Between Belba and Gaza, the fields of Paleftine are often defart on account of the abundance of mice and rats; and were they not deftroyed by the falcons, that come here by inftinct, the inhabitants could have no harveft."

The white fox is of equal advantage in the Lapland Alps; as he deftroys the Norway rats, which are generated there in great abundance, and thus hinders them from increafing too much in proportion, which would be the deftruction of vegetables.

It is fufficient for us, that nothing is made by Providence in vain; and that whatever is made, is made with fupreme wifdom. For it does not become us to pry too boldly into all the defigns of God. Let us not imagine, when thefe rapacious animals fometimes do us mifchief, that the Creator planned the order of nature according to our private principles of œconomy: for the Laplanders have one way of living; the European hufbandman another; the Hottentots and favages a third; whereas the ftupendous œconomy of the Deity is one throughout the globe; and if Providence does not always calculate exactly according to our way of reckoning, we ought to confider this affair in the fame light, as when different feamen wait for a fair wind, every one with refpect to the part he is bound to, who we plainly fee cannot all be fatisfied.

2. The whole earth would be overwhelmed with carcafes and ftinking bodies, if fome animals did not delight to feed upon them. Therefore, when an animal dies, bears, wolves, foxes, ravens, &c. do not lofe a moment till they have taken all away. But if a horfe, *e. g.* dies near the public road, you will find him, after a few days, fwoln, burft, and at laft filled with innumerable grubs of carnivorous flies, by which he is entirely confumed, and removed out of the way, that he may not become a nuifance to paffengers by his poifonous ftench.

When the carcafes of fifhes are driven upon the fhore, the voracious kinds, fuch as the thornback, the hound-fifh, the conger-eel, &c. gather about and eat them. But becaufe the flux and reflux foon change the ftate of the fea, they themfelves are often detained in pits, and become a prey to the wild beafts that frequent the fhores. Thus the earth is not only kept clean from the putrefaction of carcafes, but at the fame time, by the œconomy of nature, the neceffaries of life are provided for many animals. In the like manner many infects at once promote their own good, and that of other animals. Thus gnats lay their eggs in ftagnant, putrid, and ftinking waters, and the grubs that arife from thefe eggs clear away all the putrefaction: and this will eafily appear, if any one will make the experiment by filling two veffels with putrid water, leaving the grubs in one, and taking them all out of the other; for then he will foon find the water that is full of grubs pure and without any ftench, while the water that has no grubs will continue ftinking.

Lice increafe in a wonderful manner in the heads of children that are fcabby; nor are they without their ufe, for they confume the redundant humours.

The beetle kind in fummer extract all moift and glutinous matter out of the dung of cattle, fo that it becomes like duft, and is fpread by the wind over the ground. Were it not for this, the vegetables that lie under the dung would be fo far from thriving, that all that fpot would be rendered barren.

As the excrements of dogs is of fo filthy and feptic a nature that no infect will touch them, and therefore they cannot be difperfed by that means, care is taken that thefe animals fhould exonerate upon ftones, trunks of trees, or fome high place, that vegetables may not be hurt by them.

Cats bury their dung. Nothing is fo mean, nothing fo little, in which the wonderful order and wife difpofition of nature do not fhine forth.

Laftly, all thefe treafures of nature, fo artfully contrived, fo wonderfully propagated, fo providentially fupported throughout her three kingdoms, feem intended by the Creator for the fake of man. Every thing may be made fubfervient to his ufe, if not immediately, yet mediately; not fo to that of other animals. By the help of reafon man tames the fierceft animals; purfues and catches the fwifteft; nay, he is able to reach even thofe which lie hid in the bottom of fea.

By the help of reafon, he increafes the number of vegetables immenfely; and does that by art, which nature, left to herfelf, could fcarcely effect. By ingenuity he obtains from vegetables whatever is convenient or neceffary for food, drink, cloathing, medicine, navigation, and a thoufand other purpofes.

He has found the means of going down into the abyfs of the earth, and almoft fearching its very bowels. With what artifice has he learned to get fragments from the moft rocky mountains, to make the hardeft ftones fluid like water, to feparate the ufeful metal from the ufelefs drofs, and to turn the fineft fand to fome ufe! In fhort, when we follow the feries of created things, and confider how providentially one is made for the fake of another, the matter comes to this, that all things are made for the fake of man; and for this end more efpecially, that he, by admiring the works of the Creator, fhould extol his glory, and at once enjoy all thofe things of which he ftands in need, in order to pafs his life conveniently and pleafantly.

CONCLUSION.

THIS subject concerning the works of nature, a very small part of which we have been able to touch upon, is of such importance and dignity, that if it were to be properly treated in all its parts, men would find wherewithal to employ almost all the powers of the mind. Nay, time itself would fail before even the most acute human sagacity would be able to discover the amazing œconomy, laws, and exquisite structure, of the least insect; since, as Pliny observes, nature nowhere appears more herself than in her most minute works.

Summary as it is, however, the preceding view, as it were in a map, of the several parts of nature, their connections and dependencies, may, among other uses, convey an useful lesson, and such an one as the best of us often need to have inculcated.

From a partial consideration of things, we are very apt to criticise what we ought to admire; to look upon as useless what perhaps we should own to be of infinite advantage to us, did we see a little farther; to be peevish where we ought to give thanks; and at the same time to ridicule those who employ their time and thoughts in examining what we were (i. e. some of us most assuredly were) created and appointed to study. In short, we are too apt to treat the Almighty worse than a rational man would treat a good mechanic, whose works he would either thoroughly examine, or be ashamed to find any fault with them. This is the effect of a partial consideration of nature; but he who has the candour of mind and leisure to look farther, will be inclined to cry out,

How wond'rous is this scene! where all is form'd
With number, weight, and measure! all design'd
For some great end! where not alone the plant
Of stately growth; the herb of glorious hue,
Or food-full substance; not the labouring steed;
The herd, and flock, that feed us; not the mine
That yields us stores for elegance, and use;
The sea that loads our table, and conveys
The wanderer man from clime to clime; with all
Those rolling spheres, that from on high shed down
Their kindly influence: not these alone,
Which strike ev'n eyes incurious; but each moss,
Each shell, each crawling insect, holds a rank
Important in the plan of Him who fram'd
This scale of beings; holds a rank, which lost
Would break the chain, and leave behind a gap
Which nature's self would rue. Almighty Being,
Cause and support of all things, can I view
These objects of my wonder, can I feel
These fine sensations, and not think of thee?
Thou who dost thro' th' eternal round of time,
Dost thro' th' immensity of space exist
Alone, shalt thou alone excluded be
From this thy universe? Shall feeble man
Think it beneath his proud philosophy
To call for thy assistance, and pretend
To frame a world, who cannot frame a clod?—
Not to know thee, is not to know ourselves——
Is to know nothing—nothing worth the care
Of man's exalted spirit—all becomes,
Without thy ray divine, one dreary gloom,
Where lurk the monsters of fantastic brains,
Order bereft of thought, uncaus'd effects,
Fate freely acting, and unerring Chance.
Where meanless matter to a chaos sinks,
Or something lower still; for without thee
It crumbles into atoms void of force,
Void of resistance—it eludes our thought.
Where laws eternal to the varying code
Of self-love dwindle. Interest, passion, whim,
Take place of right and wrong: the golden chain
Of beings melts away, and the mind's eye
Sees nothing but the present. All beyond
Is visionary guess—is dream—is death.

THOMSON.

Natural, Naturalization.

NATURAL *Philosophy*, that which considers the powers and properties of natural bodies, and their mutual actions one on another. See PHYSICS.

The business of natural philosophy, says Boerhaave, is to communicate a solid and accurate knowledge of all the bodies in being, and all the affections thereof. Nor can this science be acquired otherwise than by observing, by means of our senses, all the objects which the Author of nature hath made cognizable thereto: hence, the first and principal part of this science is to collect all the manifest and sensible appearances of things, and reduce them into a body of natural history. Now there are two ways of making such observations; the first, when we view things nearly as they happen to turn up, without any design or intervention of our own: in which way no great improvements can be expected in the art, because chance, having here the direction, only exhibits occasional or extemporary properties. The other method is, when, after a thorough acquaintance with bodies, we apply them to other bodies equally known, diligently attending to the result, and observing whether any thing new arises. See EXPERIMENTAL PHILOSOPHY.

NATURALIZATION, in law, the act of naturalizing an alien, or putting him into the condition of a natural-born subject, and entitling him to the rights and privileges thereof. See ALIEN, and DENIZEN.

Naturals, Nature.

In France, naturalization is the king's prerogative; in England, it is only done by act of parliament.

In France, Swiss, Savoyards, and Scots, need not any naturalization, being reputed regnicoles, or natives.

NATURALS, among physicians, whatever naturally belongs to an animal, in opposition to non-naturals. See NON-NATURALS.

NATURE, according to Mr Boyle, has eight different significations; it being used, 1. For the Author of nature, whom the schoolmen call *Natura Naturans*, being the same with God. 2. By the nature of a thing, we sometimes mean its essence; that is, the attributes which make it what it is, whether the thing be corporeal or not; as when we attempt to define the nature of a fluid, of a triangle, &c. 3. Sometimes we confound that which a man has by nature, with what accrues to him by birth; as when we say, that such a man is noble by nature. 4. Sometimes we take nature for an internal principle of motion; as when we say, that a stone by nature falls to the earth. 5. Sometimes we understand, by nature, the established course of things. 6. Sometimes we take nature for an aggregate of powers belonging to a body,

body, efpecially a living one; in which fenfe phyficians fay, that nature is ftrong, weak, or fpent; or that, in fuch or fuch difeafes, nature left to herfelf will perform the cure. 7. Sometimes we ufe the term *nature* for the univerfe, or whole fyftem of the corporeal works of God; as when it is faid of a phœnix, or chimera, that there is no fuch thing in nature. 8. Sometimes too, and that moft commonly, we exprefs by the word *nature* a kind of femi-deity, or other ftrange kind of being.

If, fays the fame philofopher, I were to propofe a notion of nature, lefs ambiguous than thofe already mentioned, and with regard to which many axioms relating to that word may be conveniently underftood, I fhould firft diftinguifh between the univerfal and the particular nature of things. Univerfal nature I would define to be the aggregate of the bodies that make up the world in its prefent ftate, confidered as a principle; by virtue whereof they act and fuffer, according to the laws of motion prefcribed by the Author of all things. And this makes way for the other fubordinate notion; fince the particular nature of an individual confifts in the general nature applied to a diftinct portion of the univerfe; or, which is the fame thing, it is a particular affemblage of the mechanical properties of matter, as figure, motion, &c.

Kingdoms of NATURE. See KINGDOMS.

Conduct or Operations of NATURE. See NATURAL *Hiftory*.

NAVAL, fomething relating to a fhip; whence,

NAVAL *Architecture*. See SHIP-*Building*.

NAVAL *Camp*, in antiquity, a fortification, confifting of a ditch and parapet on the land-fide, or a wall built in the form of a femi-circle, and extended from one point of the fea to another. This was fometimes defended with towers, and beautified with gates, through which they iffued forth to attack their enemies. Homer hath left us a remarkable defcription of the Grecian fortifications of this fort, in the Trojan war, beginning at v. 436. Iliad η.

> Then, to fecure the camp and naval powers,
> They rais'd embattled walls with lofty tow'rs:
> From fpace to fpace were ample gates around,
> For paffing chariots; and a trench profound,
> Of large extent; and deep in earth below
> Strong piles infix'd ftood adverfe to the foe.
>
> POPE's *Tranfl.*

Towards the fea, or within it, they fixed great pales of wood, like thofe in their artificial harbours; before thefe the veffels of burden were placed in fuch order, as that they might be inftead of a wall, and give protection to thofe within; in which manner Nicias is reported by Thucydides to have encamped himfelf: but this feems only to have been practifed when the enemy was thought fuperior in ftrength, and raifed great apprehenfions of danger in them. When their fortifications were thought ftrong enough to defend them from the affaults of enemies, it was frequent to drag their fhips to fhore, which the Greeks called ἑνωλκειν, the Romans *fubducere*. Around the fhips the foldiers difpofed their tents, as appears every where in Homer: but this feems only to have been practifed in winter, when their enemy's fleet was laid up and could not affault them; or in long fieges, and when they lay in no danger from their enemies by fea; as in the Trojan war, where the defenders of Troy never once attempted to encounter the Grecians in a fea-fight.

The adjacent places were ufually filled with inns and ftews, well ftocked with females, that proftituted themfelves to the mariners, merchants, and artificers of all forts, who flocked thither in great numbers; this, however, appears to be only in times of peace.

NAVAL *Crown*, among the ancient Romans, a crown adorned with figures of prows of fhips, conferred on perfons who in fea-engagements firft boarded the enemy's veffel. See CROWN.

NAVAL *Engagement*. See NAVAL *Tactics*, chap. vii.

NAVAL *Stores*, comprehend all thofe particulars made ufe of, not only in the royal navy, but in every other kind of navigation; as timber and iron for fhipping, pitch, tar, hemp, cordage, fail-cloth, gunpowder, ordnance, and fire-arms of every fort, fhip-chandlery wares, &c.

NAVAL TACTICS;

Or, The Military Operations of Fleets.

NAVAL TACTICS is the art of ranging fleets in fuch order or difpofition, as may be judged moft convenient, either for attacking, defending, or retreating to the greateft advantage; and to regulate their feveral movements accordingly: it is not a fcience eftablifhed on principles abfolutely invariable, but founded on fuch reafons as the alteration and improvement of arms muft neceffarily occafion in a courfe of time and experience; from which alfo will naturally refult a difference in the conftruction of fhips, in the manner of working them, and, in fine, in the total difpofition and regulation of fleets and fquadrons. We fhall curforily run through this fucceffion and change of arms, &c. to the prefent improvement of our lines of battle, in order to make us the more fenfible of the reafons which have induced the moderns to prefer fo advantageous a choice as they now follow in the arrangement of their fhips.

The ancient galleys were fo conftructed as to carry feveral banks of oars, very differently difpofed from thofe in our modern galleys, which, however, vary the leaft of any others from their ancient model. Advanced by the force of their oars, the galleys ran violently aboard of each other, and by the mutual encounter of their beaks and prows, and fometimes of their fterns, endeavoured to dafh in pieces or fink their enemies.

The prow, for this purpofe, was commonly armed with a brazen point or trident, nearly as low as the furface of the fea, in order to pierce the enemy's fhips under the water. Some of the galleys were furnifhed

with large turrets, and other acceffions of building, either for attack or defence. The foldiers alfo annoyed their enemies with darts and flings, and, on their nearer approach, with fwords and javelins; and in order that their miffive weapons might be directed with greater force and certainty, the fhips were equipped with feveral platforms, or elevations above the level of the deck. The fides of the fhip were fortified with a thick fence of hides, which ferved to repel the darts of their adverfaries, and to cover their own foldiers, who thereby annoyed the enemy with greater fecurity.

As the invention of gun-powder has rendered ufelefs many of the machines employed in the naval wars of the ancients, the great diftance of time has alfo configned many of them to oblivion: fome few are, neverthelefs, recorded in ancient authors, of which we fhall endeavour to prefent a fhort defcription. And firft,

The Δελφιν was a large and maffy piece of lead or iron, caft in the form of a dolphin. This machine being fufpended by blocks at their maft-heads or yard-arms, ready for a proper occafion, was let down violently from thence into the adverfe fhips; and either penetrated through their bottom, and opened a paffage for the entering waters, or by its weight immediately funk the veffel.

The Δρηπαναν was an engine of iron crooked like a fickle, and fixed on the top of a long pole. It was employed to cut afunder the flings of the fail-yards, and, thereby letting the fails fall down, to difable the veffel from efcaping, and incommode her greatly during the action. Similar to this was another inftrument, armed at the head with a broad two-edged blade of iron, wherewith they ufually cut away the ropes that faftened the rudder to the veffel.

Δοραλα ναυμαχα, a fort of fpears or maces of an extraordinary length, fometimes exceeding 20 cubits, as appears by the 15th Iliad of Homer, by whom they are alfo called *μακρα*.

Κιραιαι were certain machines ufed to throw large ftones into the enemy's fhips.

Vegetius mentions another engine, which was fufpended to the main-maft, and refembled a battering-ram; for it confifted of a long beam and an head of iron, and was with great violence pufhed againft the fides of the enemy's galleys.

They had alfo a grappling-iron, which was ufually thrown into the adverfe fhip by means of an engine: this inftrument facilitated the entrance of the foldiers appointed to board, which was done by means of wooden bridges, that were generally kept ready for this purpofe in the fore-part of the veffel. See the article Corvus.

The arms ufed by the ancients rendered the difpofition of their fleets very different, according to the time, place, and circumftances. They generally confidered it an advantage to be to windward, and to have the fun fhining directly on the front of their enemy. The order of battle chiefly depended on their power of managing the fhips, or of drawing them readily into form; and on the fchemes which their officers had concerted. The fleet being compofed of rowing-veffels, they lowered their fails previous to the action; they prefented their prows to the enemy, and advanced againft each other by the force of their oars. Before they joined battle, the admirals went from fhip to fhip, and exhorted their foldiers to behave gallantly. All things being in readinefs, the fignal was difplayed by hanging out of the admiral's galley a gilded fhield, or a red garment or banner. During the elevation of this, the action continued; and by its depreffion, or inclination towards the right or left, the reft of the fhips were directed how to attack or retreat from their enemies. To this was added the found of trumpets; which began in the admiral's galley, and continued round the whole navy. The fight was alfo begun by the admiral's galley, by grappling, boarding, and endeavouring to overfet, fink, or deftroy the adverfary, as we have above defcribed. Sometimes, for want of grappling-irons, they fixed their oars in fuch a manner as to hinder the enemy from retreating. If they could not manage their oars as dextroufly as their antagonift, or fall alongfide fo as to board him, they penetrated his veffel with the brazen prow. The veffels approached each other as well as their circumftances would permit, and the foldiers were obliged to fight hand to hand, till the battle was decided: nor indeed could they fight otherwife with any certainty, fince the fhorteft diftance rendered their flings and arrows, and almoft all their offenfive weapons, ineffectual, if not ufelefs. The fquadrons were fometimes ranged in two or three right lines, parallel to each other; being feldom drawn up in one line, unlefs when formed into an half-moon. This order indeed appears to be the moft convenient for rowing veffels that engage by advancing with their prows towards the enemy. At the battle of Ecnomus, between the Romans and the Carthaginians, the fleet of the former was ranged into a triangle, or a fort of wedge in front, and towards the middle of its depth, of two right parallel lines. That of the latter was formed into a rectangle, or two fides of a fquare, of which one branch extended behind, and as the opening of the other profecuted the attack, was ready to fall upon the flank of fuch of the Roman galleys as fhould attempt to break their line. Ancient hiftory has preferved many of thefe orders, of which fome have been followed in later times. Thus, in a battle A. D. 1340, the Englifh fleet was formed in two lines, the firft of which contained the larger fhips, the fecond confifted of all the fmaller veffels, ufed as a referve to fupport the former whenever neceffary. In 1545, the French fleet under the command of the Marefchal d'Annebault, in an engagement with the Englifh in the Channel, was arranged in the form of a crefcent. The whole of it was divided into three bodies, the centre being compofed of 36 fhips, and each of the wings of 30. He had alfo many galleys; but thefe fell not into the line, being defigned to attack the enemy occafionally. This laft difpofition was continued down to the reigns of James I. and Lewis XIII.

Meanwhile the invention of gunpowder, in 1330, gradually introduced the ufe of fire-arms into naval war, without finally fuperfeding the ancient method of engagement. The Spaniards were armed with cannon in a fea-fight againft the Englifh and the people of Poitou abreaft of Rochelle in 1372; and this battle is the firft wherein mention is made of artillery in our navies. Many years elapfed before the marine armaments were fufficiently provided with fire-arms. So great a revolution in the manner of fighting, and which ne-

neceſſarily introduced a total change in the conſtruction of ſhips, could not be ſuddenly effected. In ſhort, the ſquadrons of men of war are no longer formed of rowing veſſels, or compoſed of galleys and ſhips of the line; but entirely of the latter, which engage under ſail, and diſcharge the whole force of their artillery from their ſides. Accordingly, they are now diſpoſed in no other form than that of a right line parallel to the enemy; every ſhip keeping cloſe-hauled upon a wind on the ſame tack. Indeed, the difference between the force and manner of fighting of ſhips and galleys rendered their ſervice in the ſame line incompatible. When we conſider therefore the change introduced, both in the conſtruction and working of ſhips, occaſioned by the uſe of cannon, it neceſſarily follows, that ſquadrons of men of war muſt appear in the order that is now generally adopted.

The machines which owe their riſe to the invention of gun-powder have now totally ſupplanted the others; ſo that there is ſcarce any but the ſword remaining, of all the weapons uſed by the ancients. Our naval battles are therefore almoſt always decided by fire-arms, of which there are ſeveral kinds, known by the general name of *artillery*.

In a ſhip of war, fire-arms are diſtinguiſhed into cannon mounted on carriages, ſwivel-cannon, grenadoes, and muſquetry. See Cannon, &c.

Beſides theſe machines, there are ſeveral other uſed in merchant-ſhips and privateers, as coehorns, carabines, fire-arrows, organs, ſtink-pots, &c. See Coehorn, &c.

Chap. I. *Of Lines or Orders.*

By orders are meant the different methods of ranging or drawing up a fleet in the ſeveral lines and forms for which it may be deſigned: in which two things are to be conſidered, 1. The poſition of each ſhip with regard to the wind: 2. The poſition of each ſhip with reſpect to the fleet. We cannot make any alteration in either of theſe circumſtances, without changing the whole poſition of the line, which will otherwiſe remain complete.

The different expeditions an admiral may be ordered upon, as well as the various circumſtances that occur in conducting a fleet, firſt gave riſe to the ſeveral lines or orders into which it is formed.

When a fleet engages, it ought to be drawn up in a different form from that in which it ſails. A fleet that ſails in ſight of an enemy muſt alter its poſition, from that which it would maintain were there none in view, or none to be expected. When a fleet ſails before the wind, it has likewiſe its particular form of ſailing; as it has alſo when it chaces the enemy, makes a retreat, guards a ſtreight or paſſage, or is obliged to force through one; or whether at anchor in a road or harbour, or going into either to inſult or attack an enemy. In this variety of circumſtances, proper regard muſt be had to the moſt advantageous poſition or form into which the fleet can be ranged before it enters upon action.

Chap. II. *Of dividing a Fleet, and of the Form of Sailing.*

1. *How to divide a fleet.* When a fleet conſiſts of 60 ſail of the line, the admiral divides it firſt into three ſquadrons, each of which has its diviſions; and three general officers, *viz.* admiral, vice-admiral, and rear-admiral. Each ſquadron has its proper colours, and each diviſion its proper maſt: for example, the white flag is proper to the firſt ſquadron of France, the white and blue for the ſecond, and the blue for the third. In Britain, the firſt admiral of the fleet carries the union-flag at the main-top-maſt head; next, the admiral of the white; and then the admiral of the blue. The particular ſhips carry pendants of the ſame colour with their ſquadrons, and at the maſts of their reſpective diviſions; ſo that the laſt ſhip in the diviſion of the blue ſquadron wears a blue pendant at the mizen top-maſt head.

The general officers, or commanders of diviſions, place themſelves in the centre of their diviſions. We muſt except the three commanding admirals, who in a ſailing poſition lead their reſpective ſquadrons.

2. *The ſailing form of a Fleet.* The following is judged the beſt, and is that which is put in practice upon moſt occaſions, whether upon expeditions, looking out for an enemy, &c. It conſiſts in dividing the fleet into three columns, or parallel lines, either upon a wind or large, as the admiral may think moſt expedient. Thus will the courſe and diſtance of the columns, as well as each ſhip's ſtation, be determined and regulated; obſerving at the ſame time that they keep abreaſt of each other as near as poſſible.

By this manner of ſailing, the fleet is cloſed as much as poſſible, can better obſerve the proper ſignals, and is ready to be ranged or formed into any poſition or line that the admiral ſhall judge proper. In ſailing, care muſt be taken to preſerve the juſt diſtance between the columns; in order to which, it will be beſt for the ſhips in general to regulate themſelves by ſome of the centre ſhips of the column to windward, rather than the ſternmoſt, as they are often too far in their rear to follow their motions.

The moſt natural courſe in this order of ſailing is to go neareſt upon a wind on either tack, or to go away large three or four points: however, the fleet may ſteer away more or leſs from the wind, or even right afore it, as may be judged moſt expedient.

In all forms of ſailing, the tranſports, tenders, &c. are ordered to keep to windward, for the following reaſons. 1. They are by ſuch a ſituation more out of danger from the enemy, as they can the readier bear down into the body of the fleet to avoid them. 2. They can more expeditiouſly execute the admiral's orders, when neceſſary. 3. They do not delay the fleet by waiting for them, being fitter to make ſail before than upon a wind.

This kind of ſhips ought not to keep farther than half a league, for the ſame reaſons that they are ordered to keep to windward; but we muſt obſerve, that when the fleet is not drawn up in a line or three columns, the fire-ſhips, &c. ought not to be farther diſtant from the men of war than they are from one another.

The ſame reaſons which prevail in placing the fire-ſhips, &c. to windward of a fleet in a ſailing poſture, will equally hold good to place them to leeward when obliged to make a retreat. 1. They are there in leſs danger from the purſuit of an enemy, becauſe they are ſur-

Of Chacing. ſurrounded by the fleet to guard them, in the form of a half-moon, from any attack that may be made upon them. 2. The fleet going large in this form, theſe ſmall ſhips may ſhorten ſail to wait for orders. 3. If the fleet ſhould be obliged to reſume the line of battle again to engage the enemy, they will ſtill be in the beſt poſition to ſail in.

In the order of retreat, the ſtore-ſhips, &c. keep themſelves at a greater diſtance than in any other form, 1. That they may not retard the progreſs of the fleet. 2. When the fleet forms again into a line of battle, they may keep better the proper diſtance required.

The fire-ſhips, &c. of the fleet to leeward ought to keep themſelves a little a-head of thoſe ſhips whoſe orders they are to follow; to the end that they may be the readier to join them upon occaſion.

Chap. III. *Of Chacing.*

Plate CXCVI. fig. 1. 1. *To chace with the greateſt advantage.* If the ſhip that chaces is a great way to leeward of the chace, ſhe ſhould continue on the ſame board, till ſhe can tack upon her: that is to ſay, arriving at the point E, ſhe will find the chace at the point F; ſo that the angle FED will make four points, or 45°.

The above method is thought to be the beſt by the moſt experienced ſeamen; becauſe by working in this manner you keep nigher the chace, and by making two tacks you will fetch her wake.

2. The ſhip D may continue on the ſame tack, till ſhe entirely cuts off the chace C; but then ſhe runs the riſk of loſing ſight of her, by continuing too long upon the ſame tack: a fog, a ſhift of wind, a headland, night coming on, and many other incidents that frequently happen at ſea, may give the chace an opportunity of eſcaping, by altering her courſe, &c. therefore we ſhould never put this method in practice, but when very near her, or when we chaſe a friend in order to join him.

Fig. 2. 3. If the ſhip A chaſing the ſhip B to windward, is at a very great diſtance, ſhe muſt continue on the ſame tack till ſhe gets upon her beam; then the ſhip A will tack, and ſtand on again the ſame with the chace, till ſhe brings the ſhip B abreaſt of her. She muſt continue on in the ſame manner, tacking every time ſhe gets abreaſt of the chace, till ſhe is no longer apprehenſive of loſing ſight of her. *Note,* This is to be underſtood when the ſhip A is at a very great diſtance from the chace, becauſe that then ſhe would run too great a length from he, were ſhe to continue on the ſame tack till ſhe could fetch the ſhip B: but then again, when the ſhip A is but at a ſmall diſtance from the ſhip B, ſhe would looſe too much time if ſhe were to tack always when ſhe got a-breaſt of the chace.

Fig. 3. 4. We have already obſerved, that if the ſhip B is to leeward of the ſhip A which ſhe chaces, and under no apprehenſion of loſing ſight of her; or becauſe ſhe might not be at any great diſtance from her, or chaces her large, in proper ſettled weather, when the days are long; or that ſhe might be a friend, whom you would willingly join: then the ſhip B ought to continue on the ſame tack with the ſhip A, till ſhe can cut her off upon the other tack.

Now we muſt know how to determine if the ſhip B in tacking will fetch the ſhip A. 1. It is evident, that if the ſhip B, which is ſuppoſed to be a better ſailer than the chace A, continues ſtill on the ſame board Of Chacing. till ſhe gets as far to windward as the ſhip A, ſhe may eaſily intercept her by tacking upon her: this appears, at firſt ſight, as if we ſhould reject this method, becauſe it makes the ſhip B continue on one tack longer than is neceſſary: but ſtill good judges think it ſhould not be entirely rejected, becauſe the ſhip B may thoroughly make up for her loſs of time in continuing on ſo long a-board; for ſhe may then bear down upon the ſhip A as much as ſhe thinks proper, at the ſame time obliging her not to alter her courſe, as was remarked above. 2. The ſhip B will exactly know when ſhe ought to tack upon the chace A, if ſhe calculates the time from her being abreaſt of her till ſhe thinks proper to tack upon her again: for continuing on the ſame length of time, ſhe may be certain ſhe cannot fail of intercepting her.

5. When the admiral would have the whole fleet to chace, or a particular ſquadron only, he will make known the ſame accordingly by hoiſting the uſual ſignal for making ſail, whether his intention be to chace or join ſome ſhips that appear in ſight, or ſtretch out a-head, and make the land. In the firſt caſe, the ſhips ſhould prepare themſelves immediately, that no time may be loſt in wearing or tacking, if occaſion for either. In the ſecond, the headmoſt ſhips ſhould bring to, to ſound, if the coaſt is not thoroughly known to the fleet.

6. The ſquadron that chaces, or the cruiſers detached from the fleet, ſhould be very careful not to engage too far in the chace, for fear of being overpowered; however, not to omit, at the ſame time, thoroughly ſatisfying themſelves with regard to the object of their chace, if poſſible. They muſt pay great attention to the admiral's ſignals at all times, to prevent ſeparation; in order to which, they ſhould collect themſelves before night, eſpecially if there be any appearance of thick or foggy weather coming on; and endeavour to join the fleet again.

7. If the admiral would have the whole fleet to chace, without obſerving any particular form, he will, to avoid confuſion, prepare them accordingly for it by ſignal to look out and watch his motions; to which he will join the general ſignal to chace at large: then the ſhips are immediately to get ready to make ſail, as ſoon as the admiral ſhall think proper to ſignify his orders to chace in any particular quarter, or for any other movement he would have them execute: thus he will be able to inform himſelf (as the ſignal might perhaps be for that purpoſe only) which are the beſt ſailing ſhips, and which the moſt experienced and ſkilful officers in his fleet; all which, with their ſeveral methods of working and ſailing, will give him an opportunity of knowing them more thoroughly, that he may employ them accordingly, whenever the ſervice ſhould require the exertion of their reſpective abilities and experience.

When the admiral would have only a particular ſquadron to chace at pleaſure, he will make a preparatory ſignal for that ſquadron to look out and watch his motions with its diſtinguiſhing flag, and that of chacing at large; but the ſhips are not to begin the chace before the ſignal for the execution of the particular motion is hoiſted at the maſt-head which denotes the ſaid ſquadron.

The

Of Anchoring.

The ſhips are diligently to obſerve when the admiral makes the ſignal to give over chace, that each, regarding the admiral's ſhip as a fixed point, is to work back, or make ſail into her ſtation, to form the order or line again, as expeditiouſly as the nature of the chace and diſtance will permit.

8. After the ſhip has ſignified to the admiral that ſhe expects to come up with the chace, and that, if an enemy, ſhe can attack her to advantage, ſhe muſt be then very attentive to the admiral's ſigns in return, whether of approbation or diſapprobation, which no doubt he will make upon the occaſion, leſt ſhe ſhould unwarily engage too far, and againſt the admiral's orders. On the ſignal of diſapprobation, ſhe muſt abſolutely quit the chace, and return again into the fleet at all events.

9. The ſame ſignal that the admiral makes to give over the engagement, will ſerve at the ſame time for the ſhips to rally or return again to their reſpective ſtations; the commanders of ſquadrons will repeat it, that the ſhips may work properly and with expedition, to form their line as before; each commanding officer with reſpect to the commander in chief, and the reſt of the ſhips with regard to the chiefs of their diviſions or commanders of ſquadrons.

If the action continue till night, the admiral will make the general ſignal for rallying, when each commander of a ſquadron is to make the ſame for his particular ſhips.

Sometimes the ſignal for diſcontinuing the action might regard only a particular part of the fleet, which will be ſignified accordingly by the proper diſtinguiſhing flag of that body or diviſion.

10. *To avoid the chace.* If the ſhip that is chaced be to windward, ſhe muſt keep on the tack on which ſhe finds ſhe gains moſt on the enemy, to keep him at the greateſt diſtance; if to leeward, ſhe will go right before the wind, or more or leſs large, according as ſhe finds either moſt to her advantage, and more agreeable to her particular properties in ſailing or working.

Chap. IV. *Of Anchoring.*

When a fleet comes to an anchor, there are five circumſtances to be conſidered: 1. That the ground be good and holding. 2. That the place be well ſheltered againſt the reigning winds that blow on the coaſt where you anchor. 3. That you may eaſily get under ſail with the ſame wind that may ſerve an enemy, and at the ſame time be able to diſpute the advantage of the wind with them. 4. That you can readily form the line as ſoon as you get under ſail. 5. That the ſhips may have room to keep clear of each other in getting under way: in order to which we ſhould give the ſhips a good birth when we come to anchor, making one or many lines, about three cables length aſunder, and 120 fathom between each ſhip.

Example. It was no doubt by ſuch wiſe precautions that the duke of York ſaved his fleet in Solebay in the year 1672; it was compoſed of 60 Engliſh and 30 French ſhips. His royal highneſs kept the ſea a long time to draw out the Dutch to a deciſive action: but ſeeing they ſtill perſiſted to ſecure themſelves amidſt the banks and ſhoals of their own coaſt, and could not by any means force them to a battle, he took the reſolution of returning to Solebay, to refreſh and recruit his men with proper neceſſaries. Admiral de Ruyter, who commanded the Dutch fleet, thought proper not to let ſlip ſo happy a conjuncture, as he imagined, of ſurpriſing the Engliſh as they lay at an anchor in the road: he accordingly ſet ſail with all his fleet, which was equal to the duke of York's, on the 6th of June, and ſtretched over on the Engliſh coaſt, with the wind at N. E. for Solebay, where he did not doubt but he ſhould meet with the enemy in ſome diſorder and confuſion. But the duke, like an experienced officer, ordered the count d'Etrées, vice-admiral, and afterwards mareſchal of France, who commanded the van, to anchor out in the offing; placing himſelf, with the reſt of his fleet, in ſuch a manner as to enable him to receive the Dutch admiral in a proper poſition, whenever he ſhould be informed of his coming. Upon his appearance, the count d'Etrées formed the line with incredible alertneſs, kept cloſe to the wind, and having ſtretched out the length of the ſquadron of Zealand, commanded by vice-admiral Barker, begun the action the 7th of June at eight in the morning, and fought the enemy with ſuch bravery, that ſeveral of their ſhips were diſabled: he had even made the proper diſpoſition to re-tack, and charge thro' Barker's ſquadron, if the calm which came on had not prevented his glorious deſign. The duke of York was engaged at the ſame time with de Ruyter, whilſt the earl of Sandwich in the rear attacked the Dutch rear-admiral Van Ghent: but the clouds of ſmoke being diſperſed, and the ſhips no longer under command in the calm, the two fleets found themſelves ſo intermixed and embarraſſed with each other, as greatly heightened the horror of the action, and made it the bloodieſt that ever was fought. The gallant earl of Sandwich periſhed with his ſhip, that was ſet on fire by a Dutch fire-ſhip: ſoon after which, his death was revenged by that of the admiral of the Amſterdam ſquadron, and by the loſs of two Dutch line-of-battle ſhips, one of which was taken, and the other ſunk. The duke of York ſhifted his flag twice. In fine, the battle laſted with incredible obſtinacy on both ſides till night, which favoured the retreat of the Dutch: the duke purſued them next day home to their very banks; where, having ſheltered themſelves, they eſcaped a total defeat from the hands of a victorious enemy.

We ſee by the preceding example, how important and neceſſary it is to be always in readineſs to get under ſail to receive an enemy; and we may learn by the following example how dangerous it is to wait for an enemy at anchor.

The mareſchal duke de Vivonne, viceroy of Sicily for the king of France, having intelligence that the enemy, after the engagement off Auguſta, had retired to the port of Palermo, reſolved to go and attack them in the road. He accordingly embarked on board the Sceptre, commanded by M. de Tourville as commodore, who hoiſted an admiral's flag, and arrived the 2d of June 1676 in ſight of Palermo, having 27 ſhips of the line and 25 galleys. He ſent his cruiſers to reconnoitre the poſition of the enemy, who brought him intelligence that they conſiſted of 27 ſhips and 29 galleys; that they lay at anchor in a line, fronting the fort of Caſtel-del-Mar, and under its cannon; and were defended on the right by the grand tower and the

Line of Battle.

the artillery of the ramparts of the city, and on the left by the batteries of the mole. The marquis de Priuli, chef d'efcadre (commodore), was detached with nine fhips and five firefhips, and the chevaliers de Bretevil and Bethormas with feven galleys, to bear down upon the enemy to the left; all which was executed with fo much bravery and refolution, that the vanguard of the enemy were obliged to cut and flip, and run afhore under the batteries of the town; where the firefhips burnt three of their fhips to the water's-edge: the whole was deftroyed by the French with very little lofs.

Chap. V. *Line of Battle.*

I. The ancients, as already obferved, ranged their fhips or galleys fo as to prefent them in front to their enemy; becaufe the machines they then made ufe of were fixed in the heads or prows of their veffels: the fame reafon now prevails with regard to the galleys, (fee the article Galley), which are drawn up in the form of a crefcent or half-moon, whofe ends or horns are oppofed to the enemy; in the middle of which is the admiral, from whence he the more diftinctly obferves the motions of his fleet throughout. The two fleets being thus drawn up, approach each other to a convenient diftance; when the engagement beginning at the ends of the half-moon, they extend themfelves infenfibly till the whole fleet is engaged, and each partakes of the danger and glory of the action. See fig. 4.

Example. The famous battle of Lepanto is the moft remarkable action of this kind that ever happened. It was fought between the Turks and Chriftians in the gulph of Lepanto, the 7th of October 1571. The Chriftian fleet of galleys confifted of 205, large and fmall; the Turks had near 260: both formed two long lines, each inclining towards the end, where they began the engagement. Don John of Auftria, generaliffimo of the Chriftian forces, had placed himfelf in the centre of his fleet, and gave the command of his right wing (van) to the famous admiral Doria, and his left (rear) to Michael Barbarigo. The bafhaw Pertau, general of the Turks, had likewife placed himfelf, together with the bafhaw Ali, in the centre of his fleet: and gave the command of his right wing to the bafhaws of Alexandria, Mehemet and Siroco, and his left to Uluchiali, governor of Algier. The action began at two o'clock in the afternoon; which was firft brought on by rowing towards each other with all their might, accompanied all the time with the moft alarming fhouts and outcries. The left wing of the Chriftians performed wonders: Barbarigo attacked the Turks with fuch incredible fury, that the barbarians could no longer refift the inceffant fire of the Chriftians, but precipitately ran themfelves afhore on the neighbouring coaft, fome plunging into the fea, others leaving their galleys to the bravery and mercy of the conquerors. The defeat was fo general, that the Turks efcaped with only 30 galleys. There perifhed in this day's bloody action 25,000 Turks; 3500 prifoners were taken, and 130 galleys; the Chriftians loft on their fide 10,000 men, and 15 galleys: they might have then deftroyed the whole Ottoman power, had they known how to have made the greateft advantage of fo glorious a victory.

Line of battle.

II. In an engagement of men of war, the fleets are drawn up in a line of battle on two parallel lines upon a wind. The fhips keep clofe to the wind on the line they are formed in, and are commonly at a cable's length diftant one from the other, the firefhips, tranfports, tenders, &c. keeping at half a league's diftance on the oppofite fide of the enemy. Thus the fleets AB, CD, (fig. 5.) that are engaged, are ranged under an eafy fail with their larboard tacks on board; and the firefhips EE of the fleet AB are to windward, the firefhips FF are to leeward of their fleet CD.

Plate CXCVII.

Example. This form was obferved, for the firft time, in the famous battle of the Texel, where the duke of York defeated the Dutch on the 13th of June 1665.

We, as well as the French, owe the entire perfection of this order to his royal highnefs. The Englifh fleet confifted of 100 fhips of the line; that of Holland was more numerous, though not in three-deck fhips: the two fleets found themfelves nigh each other early in the morning, the wind being at S. W. they ranging themfelves in two lines at S. S. E. each extending itfelf about five leagues in length, the Englifh having the advantage of the wind. The duke of York, commander in chief of the Englifh fleet, had placed himfelf in the centre, and gave the command of the van-guard to prince Rupert, and the rear to lord Sandwich. The Dutch admiral Opdam had oppofed himfelf in the centre of his fleet to the duke of York, and vice-admiral Tromp againft prince Rupert. They cannonaded each other from 3 o'clock in the morning till 11, with great fury and intrepidity, the victory ftill declaring for neither fide. The Dutch took one Englifh fhip, which too rafhly attempted to force through their line: but they falling off to S. E. found the Englifh fire greatly annoyed them. About 11 o'clock the duke of York bore down with his whole line upon the enemy, he himfelf bearing down at the fame time upon Opdam: this difpofition and refolution of his royal highnefs elevated the courage and fpirit of both parties to an almoft invincible obftinacy. The terrible roaring of the cannon, wrecks of fhips, fall of mafts, together with a thick fmoke intermixed with flafhes of fire from the fhips that blew up, heightened the horror of this action beyond the power of imagination. It is related of admiral Opdam, that, amidft all this fcene of carnage and deftruction, he fat with the greateft compofure on his poop, viewing, and giving orders to repair as much as poffible the damage and diforder he fuftained from the duke of York; animating his men all the time both by his words and actions. At two o'clock in the afternoon, his royal highnefs made the fignal for the whole line to bear down together upon the enemy; which obliged the Dutch to alter their difpofition of keeping clofe to the wind any longer. Opdam only, with one of his fhips, called the *Prince of Orange*, of three decks, ftill kept his ftation; but foon after, Opdam having received a whole broadfide from the duke of York, his fhip blew up, without its being ever known by what accident, though five of the men were faved. The Dutch, having already loft many of their fhips, and feeing their admiral blow up, put before the wind for the Texel; the duke of York purfuing them with great refolution and bravery to the

A Fleet to Windward.

the very entrance of their port: he took, burnt, and deftroyed, 22 fhips of the line, 20 of which were from 50 to 80 guns; and gained over them the moft glorious victory that was ever obtained at fea. The whole action coft him but one man of war, with the lofs of 300 or 400 men.

III. Before we enter into action, or form the line of battle, we muft confider firft the advantages or difadvantages of being to windward or to leeward.

Advantages of being to Windward.

1. The fleet to windward can edge down to the enemy, when and as near as it fhall think convenient: confequently regulates the time and diftance moft advantageous to come to action.

Plate CXCVII. fig. 6.

2. If the fleet to windward is more in number, it may eafily detach fome fhips to fend after the rear of the enemy, which muft undoubtedly throw them into confufion. Thus, the fleet AB being more in number than the fleet CD, may eafily detach the fhips EF to double upon the rear D, which cannot long refift fuch fuperior fire; therefore muft give them an opportunity (with the reft of the fhips that will of courfe join them) to range along the whole length of the enemy's line. This is an advantage the fleet to leeward cannot have, let it be ever fo numerous; for the rear of its line will be in a manner ufelefs.

Example. The advantage of the wind could never be more favourable than it was in an action off Agufta, the 22d of April 1676, when the combined fleets of Spain and Holland avoided a total defeat by having the advantage of the wind. The French fleet, commanded by Monf. Du Quefne, confifted of 27 fhips of the line. The marquis of Almira, lieutenant-general, commanded the van-guard; and Monf. Gabare, chef d'efcadre (commodore), the rear. The enemy's fleet confifted of about the fame number of fhips, but had befides 9 galleys; De Ruyter commanded the van-guard, the Spanifh admiral was in the centre, and the Dutch vice-admiral commanded the rear. The two fleets met off Agufta early in the morning; but the enemy kept their wind till 4 o'clock in the afternoon, when de Ruyter bore down upon the French rear in good order, where they received him in the fame manner with equal intrepidity: there were many fhips difabled on both fides. The marquis d'Almira was carried off by a cannon-ball, and de Ruyter was mortally wounded. Thefe two accidents caufed fome diforder in the van of the fleet; but the chevalier de Vallballe, chef d'efcadre, fupplying the place of the marquis d'Almira, behaved fo remarkably gallant, that he was juft upon the point of taking and deftroying a part of the enemy's fleet, had not their galleys moft opportunely taken their difabled fhips in tow, and faved them from falling into his hands. The action began later in the centre, and had fcarcely reached the rear guard: the enemy having the wind, had availed themfelves fo well of that advantage, that they continued the engagement no longer than was neceffary to fave their honour; waiting for the approaching night to retire from the purfuit of the victors.

3. If any of the fhips of the fleet to leeward fhould be difabled, whether in the van or rear, or even in the centre, the fleet to windward may with the greater eafe fend down their fire-fhips upon them, or fend a detachment after any part of the flying enemy.

A Fleet to Leeward.

4. We muft likewife attribute, amidft other advantages of being to windward, that of being fooner freed from the inconvenience of the fmoke of the enemy as well as of our own. 1. The wind repelling back again the fmoke of the cannon into the fhip, fo greatly incommodes thofe quartered at the guns, as totally to deprive them for fome time of the fight of the enemy. 2. The fame fmoke muft likewife much embarrafs the failors in working the fhip; as it is often found by experience, that the fails and rigging are fet on fire by the combuftible matter and fiery particles incorporated with the fmoke; befides many other fatal accidents incident to fhips in that unhappy fituation.

Advantages of being to Leeward.

It muft be acknowledged, that a fleet to leeward has likewife great advantages; and there are who maintain, that the advantage of being to leeward is at leaft equal to that of being to windward. But when they confider all circumftances more attentively, they will find the advantage of being to windward the greateft a fleet can poffibly have, whether fuperior or inferior to the enemy: though we muft allow at the fame time, that, on fome extraordinary occafions, it may be more adviseable to get to leeward if we can, that is, when it blows hard, and the fea runs fo high, that the weather fleet cannot open its lower tier, when obliged to engage a greater number of fhips, or in an action between two fingle fhips. But ftill, in an engagement between two fleets, in moderate, proper weather for engaging, that which has the weather-gage has greatly the advantage.

1. The fleet to leeward fire to windward, and confequently the fhips may make ufe of their lower tier, without being under any apprehenfions that a fudden fquall of wind fhould overpower them, by the water rufhing in irrefiftably between decks: an advantage (in fome meafure) the Englifh fleet under Sir Edward Hawke, had over the French fleet commanded by Monf. Conflans, in that ever-glorious and memorable action off Belleifle, the 20th of November 1759, where they fatally experienced the difference of our fuperior fkill, undaunted refolution, and feamanfhip. This circumftance is certainly the greateft advantage a fleet to leeward can have, efpecially when it blows hard, with a great fea. One can hardly conceive the confufion and diforder fudden gufts of wind occafion between the men between decks, when the waves come pouring in, and lay a fhip upon her broad-fide, fo as often to endanger her overfetting, or going to the bottom before the ports can be fecured.

2. The fleet to leeward can eafier cover any of their fhips that fhould be difabled in action, which muft greatly embarrafs the fleet to windward to effect, without running the rifk of being deftroyed by the enemy in attempting it; however, thefe are difafters which both are equally fubject to.

3. The fleet to leeward may eafier make a retreat if beaten; whereas the fleet to windward cannot fo well efcape, without being reduced to the neceffity of forcing its way through the enemy's line, which muft be attended with the moft fatal confequences.

It muft be acknowledged, that a fleet which puts

A Fleet to Leeward. before the wind runs a great risk, if the enemy is in a condition to pursue it: but then there are some circumstances wherein the fleet to leeward may boldly venture to crowd away before the wind; that is to say, when night approaches, the wind freshens, the sea rises, or the enemy is embarrassed with a convoy, which may prevent their pursuing them.

Example. The allies availed themselves of these advantages, in the year 1689, off Bantry. The count de Chateau-Renaud commanded the French fleet of 24 ships of the line, and convoyed 3000 men to Ireland, with a great quantity of stores, provisions, and ammunition. My lord Herbert, who commanded a squadron of much the same force, having intelligence that the French landed their troops in Bantry-bay, resolved to go and attack them there, not doubting but he should find them in some disorder: but the count had taken his measures so prudently, and was so well prepared, that he advanced in good order to receive the English, and attacked them with so much bravery, that he soon obliged them to crowd away all the sail they could make before the wind; pursuing them till night put an end to the chace: and the count, having thus happily landed his troops, returned to Brest, where he received the just applauses due to his successful expedition; having in eleven days carried succours into Ireland, beat the enemy, took a considerable convoy, and reconducted back again his fleet to Brest in good order and condition.

IV. But to return to the explanation of the line of battle: We have already observed, that fleets in action ought to be ranged on two parallel lines; for, if formed otherwise, by inclining in the van and rear, the headmost and sternmost ships will be engaged, whilst the ships in the centre will be out of the reach of each other's guns: a consequence too obvious to need any demonstration.

The ships ought to keep at a cable's length from each other, or closer, if judged convenient or necessary: otherwise, if too far asunder, one ship of such line will be exposed to the fire of two ships at a time, from the closer and more regular line of the enemy.

The size of the ships is likewise too important a point not to be properly considered in a line of battle, as it contributes more to its strength than the number of the fleet; for two reasons. 1. A large ship carries more guns, and heavier metal: so that a fleet consisting of such ships is of greater force than a more numerous fleet of smaller ships, though drawn up in a closer line; because they engage the enemy with more, as well as heavier artillery, in the same space. 2. The great ships are stronger timbered, and consequently better able to resist the shot of the enemy; therefore of greater service in action than a fleet of smaller ships, notwithstanding the advantage of a closer line; because that each ship of the former is attacked only by a less number of guns of the latter that can do her any damage.

Plate CXCVIII. fig. 7. V. *To form a line of battle from the order of retreat.* Suppose the fleet AGF in a retreating form, to change it into a line of battle, the headmost ship A must haul up upon a wind, and the rest of the fleet, running large four points on the same tack, will form itself in her wake, or the line IH. To dispute the Wind.

This evolution is so regular, so simple, and short, that it makes this order of retreat preferable to any other; for a fleet that retreats may be often obliged to come to action: it would be then greatly embarrassed, if it could not immediately resume the line again by so easy and regular a method as this. In effect, by way of illustration, let us suppose, that the enemy LLM press the fleet so close in its pursuit, as to force it to come to an engagement; then the ships that were sailing large, haul upon a wind all together, as soon as possible, on the larboard tack, the head A hauling up at the same time. This manœuvre (method of working) can cause no confusion in the fleet: on the contrary, it then presents its sides with greater advantage to the enemy; and the ships that range themselves upon a wind in the wake of the ship A, will force between two fires the enemy's ships M.

We suppose that the enemy attack only one side; for they will find it difficult in effect to attack both, without running the risk at the same time of being separated: but admit that the enemy did attack on both sides, you may still perform the evolution equally the same; and the ships GF would present their sides to the enemy, as well as when they were sailing large or before the wind.

Chap. VI. *Some necessary Manœuvres before an Engagement.*

§ 1. *To dispute the Wind with the Enemy.*

1. The fleet to leeward should avoid extending itself the length of the enemy's line, in order to oblige them to edge down upon theirs, if they intend to attack them; which will be a means, if they still persist in doing so, of losing the advantage of the wind.

It is impossible for a fleet to leeward to gain to windward so long as the enemy keep their wind, without a change happens in their favour. Therefore all that a fleet to leeward can do, must be to wait with patience for such a happy change, which they will undoubtedly avail themselves of, as well as any mistake or inadvertency the enemy may commit in the mean time. And as long as the fleet to leeward does not extend its line the length of the enemy's, it will be impossible for the latter to bring them to action, without running the hazard, by bearing down, of losing the advantage of the wind, which both fleets will be so desirous of preserving.

2. In fine, that an admiral may benefit by the shifts of wind that frequently happen, he must in a manner foresee them; which will not appear so extraordinary to officers of any experience, who know what winds reign most on the coast, or off the head-lands where they may expect an enemy: and though an admiral may be sometimes out in his conjecture, he also as often succeeds so happily as to gain the advantage of his enemy.

Monf. du Quesne, the French admiral, by his superior skill in these particulars, gained a considerable advantage over the Dutch fleet, when he engaged them off Strombolo in the year 1676. He waited till the next day for a shift of wind; which happened in his favour as he foresaw, and gave him an opportuni-

ty

To avoid or force an Action.

ty of tacking to windward of the enemy, and bearing down upon them in good order: an advantage they neglected the day before; which fatal overſight they could never afterwards recover.

3. The diſpoſition or projecting of head-lands, of currents in the Mediterranean, and tides in the ocean, contribute greatly towards gaining the wind of the enemy: for ſometimes you may only range a coaſt along, or keep out in the offing, to gain a few leagues upon a tack; and we may ſay, we think with juſtice, that the knowledge of theſe advantages is as eſſential to an admiral at ſea, as the geography of the ſeveral countries, with their woods, roads, courſe of rivers, &c. he is obliged to march through, is to a general of an army on ſhore.

4. The fleet to windward ought to keep the enemy as much as poſſible always a breaſt of it; becauſe, by doing ſo, they will preſerve the advantage they may have, unleſs the wind greatly changes againſt them. They ſhould force them likewiſe to keep their wind, unleſs they think it more prudent not to engage; but when that is the caſe, they ſhould keep entirely out of ſight of the enemy.

§ 2. *To avoid an Action.*

1. The fleet to windward can never be forced to engage; becauſe it can always continue on that tack, which keeps the enemy at the greateſt diſtance from it, by ſtretching out upon one tack whilſt they continue upon the other.

If the wind was not ſo ſubject to change, it would be very eaſy for the fleet to windward to keep in ſight of the enemy, without being under any apprehenſions of being forced to come to action; but the inconſtancy of the wind obliges the moſt experienced admirals to avoid meeting the enemy, when they think it improper to engage them. The reaſon of this maxim is founded upon the impoſſibility of an inferior fleet's avoiding an action, when in preſence for any time of a ſuperior fleet.

2. If the fleet that endeavours to avoid coming to action be to leeward, they will edge away the ſame as the enemy; but, at the ſame time, they ſhould not go away right afore the wind, without making their retreat in a half-moon, if in ſight of the enemy. So that the fleet to leeward, which is not for engaging, ſeeing the enemy ſtill perſiſt in chacing them, will bear away as they do, in order to keep them at the ſame diſtance.

There are ſome circumſtances in which the fleet to leeward may put afore the wind, without ranging it into the order of a retreat; that is, when it only deſigns to prolong the engagement, or is reſolved to engage the enemy, if they ſtill continue to purſue them to bring them to action. But, except on ſuch extraordinary occaſions, the form of a retreat puts the fleet into the beſt poſture of defence, and with the leaſt hazard and danger.

§ 3. *To force the Enemy to Action.*

Axiom I. We may look upon it as a general maxim: "When two fleets of equal force remain long in ſight, they may alternately force each other to bring on an action." The following reaſons ſupport this maxim.

To double an Enemy.

If the fleet that wants to bring on an engagement is to leeward, they muſt endeavour to keep on that tack which forereaches moſt upon the enemy, that they may keep them better in view, till the wind may happen to change in their favour.

The leaſt experience at ſea will ſerve to convince us, that it is almoſt impoſſible for a fleet that once diſcovers itſelf to the enemy, ever to retire or eſcape, unleſs it ſecures itſelf in ſome port or harbour; for fleets are generally at ſea at a ſeaſon of the year when the nights are very ſhort, and the days long; ſo that any ſtratagems or falſe courſes they may uſe, will avail them but little to eſcape the purſuit of a watchful enemy: beſides, a fleet would not run the hazard of crowding too much ſail by night, for fear of being ſeparated, which may be attended with fatal conſequences. A recent example of ſuch conduct happened with Monſ. de la Clue in 1759, who, by crowding away too much ſail at night, to puſh through the gut of Gibraltar with a ſtrong eaſterly wind, before morning loſt ſight of half his fleet, and ſubjected himſelf of courſe, by ſuch imprudence, to fall much the eaſier victim to admiral Boſcawen, who was in cloſe purſuit of him with his whole ſquadron, and engaged him the next day with a ſuperior force; which obliged the French admiral to make a running fight, tho' it availed him but little, as five out of his ſquadron were burnt or taken on the coaſt of Portugal.

Axiom II. It is ſcarcely poſſible for a much inferior fleet to remain long in preſence of an enemy, without being forced to an action. 1. A fleet that is ſuperior in number may ſend a detachment of its beſt cruiſers after the flying ſquadron, and ſoon bring it to action. 2. It may divide itſelf into three ſquadrons, leaving a conſiderable interval between each; then, whatever courſe the enemy may take to eſcape, one or other will be always ready to intercept it.

The only reſource an inferior ſquadron can have in ſuch circumſtances is, to bear away in the form of a half-moon: though even then, it can have no great hopes of avoiding an engagement, if the enemy perſiſts in chacing it to bring it to action, unleſs they ſteer for ſome harbour or friendly aſylum to ſecure themſelves in.

Corollary. We may from all this draw the following concluſive inference, that it is almoſt impoſſible for an inferior fleet, under any pretext whatever, to continue long in the preſence of one greatly ſuperior to it, without being forced to action.

§ 4. *To double an Enemy.*

To facilitate this, the ſuperior fleet muſt endeavour to ſtretch out the length of the enemy's line, and at the ſame time, leaving ſhips a-ſtern, to cloſe and double upon that of the enemy's, and force them between two fires.

1. If the ſuperior fleet is to windward, it may ſo much the eaſier double its rear upon that of the enemy's, and force it between two fires; and even if it ſhould be to leeward, it ſhould likewiſe leave ſome ſhips a-ſtern of it, becauſe of the wind's often changing during the action; beſides, the fleet to leeward may inſenſibly edge away in the heat of the engagement, to give its rear an opportunity of doubling upon the enemy, by immediately luffing up cloſe to the

 wind

To avoid being doubled.

wind again.

2. There are who maintain, that the enemy's line ſhould be doubled a-head rather than a-ſtern: becauſe, ſay they, if the enemy's van is once put into diſorder, it will of courſe fall a-ſtern upon the reſt of the line, and throw it into confuſion. But, on the contrary, it ſeems plain, that the ſhips will be leſs expoſed, and find it ſafer to double upon the enemy's line a-ſtern: for if a ſhip ſhould be diſabled a-head, it does not appear how ſhe can recover her own line again; whereas if a ſhip ſhould be diſmaſted in attempting the ſame in the enemy's rear, ſhe cannot be attacked by any of their line, without expoſing themſelves at the ſame time to the fire of two ſhips; therefore may remain a-ſtern out of danger, till ſhe has repaired her damages again.

Plate CXCIX. fig. 8.

Fig. 9.

3. It ſeems equally clear, that if the ſhips E, M, of the fleet CD, had doubled the head A, they would run a great hazard of being deſtroyed: for if the ſhip E ſhould be diſabled, how can ſhe recover her own line again? how eaſy might the enemy deſtroy her? On the contrary, if the ſhips LN, of the fleet FG, have doubled the rear I of the enemy, and the ſhip L ſhould be diſabled, ſhe may remain a-ſtern, without being under any apprehenſion from the rear I, which is already hard preſſed by the ſhips G, N.

Nothing can illuſtrate this method of working a fleet better than the famous engagement off la Hogue in the year 1692, between the count de Tourville and admiral Ruſſel. The French, having the wind, bore down in good order upon the Engliſh: but, being at the ſame time ſo much inferior in number, it was impoſſible for them to extend their line the length of the enemy's; therefore could not prevent the Engliſh from extending their rear a great way a-ſtern of the French, which made their line ſo much the longer in attempting it, and conſequently the ſhips wider aſunder, (a great diſadvantage againſt a cloſe line): The wind, which was at firſt S. W. changing to the N. W. gave the rear of the Engliſh an opportunity of ſtill cloſing its line more, and doubling upon the French; ſo that the count de Tourville with his diviſion ſoon found himſelf ſurrounded by his enemies on all ſides; in which unlucky ſituation he diſtinguiſhed himſelf with the greateſt bravery and reſolution imaginable, tho' overpowered by numbers, whoſe great ſuperiority of force could be no longer reſiſted.

§ 5. *To avoid being doubled.*

To prevent any of the enemy's line from doubling upon your's, you muſt not ſuffer them to extend any of their ſhips beyond your rear; in order to which, there are ſeveral methods to be taken when your fleet is inferior in number.

Fig. 10.

1. If you are to windward, you need not extend your line the length of the enemy's van, but attack their ſecond diviſion F with your van A; by which means their firſt diviſion FG will be in a manner uſeleſs; and if they ſhould ſtretch out a-head to tack upon you, they will loſe too much time, and run the riſk of being ſeparated by the calm which generally happens in the courſe of a ſea-engagement, occaſioned by the continual diſcharge of cannon on both ſides; you may even leave a great opening in the centre E, provided you take the neceſſary precautions to prevent your van-guard from being cut off: and thus, however inferior you may be in number, you will have it in your power to interrupt the enemy's line from extending itſelf beyond, or a-ſtern of, your rear.

To avoid being doubled.

Example. Admiral Herbert's method of ranging his fleet, when he engaged the French off Beachyhead, in the year 1690, was generally approved of. He had ſome few ſhips leſs than the enemy, and was reſolved to uſe his utmoſt efforts againſt their rear; to effect which, he ordered the firſt diviſion of the Dutch to bear down upon the ſecond diviſion of the French, at the ſame time opening his fleet in the centre, leaving a great ſpace a-breaſt of the main body of the enemy. He then cloſes his rear, which he oppoſes to theirs, keeping himſelf with his diviſion at ſome diſtance a-breaſt of the centre: then cloſing his ſhips as much as poſſible, he oppoſes them to the enemy's rear, at the ſame time reſerving his own diviſion to attack the French, if they ſhould attempt to puſh through the opening in the middle, in order to double upon the Dutch. By this method (which ſhewed great forethought and experience) he rendered the enemy's firſt diviſion almoſt uſeleſs, becauſe of its being obliged to ſtretch out a long way a-head to tack upon his van: and the calm which afterwards came on had in a great meaſure deprived it of partaking of the danger and glory of the action.

2. If the inferior fleet is to leeward, you might leave a greater interval in the centre and leſs in the van; but then you ſhould have a ſmall corps de reſerve of capital ſhips and fire-ſhips, that the enemy may not take the advantage of the intervals in your fleet to cut off your line.

3. There are ſome again for giving it as a general rule, that the commanding officers of the inferior fleet ſhould oppoſe themſelves to the reſpective general officers of the enemy; by this means ſeveral of their ſhips will remain uſeleſs in the intervals, and will be rendered incapable of doubling upon you.

This method has its inconveniencies, becauſe the van and rear of each diviſion is expoſed to the fire of two ſhips at a time, and does not ſecure the laſt diviſion from the hazard of being doubled by the enemy's rear; but, to remedy this, you may place the larger ſhips in the van and rear of each diviſion, and order it ſo that the laſt diviſion may not have it in its power to extend its rear a-ſtern of yours.

4. Again, others will have it, that the three ſquadrons of the inferior fleet ſhould attack each a ſquadron of the ſuperior fleet; obſerving at the ſame time, that each ſquadron extends its line far enough to prevent the oppoſite line from leaving any ſhips a-ſtern of it, but rather a-head.

5. In fine, there are who rather chooſe, that the inferior fleet ſhould ſtretch its line ſo long, as to leave a great diſtance between the ſhips, that it may extend its line the length of the enemy's. But this ſeems to be the worſt method that can be taken; becauſe it gives the enemy's fleet all the advantage it can deſire of exerting its whole force upon the inferior line: tho' it muſt be allowed, upon certain occaſions, this method would be very proper to follow; ſuch as, when the enemy's ſhips, though more in number, are not of ſuch force and weight of metal as the ſhips of the inferior fleet.

§ 6.

Fig. 11.

Fig. 12.

Fig. 13.

A.Bell S.

To force the enemy's Line.

§ 6 *To receive a Fleet that bears down upon you.*

The fleet to leeward feeing the enemy bear down upon it, will of courfe range itfelf, as expeditioufly as poffible, into a line of battle, by edging away a little, to gain as much time as may be neceffary to form the line without confufion. They fhould not omit at the fame time leaving fome fmall intervals between the divifions, that the fleet may be the better able to diftinguifh, and have more room for action: then each commander will exert his utmoft to keep his fhip a-breaft of any fhip of the enemy's that happens to fall to his lot; either by making more or lefs fail, or even tacking, (if abfolutely neceffary), to preferve his ftation with regard to the enemy.

§ 7. *To force through the Enemy's Line.*

1. We find in the feveral relations of the wars between the Englifh and Dutch, that they had often alternately traverfed and charged through each other's fleets; that is to fay, the fleet to leeward CHD, having ftretched out a little a-head, tacked upon the enemy AB, and forced through their line at E, then re-tacking upon them immediately at C, on the other fide, gained the wind of them; but then again, the others, in their turn, regained the fame advantage of them, and cut them off from their line. Thus they mutually traverfed each other, cutting off and deftroying one another's fhip's, with an invincible obftinacy and bravery not to be defcribed.

Plate CC. fig. 11.

This manner of fighting and working a fleet is equally daring and hazardous, and requires the moft confummate ability as well as experience to fucceed in it fo happily as the count d'Etrécs did in an engagement with the Dutch in the Texel in the year 1673. He traverfed and charged through the fquadron of Zealand, gained the wind of them, and threw them into fuch diforder, that the victory, which was before doubtful, now manifeftly declared in his favour.

2. It fhould feem eafy for the fleet to windward to hinder the enemy to leeward from forcing through their line; which, whenever they attempted, the other fleet may tack at the fame time all together, and thereby effectually prevent them from fucceeding.

3. It does not therefore appear why we fhould be under any apprehenfion from a fleet that attempts to force through our line. It even feems that it fhould never be put in practice but in the following circumftances: Such as being fometimes obliged to it, to avoid a greater evil; if the enemy fhould leave a great opening in the centre, and render part of your fleet ufelefs; or if a number of fhips fhould be difabled, &c.

4. You are fometimes obliged to traverfe the enemy's line to difengage fome of your own fhips which may happen to be cut off; in that cafe, you muft boldly rifk fomething, at the fame time not forget the neceffary precautions. 1. To clofe your fhips as much as poffible. 2. To make all the fail you can, without waiting to attack the enemy as you force through their line. 3. As foon as you have got through, you fhould tack again without lofs of time, left the enemy fhould ftand on upon the fame tack with the fhips that had broke through their line.

Admiral de Ruyter put this fort of traverfes in practice to the greateft advantage, when he beat the Englifh fleet under general Monk in the year 1666, three days fucceffively, on the north of England.

Of a General Action.

Chap. VII. *Of a general Action between two Fleets.*

§ 1. *General Obfervations.*

The engagement will not begin before the admiral makes the fignal, unlefs an action is infenfibly brought on by fome unavoidable circumftances in the line or pofition of the van or rear of both fleets, in forming or approaching each other: the admiral, in fuch cafe, will make the proper fignal for the van or rear, by the diftinguifhing flag of either of thefe divifions; which will undoubtedly regulate the neceffary manœuvres of the reft of the fleet through the whole line.

The admiral in action carries but little fail: in which, however, he muft conduct himfelf by the motions of the enemy; the fhips always obferving to keep clofe in the line; and wherever they do not, the fhips which immediately follow, fhould pay no regard to thofe that precede them, if they fhould unguardedly leave too great an opening from the reft, unlefs ordered fo to do by fignal from the admiral.

The fhips ought to be particularly careful not to fire till they find themfelves nigh enough for the line to do effectual execution; otherwife it will be but expending a quantity of ammunition to very little purpofe. They ought principally to level well their guns, without that hurry or confufion too often practifed in firing broadfides; and from which fo little advantage in general is derived, to anfwer the end propofed, that of defeating the enemy, which may be much fooner accomplifhed by a more regular and fteady fire, conftantly kept up without intermiffion, the better to embarrafs their line, and divert their attention, more than broad-fide and broad-fide, with fome intervals between (as muft naturally happen), will ever effect. We ought to be convinced of this general truth, That of all actions, a fea-fight (except in the article of boarding) fhould be conducted with the leaft hurry or precipitation in order to fucceed.

A captain muft not quit his poft in the line upon any pretence whatever, unlefs his fhip fhould be fo greatly incommoded as to render her incapable of continuing the action: the little fail a fleet is under at fuch time, in general, may give the fhips, though damaged in their rigging, &c. time enough to repair their defects, without caufing an unneceffary interruption in the line, by withdrawing out of action, when their fervice might perhaps be of the utmoft importance to the reft of the fleet.

A captain, through too impetuous a defire of diftinguifhing himfelf, ought never to break the order of the line, however inviting the advantage of an attack might then appear to him to fecure fuccefs: he muft wait with patience the fignal from the admiral or commanding officer of his divifion, becaufe it is always more effential to preferve and fupport a clofe line in action, as it conftitutes the principal ftrength of a fleet in general, than to attend to a particular attack between two fhips, which commonly decides but little with regard to the whole, however glorious in appearance, unlefs with a view at the fame time of taking or deftroying a flag-fhip of the enemy's, and where fuccefs alone, even then, can juftify the attempt.

The

Of a Detachment.

The two immediate seconds to the admiral ought to direct part of their fire against the enemy's flag-ſhip, or any other that may attack their admiral; ſo that their chief attention ſhould be employed more in his defence, than in that of their own proper ſhips, as they muſt ſacrifice every other conſideration to the honour of their flag.

The ſame attention muſt likewiſe be paid to any other ſhip that may find herſelf engaged with one of the enemy's flag-ſhips; the next to her a-head and a-ſtern ſhould ſerve in that reſpect as ſeconds, by dividing part of their fire againſt ſuch flag-officer, in order to make him ſtrike the ſooner.

If any flag-officer ſtand in need of being ſuccoured, he will of courſe make a ſignal for the corps-de-reſerve; or if there ſhould be none, he will ſignify the ſame to his diviſion; on which his two ſeconds, with thoſe nigheſt him, will cloſe in to cover him, and continue on the action: the frigates of his ſquadron will likewiſe be ready to give him the neceſſary aſſiſtance; and, if he ſhould ſtill continue the attack, he will be in a particular manner ſupported by his whole diviſion.

Thoſe ſhips that happen to be moſt expoſed to danger, will naturally make the ordinary ſignals upon the occaſion, if they ſhould receive any hurt or damage, in order to be ſupported by ſuch in the line as are within reach of them.

§ 2. *To detach from the Line a Corps-de-reſerve.*

When a fleet is ſo far ſuperior in number as to be able to extend itſelf both a-head and a-ſtern conſiderably beyond the enemy's line, if then the admiral ſhould think it expedient, that ſuch ſhips as may not be a-breaſt of the enemy, ſhould detach themſelves from the line, and form to windward or to leeward into a body of reſerve; thoſe of the ſecond diviſion of the van-guard, or thoſe of the ſecond in the rear, will immediately detach themſelves from the body of the fleet, after the repetition of the ſignal from the commanding officers of their diviſions, and place themſelves in a line with the frigates nigheſt a-breaſt of the centre of the fleet, if to windward; or if to leeward, ſomewhat a-head of the ſame; being careful at the ſame time to keep within reach of obſerving diſtinctly all the ſignals and motions of the fleet, to be the readier at hand to re-place ſuch of the ſhips as may happen to be diſmaſted or drove out of the line, where all intervals muſt be properly ſtrengthened and carefully filled up again without loſs of time.

The oldeſt captain, after the ſenior officer who commands the reſerve, ought to relieve the firſt, or cloſe that part of the line where the diſabled ſhip has been obliged to quit; and ſo on ſucceſſively of the reſt.

The commanding officer of the body of reſerve will not be detached with the whole corps, unleſs on ſome preſſing occaſion to fortify the line, where ſuch reinforcement is immediately neceſſary; if to defend one of the flag-officers of the three ſquadrons, he will be followed by the next ſenior officer of the reſerve, who was not before detached, in order to place themſelves as ſeconds, the firſt a-head and the other a-ſtern of the flag they are to ſupport, without any diminution of the honour of his own proper ſeconds at the ſame time, as they are only called in thro' neceſſity on that emergency, being not engaged before, and conſequently better able to aſſiſt and ſupport the admiral; their duty being likewiſe to exert their utmoſt efforts in attacking or boarding (if poſſible) the enemy's flag-ſhip to force him to yield, except they are particularly ordered off to ſome other quarter or part of the line.

Of Boarding.

The admiral will ſometimes order the whole body of reſerve to reinforce one of the three ſquadrons of the fleet, as he may ſee occaſion; which when he does, the corps muſt make all the ſail it can, that each ſhip may place herſelf, ſucceſſively, the firſt in the firſt interval, the ſecond in the ſecond, and ſo on throughout; but if the admiral ſhould want only part of that body, he will make the ſignal accordingly.

If the admiral, commanding an equal or ſuperior number of ſhips to the enemy, ſhould judge it neceſſary to have a ſmall reſerve of one or two ſhips for each of the three ſquadrons of the fleet, the ſhips for that purpoſe in each of the three bodies are made known by ſignal for the reſerve; they will immediately draw out of the line upon hoiſting the ſame, and form themſelves on the line with the frigates, at a convenient diſtance from their commanding officer: that is to ſay, the firſt a-breaſt, and under cover of the headmoſt ſecond; and the other a-breaſt, and under cover of the admiral, to be in readineſs to run in between him and one of his ſeconds, to enable him the better to continue on the action with freſh vigour, and preſs the enemy with unremitting ardour to ſtrike as ſoon as poſſible.

The corps-de-reſerve is generally formed at the ſame time with the line, to prevent any irregularity that may happen on leaving any intervals or openings; tho' the admiral may, if he thinks proper, draw ſhips out of the line during the action, to form a body of reſerve, according to the time or circumſtances of his ſituation, &c.

When the admiral finds he has no further occaſion for his body of reſerve, he will make proper ſignals for ſuch ſhips to reſume their reſpective poſts in the line again; the corps-de-reſerve will always repeat the ſignals which regard themſelves particularly.

§ 3. *Of Boarding.*

When the admiral ſhall judge it neceſſary or convenient to prepare the fleet for action, he will make the ſignal proper for the occaſion, and the fleet will at the ſame time make the neceſſary diſpoſition for boarding. If the admiral deſign to board any of the enemy's ſhips, he will undoubtedly make the proper ſignal for the whole fleet, a particular ſquadron, or, in fine, for a particular ſhip, by the different poſition of the ſignal, and the diſtinguiſhing mark of ſuch ſquadron or diviſion, or particular pennant of ſuch ſhip.

If any captain in the fleet think he can board with ſucceſs one of the enemy's ſhips, he will ſignify the ſame to the admiral by hoiſting the boarding flag, together with his particular pendant, to be more plainly diſtinguiſhed; the admiral, in return, will make the proper ſignal of approbation, or otherwiſe, if he diſapprove the attempt, by letting fly at the ſame time that ſhip's particular pennant, that ſhe may obſerve the ſignal the better.

When a captain ſeems to expreſs an ardent deſire of diſtinguiſhing himſelf by boarding one of the enemy's ſhips, he ought to conſider well the ill conſequences that

that might perhaps attend ſuch enterpriſe, if he fail of ſucceſs; for the breaking the order or diſpoſition of the line, by quitting his poſt, may be of much greater diſadvantage to the whole, than any advantage ariſing from his victory, except that over a flag-ſhip.

§ 4. *The Fire-ſhips to prepare.*

When the admiral makes the ſignal for his fleet to prepare for action, the fire-ſhips will at the ſame time get ready their grappling-irons, fire-engines, &c. for boarding, and will likewiſe diſpoſe all their combuſtibles into their proper channels of communication, &c. as ſoon as poſſible after the action begins: all which, when ready, they will take care to make known by ſignal to the particular diviſion or ſquadron they belong to, and they of courſe will repeat the ſame to the admirals.

The fire-ſhips muſt be particularly careful in placing themſelves out of the reach of enemy's guns, which they may do a-breaſt, and under ſhelter of their own ſhips in the line, and not in the openings between the ſhips, unleſs to prevent any of the enemy's ſhips that ſhould attempt to force through their line; when they muſt, in ſuch caſe, uſe their utmoſt efforts to prevent them. They ought always to be very attentive to the admiral's ſignals, as well as thoſe of the commanding officer of the particular ſquadrons they belong to, that they may loſe no time when the ſignal is made for them to act, which they muſt quickly anſwer by a ſignal in return.

Although no ſhip in the line might be particularly appointed to lead down or protect the fire-ſhips, beſides the frigates already ordered by eſpecial appointment to attend that ſervice; yet notwithſtanding, the ſhip a-head of which the fire-ſhip paſſes in her way to the enemy is to eſcort her, whatever diviſion ſhe may belong to, and muſt aſſiſt her with a boat well-manned and armed, as well as any other ſuccour ſhe may ſtand in need of: the two next ſhips to her muſt likewiſe give her all neceſſary aſſiſtance. The captain of a fire-ſhip is to conſider, in ſhort, that he is anſwerable for the event, in proportion as he expects to be honourably rewarded, if he ſucceed in ſo daring and hazardous an enterpriſe.

§ 5. *Particular Deſcription of the Oeconomy of a naval Engagement.*

Since a general engagement of fleets or ſquadrons of men of war is nothing elſe than a variety of particular actions of ſingle ſhips with each other, in a line of battle; it may not be improper to begin by deſcribing the latter, and then proceed to repreſent the uſual manner of conducting the former.

I. The whole œconomy of a naval engagement may be arranged under the following heads, viz. the preparation, the action, and the repair, or refitting for the purpoſes of navigation.

1. The preparation is begun by iſſuing the order to clear the ſhip for action, which is repeated by the boatſwain and his mates at all the hatchways, or ſtaircaſes, leading to the different batteries. As the management of the artillery in a veſſel of war requires a conſiderable number of men, it is evident that the officers and ſailors muſt be reſtrained to a narrow ſpace in their uſual habitations, in order to preſerve the internal regularity of the ſhip. Hence the hammocs, or hanging-beds, of the latter are crowded together as cloſe as poſſible between the decks, each of them being limited to the breadth of fourteen inches. They are hung parallel to each other, in rows ſtretching from one ſide of the ſhip to the other, nearly throughout her whole length, ſo as to admit of no paſſage but by ſtooping under them. As the cannon therefore cannot be worked while the hammocs are ſuſpended in this ſituation, it becomes neceſſary to remove them as quick as poſſible. By this circumſtance a double advantage is obtained: the batteries of cannon are immediately cleared of an encumbrance, and the hammocs are converted into a ſort of parapet, to prevent the execution of ſmall-ſhot on the quarter-deck, tops, and fore-caſtle. At the ſummons of the boatſwain, *Up all hammocs!* every ſailor repairs to his own, and, having ſtowed his bedding properly, he cords it up firmly with a laſhing or line provided for that purpoſe. He then carries it to the quarter-deck, poop, or forecaſtle, or wherever it may be neceſſary. As each ſide of the quarter-deck and poop is furniſhed with a double net-work, ſupported by iron cranes fixed immediately above the gunnel or top of the ſhip's ſide, the hammocs thus corded are firmly ſtowed by the quarter-maſter between the two parts of the netting, ſo as to form an excellent barrier. The tops, waiſte, and forecaſtle, are then fenced in the ſame manner.

Whilſt theſe offices are performed below, the boatſwain and his mates are employed in ſecuring the ſail-yards, to prevent them from tumbling down when the ſhip is cannonaded, as ſhe might thereby be diſabled, and rendered incapable of attack, retreat, or purſuit. The yards are now likewiſe ſecured by ſtrong chains or ropes, additional to thoſe by which they are uſually ſuſpended. The boatſwain alſo provides the neceſſary materials to repair the rigging, wherever it may be damaged by the ſhot of the enemy, and to ſupply whatever parts of it may be entirely deſtroyed. The carpenter and his crew in the mean while prepare his ſhot-plugs and mauls, to cloſe up any dangerous breaches that may be made near the ſurface of the water; and provide the iron-work neceſſary to refit the chain-pumps, in caſe their machinery ſhould be wounded in the engagement. The gunner with his mates and quarter-gunners is buſied in examining the cannon of the different batteries, to ſee that their charges are thoroughly dry and fit for execution; to have every thing ready for furniſhing the great guns and ſmall arms with powder, as ſoon as the action begins; and to keep a ſufficient number of cartridges continually filled, to ſupply the place of thoſe expended in battle. The maſter and his mates are attentive to have the ſails properly trimmed, according to the ſituation of the ſhip; and to reduce or multiply them, as occaſion requires, with all poſſible expedition. The lieutenants viſit the different decks, to ſee that they are effectually cleared of all encumbrance, ſo that nothing may retard the execution of the artillery; and to enjoin the other officers to diligence and alertneſs, in making the neceſſary diſpoſitions for the expected engagement, ſo that every thing may be in readineſs at a moment's warning.

When the hoſtile ſhips have approached each other to a competent diſtance, the drums beat to arms. The

Oeconomy of a naval Engagement.

The boatſwain and his mates pipe, *All hands to quarters!* at every hatchway. All the perſons appointed to manage the great guns immediately repair to their reſpective ſtations. The crows, handſpikes, rammers, ſpunges, powder-horns, matches, and train tackles, are placed in order by the ſide of every cannon. The hatches are immediately laid, to prevent any one from deſerting his poſt by eſcaping into the lower apartments. The marines are drawn up in rank and file on the quarter-deck, poop, and foreeaſtle. The laſhings of the great guns are caſt looſe, and the tompions withdrawn. The whole artillery, above and below, is run out at the ports, and levelled to the point-blank range ready for firing.

2. The neceſſary preparations being completed, and the officers and crew ready at their reſpective ſtations to obey the order, the commencement of the action is determined by the mutual diſtance and ſituation of the adverſe ſhips, or by the ſignal from the commander in chief of the fleet or ſquadron. The cannon being levelled in parallel rows, projecting from the ſhip's ſide, the moſt natural order of battle is evidently to range the ſhips abreaſt of each other, eſpecially if the engagement is general. The moſt convenient diſtance is properly within the point-blank range of a muſket, ſo that all the artillery may do effectual execution.

The combat uſually begins by a vigorous cannonade, accompanied with the whole efforts of the ſwivel-guns and the ſmall arms. The method of firing in platoons, or volleys of cannon at once, appears inconvenient in the ſea-ſervice, and perhaps ſhould never be attempted unleſs in the battering of a fortification. The ſides and decks of the ſhip, although ſufficiently ſtrong for all the purpoſes of war, would be too much ſhaken by ſo violent an exploſion and recoil. The general rule obſerved on this occaſion throughout the ſhip, is to load, fire, and ſpunge, the guns with all poſſible expedition, yet without confuſion or precipitation. The captain of each gun is particularly enjoined to fire only when the piece is properly directed to its object, that the ſhot may not be fruitleſsly expended. The lieutenants, who command the different batteries, traverſe the deck to ſee that the battle is proſcuted with vivacity; and to exhort and animate the men to their duty. The midſhipmen ſecond theſe injunctions, and give the neceſſary aſſiſtance wherever it may be required, at the guns committed to their charge. The gunner ſhould be particularly attentive that all the artillery is ſufficiently ſupplied with powder, and that the cartridges are carefully conveyed along the decks in covered boxes. The havoc produced by a continuation of this mutual aſſault may be readily conjectured by the reader's imagination: battering, penetrating, and ſplintering the ſides and decks; ſhattering or diſmounting the cannon; mangling and deſtroying the rigging; cutting aſunder or carrying away the maſts and yards; piercing and tearing the ſails ſo as to render them uſeleſs; and wounding, diſabling, or killing the ſhip's company! The comparative vigour and reſolution of the aſſailants to effect theſe pernicious conſequences in each other, generally determine their ſucceſs or defeat: we ſay generally, becauſe the fate of the combat may ſometimes be decided by an unforeſeen incident, equally fortunate for the one and fatal to the other. The defeated ſhip having acknowledged the victory, by ſtriking her colours, is immediately taken poſſeſſion of by the conqueror, who ſecures her officers and crew as priſoners in his own ſhip; and inveſts his principal officer with the command of the prize until a captain is appointed by the commander in chief.

3. The engagement being concluded, they begin to repair: the cannon are ſecured by their breechings and tackles, with all convenient expedition. Whatever ſails have been rendered unſerviceable are unbent; and the wounded maſts and yards ſtruck upon deck, and fiſhed, or replaced by others. The ſtanding rigging is knotted, and the running-rigging ſpliced wherever neceſſary. Proper ſails are bent in the room of thoſe which have been diſplaced as uſeleſs. The carpenter and his crew are employed in repairing the breaches made in the ſhip's hull, by ſhot-plugs, pieces of plank, and ſheet-lead. The gunner and his aſſiſtants are buſied in repleniſhing the alloted number of charged cartridges, to ſupply the place of thoſe which have been expended, and in refitting whatever furniture of the cannon may have been damaged by the late action.

Such is the uſual proceſs and conſequences of an engagement between two ſhips of war, which may be conſidered as an epitome of a general battle between fleets or ſquadrons. The latter, however, involves a greater variety of incidents, and neceſſarily requires more comprehenſive ſkill and judgment in the commanding officer.

II. When the admiral, or commander in chief, of a naval armament has diſcovered an enemy's fleet, his principal concern is uſually to approach it, and endeavour to come to action as ſoon as poſſible. Every inferior conſideration muſt be ſacrificed to this important object; and every rule of action ſhould tend to haſten and prepare for ſo material an event. The ſtate of the wind, and the ſituation of his adverſary, will in ſome meaſure dictate the conduct neceſſary to be purſued with regard to the diſpoſition of his ſhips on this occaſion. To facilitate the execution of the admiral's orders, the whole fleet is ranged into three ſquadrons, each of which is claſſed into three diviſions, under the command of different officers. Before the action begins, the adverſe fleets are drawn up in two lines, as above deſcribed. As ſoon as the admiral diſplays the ſignal for the line of battle, the ſeveral diviſions ſeparate from the columns, in which they were diſpoſed in the uſual order of ſailing, and every ſhip crowds into its ſtation in the wake of the next a-head; and a proper diſtance from each other, which is generally about 50 fathom, is regularly obſerved from the van to the rear. The admiral, however, will occaſionally contract or extend his line, ſo as to conform to the length of that of his adverſary, whoſe neglect or inferior ſkill on this occaſion he will naturally convert to his own advantage, as well as to prevent his own line from being doubled, a circumſtance which might throw his van and rear into confuſion.

When the adverſe fleets approach each other, the courſes are commonly hauled up in the brails, and the top-gallant ſails and ſtay-ſails furled. The movement of each ſhip is chiefly regulated by the main and fore-top ſails, and the jib; the mizen-top ſail being reſerved

Oeconomy of a naval Engagement.

ved to haften or retard the courfe of the fhip, and, in fine, by filling or backing, hoifting or lowering it, to determine her velocity.

The frigates, tenders, and fire-fhips, being alfo hauled upon a wind, lie at fome diftance, ready to execute the admiral's orders or thofe of his feconds, leaving the line of battle between them and the enemy. If there are any tranfports and ftorefhips attendant on the fleet, thefe are difpofed ftill further diftant from the action. If the fleet is fuperior in number to that of the enemy, the admiral ufually felects a body of referve from the different fquadrons, which will always be of ufe to cover the fire-fhips, bomb-veffels, &c. and may fall into the line in any cafe of neceffity: thefe alfo are ftationed at a convenient diftance from the line, and fhould evidently be oppofite to the weakeft parts thereof.

And here it may not be improper to obferve, with an ingenious French author (M. de Morogues), that order and difcipline give additional ftrength and activity to a fleet. If thus a double advantage is acquired by every fleet, it is certainly more favourable to the inferior, which may thereby change its difpofition with greater facility and difpatch than one more numerous, yet without being feparated. When courage is equal to both, good order is then the only refource of the fmaller number. Hence we may infer, that a fmaller fquadron of men of war, whofe officers are perfectly difciplined in working their fhips, may, by its fuperior dexterity, vanquifh a more powerful one, even at the commencement of the fight; becaufe the latter, being lefs expert in the order of battle, will, by its feparation, fuffer many of the fhips to remain ufelefs, or not fufficiently near, to protect each other.

The fignal for a general engagement is ufually difplayed when the oppofite fleets are fufficiently within the range of point-blank fhot, fo that they may level the artillery with certainty of execution, which is near enough for a line of battle. The action is begun and carried on throughout the fleet in the manner we have already defcribed between fingle fhips; at which time the admiral carries little fail, obferving, however, to regulate his own motions by thofe of the enemy. The fhips of the line meanwhile keep clofe in their ftations, none of which fhould hefitate to advance in their order, although interrupted by the fituation of fome fhip a-head, which has negligently fallen a-ftern of her ftation.

The various exigencies of the combat call forth the fkill and refources of the admiral, to keep his line as complete as poffible when it has been unequally attacked; by ordering fhips from thofe in referve to fupply the place of others which have fuffered greatly by the action; by directing his firefhips at a convenient time to fall aboard the enemy; by detaching fhips from one part of the line or wing which is ftronger, to another which is greatly preffed by fuperior force, and requires affiftance. His vigilance is ever neceffary to review the fituation of the enemy from van to rear; every motion of whom he fhould, if poffible, anticipate and fruftrate. He fhould feize the favourable moments of occafion, which are rapid in their progrefs, and never return. Far from being difconcerted by any unforefeen incident, he fhould endeavour, if poffible, to make it fubfervient to his defign. His experience and reflection will naturally furnifh him with every method of intelligence to difcover the ftate of his different fquadrons and divifions. Signals of inquiry and anfwers, of requeft and affent, of command and obedience, will be difplayed and repeated on this occafion. Tenders and boats will alfo continually be detached between the admiral and the commanders of the feveral fquadrons or divifions.

Retreat and Chace.

As the danger preffes on him, he ought to be fortified by refolution and prefence of mind; becaufe the whole fleet is committed to his charge, and the conduct of his officers may, in a great degree, be influenced by his intrepidity and perfeverance. In fhort, his renown or infamy may depend on the fate of the day.

If he conquers in battle, he ought to profecute his victory as much as poffible, by feizing, burning, or deftroying the enemy's fhips. If he is defeated, he fhould endeavour, by every refource his experience can fuggeft, to fave as many of his fleet as poffible, by employing his tenders, &c. to take out the wounded and put frefh men in their places; by towing the difabled fhips to a competent diftance; and by preventing the execution of the enemy's fire-fhips.

By what we have obferved, the real force or fuperiority of a fleet confifts lefs in the number of veffels, and the vivacity of the action, than in good order, dexterity in working the fhips, prefence of mind, and fkilful conduct in the captains.

Chap. VIII. *Of Retreat and Chace.*

I. When a fleet is obliged to retreat in fight of an enemy, the beft way to effect it fecurely will be by failing in a kind of half-moon, the admiral making the obtufe angle A, and to windward in the form BAC; one part of his fleet to fail on the ftarboard, whilft the other goes away on the larboard tack: keeping the fire-fhips, tranfports, &c. in the middle. Plate CC. fig. 12.

This manner of ranging a fleet feems the moft advifeable, becaufe the enemy can never approach thofe that endeavour to efcape, without expofing themfelves at the fame time to the fire of the fhips to windward: thus the enemy's fhips D can never approach the fhips E without expofing themfelves at the fame time to the fire of the admiral A, as likewife to that of his feconds. If the admiral thinks this form gives too great an extent to his fleet, he may eafily clofe his wings or quarters, and make the half-moon more complete; in the midft of which he may place his convoy in fafety. Fig. 13.

Example. This order of retreat was exactly followed by the Dutch admiral Van Tromp, in his engagement with the Englifh off Portland, in the year 1653. The Englifh fleet confifted of 70 fail, under the command of admiral Blake; and the Dutch were as ftrong, convoying about 200 rich merchant-fhips. The two fleets met off Portland, where the Englifh ufed their utmoft efforts to bring on an action. The Dutch had the advantage of the wind, and endeavoured to avoid an engagement to preferve their convoy; but Van Tromp, confidering rightly, that if the wind fhould happen to change, he muft be under the neceffity of fighting with lefs advantage, determined upon bearing down to the enemy, making his fignal at

Retreat and Chace.

at the fame time for the convoy to keep to windward: he then divided his fleet into three fquadrons, and attacked the enemy with great bravery: they received him with equal refolution; which made the action very defperate on both fides, feveral fhips being difabled, funk, burnt, or deftroyed; and nothing but the darknefs of the approaching night could feparate two fuch obftinate enemies: during which, each prepared to renew the action, that ftill remained undecided, with greater fury the next day. Van Tromp found himfelf much embarraffed how to act; but, after many deliberations, he refolved at laft upon that of a retreat: he therefore drew up his fleet into an half-moon, placing his convoy in the middle; that is to fay, his own fhip to windward formed the obtufe angle of the half-moon, the reft ranging themfelves on two lines upon a wind on the fame tack, in order to form the faces of the half-moon to cover their convoy. He then made what fail he could, and went away large, firing to the right and left of him at all thofe that attempted to infult his wings or quarters; and would have entirely faved his convoy, if fome of his fhips had not bafely deferted him. The Englifh fhips immediately took the advantage of the intervals thefe fhips left in the face of their floating half-moon, and carried off feveral of their merchant-fhips; which obliged admiral Tromp to replace himfelf in the line of battle as before, and continue the engagement till night fhould give him an opportunity of refuming his order of retreat. He was chaced the next day by the enemy; but, after fuftaining a few broadfides, he got fafe into harbour, having acquired by his great valour and fkill a rich convoy to his country, that narrowly efcaped falling a prey to the enemy.

The moft natural courfe in this form of failing is to fteer away before the wind: but, if neceffary, the fhips may bear away large upon either tack, or even may keep clofe upon a wind.

In flying, or retreating, the uncertainty of the weather is to be confidered: it may become calm, or the wind may fhift favourably. The admiral's fchemes may be affifted by the approach of night, or the proximity of the land; fince he ought rather to run the fhips afhore, if practicable, than fuffer them to be taken afloat, and thereby transfer additional ftrength to the enemy. In fhort, nothing fhould be neglected that may contribute to the prefervation of his fleet, or prevent any part of it from falling into the hands of the conqueror.

II. When you chace a fleet that endeavours to efcape, you detach your beft cruifers after them, in order to pick up the ftragglers, or force them to action; the body of the victorious fleet fhould keep the fame order or line with the enemy, as nigh as poffible, to be ready for action, if neceffary. This is only to be underftood when the fleet that is chaced may not be fo inferior to the other but that it may hazard an action; for if the one bears no proportion to the other, they muft bear down upon them in the fame manner as a conquering army afhore carries all before it when it has forced an enemy's camp: otherwife, were the conquerors to wait to draw up in form, the enemy would undoubtedly take the advantage of fuch an opportunity to make their efcape.

Navarre, Naude.

NAVARRE, a province of Spain, part of the ancient kingdom of Navarre, erected foon after the invafion of the Moors; and is otherwife called *Upper Navarre*, to diftinguifh it from Lower Navarre, belonging to the French. It is bounded on the fouth and eaft by Arragon, on the north by the Pyrenees, and on the weft by Old Caftile and Bifcay; extending from fouth to north about 80 miles, and from eaft to weft about 75. It abounds in fheep and cattle; game of all kinds, as boars, ftags, and roebucks; and in wild-fowl, horfes, and honey; yielding alfo fome grain, wine, oil, and a variety of minerals, medicinal waters, and hot baths. Some of the ancient chiefs of this country were called *Sobrarbores*, from the cuftom, as it is fuppofed, which prevailed among fome of thofe free nations of choofing and fwearing their princes under fome particular tree. The name of the province is fuppofed to be a contraction of *Nava Errea*, fignifying, in the language of the Vafcones, its ancient inhabitants, "a land of valleys." —For the particulars of its hiftory, fee the article SPAIN.

NAUDE (Gabriel), a critic and phyfician in the 17th century, was born at Paris; and became librarian to the cardinals Bagni and Antonio Barberini at Rome, and afterwards to cardinal Mazarin, who made him canon of Verdun and prior of Lartige in Limofin. Chriftina queen of Sweden at length invited him into her dominions, and beftowed many marks of her favour and efteem upon him. He returned from thence, and died at Abbeville in 1653. His principal works are, 1. *Syntagma de ftudio liberali*. 2. *Syntagma de ftudio militari*. 3. An apology for the great men who have been accufed of magic. 4. Inftructions concerning the chimerical fociety of the Roficrufians. 5. Advice on collecting a library. 6. An appendix to the life of Lewis XI. 7. The fcience of princes, or political confiderations on the body of a ftate, &c. Naude's works abound with many curious and interefting particulars.

Nave ‖ Navew.

NAVE, in architecture, the body of a church, where the people are difpofed, reaching from the ballufter, or rail of the door, to the chief choir. Some derive the word from the Greek ναὸς, "a temple;" and others from ναυς, "a fhip," by reafon the vault or roof of a church bears fome refemblance to a fhip.

NAVEL, in anatomy, the centre of the lower part of the abdomen; being that part where the umbilical veffels paffed out of the placenta of the mother. See ANATOMY, p. 366. note (G).

NAVEL-*Wort*, in botany. See COTYLEDON.

NAVEW, in botany. See BRASSICA.

N A V I G A T I O N.

NAVIGATION, is the art of conducting or carrying a ſhip from one port to another.

H I S T O R Y.

THE poets refer the invention of the art of navigation to Neptune, ſome to Bacchus, others to Hercules, others to Jaſon, and others to Janus, who is ſaid to have made the firſt ſhip. Hiſtorians aſcribe it to the Æginetes, the Phœnicians, Tyrians, and the ancient inhabitants of Britain. Some will have it, the firſt hint was taken from the flight of the kite; others, as Oppian, (*De piſcibus*, lib. i.) from the fiſh called *nautilus:* others aſcribe it to accident.—Scripture refers the origin of ſo uſeful an invention to God himſelf, who gave the firſt ſpecimen thereof in the ark built by Noah under his direction. For the raillery the good man underwent on account of his enterpriſe ſhews evidently enough the world was then ignorant of any thing like navigation, and that they even thought it impoſſible.

However, hiſtory repreſents the Phœnicians, eſpecially thoſe of their capital Tyre, as the firſt navigators; being urged to ſeek a foreign commerce by the narrowneſs and poverty of a ſlip of ground they poſſeſſed along the coaſts; as well as by the conveniency of two or three good ports, and by their natural genius to traffic. Accordingly, Lebanon, and the other neighbouring mountains, furniſhing them with excelcellent wood for ſhip-building, in a ſhort time they were maſters of a numerous fleet, which conſtantly hazarding new navigations, and ſettling new trades, they ſoon arrived at an incredible pitch of opulency and populouſneſs: inſomuch as to be in a condition to ſend out colonies, the principal of which was that of Carthage; which, keeping up their Phœnician ſpirit of commerce, in time not only equalled Tyre itſelf, but vaſtly ſurpaſſed it; ſending its merchant-fleets through Hercules's pillars, now the ſtraits of Gibraltar, along the weſtern coaſts of Africa and Europe; and even, if we believe ſome authors, to America itſelf.

Tyre, whoſe immenſe riches and power are repreſented in ſuch lofty terms both in ſacred and profane authors, being deſtroyed by Alexander the Great, its navigation and commerce were transferred by the conqueror to Alexandria, a new city, admirably ſituated for thoſe purpoſes; propoſed for the capital of the empire of Aſia, which Alexander then meditated. And thus aroſe the navigation of the Egyptians; which was afterwards ſo cultivated by the Ptolemies, that Tyre and Carthage were quite forgot.

Egypt being reduced into a Roman province after the battle of Actium, its trade and navigation fell into the hands of Auguſtus; in whoſe time Alexandria was only inferior to Rome: and the magazines of the capital of the world, were wholly ſupplied with merchandizes from the capital of Egypt.

At length, Alexandria itſelf underwent the fate of Tyre and Carthage; being ſurpriſed by the Saracens, who, in ſpite of the emperor Heraclius, overſpread the northern coaſts of Africa, &c. whence the merchants being driven, Alexandria has ever ſince been in a languiſhing ſtate, though ſtill it has a conſiderable part of the commerce of the Chriſtian merchants trading to the Levant.

The fall of Rome and its empire drew along with it not only that of learning and the polite arts, but that of navigation; the barbarians, into whoſe hands it fell, contenting themſelves with the ſpoils of the induſtry of their predeceſſors.

But no ſooner were the more brave among thoſe nations well ſettled in their new provinces; ſome in Gaul, as the Franks; others in Spain, as the Goths; and others in Italy, as the Lombards; but they began to learn the advantages of navigation and commerce, and the methods of managing them, from the people they ſubdued; and this with ſo much ſucceſs, that in a little time ſome of them became able to give new leſſons, and ſet on foot new inſtitutions for its advantage. Thus it is to the Lombards we uſually aſcribe the invention and uſe of banks, book-keeping, exchanges, rechanges, &c.

It does not appear which of the European people, after the ſettlement of their new maſters, firſt betook themſelves to navigation and commerce.—Some think it began with the French; though the Italians ſeem to have the juſteſt title to it, and are accordingly ordinarily looked on as the reſtorers hereof, as well as of the polite arts, which had been baniſhed together from the time the empire was torn aſunder. It is the people of Italy then, and particularly thoſe of Venice and Genoa, who have the glory of this reſtoration; and it is to their advantageous ſituation for navigation they in great meaſure owe their glory. In the bottom of the Adriatic were a great number of marſhy iſlands, only ſeparated by narrow channels, but thoſe well ſcreened, and almoſt inacceſſible, the reſidence of ſome fiſhermen, who here ſupported themſelves by a little trade of fiſh and ſalt, which they found in ſome of theſe iſlands. Thither the Veneti, a people inhabiting that part of Italy along the coaſts of the gulph, retired, when Alaric king of the Goths, and afterwards Attila king of the Huns, ravaged Italy.

Theſe new iſlanders, little imagining that this was to be their fixed reſidence, did not think of compoſing any body politic; but each of the 72 iſlands of this little Archipelago continued a long time under its ſeveral maſters, and each made a diſtinct commonwealth. When their commerce was become conſiderable enough to give jealouſy to their neighbours, they began to think of uniting into a body. And it was this union, firſt begun in the ſixth century, but not completed till the eighth, that laid the ſure foundation of the future grandeur of the ſtate of Venice. From the time of this union, their fleets of merchantmen were ſent to all the parts of the Mediterranean; and at laſt to thoſe of Egypt, particularly Cairo, a new city, built by the Saracen princes on the eaſtern banks of the Nile, where they traded for their ſpices and other products of the Indies. Thus they flouriſhed, increaſed their commerce

commerce, their navigation, and their conquests on the terra firma, till the league of Cambray in 1508, when a number of jealous princes conspired to their ruin; which was the more easily effected by the diminution of their East-India commerce, of which the Portuguese had got one part, and the French another. Genoa, which had applied itself to navigation at the same time with Venice, and that with equal success, was a long time its dangerous rival, disputed with it the empire of the sea, and shared with it the trade of Egypt and other parts both of the east and west.

Jealousy soon began to break out; and the two republics coming to blows, there was almost continual war for three centuries ere the superiority was ascertained; when, towards the end of the 14th century, the battle of Chioza ended the strife: the Genoese, who till then had usually the advantage, having now lost all; and the Venetians, almost become desperate, at one happy blow, beyond all expectation, secured to themselves the empire of the sea, and superiority in commerce.

About the same time that navigation was retrieved in the southern parts of Europe, a new society of merchants was formed in the north, which not only carried commerce to the greatest perfection it was capable of till the discovery of the East and West Indies, but also formed a new scheme of laws for the regulation thereof, which still obtain under the names of *Uses and Customs of the Sea.* This society is that famous league of the Hanse-towns, commonly supposed to have begun about the year 1164. See HANSE *Towns.*

For the modern state of navigation in England, Holland, France, Spain, Portugal, &c. See COMMERCE, COMPANY, &c.

We shall only add, that, in examining the reasons of commerce's passing successively from the Venetians, Genoese, and Hanse-towns, to the Portuguese and Spaniards, and from these again to the English and Dutch; it may be established as a maxim, that the relation between commerce and navigation, or, if we may be allowed to say it, their union is so intimate, that the fall of the one inevitably draws after it the other; and that they will always either flourish or dwindle together. Hence so many laws, ordinances, statutes, &c. for its regulation; and hence particularly that celebrated act of navigation, which an eminent foreign author calls the *palladium* or *tutelar deity of the commerce of England;* which is the standing rule, not only of the British among themselves, but also of other nations with whom they traffic.

The art of navigation hath been exceedingly improved in modern times, both with regard to the form of the vessels themselves, and with regard to the methods of working them. The use of rowers is now entirely superseded by the improvements made in the formation of the sails, rigging, &c. by which means the ships can not only sail much faster than formerly, but can tack in any direction with the greatest facility. It is also very probable that the ancients were neither so well skilled in finding the latitudes, nor in steering their vessels in places of difficult navigation, as the moderns. But the greatest advantage which the moderns have over the ancients is from the mariner's compass, by which they are enabled to find their way with as great facility in the midst of an immeasurable ocean, as the ancients could have done by creeping along the coast, and never going out of sight of land. Some people indeed contend, that this is no new invention, but that the ancients were acquainted with it. They say, that it was impossible for Solomon to have sent ships to Ophir, Tarshish, and Parvaim, which last they will have to be *Peru,* without this useful instrument. They insist, that is was impossible for the ancients to be acquainted with the attractive virtue of the magnet, and to be ignorant of its polarity. Nay, they affirm, that this property of the magnet is plainly mentioned in the book of Job, where the loadstone is mentioned by the mane of *topaz,* or *the stone that turns itself.* But it is certain, that the Romans, who conquered Judæa, were ignorant of this instrument; and it is very improbable, that such an useful invention, if once it had been commonly known to any nation, would have been forgot, or perfectly concealed from such a prudent people as the Romans, who were so much interested in the discovery of it.

Among those who do agree that the mariner's compass is a modern invention, it hath been much disputed who was the inventor. Some give the honour of it to Flavio Gioia of Amalfi in Campania *, who lived about the beginning of the 14th century; while others say that it came from the east, and was earlier known in Europe. But, at whatever time it was invented, it is certain, that the mariner's compass was not commonly used in navigation before the year 1420. In that year the science was considerably improved under the auspices of Henry duke of Visco, brother to the king of Portugal. In the year 1485, Roderic and Joseph, physicians to king John II. of Portugal, together with one Martin de Bohemia, a Portuguese native of the island of Fayal, and scholar to Regiomontanus, calculated tables of the sun's declination for the use of sailors, and recommended the astrolabe for taking observations at sea. Of the instructions of Martin, the celebrated Christopher Columbus is said to have availed himself, and to have improved the Spaniards in the knowledge of the art; for the farther progress of which a lecture was afterwards founded at Seville by the emperor Charles V.

* See *Mariner's Compass.*

The discovery of the variation is claimed by Columbus, and by Sebastian Cabot. The former certainly did observe this variation without having heard of it from any other person, on the 14th of September 1492, and it is very probable that Cabot might do the same. At that time it was found that there was no variation at the Azores, where some geographers have thought proper to place the first meridian; though it hath since been observed that the variation alters in time.—The use of the cross-staff now began to be introduced among sailors. This ancient instrument is described by John Werner of Nuremberg, in his annotations on the first book of Ptolemy's Geography, printed in 1514. He recommends it for observing the distance between the moon and some star, in order thence to determine the longitude.

At this time the art of navigation was very imperfect on account of the inaccuracies of the plane chart, which

which was the only one then known, and which, by its grofs errors, muft have greatly mifled the mariner, efpecially in voyages far diftant from the equator. Its precepts were probably at firft only fet down on the fea-charts, as is the cuftom at this day: but at length there were two Spanifh treatifes publifhed in 1545; one by Pedro de Medina; the other by Martin Cortis, which contained a complete fyftem of the art, as far as it was then known. Thefe feem to have been the oldeft writers who fully handled the art; for Medina, in his dedication to Philip prince of Spain, laments that multitudes of fhips daily perifhed at fea, becaufe there were neither teachers of the art, nor books by which it might be learned; and Cortes, in his dedication, boafts to the emperor, that he was the firft who had reduced navigation into a compendium, valuing himfelf much on what he had performed. Medina defended the plane chart; but he was oppofed by Cortes, who fhewed its errors, and endeavoured to account for the variation of the compafs, by fuppofing the needle to be influenced by a magnetic pole (which he called the *point attractive)* different from that of the world: which notion hath been farther profecuted by others. Medina's book was foon tranflated into Italian, French, and Flemifh, and ferved for a long time as a guide to foreign navigators. However Cortes was the favourite author of the Englifh nation, and was tranflated in 1561; while Medina's work was entirely neglected, though tranflated alfo within a fhort time of the other. At that time the fyftem of navigation confifted of the following particulars, and others fimilar: An account of the Ptolemaic hypothefis, and the circles of the fphere; of the roundnefs of the earth, the longitudes, latitudes, climates, &c. and eclipfes of the luminaries; a kalendar; the method of finding the prime, epact, moon's age, and tides; a defcription of the compafs, an account of its variation, for the difcovering of which Cortes faid an inftrument might eafily be contrived; tables of the fun's declination for four years, in order to find the latitude from his meridian altitude; directions to find the fame by certain ftars: of the courfe of the fun and moon; the length of the days; of time and its divifions; the method of finding the hour of the day and night; and laftly, a defcription of the fea-chart, on which to difcover where the fhip is, they made ufe of a fmall table, that fhewed, upon an alteration of one degree of the latitude, how many leagues were run in each rhumb, together with the departure from the meridian. Befides, fome inftruments were defcribed, efpecially by Cortes; fuch as one to find the place and declination of the fun, with the days, and place of the moon; certain dials, the aftrolabe, and crofs-ftaff; with a complex machine to difcover the hour and latitude at once.

About the fame time were made propofals for finding the longitude by obfervations on the moon. In 1530, Gemma Frifius advifed the keeping of the time by means of fmall clocks or watches, then, as he fays, newly invented. He alfo contrived a new fort of crofs-ftaff and an inftrument called the *nautical quadrant;* which laft was much praifed by William Cuningham, in his *Aftronomical Glafs*, printed in the year 1559.

In 1537 Pedro Nunez, or Nonius, publifhed a book in the Portuguefe language, to explain a difficulty in navigation propofed to him by the commander Don Martin Alphonfo de Sufa. In this he expofes the errors of the plane chart, and likewife gives the folution of feveral curious aftronomical problems; amongft which is that of determining the latitude from two obfervations of the fun's altitude and intermediate azimuth being given. He obferved, that though the rhumbs are fpiral lines, yet the direct courfe of a fhip will always be in the arch of a great circle, whereby the angle with the meridians will continually change: all that the fteerfman can here do for the preferving of the original rhumb, is to correct thefe deviations as foon as they appear fenfible. But thus the fhip will in reality defcribe a courfe without the rhumb-line intended; and therefore his calculations for affigning the latitude, where any rhumb-line croffes the feveral meridians, will be in fome meafure erroneous. He invented a method of dividing a quadrant by means of concentric circles, which, after being much improved by Dr Halley, is ufed at prefent, and is called a *nonius*.

In 1577, Mr William Bourne publifhed a treatife, in which, by confidering the irregularities in the moon's motion, he fhews the errors of the failors in finding her age by the epact, and alfo in determining the hour from obferving on what point of the compafs the fun and moon appeared. He advifes, in failing towards the high latitudes, to keep the reckoning by the globe, as there the plane chart is moft erroneous. He defpairs of our ever being able to find the longitude, unlefs the variation of the compafs fhould be occafioned by fome fuch attractive point, as Cortes had imagined; of which, however, he doubts: but as he had fhewn how to find the variation at all times, he advifes to keep an account of the obfervations, as ufeful for finding the place of the fhip; which advice was profecuted at large by Simon Stevin in a treatife publifhed at Leyden in 1599; the fubject of which was the fame year printed at London in Englifh by Mr Edward Wright, intitled the *Haven-finding Art*. In this ancient tract alfo is defcribed the way by which our failors eftimate the rate of a fhip in her courfe, by an inftrument called the *log*. This was fo named from the piece of wood or log that floats in the water while the time is reckoned during which the line that is faftened to it is veering out. The author of this contrivance is not known; neither was it taken notice of till 1607, in an Eaft-India voyage publifhed by Purchas: but from this time it became famous, and was much taken notice of by almoft all writers on navigation in every country; and it ftill continues to be ufed as at firft, though many attempts have been made to improve it, and contrivances propofed to fupply its place; many of which have fucceeded in quiet water, but proved ufelefs in a ftormy fea.

In 1581 Michael Coignet, a native of Antwerp, publifhed a treatife in which he animadverted on Medina. In this he fhewed, that as the rhumbs are fpirals, making endlefs revolutions about the poles, numerous errors muft arife from their being reprefented by ftraight lines on the fea-charts; but though he hoped to find a remedy for thefe errors, he was of opinion that the propofals of Nonius were fcarcely practicable, and therefore in a great meafure ufelefs. In treating

treating of the sun's declination, he took notice of the gradual decrease in the obliquity of the ecliptic; he also described the cross-staff with three transverse pieces, as it is at present made, and which he owned to have been then in common use among the sailors. He likewise gave some instruments of his own invention; but all of them are now laid aside, excepting perhaps his nocturnal. He constructed a sea-table to be used by such as sailed beyond the 60th degree of latitude; and at the end of the book is delivered a method of sailing on a parallel of latitude by means of a ring dial and a 24 hour-glass. The same year the discovery of the dipping needle was made by Mr Robert Forman*. In his publication on that art he maintains, in opposition to Cortes, that the variation of the compass was caused by some point on the surface of the earth, and not in the heavens: he also made considerable improvements in the construction of compasses themselves; shewing especially the danger of not fixing, on account of the variation, the wire directly under the *flower-de-luce;* as compasses made in different countries have placed it differently. To this performance of Forman's is always prefixed a discourse on the variation of the magnetical needle, by Mr William Burrough, in which he shews how to determine the variation in many different ways. He also points out many errors in the practice of navigation at that time, and speaks in very severe terms concerning those who had published upon it. All this time the Spaniards had continued to publish treatises on the art. In 1585 an excellent compendium was published by Roderico Zamorano; which contributed greatly towards the improvement of the art, particularly in the sea-charts. Globes of an improved kind, and of a much larger size than those formerly used, were now constructed, and many improvements were made in other instruments; however, the plane chart continued still to be followed, though its errors were frequently complained of. Methods of removing these errors had indeed been sought after; and Gerard Mercator seems to have been the first who found the true method of doing this so as to answer the purposes of seamen. His method was to represent the parallels both of latitude and longitude by parallel straight lines, but gradually to augment the former as they approached the pole. Thus the rhumbs, which otherwise ought to have been curves, were now also extended into straight lines; and thus a straight line drawn between any two places marked upon the chart would make an angle with the meridians, expressing the rhumb leading from the one to the other. But though, in 1569, Mercator published an universal map constructed in this manner, it doth not appear that he was acquainted with the principles on which this proceeded; and it is now generally believed, that the true principles on which the construction of what is called *Mercator's chart* depends, were first discovered by an Englishman, Mr Edward Wright.

* See *Dipping-needle.*

Mr Wright supposes, but, according to the general opinion, without sufficient grounds, that this enlargement of the degrees of latitude was known and mentioned by Ptolemy, and that the same thing had also been spoken of by Cortes. The expressions of Ptolemy alluded to, relate indeed to the proportion between the distances of the parallels and meridians; but instead of proposing any gradual enlargement of the parallels of latitude, in a general chart, he speaks only of particular maps; and advises not to confine a system of such maps to one and the same scale, but to plan them out by a different measure, as occasion might require: only with this precaution, that the degrees of longitude in each should bear some proportion to those of latitude; and this proportion is to be deduced from that which the magnitude of the respective parallels bear to a great circle of the sphere. He adds, that in particular maps, if this proportion be observed with regard to the middle parallel, the inconvenience will not be great tho' the meridians should be straight parallels to each other. Here he is said only to mean, that the maps should in some measure represent the figures of the countries for which they are drawn. In this sense Mercator, who drew maps for Ptolemy's tables, understood him: thinking it, however, an improvement not to regulate the meridians by one parallel, but by two; one distant from the northern, the other from the southern extremity of the map by a fourth part of the whole depth; by which means, in his maps, though the meridians are straight lines, yet they are generally drawn inclining to each other towards the poles. With regard to Cortes, he speaks only of the number of degrees of latitude, and not of the extent of them; nay, he gives express directions that they should all be laid down by equal measurement on a scale of leagues adapted to the map.

For some time after the appearance of Mercator's map, it was not rightly understood, and it was even thought to be entirely useless, if not detrimental. However, about the year 1592, its utility began to be perceived; and seven years after, Mr Wright printed his famous treatise entitled, *The Correction of certain Errors in Navigation;* where he fully explained the reason of extending the length of the parallels of latitude, and the uses of it to navigators. In 1610, a second edition of Mr Wright's book was published with improvements. An excellent method was proposed of determining the magnitude of the earth; at the same time it was judiciously proposed to make our common measures in some proportion to a degree on its surface, that they might not depend on the uncertain length of a barley-corn. Some of his other improvements were, "The table of latitudes for dividing the meridian computed to minutes;" whereas it had only been divided to every tenth minute. He also published a description of an instrument which he calls the *sea-rings;* and by which the variation of the compass, altitude of the sun, and time of the day, may be determined readily at once in any place, provided the latitude is known. He shewed also how to correct the errors arising from the excentricity of the eye in observing by the cross-staff. He made a total amendment in the tables of the declinations and places of the sun and stars from his own observations made with a six-foot quadrant in the years 1594, 95, 96, and 97. A sea-quadrant to take altitudes by a forward or backward observation; and likewise with a contrivance for the ready finding the latitude by the height of the pole-star, when not upon the meridian. To this edition was subjoined a translation of Zemorano's Compendium above-mentioned; in which he corrected some mistakes in the original; adding a large table of the variation of the compass observed in very different parts

parts of the world, to ſhew that it was not occaſioned by any magnetical pole.

Theſe improvements ſoon became known abroad. In 1608, a treatiſe intitled, *Hypomnemata Mathematica*, were publiſhed by Simon Stevin, for the uſe of Prince Maurice. In that part relating to navigation, the author having treated of ſailing on a great circle, and ſhewn how to draw the rhumbs on a globe mechanically, ſets down Wright's two tables of latitude and of rhumbs, in order to deſcribe theſe lines more accurately, pretending even to have diſcovered an error in Wright's table. But all Stevin's objections were fully anſwered by the author himſelf, who ſhowed that they aroſe from the groſs way of calculating made uſe of by the former.

In 1624, the learned Wellebrordus Snellius, profeſſor of mathematics at Leyden, publiſhed a treatiſe of navigation on Wright's plan, but ſomewhat obſcurely; and as he did not particularly mention all the diſcoveries of Wright, the latter was thought by ſome to have taken the hint of all his diſcoveries from Snellius. But this ſuppoſition is long ago refuted; and Wright enjoys the honour of thoſe diſcoveries which is juſtly his due.

Mr Wright having ſhown how to find the place of the ſhip on his chart, obſerved that the ſame might be performed more accurately by calculation: but conſidering, as he ſays, that the latitudes, and eſpecially the courſes at ſea, could not be determined ſo preciſely, he forbore ſetting down particular examples; as the mariner may be allowed to ſave himſelf this trouble, and only mark out upon his chart the ſhip's way after the manner then uſually practiſed. However, in 1614, Mr Raphe Handſon, among his nautical queſtions ſubjoined to a tranſlation of Pitiſcus's trigonometry, ſolved very diſtinctly every caſe of navigation, by applying arithmetical calculations to Wright's table of latitudes, or of meridional parts, as it hath ſince been called. Though the method diſcovered by Wright for finding the change of longitude by a ſhip ſailing on a rhumb is the proper way of performing it, Handſon alſo propoſes two ways of approximation to it without the aſſiſtance of Wright's diviſion of the meridian line. The firſt was computed by the arithmetical mean between the co-ſines of both latitudes; the other by the ſame mean between the ſecants as an alternative, when Wright's book was not at hand; tho' this latter is wider from the truth than the firſt. By the ſame calculations alſo he ſhowed how much each of theſe compendiums deviates from the truth, and alſo how widely the computations on the erroneous principles of the plane chart differ from them all. The method, however, commonly uſed by our ſailors is commonly called the *middle latitude;* which, though it errs more than that by the arithmetical mean between the two co-ſines, is preferred on account of its being leſs operoſe: yet in high latitudes it is more eligible to uſe that of the arithmetical mean between the logarithmic co-ſines, equivalent to the geometrical mean between the co-ſines themſelves; a method ſince propoſed by Mr John Baſſat. The computation by the middle latitude will always fall ſhort of the true change of longitude; that by the geometrical mean will always exceed; but that by the arithmetical mean falls ſhort in latitudes above 45 degrees, and exceeds in leſſer latitudes. However, none of theſe methods will differ much from the truth when the change of latitude is ſufficiently ſmall.

About this time logarithms were invented by John Napier, baron of Merchiſtoun in Scotland, and proved of the utmoſt ſervice to the art of navigation. They were firſt applied by Mr Edward Gunter in 1620. He conſtructed a table of artificial ſines and tangents to every minute of the quadrant. Theſe were applied according to Wright's table of meridional parts, and have been found extremely uſeful in other branches of the mathematics. He contrived alſo a moſt excellent ruler, commonly known by the name of *Gunter's ſcale*, on which were inſcribed the logarithmic lines for numbers, and for ſines and tangents of arches *. He alſo greatly improved the ſector for the ſame purpoſes. He ſhewed alſo how to take a back-obſervation by the croſs-ſtaff, whereby the error ariſing from the excentricity of the eye is avoided. He deſcribed likewiſe another inſtrument of his own invention, called the *croſs-bow*, for taking altitudes of the ſun or ſtars, with ſome contrivances for the more ready collecting the latitude from the obſervation. The diſcoveries concerning the logarithms were carried to France in 1624 by Mr Edmund Wingate, who publiſhed two ſmall tracts in that year at Paris. In one of theſe he taught the uſe of Gunter's ſcale; and in the other, of the tables of artificial ſines and tangents, as modelled according to Napier's laſt form, erroneouſly attributed by Wingate to Briggs.

* See *Gunter's Scale*.

Gunter's ruler was projected into a circular arch by the reverend Mr William Oughtred in 1633, and its uſes fully ſhown in a pamphlet intitled, *The circles of proportion;* where, in an appendix, are well handled ſeveral important points in navigation. It has alſo been made in the form of a ſliding ruler.

The logarithmic tables were firſt applied to the different caſes of ſailing by Mr Thomas Addiſon, in his treatiſe intitled, *Arithmetical navigation*, printed in 1625. He alſo gives two traverſe tables, with their uſes; the one to quarter points of the compaſs, the other to degrees. Mr Henry Gellibrand publiſhed his diſcovery of the changes of the variation of the compaſs, in a ſmall quarto pamphlet, intitled, *A diſcourſe mathematical on the variation of the magnetical needle*, printed in 1635. This extraordinary phenomenon he found out by comparing the obſervations made at different times near the ſame place by Mr Burrough, Mr Gunter, and himſelf, all perſons of great ſkill and experience in theſe matters. This diſcovery was likewiſe ſoon known abroad; for Father Athanaſius Kircher, in his treatiſe intitled, *Magnes*, firſt printed at Rome in 1641, informs us, that he had been told it by Mr John Greaves; and then gives a letter of the famous Marinus Merſennus, containing a very diſtinct account of the ſame.

As altitudes of the ſun are taken on ſhipboard by obſerving his elevation above the viſible horizon, to collect from thence the ſun's true altitude with correctneſs, Wright obſerves it to be neceſſary that the dip of the horizon below the obſerver's eye ſhould be brought into the account, which cannot be calculated without knowing the magnitude of the earth. Hence he was induced to propoſe different methods for finding this; but complains that the moſt effectual was out

of

of his power to execute; and therefore contented himself with a rude attempt, in some measure sufficient for his purpose: and the dimensions of the earth deduced by him corresponded so well with the usual divisions of the log-line, that as he writ not an express treatise on navigation, but only for the correcting such errors as prevailed in general practice, the log-line did not fall under his notice. Mr Richard Norwood, however, put in execution the method recommended by Mr Wright as the most perfect for measuring the dimensions of the earth, with the true length of the degrees of a great circle upon it; and, in 1635, he actually measured the distance between London and York; from whence, and the summer solstitial altitudes of the sun observed on the meridian at both places, he found a degree on a great circle of the earth to contain 367,196 English feet, equal to 57,300 French fathoms or toises: which is very exact, as appears from many measures that have been made since that time. Of all this Mr Norwood gave a full account in his treatise called *The seaman's practice*, published in 1637. He there shows the reason why Snellius had failed in his attempt; he points out also various uses of his discovery, particularly for correcting the gross errors hitherto committed in the divisions of the log-line. These necessary amendments, however, were little attended to by the sailors, whose obstinacy in adhering to established errors has been complained of by the best writers on navigation; but at length they found their way into practice, and few navigators of reputation now make use of the old measure of 42 feet to a knot. In that treatise also Mr Norwood describes his own excellent method of setting down and perfecting a sea-reckoning, by using a traverse table; which method he had followed and taught for many years. He shows also how to rectify the course by the variation of the compass being considered; as also how to discover currents, and to make proper allowance on their account. This treatise, and another on trigonometry, were continually reprinted, as the principal books for learning scientifically the art of navigation. What he had delivered, especially in the latter of them, concerning this subject, was contracted as a manual for sailors, in a very small piece called his *Epitome*; which useful performance has gone through a great number of editions. No alterations were ever made in the Seaman's Practice till the 12th edition in 1676, when the following paragraph was inserted in a smaller character: "About the year 1672, Monsieur Picart has published an account in French, concerning the measure of the earth, a breviate whereof may be seen in the Philosophical Transactions, n° 112; wherein he concludes one degree to contain 365,184 English feet, nearly agreeing with Mr Norwood's experiment;" and this advertisement is continued through the subsequent editions as late as the year 1732. About the year 1645, Mr Bond published in Norwood's epitome a very great improvement in Wright's method by a property in his meridian line, whereby its divisions are more scientifically assigned than the author himself was able to effect; which was from this theorem, that these divisions are analogous to the excesses of the logarithmic tangents of half the respective latitudes augmented by 45 degrees above the logarithm of the radius. This he afterwards explained more fully in the third edition of Gunter's works, printed in 1653; where, after observing that the logarithmic tangents from 45° upwards increase in the same manner that the secants added together do; if every half degree be accounted as a whole degree of Mercator's meridional line. His rule for computing the meridional parts belonging to any two latitudes, supposed on the same side of the equator, is to the following effect. "Take the logarithmic tangent, rejecting the radius, of half each latitude, augmented by 54 degrees; divide the difference of those numbers by the logarithmic tangent of 50° 30′, the radius being likewise rejected; and the quotient will be the meridional parts required, expressed in degrees." This rule is the immediate consequence from the general theorem, That the degrees of latitude bear to one degree, (or 60 minutes, which in Wright's table stands for the meridional parts of one degree), the same proportion as the logarithmic tangent of half any latitude augmented by 45 degrees, and the radius neglected, to the like tangent of half a degree augmented by 45 degrees, with the radius likewise rejected. But here was farther wanting the demonstration of this general theorem, which was at length supplied by Mr James Gregory of Aberdeen, in his *Exercitationes Geometricæ*, printed at London in 1668; and afterwards more concisely demonstrated, together with a scientific determination of the divisor, by Dr Halley in the Philosophical Transactions for 1695, n° 219. from the consideration of the spirals into which the rhumbs are transformed in the stereographic projection of the sphere upon the plane of the equinoctial; and which is rendered still more simple by Mr Roger Cotes, in his Logometria, first published in the Philosophical Transactions for 1714, n° 388. It is moreover added in Gunter's book, that if $\frac{1}{10}$ of this division, which does not sensibly differ from the logarithmic tangent of 45° 1′ 30″ (with the radius subtracted from it), be used, the quotient will exhibit the meridional parts expressed in leagues: and this is the divisor set down in Norwood's Epitome. After the same manner the meridional parts will be found in minutes, if the like logarithmic tangent of 45° 1′ 30″, diminished by the radius, be taken; that is, the number used by others being 12633, when the logarithmic tables consist of eight places of figures besides the index. In an edition of the seaman's kalendar, Mr Bond declared, that he had discovered the longitude by having found out the true theory of the magnetic variation; and to gain credit to his assertion, he foretold, that at London, in 1657, there would be no variation of the compass, and from that time it would gradually increase the other way; which happened accordingly. Again, in the Philosophical Transactions for 1668, n° 40. he published a table of the variation for 49 years to come. Thus he acquired such reputation, that his treatise, intitled, *The longitude found*, was, in 1676, published by the special command of Charles II. and approved by many celebrated mathematicians. It was not long, however, before it met with opposition; and, in 1678, another treatise, intitled, *The longitude not found*, made its appearance; and as Mr Bond's hypothesis did not in any manner answer its author's sanguine expectations, the affair was undertaken by Dr Halley. The result of his speculations was, that the magnetic needle is influenced

influenced by four poles; but this wonderful phenomenon feems hitherto to have eluded all our refearches. In 1700, however, Dr Halley publifhed a general map, with curve lines expreffing the paths where the magnetic needle had the fame variation; which was received with univerfal applaufe. But as the pofitions of thefe curves vary from time to time, they fhould frequently be corrected by fkilful perfons; as was done in 1744 and 1756, by Mr William Mountaine, and Mr James Dodfon, F. R. S. In the Philofophical Tranfactions for 1690, Dr Halley alfo gave a differtation on the monfoons; containing many very ufeful obfervations for fuch as fail to places fubject to thefe winds.

After the true principles of the art were fettled by Wright, Bond, and Norwood, the authors on navigation became fo numerous, that it would be impoffible to enumerate them; and every thing relative to it was fettled with an accuracy not only unknown to former ages, but which would have been reckoned utterly impoffible. The earth being found to be a fpheroid, and not a perfect fphere, with the fhorteft diameter paffing through the poles, a tract was publifhed in 1741 by the Rev. Dr Patrick Murdoch, wherein he accommodated Wright's failing to fuch a figure; and Mr Colin Maclaurin, the fame year, in the Philofophical Tranfactions, n° 461, gave a rule for determining the meridional parts of a fpheroid; which fpeculation is farther treated of in his book of Fluxions, printed at Edinburgh in 1742.

Among foreign nations alfo many treatifes were now publifhed; but excepting the remarkable difcovery of the longitude by Mr Harrifon, no confiderable improvement hath been made any-where. Indeed, the fubject hath been fo much canvaffed and ftudied by men of learning and ingenuity in all nations, that there feems to be little room for farther improvements; and the art of navigation feems to be nearly brought to as much perfection as it is capable of.

PART I. THEORY OF NAVIGATION.

THE motion of a fhip in the water is well known to depend on the action of the wind upon its fails, regulated by the direction of the helm. As the water is a refifting medium, and the bulk of the fhip very confiderable, it thence follows, that there is always a great refiftance on her fore-part; and when this refiftance becomes fufficient to balance the moving force of the wind upon the fails, the fhip attains her utmoft degree of velocity, and her motion is no longer accelerated. This velocity is different according to the different ftrength of the wind: but the ftronger the wind, the greater refiftance is made to the fhip's paffage through the water; and hence, though the wind fhould blow ever fo fiercely, there is alfo a limit to the velocity of the fhip: for the fails and ropes can bear but a certain force of air; and when the refiftance on the fore-part becomes more than equivalent to their ftrength, the velocity can be no longer increafed, and the tackle gives way.

The direction of a fhip's motion depends on the fituation of her fails with regard to the wind. The moft natural and eafy pofition is, when fhe runs directly before it; but this is not often the cafe, on account of the variable nature of the winds, and the fituations of the different ports to which the fhip may be bound. When the wind therefore happens not to be favourable, the rudder and fails muft be managed in fuch a manner that the fhip may make an angle with the direction of the current of air, as reprefented Plate CCI. fig. 4. Thus, fuppofing a fhip at D, bound for the port B. Suppofing DG the length of the keel, it muft be kept by the rudder in fuch a pofition as to make the acute angle EDB with the direction of the wind. If, when fke arrives at B, it is required to fail to another port A, the keel muft be kept in the pofition BF; and thus, by continually making the angle EBA with the direction of the wind, fhe will arrive at the defired port: and in this manner may a fhip be fteered to any other port, fuppofe to C or H.

The reafon of the fhip's motion in thefe cafes is, that the water refifts the fide more than the fore-part, and that in the fame proportion that her length exceeds her breadth. This proportion is fo confiderable, that the fhip continually flies off where the refiftance is leaft, and that fometimes with great fwiftnefs. In this way of failing, however, there is a great limitation: for if the angle made by the keel with the direction of the wind be too acute, the fhip cannot be kept in that pofition; neither is it poffible for a large fhip to make a more acute angle with the wind than $67\frac{1}{2}$ degrees; though fmall floops, it is faid, may make an angle of 56 or 57 degrees with it. In all thefe cafes, however, the velocity of the fhip is greatly retarded; and not only on account of the obliquity of her motion, but by reafon of what is called her *lee-way*. This is occafioned by the yielding of the water on the lee-fide of the fhip, by which means the veffel acquires a compound motion, partly in the direction of the wind, and partly in that which is neceffary for attaining the defired haven. Thus, fuppofing a fhip to fet out from B, in the direction BA, the force of the wind will have fuch an impreffion upon her, that, inftead of keeping the ftraight path BFFF, fhe will follow that of B*abc*, &c. and thus will fall fhort of her intended port by fome confiderable fpace, as A*f*.

It is perhaps impoffible to lay down any mathematical principles on which the lee-way of a fhip could be properly calculated; only we may fee in general that it depends on the ftrength of the wind, the roughnefs of the fea, and the velocity of the fhip. When the wind is not very ftrong, the refiftance of the water on the lee-fide bears a very great proportion to that of the current of air; and therefore it will yield but very little: however, fuppofing the fhip to remain in the fame place, it is evident, that the water having once begun to yield will continue to do fo for fome time, even though no additional force was applied to it; but as the wind continually applies the fame force as at firft, the lee-way of the fhip muft go on conftantly increafing till the refiftance of the water

Theory. on the lee fide balances the force applied on the other, when it will become uniform, as doth the motion of a fhip failing before the wind. If the fhip changes her place with any degree of velocity, then every time fhe moves her own length, a new quantity of water is to be put in motion, which hath not yet received any momentum, and which of confequence will make a greater refiftance than it can do when the fhip remains in the fame place. In proportion to the fwiftnefs of the fhip, then, the lee-way will be the lefs: but if the wind is very ftrong, the velocity of the fhip bears but a fmall proportion to that of the current of air; and the fame effects muft follow as though the fhip moved flowly, and the wind was gentle; that is, the fhip muft make a great deal of lee-way.—The fame thing happens when the fea rifes high, whether the wind is ftrong or not; for then the whole water of the ocean, as far as the fwell reaches, hath acquired a motion in a certain direction, and that to a very confiderable depth. The mountainous waves will not fail to carry the fhip very much out of her courfe; and this deviation will certainly be according to their velocity and magnitude. In all cafes of a rough fea, therefore, a great deal of lee-way is made.—Another circumftance alfo makes a variation in the quantity of the lee-way; namely, the lightnefs or heavinefs of the fhip; it being evident, that when the fhip finks deep in the water, a much greater quantity of that element is to be put in motion before fhe can make any lee-way, than when fhe fwims on the furface. As therefore it is impoffible to calculate all thefe thing with mathematical exactnefs, it is plain that the real courfe of a fhip is exceedingly difficult to be found, and frequent errors muft be made, which only can be corrected by celeftial obfervations.

In many places of the ocean there are *currents*, or places where the water, inftead of remaining at reft, runs with a very confiderable velocity for a great way in fome particular direction, and which will certainly carry the fhip greatly out of her courfe. This occafions an error of the fame nature with the lee-way; and therefore, whenever a current is perceived, its velocity ought to be determined, and the proper allowances made.

Another fource of error in reckoning the courfe of a fhip proceeds from the variation of the compafs. There are few parts of the world where the needle points exactly north; and in thofe where the variation is known, it is fubject to very confiderable alterations. By thefe means the courfe of the fhip is miftaken; for as the failors have no other ftandard to direct them than the compafs, if the needle, inftead of pointing due north, fhould point north-eaft, a prodigious error would be occafioned during the courfe of the voyage, and the fhip would not come near the port to which fhe was bound. To avoid errors of this kind the only method is, to obferve the azimuths as frequently as poffible, by which the difference of variation will be perceived, and the proper allowances can then be made for errors in the courfe which this may have occafioned.

Errors will arife in the reckoning of a fhip, efpecially when fhe fails in high latitudes, from the fpheroidal figure of the earth; for as the polar diameter of our globe is found to be confiderably fhorter than the equatorial one, it thence follows, that the farther we remove from the equator the longer are the degrees of latitude. Of confequence, if a navigator affigns any certain number of miles for the length of a degree of latitude near the equator, he muft vary that meafure as he approaches towards the poles, otherwife he he will imagine that he hath not failed fo far as he actually hath done. It would therefore be neceffary to have a table containing the length of a degree of latitude in every different parallel from the equator to either pole; as without this a troublefome calculation muft be made at every time the navigator makes a reckoning of his courfe. Such a table, however, hath not yet appeared; neither indeed feems it to be eafy to make it, on account of the difficulty of meafuring the length even of one or two degrees of latitude in different parts of the world. Sir Ifaac Newton firft difcovered this fpheroidal fhape of the earth; and fhewed, from experiments on pendulums, that the polar diameter was to the equatorial one as 229 to 230. This proportion, however, hath not been admitted by fucceeding calculators. The French mathematicians who meafured a degree on the meridian in Lapland, made the proportion between the equatorial and polar diameters to be as 1 to 0.9891. Thofe who meafured a degree at Quito in Peru, made the proportion 1 to 0.99624, or 266 to 265. M. Bouquer makes the proportion to be as 179 to 178; and M. Buffon, in one part of his theory of the earth, makes the equatorial diameter exceed the polar one by $\frac{1}{181}$ of the whole. From thefe variations it appears that the point is not exactly determined, and confequently that any corrections which can be made with regard to the fpheroidal figure of the earth muft be very uncertain.

It is of confequence to navigators in a long voyage to take the neareft way to their port; but this can feldom be done without confiderable difficulty. The fhorteft diftance between any two points of a fphere is meafured by an arch of a great circle intercepted between them; and therefore, excepting where both places lie under the fame parallel of latitude, it is adsifeable to direct the fhip along a great circle of the earth's furface. But this is a matter of confiderable difficulty, becaufe there are no fixed marks by which it can be readily known whether the fhip fails in the direction of a great circle or not. For this reafon the failors commonly choofe to direct their courfe by the rhumbs, or the bearing of the place by the compafs. Thefe bearings do not point out the fhorteft diftance between places; becaufe, on a globe, the rhumbs are fpirals, and not arches of great circles. However, when the places lie directly under the equator, or exactly under the fame meridian, the rhumb then coincides with the arch of a great circle, and of confequence fhews the neareft way. The failing on the arch of a great circle is called *great circle failing*; and the cafes of it depend all on the folution of problems in fpheric trigonometry.

PART II. PRACTICE OF NAVIGATION.

THE main end of all practical navigation is to conduct the ſhip in ſafety to her deſtined port; and for this purpoſe it is of the utmoſt conſequence to know in what particular part of the ſurface of the globe ſhe is at any particular time. This can only be done by having an accurate map of the ſea-coaſts of all the countries of the world, and, by tracing out the ſhip's progreſs along the map, to know at what time ſhe approaches the deſired haven, or how ſhe is to direct her courſe in order to reach it. It is therefore a matter of great importance for navigators to be furniſhed with maps, or *charts*, as they are called, not only very accurate in themſelves, but ſuch as are capable of having the ſhip's courſe eaſily traced upon them, without the trouble of laborious calculations, which are ready to create miſtakes.—The names of the two great diviſions of navigation are taken merely from the kind of charts made uſe of. Plane ſailing is that in which the plane chart is made uſe of; and Mercator's ſailing, or globular ſailing, is that in which Mercator's chart is uſed. In both theſe methods, it is eaſy to find the ſhip's place with as great exactneſs as the chart will allow, either by the ſolution of a caſe in plane trigonometry, or by geometrical conſtruction.

§ 1. *Of Plane ſailing.*

As a neceſſary preliminary to our underſtanding this method of navigation, we ſhall here give the conſtruction of the plane chart.

1. This chart ſuppoſes the earth to be a plane, and the meridians parallel to one another; and likewiſe the parallels of latitude at equal diſtance from one another, as they really are upon the globe. Tho' this method be in itſelf evidently falſe; yet, in a ſhort run, and eſpecially near the equator, an account of the ſhip's way may be kept by it tolerably well.

Having determined the limits of the chart, that is, how may degrees of latitude and longitude, or meridional diſtance (they being in this chart the ſame), it is to contain: ſuppoſe from the lat. of 20° N. to the lat. of 71° N.; and from the longitude of London in 0. deg. to the lon. of 50° W.; then chooſe a ſcale of equal parts, by which the chart may be contained within the ſize of the ſheet of paper on which it is intended to be drawn. In the chart annexed, the ſcale is ſuch, that each degree of latitude and longitude is $\frac{1}{8}$ part of an inch.

Plate CCI. fig. 5. Make a parallelogram ABCD, the length of which AB from north to ſouth ſhall contain 51 degrees, the difference of latitude between the limits of 20° and 71°; and the breadth AD from eaſt to weſt ſhall contain the propoſed 50 degrees of longitude, the degrees being taken from the ſaid ſcale of 8 degrees to an inch; and this parallelogram will be the boundaries of the chart.

About the boundaries of the chart make ſcales containing the degrees, halves and quarters of degrees (if the ſcale is large enough); drawing lines acroſs the chart thro' every 5 or 10 degrees; let the degrees of latitude and longitude have their reſpective numbers annexed, and the ſheet is then fitted to receive the places intended to be delineated thereon.

On a ſtrait ſlip of paſteboard, or ſtiff paper, let the ſcale of the degrees and parts of degrees of longitude, in the line AD, be laid cloſe to the edge; and the diviſions numbered from the right hand towards the left, being all weſt longitude.

Seek in a geographical table for the latitudes and longitudes of the places contained within the propoſed limits; and let them be written out in the order in which they increaſe in latitude.

Then, to lay down any place, lay the edge of the paſteboard ſcale to the diviſions on each ſide the chart, ſhewing the latitude of the place; ſo that the beginning of its diviſions fall on the right-hand border AB; and againſt the diviſion ſhewing the longitude of the given place make a point, and this gives the poſition of the place propoſed; and in like manner are all the other places to be laid down.

Draw waving lines from one point to the other, where the coaſt is contiguous, and thus the repreſentation of the lands within the propoſed limits will be delineated.

Write the names to the reſpective parts, and in ſome convenient place inſert a compaſs, and the chart will be completed.

2. The angle formed by the meridian and rhumb that a ſhip ſails upon, is called the *ſhip's courſe.* Thus if a ſhip ſails on the NNE rhumb, then her courſe will be 22° 30′; and ſo of others.

3. The diſtance between two places lying on the ſame parallel counted in miles of the equator, or the diſtance of one place from the meridian of another counted as above on the parallel paſſing over that place, is called *meridional diſtance;* which, in plane ſailing, goes under the name of *departure.*

4. Let A (n° 3.) denote a certain point on the earth's ſurface, AC its meridian, and AD the parallel of latitude paſſing through it; and ſuppoſe a ſhip to ſail from A on the NNE rhumb till ſhe arrive at B; and through B draw the meridian BD, (which, according to the principles of plane ſailing, muſt be parallel to CA,) and the parallel of latitude BC: then the length of AB, viz. how far the ſhip has ſailed upon the NNE rhumb, is called her *diſtance;* AC or BD will be her difference of latitude, or northing; CB will be her departure, or eaſting; and the angle CAB will be the courſe. Hence it is plain, that the diſtance ſailed will always be greater than either the difference of latitude or departure; it being the hypothenuſe of a right-angled triangle, whereof the other two are the legs; except the ſhip ſails either on a meridian or a parallel of latitude: for if the ſhip ſails on a meridian, then it is plain, that her diſtance will be juſt equal to her difference of latitude, and ſhe will have no departure; but if ſhe ſail on a parallel, then her diſtance will be the ſame with her departure, and ſhe will have no difference of latitude. It is evident alſo from the figure, that if the courſe be leſs than 4 points, or 45 degrees, its complement, viz. the other oblique angle, will be greater than 45 degrees, Plate CCII.

and fo the difference of latitude will be greater than the departure; but if the courfe be greater than 4 points, then the difference of latitude will be lefs than the departure; and laftly, if the courfe be juft 4 points, the difference of latitude will be equal to the departure.

5. Since the diftance, difference of latitude, and departure, form a right-angled triangle, in which the oblique angle oppofite to the departure is the courfe, and the other its complement; therefore, having any two of thefe given, we can (by plain trigonometry) find the reft; and hence arife the cafes of plane-failing, which are as follow.

Case I. Courfe and diftance given, to find difference of latitude and departure.

Example. Suppofe a fhip fails from the latitude of 30° 25′ north, NNE, 32 miles, (n° 4.): Required the difference of latitude and departure, and the latitude come to. Then (by right-angle trigonometry,) we have the following analogy, for finding the departure, *viz.*

As radius - - -		10.00000
to the diftance AC -	32 -	1.50515
fo is the fine of the courfe A	22°, 30′ -	9.58284
to the departure BC -	12.25 -	1.08799

fo the fhip has made 12.25 miles of departure eafterly, or has got fo far to the eaftward of her meridian. Then for the difference of latitude or northing the fhip has made, we have (by rectangular trigonometry) the following analogy, *viz.*

As radius - - -		10.00000
is to the diftance AC -	32 -	1.50515
fo is the co-fine of courfe A	22° 30′	9.58284
to the difference of lat. AB	29.57	1.47077

fo the fhip has differed her latitude, or made of northing, 29.57 minutes.

And fince her former latitude was north, and her difference of latitude alfo north; therefore,

To the latitude failed from -	30°, 25′ N
add the difference of latitude -	00°, 29. 57
and the fum is the latitude come to	30°, 54.57 N

By this cafe are calculated the tables of difference of latitude, and departure, to every degree, point, and quarter-point of the compafs.

Case II. Courfe and difference of latitude given, to find diftance and departure.

Example. Suppofe a fhip in the latitude of 45° 25′ north, fails NE*b*N½ eafterly (n° 5.) till fhe come to the latitude of 46° 55′ north: Required the diftance and departure made good upon that courfe.

Since both latitudes are northerly, and the courfe alfo northerly; therefore,

From the latitude come to -	46°, 55′
fubtract the latitude failed from -	45°, 25′
and there remains - -	01°, 30′
the difference of latitude, equal to -	90 miles.

And (by rectangular trigonometry) we have the following analogy, for finding the departure BD, *viz.*

As radius - - -		10.00000
is to the diff. of latitude AB -	90 -	1.95424
fo is the tangent of courfe A -	39°, 22′	9.91404
to the departure BD -	73 84	1.86828

fo the fhip has got 73.84 miles to the eaftward of her fomer meridian.

Again, for the diftance AD, we have (by rectangular trigonometry) the following proportion, *viz.*

As radius - - -		10.00000
is to the fecant of the courfe	39°, 22′	10.11176
fo is the difference of latitude AB	90 -	1.95424
to the diftance AD -	116.4	2.06600

Case III. Difference of latitude and diftance given, to find courfe and departure.

Example. Suppofe a fhip fails from the latitude of 56° 50′ north, on a rhumb between fouth and weft, 126 miles, and fhe is then found by obfervation to be in the latitude of 55° 40′ north: Required the courfe fhe failed on, and her departure from the meridian. N° 6.

Since the latitudes are both north, and the fhip failing towards the equator; therefore,

From the latitude failed from -	56°, 50′
fubtract the obferved latitude -	55°, 10′
and the remainder - -	01°, 40′

equal to 70 miles, is the difference of latitude.

By rectangular trigonometry we have the following proportion for finding the angle of the courfe F, *viz.*

As the diftance failed DF -	126 -	2.10037
is to radius - - -		10.00000
fo is the diff. of latitude FD -	70 -	1.84510
to the co-fine of the courfe F -	56°, 15′	9.74473

which, becaufe fhe fails between fouth and weft, will be fouth 56° 15′ weft, or SW*b*W. Then, for the departure, we have (by rectangular trigonometry) the following proportion, *viz.*

As radius - - -		10.00000
is to the diftance failed DF -	126 -	2.10037
fo is the fine of the courfe F -	56°, 15′	9.91985
to the departure DE -	104.8 -	2.02022

confequently fhe has made 104.8 miles of departure wefterly.

Case IV. Difference of latitude and departure given, to find courfe and diftance.

Example. Suppofe a fhip fails from the latitude of 44° 50′ north, between fouth and eaft, till fhe has made 64 miles of eafting, and is then found by obfervation to be in the latitude of 42° 56′ north: Required the courfe and diftance made good.

Since the latitudes are both north, and the fhip failing towards the equator; therefore,

From the latitude failed from -	44°, 50′N
take the latitude come to - -	42°, 56′
and there remains - -	01°, 54′

equal to 114 miles, the difference of latitude or fouthing.

In this cafe (by rectangular trigonometry) we have the following proportion to find the courfe KGL (N° 7.) *viz.*

As the diff. of latitude GK 114	-	2.05690
is to radius - -	-	10.00000
fo is the departure KL -	64 -	1.80618
to the tangent of courfe G -	29°, 19′ -	9.74928

which, becaufe the fhip is failing between fouth and eaft, will be fouth 29° 19′ eaft, or SSE ½ eaft nearly.

Then for the diftance, we fhall have (by rectangular trigonometry) the following analogy, *viz.*

As

As radius	- - -		10.00000
is to the diff. of latitude GK	114	-	2.05690
ſo is the ſecant of the courſe	-	29°, 19'	10.05952
to the diſtance GL	-	130.8 -	2.11642

conſequently the ſhip has ſailed on a SSE $\frac{1}{2}$ eaſt courſe 130.8 miles.

Case V. Diſtance and departure given, to find courſe and difference of latitude.

Example. Suppoſe a ſhip at ſea ſails from the latitude of 34° 24' north, between north and weſt 124 miles, and is found to have made of weſting 86 miles: Required the courſe ſteered, and the difference of latitude or northing made good.

In this caſe (by rectangular trigonometry) we have the following proportion for finding the courſe ADB, (N° 8.) *viz.*

As the diſtance AD	-	124 -	2.09342
is to radius	- -	-	10.00000
ſo is the departure AB	-	86 -	1.93450
to the ſine of the courſe D	43° 54'	-	9.84108

ſo the ſhip's courſe is north 33° 45' weſt, or NW*b*N $\frac{1}{4}$ weſt nearly.

Then for the difference of latitude, we have (by rectangular trigonometry) the following analogy, *viz.*

As radius	- -	-	10.00000
is to the diſtance AD	-	124 -	2.09342
ſo is the co-ſine of the courſe	43°, 54'	-	9.85766
to the diff. of latitude BD	-	89.35 -	1.95108

which is equal to 1 degree and 29 minutes nearly.

Hence, to find the latitude the ſhip is in, ſince both latitudes are north, and the ſhip ſailing from the equator; therefore,

To the latitude ſailed from	34°, 24'
add the difference of latitude	1°, 29'
the ſum is	35°, 53

the latitude the ſhip is in north.

Case VI. Courſe and departure given, to find diſtance and difference of latitude.

Example. Suppoſe a ſhip at ſea, in the latitude of 24° 30' ſouth, ſails SE*b*S, till ſhe has made of eaſting 96 miles: Required the diſtance and difference of latitude made good on that courſe.

In this caſe (by rectangular trigonometry and by caſe 2.) we have the following proportion for finding the diſtance, (N° 9.) *viz.*

As the ſine of the courſe G	33°, 45'	-	9.74474
is to the departure HM	-	96 -	1.98227
ſo is radius	-	-	10.00000
to the diſtance GM	-	172.8 -	2.23753

Then, for the difference of latitude, we have (by rectangular trigonometry) the following analogy, *viz.*

As the tangent of courſe	-	33°, 45' -	9.82489
is to the departure HM	-	96 -	1.98227
ſo is radius	-	-	10.00000
to the difference of latitude GH	-	143.7 -	2.15738

equal to 2°, 24' nearly. Conſequently, ſince the latitude the ſhip failed from was ſouth, and ſhe ſailing ſtill towards the ſouth,

To the latitude ſailed from	24°, 30'
add the difference of latitude	2°, 24'
and the ſum	26°, 54

is the latitude ſhe is come to ſouth.

6. When a ſhip ſails on ſeveral courſes in 24 hours, the reducing all theſe into one, and thereby finding the courſe and diſtance made good upon the whole, is commonly called the *reſolving of a traverſe.*

7. At ſea they commonly begin each day's reckoning from the noon of that day, and from that time they ſet down all the different courſes and diſtances ſailed by the ſhip till noon next day upon the log-board; then from theſe ſeveral courſes and diſtances, they compute the difference of latitude and departure for each courſe (by *Caſe* 1. *of Plane Sailing;*) and theſe, together with the courſes and diſtances, are ſet down in a table, called the *traverſe table*, which conſiſts of five columns: in the firſt of which are placed the courſes and diſtances; in the two next, the differences of latitude belonging to theſe courſes, according as they are north or ſouth; and in the two laſt are placed the departures belonging to theſe courſes, according as they are eaſt or weſt. Then they ſum up all the northings and all the ſouthings; and taking the difference of theſe, they know the difference of latitude made good by the ſhip in the laſt 24 hours, which will be north or ſouth, according as the ſum of the northings or ſouthings is greateſt: the ſame way, by taking the ſum of all the eaſtings, and likewiſe of all the weſtings, and ſubtracting the leſſer of theſe from the greater, the difference will be the departure made good by the ſhip laſt 24 hours, which will be eaſt or weſt according as the ſum of the eaſtings is greater or leſs than the ſum of the weſtings; then from the difference of latitude and departure made good by the ſhip laſt 24 hours, found as above, they find the true courſe and diſtance made good upon the whole (by *Caſe* 4. *of Plane Sailing*), as alſo the courſe and diſtance to the intended port.

Example. Suppoſe a ſhip at ſea, in the latitude of 48° 24' north at noon any day, is bound to a port in the latitude of 43° 40' north, whoſe departure from the ſhip is 144 miles eaſt; conſequently the direct courſe and diſtance of the ſhip is SSE $\frac{1}{4}$ eaſt 315 miles; but by reaſon of the ſhifting of the winds ſhe is obliged to to ſteer the following courſes till noon next day, *viz.* SE*b*S 56 miles, SSE 64 miles, NW*b*W 48 miles, S*b*W $\frac{1}{4}$ weſt 54 miles, and SE*b*S $\frac{1}{4}$ eaſt 74 miles: Required the courſe and diſtance made good the laſt 24 hours, and the bearing and diſtance of the ſhip from the intended port.

The ſolution of this traverſe depends entirely on the 1ſt and 4th *Caſes of Plane Sailing;* and firſt we muſt (by *Caſe* 1.) find the difference of latitude and departure for each courſe. Thus,

1 Courſe SE*b*S diſtance 56 miles.

For departure.

As radius	-	-	10.00000
is to the diſtance	- 56	-	1.74819
ſo is the ſine of the courſe	33°, 45'	-	9.74474
to the departure	- 31.11	-	1.49293

For difference of latitude.

As radius	-	-	10.00000
is to the diſtance	-	56 -	1.74819
ſo is the co-ſine of the courſe		33°, 45'	9.91985
to the diff. of latitude	-	46.57 -	1.66804

2. Courſe SSE and diſtance 64 miles.

For departure.

As radius	-	-	10.00000
is to the diſtance	-	64 -	1.80618
ſo is the ſine of the courſe	-	22°, 30'	9.58284

to

PRACTICE.

to the departure	-	24.5 -	1.38902

For difference of latitude.

As radius	-	-	10.00000
is to the diftance	-	64 -	1.80618
fo is the co-fine of the courfe		22°, 30'	9.96562
to the difference of latitude	-	59.13 -	1.77180

3. Courfe NW*b*W and diftance 48 miles.

For departure.

As radius	-	-	10.00000
is to the diftance	-	48 -	1.68124
fo is the fine of the courfe	-	56°, 15'	9.91985
to the departure	-	39.91 -	1.60109

For difference of latitude.

As radius	-	-	10.00000
is to the diftance	-	48 -	1.68124
fo is the co-fine of the courfe		56°, 15'	9.74474
to the difference of latitude	-	26.67	1.42598

4. Courfe S*b*W ½ weft and diftance 54 miles.

For departure.

As radius	-	-	10.00000
is to the diftance	-	54 -	1.73239
fo is the fine of the courfe		16°, 52'	9.46262
to the departure	-	15.67 -	8.19501

For difference of latitude.

As radius	-	-	10.00000
is to the diftance	-	54 -	1.73239
fo is the co-fine of the courfe		16°, 52'	9.98090
to the difference of latitude	-	51.67 -	1.71329

5. Courfe SE*b*S ½ eaft and diftance 74 miles.

For departure.

As radius	-	-	10.00000
is to the diftance	-	74 -	1.86923
fo is the fine of the courfe		39°, 22' -	9.80228
to the departure	-	46.94 -	1.67151

For difference of latitude.

As radius	-	-	10.00000
is to the diftance	-	74 -	1.80923
fo is the co-fine of the courfe		39°, 22'	9.88824
to the difference of latitude		57.21 -	1.75747

Now thefe feveral courfes and diftances, together with the differences of latitude and departures deduced from them, being fet down in their proper columns in the traverfe table, will ftand as follows.

The Traverse Table.

Courfes.	*Diftances.*	*Diff. of Lat.*		*Departure.*	
		N	*S*	*E*	*W*
SE*b*S —	56	——	46.57	31.11	——
SSE —	64	——	59.13	24.5	——
NW*b*W —	48	26.67	——	——	39.91
S*b*W½W —	54	——	51.67	——	15.67
SE*b*S½E —	94	——	57.21	46.94	——
		26.67	214.58	102.55	55.58
			26.67	55.58	
	Diff. of Lat.		187.91	46.97	*Dep.*

From the above table it is plain, fince the fum of the northings is 26.67, and of the fouthings 214.58, the difference between thefe, *viz.* 187.91, will be the fouthing made good by the fhip the laft 24 hours; alfo the fum of the eaftings being 102.55, and of the weftings 55.58, the difference 46.97 will be the eafting or departure made good by the fhip's laft 24 hours; confequently, to find the true courfe and diftance made good by the fhip in that time, it will be (by *Cafe* 4. *of Plane Sailing*,)

PRACTICE.

As the difference of latitude	-	187.91	2.27393
is to the radius	-	-	10.00000
fo is the departure	-	46.97	1.67182
to the tangent of the courfe		14°, 03' -	9.39789

which is S*b*E ¼ eaft nearly. Then for the diftance, it will be,

As radius	-	-	10.00000
is to the difference of latitude	-	187.91	2.27393
fo is the fecant of the courfe	-	14°, 03'	10.01319
to the diftance	-	193.7 -	2.28712

confequently the fhip has made good the laft 24 hours, on a S*b*E ¼ eaft courfe, 193.7 miles: and fince the fhip is failing towards the equator; therefore,

From the latitude failed from	-	48°, 24' N
take the diff. of latitude made good	-	3 , 08 S
there remains	- -	45 , 16 N

the latitude the fhip is in north. And becaufe the port the fhip is bound for lies in the latitude of 43° 40' N. and confequently fouth of the fhip; therefore,

From the latitude the fhip is in	-	45°, 16' N
take the latitude fhe is bound for	-	43 , 40 N
and there remains	- -	1 , 36

or 96 miles, the difference of latitude or fouthing the fhip has to make. Again, the whole eafting the fhip had to make being 144 miles, and fhe having already made 46.97 or 47 miles of eafting; therefore the departure or eafting fhe ftill has to make will be 97 miles: confequently, to find the direct courfe and diftance between the fhip and the intended port, it will be (by *Cafe* 4. *of Plane Sailing*,)

As the difference of latitude	-	96 -	1.98227
is to radius	- -	-	10.00000
fo is the departure	-	97 -	1.98677
to the tangent of the courfe		45°, 19'	10.00450

And

As radius	-	-	10.00000
is to the difference of latitude		96 -	1.98227
fo is the fecant of the courfe		45°, 19'	10.15293
to the diftance	-	136.5 -	2.13620

whence the true bearing and diftance of the intended port is SE, 136.5 miles.

§ 2. *Of Parallel Sailing.*

1. Since the parallels of latitude do always decreafe the nearer they approach the pole, it is plain a degree on any of them muft be lefs than a degree upon the equator. Now in order to know the length of a degree on any of them, let PB (n° 10.) reprefent half the earth's axis, PA a quadrant of a meridian, and confequently A a point on the equator, C a point on the meridian, and CD a perpendicular from that point upon the axis, which plainly will be the fine of CP the diftance of that point from the pole, or the co-fine of CA its diftance from the equator; and CD will be to AB, as the fine of CP, or co-fine of CA, is to the radius. Again, if the quadrant PAB is turned round upon the axis PB, it is plain the point A will defcribe the circumference of the equator whofe radius is AB, Plate CCI.

and

and any other point C upon the meridian will describe the circumference of a parallel whofe radius is CD.

Cor. I. Hence (becaufe the circumference of circles are as their radii) it follows, that the circumference of any parallel is to the circumference of the equator, as the co-fine of its latitude is to radius.

Cor. II. And fince the wholes are as their fimilar parts, it will be, As the length of a degree on any parallel is to the length of a degree upon the equator, fo is the co-fine of the latitude of that parallel to radius.

Cor. III. Hence, as radius is to the co-fine of any latitude, fo are the minutes of difference of longitude between two meridians, or their diftance in miles upon the equator, to the diftance of thefe two meridians on the parallel in miles.

Cor. IV. And as the co-fine of any parallel is to radius, fo is the length of any arch on that parallel (intercepted between two meridians) in miles, to the length of a fimilar arch on the equator, or minutes of difference of longitude.

Cor. V. Alfo, as the co-fine of any one parallel is to the co-fine of any other parallel, fo is the length of any arch on the firft, in miles, to the length of the fame arch on the other in miles.

2. From what has been faid, arifes the folution of the feveral cafes of parallel failing, which are as follow.

Case I. Given the difference of longitude between two places, both lying on the fame parallel; to find the diftance between thofe places.

Example I. Suppofe a fhip in the latitude of 54° 20′ north, fails directly weft on that parallel till fhe has differed her longitude 12° 45′; required the diftance failed on that parallel.

Firft, The difference of longitude reduced into minutes, or nautical miles, is 765′, which is the diftance between the meridian failed from, and the meridian come to, upon the equator; then to find the diftance between thefe meridians on the parallel of 54° 20′, or the diftance failed, it will be, by *Cor.* 3. of the laft article,

As radius	- -	10.00000
is to the co-fine of the lat.	- 54°, 20′ -	9.76572
fo are the minutes of diff. long.	765 -	2.88366
to the diftance on the parallel	446.1 -	2.64938

Example II. A degree on the equator being 60 minutes or nautical miles; required the length of a degree on the parallel of 51° 32′.

By Cor. 3. of the laft article, it will be

As radius	- -	10.00000
is to the co-fine of the latitude	- 51°, 32′	9.79383
fo are the minutes in 1 degree on the equa.	60	1.77815
to - - -	37.32	1.57198

the miles anfwering to a degree on the parallel of 51° 32′

By this problem the following table is conftructed, fhewing the geographic miles anfwering to a degree on any parallel of latitude; in which you may obferve, that the columns marked at the top with *D. L.* contain the degrees of latitude belonging to each parallel; and the adjacent columns marked at the top, *Miles*, contain the geographic miles anfwering to a degree upon thefe parallels.

A Table fhewing how many Miles anfwer to a Degree of Longitude, at every Degree of Latitude.

D. L.	*Miles.*	*D. L.*	*Miles.*	*D. L.*	*Miles.*	*D. L.*	*Miles*	*D. L.*	*Miles.*
1	59.99	19	56.73	37	47.92	55	34.41	73	17.54
2	59.97	20	56.38	38	47.28	56	33.55	74	16.53
3	59.92	21	56 01	39	46.62	57	32.68	75	15.52
4	59.86	22	55.63	40	45.95	58	31.79	76	14.51
5	59.77	23	55.23	41	45.28	59	30.90	77	13.50
6	59.67	24	54.81	42	44.95	60	30.00	78	12.48
7	59.56	25	54.38	43	43.88	61	29.09	79	11.45
8	59.44	26	53.93	44	43.16	62	28.17	80	10.42
9	59.26	27	53.46	45	42.43	63	27.24	81	9.38
10	59.08	28	52.97	46	51.68	64	26.30	82	8.35
11	59.89	29	52.47	47	40.92	65	25.36	83	7.32
12	58.68	30	51.96	48	40 15	66	24.41	84	6.28
13	58.46	31	51.43	49	39.36	67	23.45	85	5.23
14	58.22	32	50.88	50	38.57	68	22.48	86	4.18
15	57.95	33	50.32	51	37.76	69	21.50	87	3.14
16	57.67	34	49.74	52	36 94	70	20.52	88	2.09
17	57.36	35	49.15	53	36.11	71	19.54	89	1.05
18	57.06	36	48.54	54	35.26	72	18.54	90	0.00

Though this table does only fhew the miles anfwering to a degree of any parallel, whofe latitude confifts of a whole number of degrees; yet it may be made to ferve for any parallel whofe latitude is fome number of degrees and minutes, by making the following proportion, *viz.*

As 1 degree, or 60 minutes, is to the difference between the miles anfwering to a degree in the next greater and next lefs tabular latitude than that propofed; fo is the excefs of the propofed latitude above the next tabular latitude, to a proportional part; which, fubtracted from the miles anfwering to a degree of longitude in the next lefs tabular latitude, will give the miles anfwering to a degree in the propofed latitude.

Example. Required to find the miles anfwering to a degree on the parallel of 56° 44′.

Firft, The next lefs parallel of latitude in the table than that propofed, is that of 56°; a degree of which (by the table) is equal to 33.55 miles; and the next greater parallel of latitude in the table, than that propofed, is that of 57°, a degree of which is (by the table) equal to 32.68 miles; the difference of thefe is 87, and the diftance between thefe parallels is 1 degree, or 60 minutes; alfo the diftance between the parallel of 56°, and the propofed parallel of 56° 44′, is 44 minutes: then by the preceding proportion it will be, as 60 is to 87, fo is 44 to 638, the difference between a degree on the parallel of 56° and a degree on the parallel of 56° 44′; which therefore, taken from 33.55, the miles anfwering to a degree on the parallel of 56°, leaves 32.912, the miles anfwering to a degree on the parallel of 56° 44′, as was required.

Case II. The diftance failed in any parallel of latitude, or the diftance between any two places on that parallel, being given; to find the difference of longitude.

Example. Suppofe a fhip in the latitude of 55° 36′ north.

 north ſails directly eaſt 685.6 miles: Required how much ſhe has differed her longitude.

By Cor. 4. Art. 1. of this ſection, it will be

As the co-ſine of the lat.	55° 36′	9.75202
is to radius		10.00000
ſo is the diſtance ſailed	685.6	2.83607
to min. of diff. of long.	1213	3.08405

which reduced into degrees, by dividing by 60, makes 20° 13′, the difference of longitude the ſhip has made.

This alſo may be ſolved by help of the foregoing table, *viz.* by finding from it the miles anſwering to a degree on the propoſed parallel, and dividing with this the given number of miles, the quotient will be the degrees and minutes of difference of longitude required.

Thus in the laſt example, we find, from the foregoing table, that a degree on the parallel of 55° 36′ is equal to 33.89 miles; by this we divide the propoſed number of miles 685.6, and the quotient is 20.13 degrees, *i. e.* 20° 13′, the difference of longitude required.

Case III. The difference of longitude between two places on the ſame parallel, and the diſtance between them, being given; to find the latitude of that parallel.

Example. Suppoſe a ſhip ſails on a certain parallel directly weſt 624 miles, and then has differed her longitude 18° 46′, or 1126 miles: Required the latitude of the parallel ſhe ſailed upon.

By Cor. 3. Art. 1. of this ſection, it will be,

As the min. of diff. long.	1126	3.05154
is to the diſtance ſailed	624	2.79518
ſo is radius		10.00000
to the co-ſine of the lat.	56°, 21′	9.74364

conſequently the latitude of the ſhip or parallel ſhe ſailed upon was 56° 21′.

From what has been ſaid, may be ſolved the following problems.

Prob. I. Suppoſe two ſhips in the latitude of 46° 30′ north, diſtant aſunder 654 miles, ſail both directly north 256 miles, and conſequently are come to the latitude of 50° 46′ north: Required their diſtance on that parallel.

By Cor. 6. Art. 1. of this ſection, it will be,

As the co-ſine of	46°, 30′	9.83781
is to the co-ſine of	50°, 46′	9.80105
ſo is	654	2.81558
to	601	2.77882

the diſtance between the ſhips when on the parallel of 50° 46′.

Prob. II. Suppoſe two ſhips in the latitude of 45° 48′ north, diſtant 846 miles, ſail directly north till the diſtance between them is 624 miles: Required the latitude come to, and the diſtance ſailed.

By Cor. 5. Art. 1. of this ſection, it will be,

As their firſt diſtance	846	2.92737
is to their ſecond diſtance	624	2.79518
ſo is the co-ſine of	45°, 48′	9.84334
to the coſine	59, 04	9.71115

the latitude of the parallel the ſhips are come to.

Conſequently to find their diſtance ſailed,

From the latitude come to	59°, 04′
ſubtract the latitude ſailed from	45, 48
and there remains	13, 16

equal to 796 miles, the difference of latitude or diſtance ſailed.

§ 3. *Of Middle-latitude Sailing.*

1. When two places lie both on the ſame parallel, we ſhewed in the laſt ſection, how, from the difference of longitude given, to find the miles of eaſting or weſting between them, *et è contra*. But when two places lie not on the ſame parallel, then their difference of longitude cannot be reduced to miles of eaſting or weſting on the parallel of either place: for if counted on the parallel of that place that has the greateſt latitude, it would be too ſmall; and if on the parallel of that place having the leaſt latitude, it would be too great. Hence the common way of reducing the difference of longitude between two places, lying on different parallels, to miles of eaſting or weſting, *et è contra*, is by counting it on the middle parallel between the places, which is found by adding the latitudes of the two places together, and taking half the ſum, which will be the latitude of the middle parallel required. And hence ariſes the ſolution of the following caſes.

Case I. The latitudes of two places, and their difference of longitude, given; to find the direct courſe and diſtance.

Example. Required the direct courſe and diſtance between the Lizard in the latitude of 50° 00′ north, and longitude of 5° 14′ weſt, and St Vincent in the latitude of 17° 10′ N. and longitude of 24 20 W.

Firſt, To the latitude of the Lizard	50°, 00′ N.
add the latitude of St Vincent	17, 10
The ſum is	67, 10
Half the ſum or latitude of the middle parallel is	33, 35 N.
Alſo the difference of latitude is	33, 50

equal to 1970 miles of ſouthing. Again,

From the longitude of St Vincent	24, 20 W.
take the longitude of the Lizard	05, 14
there remains	16, 06

equal to 1146 min. of diff. of long. weſt.

Then for the miles of weſting, or departure, it will be, (by *Caſe* 1. *of Parallel Sailing*)

As radius		10.00000
is to the co-ſine of the middle parallel	33°, 35′	9.92069
ſo is min. diff. of long.	1146	3.05918
to the miles of weſting	954.7	2.97987

And for the courſe it will be, (by *Caſe* 4. *of Plane Sailing*)

As the diff. of lat.	1970	3.29447
is to radius		10.00000
ſo is the departure	954.7	2.97987
to the tang. of the courſe	25°, 51′	9.68540

which, becauſe it is between ſouth and weſt, it will be SSW $\frac{1}{4}$ weſt nearly.

For the diſtance, it will be, by the ſame caſe,

As radius		10.00000
is to the diff. of lat.	1970	3.29447
ſo is the ſecant of the courſe	25°, 51′	10.04579
to the diſtance	2189	3.34026

whence the direct courſe and diſtance from the Lizard to St Vincent is SSW $\frac{1}{4}$ 2189 W miles.

Case II. One latitude, courſe, and diſtance ſailed being

PRACTICE

being given; to find the other latitude and difference of longitude.

Example. Suppoſe a ſhip in the latitude of 50° 00' north, ſails ſouth 50°06' weſt, 150 miles: Required the latitude the ſhip has come to, and how much ſhe has differed her longitude.

Firſt, For the difference of latitude, it will be, (by *Caſe* 1. *of Plane Sailing*,)

As radius		10.00000
is to the diſtance	150	2.17609
ſo is the co-ſine of the courſe 50°, 06'		9.80716
to the diff. of latitude	96.22	1.98325

equal to 1°, 36'. And ſince the ſhip is ſailing towards the equator; therefore,

From the latitude ſhe was in	50°, 00'
take the diff. of latitude	1, 36
and there remains	48, 24

the latitude ſhe has come to north. Conſequently the latitude of the middle parallel will be 49° 12'.

Then for departure or weſting it will be, by the ſame *Caſe*,

As radius		10.00000
is to the diſtance	150	2.17609
ſo is the ſine of the courſe 50°, 06'		9.88489
to the departure	115.1	2.06098

As for the difference of longitude, it will be, (by *Caſe* 2. *of Plane Sailing*,)

As the co-ſine of the middle parallel 49° 12'		9.81519
is to radius		10.00000
ſo is the departure	115.1	2.06098
to the min. diff. of longitude	176.1	2.24579

equal to 2° 56', which is the difference of longitude the ſhip has made weſterly.

Case III. Courſe and difference of latitude given; to find the diſtance ſailed, and difference of longitude.

Example. Suppoſe a ſhip in the latitude of 53° 34' north, ſails SE*b*S, till by obſervation ſhe is found to be in the latitude of 51° 12', and conſequently has differed her latitude 2° 22', or 142 miles: Required the diſtance ſailed, and the difference of longitude.

Firſt, for the departure, it will be, (by *Caſe* 2. *of Plane Sailing*,)

As radius		10.00000
is to the diff. of latitude	142	2.15229
ſo is the tang. of courſe 33°, 45'		9.82489
to the departure	94.88	1.97718

And for the diſtance it will be, (by the ſame *Caſe*,)

As radius		10.00000
is to the diff. of latitude	142	2.15229
ſo is the ſecant of the courſe 33°, 45'		10.08015
to the diſtance	170.8	2.23244

Then, ſince the latitude ſailed from was 53° 34' north, and the latitude come to 51° 12' north; therefore the middle parallel will be 52° 23'; and conſequently, for the difference of longitude, it will be (by *Caſe* 2. *of Parallel Sailing*.)

As the co-ſine of the mid. parallel 52°, 23'		9.78560
is to the departure	94.88	1.97718
ſo is radius		10.00000
to min. of diff. of longitude	155.5	2.19158

equal to 2o 35' the difference of longitude eaſterly.

Case IV. Difference of latitude and diſtance ſailed, given; to find the courſe and difference of longitude.

Example. Suppoſe a ſhip in the latitude of 43° 26' north, ſails between ſouth and eaſt, 246 miles, and then is found by obſervation to be in the latitude of 41° 06' north: Required the direct courſe and difference of longitude.

Firſt, For the courſe, it will be, (by *Caſe* 3. *of Plane Sailing*,)

As the diſtance	246	2.39094
is to radius		10.00000
ſo is the diff. of latitude	140	2.14613
to the co-ſine of the courſe 55°, 19'		9.75519

which, becauſe the ſhip ſails between ſouth and eaſt, will be ſouth 55° 19' eaſt, or SE*b*E nearly.

Then for departure, it will be, by the ſame *Caſe*,

As radius		10.00000
is to the diſtance	246	2.39094
ſo is the ſine of the courſe 55°, 19'		9.91504
to the departure	202.3	2.30598

Laſtly, For the difference of longitude, it will be, (by *Caſe* 2. *of Parallel Sailing*,)

As the co-ſine of the mid. par. 42°, 16		9.86924
is to the departure	302.3	2.30598
ſo is radius		10.00000
to min. of diff. of longitude	273.3	2.43674

equal to 4° 33', the difference of longitude eaſterly.

Case V. Courſe and departure given, to find difference of latitude, difference of longitude, and diſtance ſailed.

Example. Suppoſe a ſhip in the latitude of 48° 23' north, ſails SW*b*S, till ſhe has made of weſting 123 miles: Required the latitude come to, the difference of longitude, and the diſtance ſailed.

Firſt, For the diſtance, it will be, (by *Caſe* 6. *of Plane Sailing*,)

As the ſine of the courſe 33°, 45'		6.74474
is to the departure	123	2.08991
ſo is radius		10.00000
to the diſtance	221.4	2.34517

And for the difference of latitude, it will be, by the ſame *Caſe*,

As the tang. of courſe 33°, 45'		9.82489
is to the departure	123	2.08991
ſo is radius		10.00000
to the diff. of latitude	184	2.26502

equal to 3° 04': And ſince the ſhip is ſailing towards the equator, the latitude come to will be 45° 19' north; and conſequently the middle parallel will be 46° 51'.

Then to find the difference of longitude, it will be, (*Caſe* 2. *of Parallel Sailing*,)

As the co-ſine of mid. par. 46°, 51'		9.83500
is to departure	123	2.08991
ſo is radius		10.00000
to min. of diff. of longit.	180	2.25491

which is equal to 3° 00', the difference of longitude weſterly.

Case VI. Difference of latitude and departure given, to find courſe, diſtance, and difference of longitude.

Example. Suppoſe a ſhip in the latitude of 46° 37' north, ſails between ſouth and eaſt, till ſhe has made of eaſting 146 miles, and is then found by obſervation to be in the latitude of 43° 24' north: Re-

Required the courſe, diſtance, and difference of longitude.

Firſt, By *Caſe* 4. *of Plane Sailing*, it will be for the courſe,

As the diff. of latitude	193	2.28556
is to departure	146	2.16137
ſo is radius		10.00000
to the tang. of the courſe	36°, 55'	9.87581

which, becauſe the ſhip is ſailing between ſouth and eaſt, will be ſouth 36° 55' eaſt, or SE*b*S ¼ eaſt nearly.

For the diſtance, it will be, by the ſame *Caſe*,

As radius		10.00000
is to the diff. of latitude	193	2.28556
ſo is the ſecant of the courſe	36°, 55'	10.09718
to the diſtance	241.4	2.38274

Then for the difference of longitude, it will be, by *Caſe* 2. *of Parallel Sailing*,

As the co-ſine of the mid. par.	45°, 00'	9.84949
is to the departure	146	2.16137
ſo is radius		10.00000
to min. of diff. of longitude	205	2.31188

equal to 3° 25', the difference of longitude eaſterly.

Case VII. Diſtance and departure given, to find difference of latitude, courſe, and difference of longitude.

Example. Suppoſe a ſhip in the latitude of 33° 40' north, ſails between ſouth and eaſt 165 miles, and has then made of eaſting 112.5 miles: Required the difference of latitude, courſe, and difference of longitude.

Firſt, for the courſe, it will be, by *Caſe* 5. *of Plane ſailing*,

As the diſtance	165	2.21748
is to radius		10.00000
ſo is the departure	102.5	2.05115
to the ſine of the courſe	42°, 59'	9.83367

which, becauſe the ſhip ſails between ſouth and eaſt, will be ſouth 42° 59' eaſt, or SE*b*E ½ eaſt nearly.

And for the difference of latitude, it will be, by the ſame *Caſe*,

As radius		10.00000
is to the diſtance	165	2.21748
ſo is the co-ſine of the courſe	42,° 59'	9.86436
to the difference of lat.	120.7	2.08184

equal to 2° 00'; conſequently the latitude come to will be 31° 40' north, and the latitude of the middle parallel will be 32° 40'. Hence, to find the difference of longitude, it will be, by *Caſe* 2. *of Parallel Sailing*,

As the co-ſine of the mid. par.	32°, 40'	9.92522
is to the departure	112.5	2.05115
ſo is radius		10.00000
to min. of diff. of long.	133.6	2.12593

equal to 2° 13' nearly, the difference of longitude eaſterly.

Case VIII. Difference of longitude and departure given; to find difference of latitude, courſe, and diſtance ſailed.

Example. Suppoſe a ſhip in the latitude of 50° 46' north, ſails between ſouth and weſt, till her difference of longitude is 3° 12', and is then found to have departed from her former meridian 126 miles; required the difference of latitude, courſe, and diſtance ſailed.

Firſt, For the latitude ſhe has come to, it will be, by *Caſe* 3. *of Parallel Sailing*,

As min. of diff. of long.	192	2.28330
is to departure	126	2.10037
ſo is radius		10.00000
to the co-ſine of the mid. par.	48°, 59'	9.81707

Now ſince the middle latitude is equal to half the ſum of the two latitudes (by art. 1. of this ſect.) and ſo the ſum of the two latitudes equal to double the middle latitude; it follows, that if from double the middle latitude we ſubtract any one of the latitudes, the remainder will be the other. Hence from twice 48° 59', *viz.* 97° 58', taking 50° 46' the latitude ſailed from, there remains 47° 12' the latitude come to; conſequently the difference of latitude is 3° 34', or 214 minutes.

Then for the courſe, it will be, by *Caſe* 4. *of Plane Sailing*,

As diff. of lat.	214	2.33041
is to radius		10.00000
ſo is the departure	126	2.10037
to the tang. of the courſe	30°, 29'	9.76996

which, becauſe it is between ſouth and weſt, will be ſouth 30° 29' weſt, or SSW ½ weſt nearly.

And for the diſtance, it will be, by the ſame *Caſe*,

As radius		10.00000
is to the diff. of lat.	214	2.33041
ſo is the ſecant of the courſe	30°, 29'	10.06461
to the diſtance	248.4	2.39502

2. From what has been ſaid, it will be eaſy to ſolve a traverſe, by the rules of *Middle-latitude Sailing*.

Example. Suppoſe a ſhip in the latitude of 43° 25' north, ſails upon the following courſes, *viz.* SW*b*S 63 miles, SSW ½ weſt 45 miles, S*b*E 54 miles, and SW*b*W 74 miles: Required the latitude the ſhip has come to, and how far ſhe has differed her longitude.

Firſt, By *Caſe* 2. *of this Sect.* find the difference of latitude and difference of longitude belonging to each courſe and diſtance, and they will ſtand as in the following table.

Courſes.	*Diſtances.*	*Diff. of Lat.*		*Diff. of Longit.*	
		N	*S*	*E*	*W*
SW*b*S	— 63	——	52.4	——	47.85
SSW½W	— 45	——	39.7	——	28.62
S*b*E	— 54	——	53.0	14.75	——
SW*b*W	— 74	——	41.1	——	81.08
			——		157.55
		Diff. of Lat.	186.2		13.75
				Diff. of Long.	143.80

Hence it is plain the ſhip has differed her latitude 186.2 minutes, or 3° 6', and ſo has come to the latitude of 40° 19' north, and has made of difference of longitude 143.8 minutes, or 2° 23' 48" weſterly.

3. This method of ſailing, though it be not ſtrictly true, yet it comes very near the truth, as will be evident, by comparing an example wrought by this method with the ſame wrought by the method delivered

PRACTICE vered in the next section, which is strictly true; and it serves, without any considerable error, in runnings of 450 miles between the equator and parallel of 30 degrees, of 300 miles between that and the parallel of 60 degrees, and of 150 miles as far as there is any occasion, and consequently must be sufficiently exact for 24 hours run.

§. 4. *Of Mercator's sailing.*

1. THOUGH the meridians do all meet at the pole, and the parallels to the equator do continually decrease, and that in proportion to the co-sines of their latitudes; yet in old sea-charts the meridians were drawn parallel to one another, and consequently the parallels of latitude made equal to the equator, and so a degree of longitude on any parallel as large as a degree on the equator: also in these charts the degrees of latitude were still represented (as they are in themselves) equal to each other, and to those of the equator. By these means the degrees of longitude being increased beyond their just proportion, and the more so the nearer they approach the pole, the degrees of latitude at the same time remaining the same, it is evident places must be very erroneously marked down upon these charts with respect to their latitude and longitude, and consequently their bearing from one another very false.

2. To remedy this inconvenience, so as still to keep the meridians parallel, is is plain we must protract, or lengthen, the degrees of latitude in the same proportion as those of longitude are, that so the proportion in easting and westing may be the same with that of southing and northing, and consequently the bearings of places from one another be the same upon the chart as upon the globe itself.

Plate CCIV. Let ABD (N° 11.) be a quadrant of a meridian, A the pole, D a point on the equator, AC half the axis, B any point upon the meridian, from which draw BF perpendicular to AC, and BG perpendicular to CD; then BG will be the sine, and BF or CG the co-sine of BD the latitude of the point B; draw D the tangent and CE the secant of the arch CD. It has been demonstrated in Sect. 2. that any arch of a parallel is to the like arch of the equator as the co-sine of the latitude of that parallel is to radius. Thus any arch as a minute on the parallel described by the point B, will be to a minute on the equator as BF or CG is to CD; but since the triangles CGB CDE are similar, therefore CG will be to CD as CB is to CE, *i. e.* the co-sine of any parallel is to radius as radius is to the secant of the latitude of that parallel. But it has been just now shown, that the co-sine of any parallel is to radius, as the length of any arch as a minute on that parallel is to the length of the like arch on the equator: therefore the length of any arch as a minute on any parallel, is to the length of the like arch on the equator, as radius is to the secant of the latitude of that parallel; and so the length of any arch, as a minute on the equator, is longer than the like arch of any parallel in the same proportion as the secant of the latitude of that parallel is to radius. But since in this projection the meridians are parallel, and consequently each parallel of latitude equal to the equator, it is plain the length of any arch as a minute on any parallel, is increased beyond its just proportion, at such rate as the secant of the latitude of that parallel is greater than radius; and therefore, to keep up the proportion of northing and southing to that of easting and westing, upon this chart, as it is upon the globe itself, the length of a minute upon the meridian at any parallel must also be increased beyond its just proportion at the same rate, *i. e.* as the secant of the latitude of that parallel is greater than radius. Thus to find the length of a minute upon the meridian at the latitude of 75 degrees, since a minute of a meridian is every-where equal on the globe, and also equal to a minute upon the equator, let it be represented by unity; then making it as radius is to the secant of 75 degrees, so is unity to a fourth number, which is 3.864 nearly; and consequently, by whatever line you represent one minute on the equator of this chart, the length of one minute on the enlarged meridian at the latitude of 75 degrees, or the distance between the parallel of 75° 00′ and the parallel of 75° 01′, will be equal to 3 of these lines, and $\frac{864}{1000}$ of one of them. By making the same proportion, it will be found, that the length of a minute on the meridian of this chart at the parallel of 60°, or the distance between the parallel of 60° 00′ and that of 60° 01′, is equal to two of these lines. After the same manner, the length of a minute on the enlarged meridian may be found at any latitude; and consequently, beginning at the equator, and computing the length of every intermediate minute between that and any parallel, the sum of all these shall be the length of a meridian intercepted between the equator and that parallel; and the distance of each degree and minute of latitude from the equator upon the meridian of this chart, computed in minutes of the equator, forms what is commonly called a *table of meridional parts*.

If the arch BD (N° 11.) represent the latitude of any point B, then (CD being radius) CE will be the secant of that latitude: but it has been shown above, that radius is to secant of any latitude, as the length of a minute upon the equator is to the length of a minute on the meridian of this chart at that latitude; therefore CD is to CE, as the length of a minute on the equator is to the length of a minute upon the meridian, at the latitude of the point B. Consequently, if the radius CD be taken equal to the length of a minute upon the equator, CE, or the secant of the latitude, will be equal to the length of a minute upon the meridian at that latitude. Therefore, in general, if the length of a minute upon the equator be made radius, the length of a minute upon the enlarged meridian will be every-where equal to the secant of the arch contained between it and the equator.

COR. 1. Hence it follows, since the length of every intermediate minute between the equator and any parallel, is equal to the secant of the latitude, (the radius being equal to a minute upon the equator), the sum of all these lengths, or the distance of that parallel on the enlarged meridian from the equator, will be equal to the sum of all the secants, to every minute contained between it and the equator.

COR. 2. Consequently the distance between any two parallels on the same side of the equator is equal to the difference of the sums of all the secants contained be-

tween the equator and each parallel, and the diftance between any two parallels on contrary fides of the equator is equal to the fum of the fums of all the fecants contained between the equator and each parallel.

3. By the tables of meridional parts given by all the writers on this fubject, may be conftructed the nautical chart, commonly called *Mercator's chart*. Thus, for example, let it be required to make a chart that fhall commence at the equator, and reach to the parallel of 60 degrees, and fhall contain 80 degrees of longitude.

Draw the line EQ reprefenting the equator, (fee N° 12.): then take, from any convenient line of equal parts, 4800, (the number of minutes containing in 80 degrees), which fet off from E to Q, and this will determine the breadth of the chart.

Divide the line EQ into eight equal parts, in the points 10, 20, 30, &c, each containing 10 degrees; and each of thefe divided into 10 equal parts, will give the fingle degrees upon the equator: then through the points E, 10, 12, &c. drawing lines perpendicular to EQ, thefe fhall be meridians.

From the fcale of equal parts take 4527.4, (the meridional parts anfwering to 60 degrees), and fet that off from E to A and from Q to B, and join AB; then this line will reprefent the parallel of 60, and will determine the length of the chart.

Again, from the fcale of equal parts take 603.1, (the meridional parts anfwering to 10 degrees), and fet that off from E to 10 on the line EA; and through the point 10 draw 10, 10, parallel to EQ; and this will be the parallel of 10 degrees. The fame way, fetting off from E on the line EA, the meridional parts anfwering to each degree, &c. of latitude, and through the feveral points drawing lines parallel to EQ, we fhall have the feveral parallels of latitude.

If the chart does not commence from the equator, but is only to ferve for a certain diftance on the meridian between two given parallels on the fame fide of the equator; then the meridians are to be drawn as in the laft example: and for the parallels of latitude you are to proceed thus, viz. From the meridional parts anfwering to each point of latitude in your chart fubtract the meridional parts anfwering to the leaft latitude, and fet off the differences feverally, from the parallel of the leaft latitude, upon the two extreme meridians; and the lines joining thefe points of the meridians fhall reprefent the feveral parallels upon your chart.

Thus let it be required to draw a chart that fhall ferve from the latitude of 20 degrees north to 60 degrees north, and that fhall contain 80 degrees of longitude.

Having drawn the line DC to reprefent the parallel of 20 degrees (fee N° 12.) and the meridians to it, as in the foregoing example; fet off 663.3 (the difference between the meridional parts anfwering to 30 degrees, and thofe of 20 degrees) from D to 30, and from C to 30; then join the points 30 and 30 with a right line, and that fhall be the parallel of 30. Alfo fet off 1397.6 (the difference between the meridional parts anfwering to 40 degrees, and thofe of 20 degrees) from D to 40, and from C to 40; and joining the points 40 and 40 with a right line, that fhall be the parallel of 40. And proceeding after the fame way, we may draw as many of the intermediate parallels as we have occafion for.

But if the two parallels of latitude that bound the chart, are on the contrary fides of the equator; then draw a line reprefenting the equator and meridians to it, as in the firft example; and from the equator fet off on each fide of it the feveral parallels contained between it and the given parallels as above, and your chart is finifhed.

If Mercator's chart, conftructed as above, hath its equator extended on each fide of the point E 180 degrees, and if the feveral places on the furface of the earth be there laid down according to their latitudes and longitudes, we fhall have what is commonly called *Mercator's map of the earth*. This map is not to be confidered as a fimilar and juft reprefentation of the earth's furface; for in it the figures of countries are diftorted, efpecially near the poles: but fince the degrees of latitude are every where increafed in the fame proportion as thofe of longitude are, the bearings between the places will be the fame in this chart as on the globe; and the proportions between the latitudes, longitudes, and nautical diftances, will alfo be the fame on this chart, as on the globe itfelf; by which means the feveral cafes of navigation are folved after a moft eafy manner, and adapted to the meaneft capacities.

N. B. Here you muft take notice, that in all charts the upper part is the north fide, and the lower part or bottom is the fouth fide; alfo that part of it towards the right-hand is the eaft, and that towards the left-hand the weft fide of the chart.

4. Since, according to this projection, the meridians are parallel right lines; it is plain, that the rhumbs which form always equal angles with the meridians, will be ftraight lines; which property renders this projection of the earth's furface much more eafy and proper for the ufe than any other.

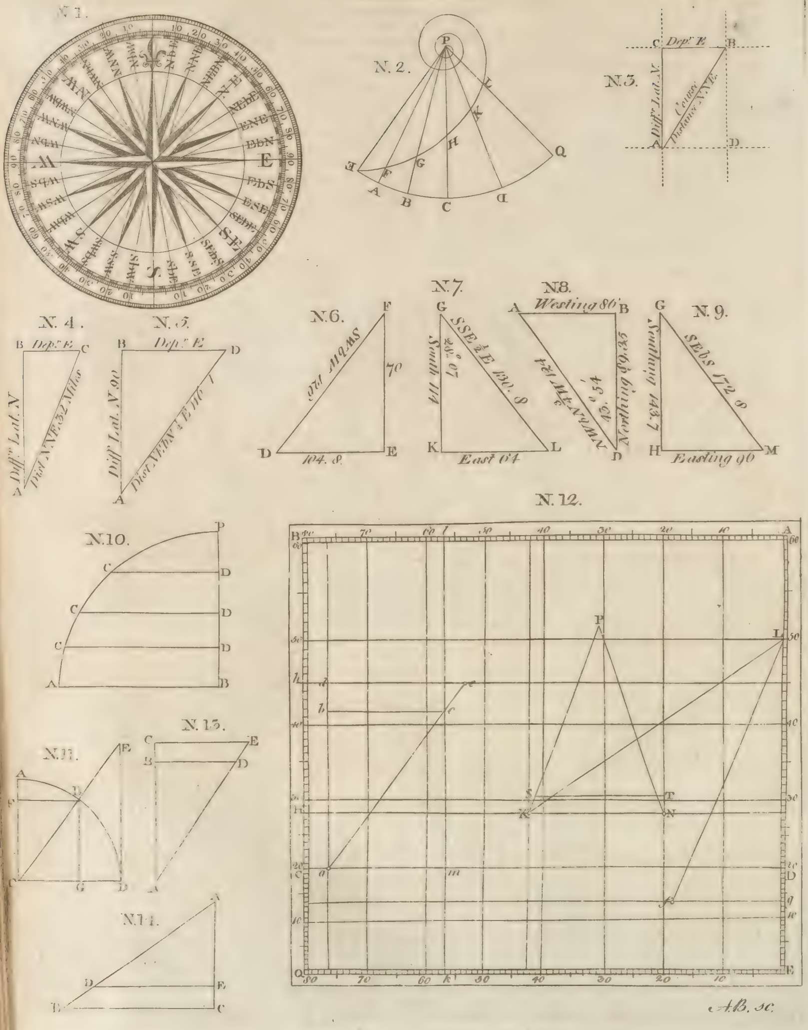
5. This method of projecting the earth's furface upon a plane, was firft invented by Mr Edward Wright, but firft publifhed by Mercator; and hence the failing by the chart was called *Mercator's failing*.

6. In N° 13. let A and E reprefent two places upon Mercator's chart, AC the meridian of A, and CE the parallel of latitude paffing through E; draw AE, and fet off upon AC the length AB equal to the number of minutes contained in the difference of latitude between the two places, and taken from the fame fcale of equal parts the chart was made by, or from the equator, or any graduated parallel of the chart, and through B draw BD parallel to CE meeting AE in D. Then AC will be the enlarged difference of latitude, AB the proper difference of latitude, CE the difference of longitude, BD the departure, AE the enlarged diftance, and AD the proper diftance, between the two places A and E; alfo the angle BAD will be the courfe, and AE the rhumb-line between them.

7. Now fince in the triangle ACE, BD is parallel to one of its fides CE; it is plain the triangles ACE, ABD, will be fimilar, and confequently the fides proportional. Hence arife the folutions of the feveral cafes in this failing, which are as follow.

Case I. The latitudes of two places given, to find the meridional or enlarged difference of latitude between

NAVIGATION. Plate CCII.



A.B. sc.

PRACTICE tween them.

Of this cafe there are three varieties, *viz.* either one of the places lies on the equator, or both on the fame fide of it; or laftly, on different fides.

1. If one of the propofed places lies on the equator, then the meridional difference of latitude is the fame with the latitude of the other place, taken from the table of meridional parts.

EXAMPLE. Required the meridional difference of latitude between St Thomas, lying on the equator, and St Antonio in the latitude of 17° 20′ north. We look in the tables for the meridional parts anfwering to 17° 20′, and find it to be 1056.2, the enlarged difference of latitude required.

2. If the two propofed places be on the fame fide of the equator, then the meridional difference of latitude is found by fubtracting the meridional parts anfwering to the leaft latitude from thofe anfwering to the greateft, and the difference is that required.

EXAMPLE. Required the meridional difference of latitude between the Lizard in the latitude of 50° 00′ north, and Antigua in the latitude of 17° 30′ north.

From the meridional parts of	-	50°, 00′	3474.5
fubtract the meridional parts of		17 , 30	1066.7
there remains	-	-	2407.8

the meridional difference of latitude required.

3. If the places lie on different fides of the equator, then the meridional difference of latitude is found by adding together the meridional parts anfwering to each latitude, and the fum is that required.

EXAMPLE. Required the meridional difference of latitude between Antigua in the latitude of 17° 30′ north, and Lima in Peru in the latitude of 12° 30′ fouth.

To the merid. parts anfwering to		17°, 30′	1066.7
add thefe anfwering to	-	12 , 30	756.1
the fum is	-	-	1822.8

the meridional difference of latitude required.

CASE II. The latitudes and longitudes of two places given, to find the direct courfe and diftance between them.

EXAMPLE. Required to find the direct courfe and diftance between the Lizard in the latitude of 50° 00′ north, and Port-Royal in Jamaica in the latitude of 17° 40′; differing in longitude 70° 46′, Port-Royal lying fo far to the weftward of the Lizard.

PREPARATION.

From the latitude of the Lizard	-	50°, 00′	
fubtract the latitude of Port-Royal	-	17 , 40	
and there remains	-	32 , 20	

equal to 1940 minutes, the proper difference of latitude.

Then from the meridional parts of		50°, 00′	3474.5
fubtract thofe of	-	17 , 40	1077.2
and there remains	-	-	2397.3

the meridional or enlarged difference of longitude.

GEOMETRICALLY. Draw the line AC (N° 14.) reprefenting the meridian of the Lizard at A, and fet off from A, upon that line, AE equal to 1940 (from any fcale of equal parts) the proper difference of latitude, alfo AC equal to 2397.3 (from the fame fcale) the meridional or enlarged difference of latitude. Upon the point C raife CB perpendicular to AC, and make CB equal to 4246, the minutes of difference of longitude. PRACTICE

Join AB, and through E draw ED parallel to BC: fo the cafe is conftructed; and AD applied to the fame fcale of equal parts the other legs were taken from, will give the direct diftance, and the angle DAE meafured by the line of chords will give the courfe.

By CALCULATION.

For the angle of the courfe EAD, it will be, (by rectangular trigonometry,)

AC : CB :: R : T, BAC, *i. e.*

As the meridional diff. of lat.	2397.3	-	3.37970
is to the difference of long.	4246.0	-	3.62798
fo is radius	-	-	10.00000
to the tang.of the direct courfe	60° 33′		10.34828

which, becaufe Port-Royal is fouthward of the Lizard, and the difference of longitude wefterly, will be fouth 60° 33′ weft, or SW*b*W ¼ weft nearly.

Then for the diftance AD, it will be, (by rectangular trigonometry),

R : AE :: Sec. A : AD, *i. e.*

As the radius	-	-	10.00000
is the proper diff. of lat.	-	1940 -	3.28780
fo is the fecant of the courfe	-	60°, 33′	10.30833
to the diftance	-	3945.6	3.59613

confequently the direct courfe and diftance between the Lizard and Port-Royal in Jamaica, is fouth 60° 33′, 3945.6 miles.

CASE III. Courfe and diftance failed given, to find difference of latitude and difference of longitude.

EXAMPLE. Suppofe a fhip from the Lizard in the latitude of 50° 00′ north, fails fouth 35° 40′ weft 156 miles: Required the latitude come to, and how much fhe has altered her longitude.

GEOMETRICALLY. 1. Draw the line BK (n° 15;) Plate CCIII reprefenting the meridian of the Lizard at B; from B draw the line BM, making with BK an angle equal to 35° 40′, and upon this line fet off BM equal to 156 the given diftance, and from M let fall the perpendicular MK upon BK.

Then for BK the proper difference of latitude, it will be, (by rectangular trigonometry,)

R : MB :: S, BMK : BK,

i. e. As radius	-	-	10.00000
is to the diftance	-	156 -	2.19312
fo is the co-fine of the courfe		35°, 40′ -	9.90978
to the proper difference of lat.		127 -	2.10290

equal to 2° 07′; and fince the fhip is failing from a north latitude towards the fouth, therefore the latitude come to will be 47° 53′ north. Hence the meridional difference of latitude will be 193.4.

2. Produce BK to D, till BD be equal to 193.4; through D draw DL parallel to MK, meeting DM produced in L; then DL will be the difference of longitude: to find which by calculation, it will be, (by rectangular trigonometry,)

R : BD :: T, LBD : DL,

i. e. As radius	-	-	10.00000
is to the meridional diff. of lat.		193.4 -	2.28646
fo is the tangent of the courfe		35°, 40′	9.85594
to minutes of diff. of long.	-	138.8 -	2.14240

equal to 2° 18′ 48″, the difference of longitude the fhip has made wefterly.

CASE IV. Given courfe and both latitudes, *viz.* the la-

PRACTICE latitude ſailed from, and the latitude come to; to find the diſtance ſailed, and the difference of longitude.

EXAMPLE. Suppoſe a ſhip in the latitude of 50° 20' north, ſails ſouth 33° 45' eaſt, until by obſervation ſhe is found to be in the latitude of 51° 45' north: Required the diſtance ſailed, and the difference of longitude.

GEOMETRICALLY. Draw AB (N° 16.) to repreſent the meridian of the ſhip in the firſt latitude, and ſet off from A to B 155 the minutes of the proper difference of latitude, alſo AG equal to 257.9 the minutes of the enlarged difference of latitude. Through B and G, draw the lines BC and GK perpendicular to AG; alſo draw AK, making with AG an angle of 33° 45', which will meet the two former lines in the points C and K; ſo the caſe is conſtructed, and AC and GK may be found from the line of equal parts: To find which,

By CALCULATION;

Firſt, For the difference of longitude, it will be, (by rectangular trigonometry,)

R : AG :: T, GAK : GK,

i. e. As radius	- -	10.00000
is to the enlarged diff. of lat.	257.9 -	2.41145
ſo is the tang. of the courſe	33°, 45' -	9.82489
to min. of diff. of longitude	172.3 -	2.23634

equal to 2° 52' 18", the difference of longitude the ſhip has made eaſterly.

This might alſo have been found, by firſt finding the departure BC, (by *Caſe* 2. *of Plane Sailing*), and then it would be

AB : BC :: AG : GK, the difference of longitude required.

Then for the direct diſtance AC, it will be, (by rectangular trigonometry,)

R : AB :: Sec. A : AC,

i. e. As radius	- -	10.00000
is to the proper diff. of lat.	- 155 -	2.19033
ſo is the ſecant of the courſe	33°, 45'	10.08015
to the direct diſtance	- 186.4 -	2.27048

conſequently the ſhip has ſailed ſouth 33° 45' eaſt 186.4 miles, and has differed her longitude 2° 52' 18" eaſterly.

CASE V. both latitudes, and diſtance ſailed, given; to find the direct courſe, and difference of longitude.

EXAMPLE. Suppoſe a ſhip from the latitude of 45° 26' north, ſails between north and eaſt 195 miles, and then by obſervation ſhe is found to be in the latitude of 48° 6' north: Required the direct courſe and difference of longitude.

GEOMETRICALLY. Draw AB (n° 17.) equal to 160 the proper difference of latitude, and from the point B raiſe the perpendicular BD; then take 195 in your compaſſes, and ſetting one foot of them in A, with the other croſs the line BD in D. Produce AB, till AC be equal to 233.6 the enlarged difference of latitude. Through C draw CK parallel to BD, meeting AD produced in K: ſo the caſe is conſtructed; and the angle A may be meaſured by the line of chords, and CK by the line of equal parts: To find which,

By CALCULATION:

Firſt, For the angle of the courſe BAD, it will be (by rectangular trigonometry,)

AB : R :: AD : Sec. A. *i. e.*

As the proper diff. of lat.	- 160 -	2.20412
is to radius	- -	10.00000
ſo is the diſtance	- 195 -	2.29003
to the ſecant of the courſe	- 34°, 52'	10.08591

which, becauſe the ſhip is ſailing between north and eaſt, will be north 34° 52' eaſt, or NE*b*N 1° 7' eaſterly.

Then for the difference of longitude, it will be, (by rectangular trigonometry,)

R : AC :: T, A : CK.

i. e. As radius	- -	10.00000
is to the merid. diff. of lat.	- 233.6 -	2.36847
ſo is the tang. of the courſe	34°, 52'	9.84307
to min. of diff. of longitude	162.8 -	2.21154

equal to 2° 42' 48", the difference of longitude eaſterly.

CASE VI. One latitude, courſe, and difference of longitude, given; to find the other latitude, and diſtance ſailed.

EXAMPLE. Suppoſe a ſhip from the latitude of 48° 50' north, ſails ſouth 34° 40' weſt, till her difference of longitude is 2° 42': Required the latitude come to, and the diſtance ſailed.

GEOMETRICALLY. 1. Draw AE (n° 18.) to repreſent the meridian of the ſhip in the firſt latitude, and make the angle EAC equal to 34° 40', the angle of the courſe; then draw FC parallel to AE, at the diſtance of 164 the minutes of difference of longitude, which will meet AC in the point C. From C let fall upon AE the perpendicular CE; then AE will be the enlarged difference of latitude. To find which by calculation, it will be, (by rectangular trigonometry,)

T, A : R :: CE : AE,

i. e. As the tang. of the courſe	34°, 40'	9.83984
is to the radius	- -	10.00000
ſo is min. of diff. longitude	- 164 -	2.21484
to the enlarged diff. of latitude	237.2 -	2.37500

and becauſe the ſhip is ſailing from a north latitude ſoutherly, therefore

From the merid. parts of the latitude ſailed from	- 48°, 50'	3366.9
take the merid. difference of latitude	-	237.2
and there remains	- -	3129.7

the meridional parts of the latitude come to, *viz.* 46° 09'.

Hence for the proper difference of latitude,

From the latitude ſailed from	-	48°, 50' N
take the latitude come to	- -	46 , 09 N
and there remains	- -	2 , 41

equal to 161, the minutes of difference of latitude.

2. Set off upon AE the length AD equal to 161 the proper difference of latitude, and thro' D draw DB parallel to CE: then AB will be the direct diſtance. To find which by calculation, it will be, (by rectangular trigonometry,)

R : AD :: Sec. A : AB.

i. e. As radius	- -	10.00000
is to the proper diff of latitude	- 161	2.20683
ſo is the ſecant of the courſe	- 34°, 40'	10.08488
to the direct diſtance	- 195.8 -	2.29171

CASE VII. One latitude, courſe, and departure given; to find the other latitude, diſtance ſailed, and difference of longitude.

EXAMPLE. Suppoſe a ſhip ſails from the latitude of 54°

54° 36' north, south 42° 33' east, until she has made of departure 116 miles: Required the latitude she is in, her direct distance sailed, and how much she has altered her longitude.

Geometrically. 1. Having drawn the meridian AB, (n° 19.) make the angle BAD equal to 42° 33'. Draw FD parallel to AB at the distance of 116, which will meet AD in D. Let fall upon AB the perpendicular DB. Then AB will be the proper difference of latitude, and AD the direct distance: to find which by calculation, first, for the distance AD it will be (by rectangular trigonometry,)

S, A : BD :: R : AD.

i. e. As the sine of the course	42°, 33' -	9.83010
is to the departure -	116 -	2.06446
so is radius -	-	10.00000
to the direct distance -	171.5 -	2.23436

Then for the proper difference of latitude, it will be, (by rectangular trigonometry,)

T, A : BD :: R : AB,

i. e. as the tang. of the course	42°, 33'	9.96281
is to the departure -	116 -	2.06446
so is radius -	-	10.00000
to the proper difference of latitude	126.4	2.10165

equal to 2° 6': consequently the ship has come to the latitude of 52° 30' north; and so the meridional difference of latitude will be 212.2.

2. Produce AB to E, till AE be equal to 212.2; and through E draw EC parallel to BD, meeting AD produced in C; then EC will be the difference of longitude; to find which by calculation, it will be, (by rectangular trigonometry,)

R : AE :: T, A : EC.

i. e. As radius -	-	10.00000
is to the merid diff. of latitude	212.2 -	2.32675
so is the tang. of the course	42°, 33'	9.96281
to the min. of diff. of longitude	194.8 -	2.28956

equal to 3° 14' 48", the difference of longitude easterly.

This might have been found otherwise, thus: because the triangles ACE, ADB, are similar; therefore it will be,

AB : BD :: AE : EC.

i. e. As the proper diff. of latitude	126.4	2.10165
is to the departure -	116	2.06446
so is the enlarged diff of lat. -	212.2	2.32675
to min. diff. of longitude -	194.8	2.28956

Case VIII. Both latitudes and departure given, to find course, distance, and difference of longitude.

Example. Suppose a ship from the latitude of 46° 20' N. sails between south and west, till she has made of departure 126.4 miles; and is then found by observation to be in the latitude of 43° 35' north: Required the course and distance sailed, and difference of longitude.

Geometrically. Draw AK (n° 20.) to represent the meridian of the ship in her first latitude; set off upon it AC, equal to 165, the proper difference of latitude. Draw BC perpendicular to AC, equal to 126.4 the departure, and join AB. Set off from A, AK equal to 233.3, the enlarged difference of latitude; and through K draw KD parallel to BC, meeting AB produced in D; so the case is constructed, and DK will be the difference of longitude, AB the distance, and the angle A the course; to find which,

By Calculation:

First, For DC the difference of longitude, it will be,

AC : CB :: AK : KD.

i. e. As the proper diff. of latitude	165	2.21748
is to the departure -	126.4	2.10175
so is the enlarged diff. of latitude	233.3	2.36791
to min. of diff. longitude -	178.7	2.25218

equal to 2° 58' 42", the difference of longitude westerly.

Then for the course it will be, (by rectangular trigonometry,)

AC : BC :: R : T, A.

i. e. As the proper diff. of latitude	165	2.21748
is to departure -	- 126.4	2.10175
so is radius -	-	10.00000
to the tangent of the course	37°, 27'	9.88427

which, because the ship sails between south and west, will be south 37° 27' west, or SW*b*S 6° 30' westerly.

Lastly, For the distance AB, it will be, (by rectangular trigonometry,)

S, A : BC :: R : AB.

i. e. As the sine of the course	37°, 27'	9.78395
is to the departure -	126.4 -	2.10175
so is radius -	-	10.00000
to the direct distance -	207.9 -	2.31780

Case IX. One latitude, distance sailed, and departure given; to find the other latitude, difference of longitude, and course.

Example. Suppose a ship in the latitude of 48° 33' north, sails between south and east 138 miles, and has then made of departure 112.6: Required the latitude come to, the direct course, and difference of longitude.

Geometrically. 1. Draw BD (n° 21.) for the meridian of the ship at B; and parallel to it draw FE, at the distance of 112.6, the departure. Take 138, the distance, in your compasses, and fixing one point of them in B, with the other cross the line FE in the point E; then join B and E, and from E let fall upon BD the perpendicular ED; so BD will be the proper difference of latitude, and the angle B will be the course; to find which, by calculation,

First, For the course it will be, (by rectangular trigonometry,)

BE : R :: DE : S, B.

i. e. As the distance -	138 -	2.13988
is to radius -	-	10.00000
so is the departure -	112.6 -	2.05154
to the sine of the course -	54° 41' -	9.91166

which, because the ship sails between south and east, will be south 54° 41' east, or SE 0° 41' easterly.

Then for the difference of latitude, it will be, (by rectangular trigonometry,)

R : BE :: Co S, B : BD.

i. e. As radius -	-	10.00000
is to the distance -	138 -	2.13988
so is the co-sine of the course	54° 41' -	9.76200
to the difference of latitude	79.8 -	1.90188

equal to 1° 19'. Consequently the ship has come to the latitude of 47° 13'. Hence the meridional difference of latitude will be 117.7.

2dly, Produce B to A, till BA be equal to 117.7; and

PRACTICE

and through A draw AC parallel to DE, meeting BE produced in C; then AC will be the difference of longitude; to find which by calculation, it will be,

BD : DE :: BA : AC.

i. e. As the proper diff. of latitude	79.8	1.90180
is to the departure -	112.6	2.05154
so is the enlarged diff. of latitude	117.7	2.07078
to the diff. of longitude -	166.1	2.22044

equal to 2° 46' 06″, the difference of longitude easterly.

10. From what has been said, it will be easy to solve a traverse according to the rules of Mercator's sailing.

Example. Suppose a ship at the Lizard in the latitude 50° 00' north, is bound to the Madera in the latitude of 32°, 20' north, the difference of longitude tween them being 11°, 40', the west end of the Madera lying so much to the westward of the Lizard, and consequently the direct course and distance (by *Case* 2. *of this Sect.*), is south 26° 15' west 1181.9 miles; but by reason of the winds she is forced to sail on the following courses, (allowance being made for lee-way and variation, &c.), *viz.* SSW 44 miles, S*b*W ½ west 36 miles, SW*b*S 56 miles, and S*b*E 28 miles: Required the latitude the ship is in, her bearing and distance from the Lizard, and her direct course and distance from the Madera, at the end of these courses.

The geometrical construction of this traverse is performed by laying down the two ports according to construction of *Case* 2. *of this Section*, and the several courses and distances according to *Case* 3. by which we have the following solution by calculation.

1. Course SSW, distance 44 miles.

For difference of latitude.

As radius - - -		10.00000
is to the distance -	44 -	1.64345
so is the co-sine of the course	22°, 30'	9.96562
to the difference of latitude	40.65	1.60907

and since the course is southerly, therefore the latitude come to will be 49° 20' north, and consequently the meridional difference of latitude will be 61.8. Then,

For difference of longitude.

As radius - - -		10.00000
is to the enlarged diff. of lat.	61.8 -	1.79099
so is the tang. of the course	22°, 30' -	9.61722
to min. of diff. of longitude	25.6 -	1.40821

2. Course S*b*W ½ west, distance 36 miles.

For difference of latitude.

As radius - - -		10.00000
is to the distance -	36 -	1.55630
so is the co-sine of the course	16°, 52'	9 98090
to the difference of latitude	34.46 -	1.53720

and since the course is southerly, therefore the latitude come to will be 48° 45'. Hence the meridional difference of latitude will be 53.4. Then,

For difference of longitude.

As radius - - -		10.00000
is to the enlarged diff. of lat.	53.4	1.72754
so is the tang. of the course	16°, 52'	9.48171
to the difference of longitude	16.19	1.20925

3. Course SW*b*S, distance 56 miles.

For difference of latitude.

As radius - - -		10.00000
is to the distance -	56 -	1.74819
so is the co-sine of the course	33°, 45' -	9.91985
to the difference of latitude	46.56 -	1.66804

PRACTICE

consequently the latitude come to is 47° 59'; and therefore the enlarged difference of latitude will be 69.2. Then,

For difference of longitude.

As radius - - -		10.00000
is to the enlarged diff. of lat.	69.2	1.84011
so is the tang. of the course	33°, 45'	9.82489
to the difference of longitude	46.24	1.66500

4. Course S*b*E, distance 28 miles.

For difference of latitude.

As radius - - -		10.00000
is to the distance -	28 -	1.44716
so is the co-sine of the course	11°, 15'	9 99157
to the difference of latitude	27.46	1.43873

consequently the latitude come to will be 47°, 31'; and hence the meridional difference of latitude will be 43.2. Then,

For difference of longitude.

As radius - - -		10.00000
is to the enlarged diff. of lat.	43.2	1.63548
so is the tang. of the course	11°, 15'	9.29866
to the diff. of longitude	8.59 -	0.93414

Now these several courses and distances, together with the difference of latitude and longitude belonging to each of them, being set down in their proper columns in the *Traverse Table*, will stand as follow.

Courses.	*Distances.*	*Diff. of Lat.* *N.*	*S.*	*Diff. of Longit.* *E.*	*W.*
SSW —	44	——	40.65	——	25.6
S*b*W½W —	36	——	34.46	——	16.16
SW*b*S —	56	——	46.56	——	49.24
S*b*E — —	28	——	27.46	8.56	——
	Diff. of Lat.		149.13	8.59	88.03
					0.59
				Diff. of Long.	79.44

Hence it is plain that the ship has made of southing 149.13 minutes, and consequently has come to the latitude of 47° 31' north, and so the meridional difference of latitude between that and her first latitude will be 226.1: And since she has made of difference of longitude 79.44 minutes westerly; therefore, for the direct course and distance between the Lizard and the ship, it will be, (by *Case* 2. *of this Section.*

For the direct course.

As the merid. diff. of latitude	226.1 -	2.35430
is to radius - - -		10.00000
so is the difference of longitude	79.44 -	1.90004
to the tang. of the course -	19° 22' -	9.54593

which, because the difference of latitude is southerly, and the difference of longitude westerly, will be south 19° 22' west, or S*b*W 8° 7' westerly. Then,

For the direct distance.

As radius - - -		10.00000
is to the proper diff. of lat.	149.13 -	2.17349
so is the secant of the course	19° 22' -	10.02530

to

Practice

to the direct diftance -	158 -	2.19879
From the latitude the fhip is in -		47°, 31'N
fubtract the lat. of the Madera -		32 , 20 N
and there remains - -		15 , 11

equal to 911 minutes, the proper difference of latitude between the fhip and the Madera.

Again, from the merid. parts anfwering to the latitude the fhip is in	3248.4
Take the meridional parts anfwering to the latitude of the Madera	2052.0
and there remains - - -	1196.4

the enlarged difference of latitude between the fhip and the Madera.

Alfo, from the diff. of long. between the Lizard and the Madera	11°, 40' W
Take the difference of of lon. between the Lizard and the fhip	1 , $19\frac{44}{100}$ W
and there remains - -	10 , $20\frac{56}{100}$W

equal to 620.56 min. of difference of longitude between the fhip and the Madera wefterly.

Then for the direct courfe and diftance between the fhip and the Madera, it will be,

For the direct courfe:

As the merid. diff. of latitude	1196.4	3.07788
is to radius - -		10.00000
fo is the difference of longitude	620.56	2.79278
to the tang. of the courfe	27°, 25'	9.71493

For the direct diftance:

As radius - - -		10.00000
is to the proper diff. of latitude	911	2.95952
fo is the fecant of the courfe	27°, 25'	10.05174
to the direct diftance -	1027	3.01126

11. It is very common in working a day's reckoning at fea, to find the difference of latitude and departure to each courfe and diftance; and adding all the departures together, and all the differences of latitudes for the whole departure, and difference of latitude made good that day, from thence (by *Cafe* 8. *of this Section*) to find the difference of longitude, &c. made good that day. Now that this method is falfe, will evidently appear, if we confider that the fame departure, reckoned on two different parallels, will give unequal differences of longitude; and confequently, when feveral departures are compounded together and reckoned on the fame parallel, the difference of longitude refulting from that cannot be the fame with the fum of the differences of longitude refulting from the feveral departures on different parallels; and therefore we have chofen, in the laft *example* of a *traverfe*, to find the difference of longitude anfwering to each particular courfe and diftance, the fum of which muft be the true difference of longitude made good by the fhip on thefe feveral courfes and diftances.

12. We fhewed, at *Art.* 3. *of this Section*, how to conftruct a *Mercator's chart*; and now we fhall proceed to its feveral ufes, contained in the following problems.

Prob. I. Let it be required to lay down a place upon the chart, its latitude, and the difference of longitude between it and fome known place upon the chart being given.

Example. Let the known place be the Lizard lying on the parallel of 50° 00' north, and the place to be laid down St Katharine's on the eaft coaft of America, differing in longitude from the Lizard 42° 36', lying fo much to the weftward of it.

Let L reprefent the Lizard on the chart, (fee N° 12.) lying on the parallel of 50° 00' north, its meridian. Set off AE from E upon the equator EQ 42° 36', towards Q, which will reach from E to F. Through F draw the meridian FG, and this will be the meridian of St Katharine's; then fet off from Q to H upon the graduated meridian QB, 28 degrees; and thro' H draw the parallel of latitude HM, which will meet the former meridian in K, the place upon the chart required. Plate CCII.

Prob. II. Given two places upon the chart, to find their difference of latitude and difference of longitude.

Through the two places draw parallels of latitude; then the diftance between thefe parallels, numbered in degrees and minutes upon the graduated meridian, will be the difference of latitude required; and thro' the two places drawing meridians, the diftance between thefe, counted in degrees and minutes on the equator or any graduated parallel, will be the difference of longitude required.

Prob. III. To find the bearing of one place from another upon the chart.

Example. Required the bearing of St Katharine's at K (fee N° 12.) from the Lizard at L.

Draw the meridian of the Lizard AE, and join K and L with the right line KL; then by the line of chords meafuring the angle KLE, and with that entering the tables, we fhall have the thing required.

This may alfo be done, by having compaffes drawn on the chart, (fuppofe at two of its corners); then lay the edge of a ruler over the two places, and let fall a perpendicular, or take the neareft diftance from the centre of the compafs next the firft place, to the ruler's edge; then with this diftance in your compaffes, flide them along by the ruler's edge, keeping one foot of them clofe to the ruler, and the other as near as you can judge perpendicular to it, which will defcribe the rhumb required.

Prob. IV. To find the diftance between two given places upon the chart.

This problem admits of four cafes, according to the fituation of the two places with refpect to one another.

Case I. When the given places lie both upon the equator.

In this cafe their diftance is found by converting the degrees of difference of longitude intercepted between them into minutes.

Case II. When the two places lie both on the fame meridian.

Draw the parallels of thofe places; and the degrees upon the graduated meridian, intercepted between thofe parallels, reduced to minutes, give the diftance required.

Case III. When the two places lie on the fame parallel.

Example. Required to find the diftance between the points K and N (fee N° 12.) both lying on the parallel of 28° 00' north. Take from your fcale the chord

Practice chord of 60° or radius in your compaffes, and with that extent on KN as a bafe make the ifofceles triangle KPN; then take from the line of fines the co-fine of the latitude, or fine of 72°, and fet that off from P to S and T. Join S and T with the right line ST, and that applied to the graduated equator will give the degrees and minutes upon it equal to the diftance; which, converted into minutes, will be the diftance required.

The reafon of this is evident from the fection of *Parallel Sailing:* for it has been there demonftrated, that radius is to the co-fine of any parallel, as the length of any arch on the equator, to the length of the fame arch on that parallel. Now in this chart KN is the diftance of the meridians of the two places K and N upon the equator; and fince, in the triangle PNK, ST is the parallel to KN, therefore PN : PT : : NK : TS. Confequently TS will be the diftance of the two places K and N upon the parallel of 28°.

If the parallel the two places lie on be not far from the equator, and they not far afunder; then their diftance may be found thus: Take the diftance between them in your compaffes, and apply that to the graduated meridian, fo as the one foot may be as many minutes above as the other is below the given parallel; and the degrees and minutes intercepted, reduced to minutes, will give the diftance.

Or it may alfo be found thus: Take the length of a degree on the meridian at the given parallel, and turn that over on the parallel from the one place to the other, as oft as you can; then as oft as that extent is contained between the places, fo many times 60 miles will be contained in the diftance between them.

Case IV. When the places differ both in longitude and latitude.

Example. Suppofe it were required to find the diftance between the two places *a* and *e* upon the chart. By Prob. II. Find the difference of latitude between them; and take that in your compaffes from the graduated equator, which fet off on the meridian of *a*, from *a* to *b;* then thro' *b* draw *bc* parallel to *de;* and taking *ac* in your compaffes, apply it to the graduated equator, and it will fhew the degrees and minutes contained in the diftance required, which multiplied by 60 will give the miles of diftance.

The reafon of this is evident from *Art. 6. of this Section:* for it is plain *ad* is the enlarged difference of latitude, and *ab* the proper; confequently *ae* the enlarged diftance, and *ac* the proper.

Prob. V. To lay down a place upon the chart, its latitude and bearing from fome known place upon the chart being known, or (which is the fame) having the courfe and difference of latitude that a fhip has made, to lay down the running of the fhip, and find her place upon the chart.

Example. A fhip from the Lizard in the latitude of 50° 00' north, fails SSW till fhe has differed her latitude 36° 40'. Required her place upon the chart.

Count from the Lizard at L, on the graduated meridian downwards (becaufe the courfe is foutherly) 36° 40' to *g*; through which draw a parallel of latitude, which will be the parallel the fhip is in; then from L draw a SSW line L*f*, cutting the former parallel in *f*, and this will be the fhip's place upon the chart. Practice

Prob. VI. One latitude, courfe, and diftance, failed, given; to lay down the running of the fhip, and find her place upon the chart.

Example. Suppofe a fhip at *a* in the latitude of 20° 00' north, fails north 37° 20', eaft 191 miles: Required the fhip's place upon the chart.

Having drawn the meridian and parallel of the place *a*, fet off the rhumb-line *ae*, making with *ab* an angle of 37° 20'; and upon it fet off 191 from *a* to *c;* thro' *c* draw the parallel *cb;* and taking *ab* in your compaffes, apply it to the graduated equator, and obferve the number of degrees it contains; then count the fame number of degrees on the graduated meridian from C to *b*, and through *b* draw the parallel *he*, which will cut *ac* produced in the point *e*, the fhip's place required.

Prob. VII. Both latitudes and diftance failed, given; to find the fhip's place upon the chart.

Example. Suppofe a fhip fails from *a*, in the latitude of 20° 00' north, between north and eaft 191 miles, and is then in the latitude of 45° 00' north: Required the fhip's place upon the chart.

Draw *de* the parallel of 45°, and fet off upon the meridian of *a* upwards, *ab* equal to the proper difference of latitude taken from the equator or graduated parallel. Through *b* draw *bc* parallel to *de;* then with 191 in your compaffes, fixing one foot of them in *a*, with the other crofs *be* in *c*. Join *a* in *c* with the right line *ac;* which produced will meet *de* in *e*, the fhip's place required.

Prob. VIII. One latitude, courfe, and difference of longitude, given; to find the fhip's place upon the chart.

Example. Suppofe a fhip from the Lizard in the latitude of 50° 00' north, fails SW*b*W, till her difference of longitude is 42° 36': Required the fhip's place upon the chart.

Having drawn AE the meridian of the Lizard at L, count from E to F upon the equator 42° 36'; and through F draw the meridian EG; then from L draw the SW*b*W line LK, and where this meets FG, as at K, will be the fhip's place required.

Prob. IX. One latitude, courfe, and departure, given; to find the fhip's place upon the chart.

Example. Suppofe a fhip at *a* in the latitude of 20° 00' north, fails north 37° 20' eaft, till fhe has made of departure 116 miles: Required the fhip's place upon the chart.

Having drawn the meridian of *a*, at the diftance of 116, draw parallel to it the meridian *kl*. Draw the rhumb-line *ac*, which will meet *kl* in fome point *c;* then through *c* draw the parallel *cb*, and *ab* will be the proper difference of latitude, and *bc* the departure. Take *ab* in your compaffes, and apply it to the equator or graduated parallel; then obferve the number of degrees it contains, and count fo many on the graduated meridian from C upwards to *b*. Through *b* draw the parallel *he*, which will meet *ac* produced in fome point as *e*, which is the fhip's place upon the chart.

Prob. X. One latitude, diftance, and departure, given; to find the fhip's place upon the chart.

Example. Suppofe a fhip at *a* in the latitude of 20° 00' north, fails 191 miles between north and eaft, and then

PRACTICE then is found to have made of departure 116 miles: Required the ſhip's place upon the chart.

Having drawn the meridian and parallel of the place *a*, ſet off upon the parallel *am* equal to 116, and thro' *m* draw the meridian *kl*. Take the given diſtance 191 in your compaſſes; ſetting one foot of them in *a*, with the other croſs *kl* in *c*. Join *ac*, and through *c* draw the parallel *cb*; ſo *cb* will be the departure, and *ab* the proper difference of latitude; then proceeding with this, as in the foregoing problem, you will find the ſhip's place to be *e*.

PROB. XI. The latitude failed from, difference of latitude, and departure, given; to find the ſhip's place upon the chart.

EXAMPLE. Suppoſe a ſhip from *a* in the latitude of 20° 00' north, fails between north and eaſt, till ſhe be in the latitude of 45° 00' north, and is then found to have made of departure 116 miles: Required the ſhip's place upon the chart.

Having drawn the meridian of *a*, ſet off upon it, from *a* to *b*, 25 degrees, (taken from the equator or graduated parallel), the proper difference of latitude; then through *b* draw the parallel *bc*, and make *bc* equal to 116 the departure, and join *ac*. Count from the parallel of *a* on the graduated meridian upwards to *b* 25 degrees, and through *b* draw the parallel *be*, which will meet *ac* produced in ſome point *e*, and this will be the place of the ſhip required.

13. In the ſection of *Plane Sailing*, it is plain, that the terms *meridional diſtance*, *departure*, and *difference of longitude*, were ſynonimous, conſtantly ſignifying the ſame thing; which evidently followed from the ſuppoſition of the earth's ſurface being projected on a plane in which the meridians were made parallel, and the degrees of latitude equal to one another and to thoſe of the equator. But ſince it has been demonſtrated (in this ſection) that if, in the projection of the earth's ſurface upon a plane, the meridians be made parallel, the degrees of latitude muſt be unequal, ſtill increaſing the nearer they come to the pole; it follows, that theſe terms muſt denote lines really different from one another.

§ 6. *Of Oblique Sailing.*

THE queſtions that may be propoſed on this head being innumerable, we ſhall only give a few of the moſt uſeful.

PROB. I. Coaſting along the ſhore, I ſaw a cape bear from me NNE; then I ſtood away NW*b*W 20 miles, and I obſerved the ſame cape to bear from me NE*b*E: Required the diſtance of the ſhip from the cape at each ſtation.

Plate CCIII. GEOMETRICALLY. Draw the circle NWSE (N° 22.) to repreſent the compaſs, NS the meridian, and WE the eaſt and weſt line, and let C be the place of the ſhip in her firſt ſtation; then from C ſet off upon the NW*b*W line, CA 20 miles, and A will be the place of the ſhip in her ſecond ſtation.

From C draw the NNE line CB, and from A draw AB parallel to the NE*b*E line CD, which will meet CB in B the place of the cape, and CB will be the diſtance of it from the ſhip in its firſt ſtation, and AB the diſtance in the ſecond: to find which,

By CALCULATION;

In the triangle ABC are given AC, equal to 20 miles; the angle ACB, equal to 78° 45', the diſtance between the NNE and NW*b*W lines; alſo the angle ABC, equal to BCD, equal to 33° 45', the diſtance between the NNE and NE*b*E lines; and conſequently the angle A, equal to 67° 30'.

Hence for CB, the diſtance of the cape from the ſhip in her firſt ſtation, it will be (by oblique trigonometry)

S. ABC : AC :: S. BAC : CB,

i. e. As the ſine of the angle B	33° 45'	- 9.74473
is to the diſtance run AC -	20 —	- 1.30103
ſo is the ſine of BAC -	67, 30	- 9.96562
to CB - -	33.26	- 1.52191

the diſtance of the cape from the ſhip at the firſt ſtation. Then for AB, it will be, by oblique trigonometry,

S. ABC : AC :: S. ACB : AB.

i. e. as the ſine of B -	33°, 45'	- 9.74474
is to AC - -	20 —	- 1.30103
ſo is the ſine of C -	78 - 45	- 9.99157
to AB - -	35.31	- 1.54786

the diſtance of the ſhip from the cape at her ſecond ſtation.

PROB. II. Coaſting along the ſhore, I ſaw two headlands; the firſt bore from me NE*b*E 17 miles, the other SSW miles: Required the bearing and diſtance of theſe headlands from one another.

GEOMETRICALLY. Having drawn the compaſs NWSE (N° 23.) let C repreſent the place of the ſhip; ſet off upon the NE*b*E line CA 17 miles from C to A, and upon the SSW line CB 20 miles from C to B, and join AB: then A will be the firſt headland, and B the ſecond; alſo AB will be their diſtance, and the angle A will be the bearing from the NE*b*N line: to find which,

By CALCULATION;

In the triangle ACB are given, AC 17, CB 20, and the angle ACB equal to 101° 15', the diſtance between the NE*b*E and SSW lines. Hence (by oblique angular trigonometry) it will be

As the ſum of the ſides AC and CB -	37	1.56820
is to their difference - -	3	0.47712
ſo is the tang. of ½ the ſum of the angles A and B -	39°, 22½	9.91417
to the tang. of half their diff. -	3 , 49	8.82309

conſequently the angle A will be 43° 11', and the angle B 35° 34'; alſo the bearing of B from A will be S*b*W 1° 49' weſterly, and the bearing of A from B will be N*b*E 1° 49' eaſterly.

Then for the diſtance AB, it will be, (by oblique angular trigonometry),

S. A : CB :: S. C : AB.

i. e. As the ſine of A -	43°, 11' -	9.83527
is to CB - -	20 -	1.30103
ſo is the ſine of C -	101, 15 -	9.99157
to AB - -	28.67 -	1.45733

the diſtance between the two headlands.

PROB. III. Coaſting along the ſhore, I ſaw two headlands; the firſt bore from me NW*b*N, and the ſecond NNE; then ſtanding away E*b*N ¾ northerly 20 miles, I found the firſt bore from me WNW ½ weſterly, and the ſecond N*b*W ½ weſterly: Required the bearing and diſtance of theſe two headlands.

GEOMETRICALLY. Having drawn the compaſs NWSE (N° 24.) let C repreſent the firſt place of the ſhip;

PRACTICE ſhip; from which draw the NW*b*N line CB, and the NNE line CD, alſo the E*b*N $\frac{3}{4}$ N line CA, which make equal to 20. From A draw AB parallel to the WNW $\frac{1}{4}$ W line, and AD parallel to the N*b*W $\frac{1}{4}$ W meeting the two firſt lines in the points B and D; then B will be the firſt and D the ſecond headlands. Join the points B and D, and BD will be the diſtance between them, and the angle CDB the bearing from the NNE line: to find which,

By Calculation;

1. In the triangle ABC are given the angle BCA, equal to 104° 04′, the diſtance between the NW*b*N line, and the ENE$\frac{1}{4}$E line; the angle BAC, equal to 36° 34′, the diſtance between the WSW$\frac{1}{4}$W line and the WNW $\frac{1}{4}$ W line; the angle ABC equal to 39° 22′, the diſtance between the ESE $\frac{1}{2}$ E line; and the SW*b*S line, alſo the ſide CA equal to 20 miles: whence for CB, it will be (by oblique trigonometry)

As the ſine of CBA	39°, 22′	9.80228
is to AC	20	1.30103
ſo is the ſine of CAB	36°, 34′	9.77507
to CB	18.79	1.27382

the diſtance between the firſt headland and the ſhip in her firſt ſtation.

2. In the triangle ACD, are given the angle ACD, equal to 47° 49′, the diſtance between the ENE$\frac{1}{4}$E line, and the NNE line; the angle CAD, equal to 92° 49′, the diſtance between the WSW$\frac{1}{4}$W line; and the N*b*W$\frac{1}{4}$W line, the angle CDA equal to 39° 22′, the diſtance between the SSW line and the S*b*E$\frac{1}{2}$E line; alſo the leg CA equal to 20.

Hence for CD, it will be (by oblique trigonometry)

As the ſine CAD	39°, 22′	9.80228
is to AC	20	1.30103
ſo is the ſine of CAD	92°, 34′	9.99960
to CD	31.5	1.49835

the diſtance between the ſecond headland and the ſhip in her firſt ſtation.

3. In the triangle BCD are given BC 18.79, CD 31.5, and the angle BCD equal to 56° 15′, the diſtance between the NW*b*N line and the NNE line.

Hence for the angle CDB, it will be (by oblique trigonometry)

As the ſum of the ſides	50.29	1.70148
is to the difference of ſides	12.71	1.10415
ſo is tangent of $\frac{1}{2}$ ſum of the unknown angles	61°, 51′	10.27189
to tang. of half their diff.	25, 18	9.67458

conſequently the angle CBD is 87° 10′, and the angle CDB 36° 35′. Hence the bearing of the firſt headland from the ſecond will be S 59° 8′, W or SW*b*W$\frac{1}{2}$W nearly; and for the diſtance between them, it will be,

As the ſine of BDC	36°, 35′	9.77524
is to BC	18.79	1.27382
ſo is the ſine of BCD	56°, 15′	9.91985
to BD	26.21	1.41843

the diſtance between the two headlands.

This, and the firſt problem, are of great uſe in drawing the plot of any harbour, or laying down any ſea-coaſt.

Suppoſe a ſhip that makes her way good within 6$\frac{1}{2}$ points of the wind, at north, is bound to a port bearing eaſt 86 miles diſtance from her: Required the courſe and diſtance upon each tack, to gain the intended port. PRACTICE

Geometrically. Having drawn the compaſs NE SW, (N° 25.) let C repreſent the ſhip's place, and ſet off upon the eaſt line CA 86 miles, ſo A will be the intended port. Draw CD and CB on each ſide of the north line at 6$\frac{1}{2}$ points diſtance from it, and through A draw AB parallel to CD meeting CB in B; then the ENE$\frac{1}{2}$E line CB, will be the courſe of the ſhip upon the ſtarboard tack, and CB its diſtance on that tack; alſo the ESE$\frac{1}{2}$E line Ab, will be the courſe on the larboard tack, and BA the diſtance on that tack: to find which,

By Calculation;

In the triangle ABC are given the angle ACB, equal to 16° 53′, the diſtance between the eaſt and ENE$\frac{1}{2}$E line; the angle CBA, equal to 146° 14′, the diſtance between the ENE$\frac{1}{2}$E and the WNW$\frac{1}{4}$W lines; the angle BAC equal to 16° 53, the diſtance between the eaſt and ESE$\frac{1}{2}$E lines; alſo AC 86 miles.

Hence, ſince the angle at A and C are equal, the legs CB and BA will likewiſe be equal; to find either of which (ſuppoſe CB) it will be (by oblique angled trigonometry)

As the ſine of B	146°, 14′	9.74493
is to AC	86	1.93450
ſo is the ſine of A	16.53	9.46303
to CB	44.94	1.65260

the diſtance the ſhip muſt ſail on each tack.

There is a great variety of uſeful queſtions of this nature that may be propoſed; but the nature of them being better underſtood by practice at ſea, we ſhall leave them, and go on to *Great Circle Sailing*.

§ 6. *Great Circle Sailing*.

A great many caſes might be propoſed in this kind of ſailing; but as they ſerve rather for exerciſes in the ſolution of ſpheric triangles than for any real uſe towards the navigating of a ſhip, we ſhall only give the ſolution of one problem, as being the moſt generally uſeful.

Prob. Given the latitudes and longitudes of two places on the earth: Required the neareſt diſtance on the ſurface, together with the angles of poſition (or that which a great circle, paſſing over both places, makes with the meridian of one of them) from either place to the other.

Case I. When both places lie under the ſame meridian, their difference of latitude ſhews their neareſt diſtance.

Case II. When the two places lie under the equator, their diſtance is equal to the difference of longitude between them.

Case III. When the places lie under the ſame parallel of latitude.

Example. What is the leaſt diſtance between St Mary's in Lat. 37° 00′ N. Long. 25° 0′ W. and Cape Henry, in Lat. 37° 00′ Long. 76° 23′ weſt?

Deſcribe a circle PESQ repreſenting the meridian Plate CCI. of one of the places; ſuppoſe of the eaſtern one, as fig. 6. St Mary's; draw the line EQ repreſenting the equator, and at right angles to it draw the line PS, for the axis of the earth, the extremity of which, P, is the north pole, and S the ſouth pole; and on this circle lay off from P to A the complement of the lati-

latitude of St Mary's, the eastern place. On the equator, from Q to C, lay off the difference of longitude between the two places; and through the points P, C, S, describe a circle, which will be the meridian of the other place Cape Henry; on which lay from P to B the co-latitude of this place, which is done by describing the arc A*a* about the pole P according to the rules of projection, at the distance of the co-latitude. Through the points ABD describe a great circle; then will A represent St Mary's, and B Cape Henry; PA and PB are their co-latitudes; the angle APB, which is measured by the arc QC, is the difference of longitude; the arc AB is the nearest distance of these places; the angle PAB is the angle of position from A to B; and the angle PBA is the angle of position from B to A. The arc AB, and the angle PAB or PBA, may be measured according to the rules laid down under the article Projection. Now, the places having the same latitude, PA is equal to PB, and the angles PAB and PBA are likewise equal. Therefore if the arc PI be described, making the angle API = 25° 41½', the half of the difference of longitude; PI will be perpendicular to AB, and bisect it. And in the triangle AIP, right-angled at I, there will be given the hypothenuse AP = 53° 00' the angle API = 25° 41½'; to find the leg AI = half the distance sought, and the angle PAI = the angle of position. Then, for the distance: As radius is to the sine of the hypothenuse PA, so is the sine of the given angle API to the sine of the leg AI. Or,

As radius	= 90° 00'	-	10.00000
To cos. lat.	= 37 00	-	9.90235
So sine ½ diff. long.	= 25 41½	-	9.63702
To sine ½ dist.	= 20 75½	-	9.53937

which doubled, gives 40° 31' for the distance; and this distance, reduced to nautical miles, is 2431; less by 31 than that given by parallel sailing.—For the angle of position, As radius is to the co-sine of the hypothenuse PA, so is the tangent of the given angle API to the co-tangent of the angle A. Or,

As radius	= 90° 00'	-	10.00000
To sine lat.	= 37 00	-	9.77946
So tang. ½ dif. long.	= 25 41½	-	9.68222
To co-tang. ang. posit.	= 73 51	-	9.46168

Hence it appears, that to sail from A to B, or from B to A, the ship must first steer N. 73° 51' W. or E. and then gradually increase her course till she comes to I, where it will be due west or east; and from thence the course is to be gradually diminished again till she comes to the other port, where it will be 73° 51', the same as she set out with.

Case IV. When one place has latitude, and the other has none.

Example. What is the nearest distance between the island of St Thomas, in lat. 0° 00', and long. 1°? The co-latitude of St Julian is 41° 09'; and the difference of longitude between the two places is 66° 10'.—Let the point A (plate CCI. fig. 7.) be St Thomas, and P and S the north and south poles. Make AC, the measure of the angle ASC, equal to 66° 10' the difference of longitude. Then, as Port St Julian is in south latitude, about S the south pole at the distance of Julian's co-latitude, describe the arc *aa*, cutting SCP, the meridian of Julian in B, through the points A, B, E, a great circle being described, the arc AB is the distance sought. The distances and angles may now be measured according to the rules of projection, or it falls under a case in spheric trigonometry: for, in the quadrantal triangle ASB, there are given the co-latitude of St Thomas or AS = 90° 00'; the co-latitude of St Julian, or SB = 41° 09'; the difference of longitude, or the angle ASB = 66° 10', from whence all the rest may be found. Or, in the supplemental triangle, ACB, right-angled at C, there is given the latitude of St Julian's, or the leg CB = 48° 51'; the difference of longitude, or the leg CA = 66° 10', whence the rest may easily be found; and hence it will appear, that a ship sailing from the island of St Thomas must first shape her course south 51° 22' W; and then, by constantly altering her course towards the west, so as to arrive at Port St Julian on a course S. 71° 36' W. she will have sailed the shortest distance between these places.

Case V. When the latitudes of the given places are both north, or both south.

Example. What is the nearest distance between the Lizard and the island of Bermudas, and also the angles of position?—The difference of longitude of the two places is 58° 11'.

Make PA (Plate CCI. fig. 8.) = 57° 25', the co-latitude of Bermudas; P*a* = 40° 03', the co-latitude of the Lizard; and with the tangent of P*a* describe the arc *aa*. With the secant of 58° 11', the difference of longitude, describe arcs from P and S, which gives the centre of the circle PCS the meridian of the Lizard; its intersection with *aa* gives B, the place of the Lizard. The arcs of the circle and angles may be measured by spheric trigonometry as before. Had the eastern place, the Lizard, been put upon the primitive circle, the great circle AB would have been difficult to describe; and therefore the western place was put upon it, it being a matter of indifference which of the places are so taken.

Case VI. When one of the given places has north latitude, and the other has south latitude.

Example. What is the nearest distance from the island of St Helena to the island of Bermudas, and also the angles of position at each place; the difference of longitude between the two being 57° 43'?

Make QA (fig. 9.) = 15° 55', the lat. of St Helena; describe the arc *aa* about P, with the tangent of P*a* = 57° 25', the co-latitude of Bermudas. Arcs described from P, S, with the secant of 57° 43', the difference of longitude, will give the centre of the circle PCS, the meridian of Bermudas; and its intersection B with *aa*, is the place of Bermudas. Describe a great circle through A, B, D; the intercepted arc AB is the distance sought; and the angles PAB, ABS, are the positions required, which must be measured according to the rules of spheric trigonometry. From the solutions of these triangles it will appear, that when a ship sails from St Helena to Bermudas on the arc of a great circle, she must first shape her course N. 48° 00' W. and gradually alter it from the north towards the west, so as to arrive at Bermudas on a course N 50° 01' west, after having run 73° 26', or 4406 miles. The course found by Mercator's sailing is N. 48° 45' W. and the distance is 4414 miles.——By this it appears

Practice.

pears, that when the places are one in N. latitude, and the other in S. latitude; neither of them being very far from the equator, there is but a ſmall difference between the reſults found by Mercator's and great circle failing: for, near the equator, the rhumb-lines do not differ much from great circles.

From the ſolution of the foregoing caſes, it is plain, that to fail on the arc of a great circle, the ſhip muſt continually alter her courſe. But as this is a difficulty too great to be admitted into the practice of navigation, it has been thought ſufficiently exact to effect this buſineſs by a kind of approximation, founded upon this principle, that, in ſmall arcs, the difference between the arc and its tangent is ſo little, that they may be taken one for the other in any nautical operations. Upon this principle, the great circles of the earth are ſuppoſed to be made up of ſhort right lines, each of which is a ſegment of a rhumb-line. And on this ſuppoſition the ſolution of the following problem is founded.

Having given the latitudes and longitudes of the places failed from, and bound to; to find the ſucceſſive latitudes on the arc of a great circle in thoſe places where the alteration in longitude ſhall be a given quantity; together with the courſes and diſtances between thoſe places.

1. Find the angle of poſition at each place, and their diſtance by one of the preceding ſix caſes.

2. Find the greateſt latitude the great circle runs through; that is, find the perpendicular from the pole to that circle; and alſo find the ſeveral angles at the pole, made by the given alterations of longitude between this perpendicular and the ſucceſſive meridians come to.

3. With this perpendicular, and the polar angles ſeverally find as many correſponding latitudes, by ſaying:

As rad. : tan. greateſt lat. : : coſ. 1 polar ang. : tan. 1 lat.
: : coſ. 2 polar ang. : tan. 2 lat.
&c. &c.

4. Having the ſeveral latitudes paſſed thro', and the difference of longitude between each, find, by Mercator's failing, the courſes and diſtances between thoſe latitudes,

And theſe are the ſeveral courſes and diſtances the ſhip muſt run to keep nearly on the arc of a great circle.

The ſmaller the alterations in longitude are taken, the nearer will this method approach the truth; but it is ſufficient to compute to every five degrees of difference of longitude, the length of an arc of five degrees differing from its chord or tangent only by 0.0002.

Example. A ſhip being bound from a place in lat. 37° 00' N. lon. 22° 56' W. to a place in the ſame lat. and in lon. 76° 23' W. it is propoſed ſhe ſhall fail as near the arc of a great circle as ſhe can, by altering her courſe at every five degrees difference of longitude: Required the latitude at each time of altering the courſe, and alſo the courſes and diſtances between thoſe ſeveral latitudes.

Place failed from lat. is 37° 00' N.	the long.	22° 56' W.
Place bound to lat. is 37 00 N.	the long.	76 23 W.
	The diff. of long.	53 27

The figure being deſcribed, and the computation made, the diſtance BA is found to be 42° 06', and the angle A or the angle B=73° 09', the angle of poſition. Plate CCI. fig. 10.

Now the triangle APB, being iſoſceles, the perpendicular PI falls in the middle of AB; and the latitudes, courſes, and diſtances, being known in running the half BI, thoſe in the half IA will alſo be known.

Let the points *a*, *b*, *c*, *d*, &c. be the places arrived at on each alteration of five degrees of longitude: then will the arcs P*a*, P*b*, P*c*, P*d*, &c. be the reſpective co-latitudes of thoſe places, and are the hypothenuſes of the right-angled ſpheric triangles PI*a*, PI*b*, PI*c*, PI*d*, &c.

In the triangle PIB.
Given PB = 53° 00'
the angle PBI = 73 09
To find PI.

As rad.	= 90° 00'	10.00000
To ſin. PB	= 53 00	9.90235
So ſin. the ang. B	= 73 09	9.98094
To ſin. PI	= 49 51	9.88329

Now the angle IPB $=\left(\frac{53^\circ\ 27'}{2}\right)$ 26° 43½'; the angle IP*a*=21° 43½'; the angle IP*b*=16° 43½'; the angle IP*c* =11° 43½'; the angle IP*d*=6° 43½', are the ſeveral polar angles.

		21° 43½'	16° 43½'	11° 43½'	6° 43½'
Then rad.	= 90° 00'	10.00000	10.00000	10.00000	10.00000
To co-tang. PI	= 49 51	9.92612	9.92612	9.92612	9.92612
So co-ſine polar angle		9.96800	9.98123	9.99084	9.99700
To tang. lat.		9.89412	9.90735	9.91696	9.92312
	Which are	38° 05'	38° 56'	39° 33'	39° 57'

The degrees and min. ſet over each column, are the polar angles uſed in that proportion, and the correſponding latitudes ſtand at bottom.

The firſt term of theſe proportions being radius, and the ſecond term *conſtant*, the operations may be very expeditiouſly performed thus.

On a ſlip of paper let the log. of the ſecond or conſtant term be written of the ſame ſize with the printed figures; apply this log. co-tang. ſucceſſively to the log. co-ſines of the polar angles: Then the ſum of the

the two log^s. being written down each time, will give the log. tangents of the feveral latitudes arrived at.

By this method, each proportion will be worked by writing down only one line.

Hence it appears, the fhip muft firft fail from the lat. 37° 00' N. to lat. 38° 05' N.; thence to lat. 38° 56' N.; thence to lat. 39° 33'; thence to lat. 39° 57' N.; thence to lat. 40° 09' N., which is the greateft latitude fhe muft go to; and from thence fhe muft proceed through the latitudes 39° 57', 39° 33', 38° 56', 38° 05', and fo to 37° 00', the parallel fhe fet out from, and in which fhe is to find the place fhe is bound to.

Now between thefe feveral latitudes, with the refpective differences of longitude, find by Mercator's failing the courfes and diftances.

If the refults of the feveral operations, in the queftions of great circle failing be entered in fuch a table as the following, it will be found of fome convenience to the operator.

Polar angles.	Succeff. longs.	Succeff. lats.	Diff. long.	Diff. lat.	Merid. parts.	Merid. diff. lat.	Cour.	Dift.
The angle IPB 26° 43½'	22° 56'	37° 00'			2392.6			
IP*a* 21 43½	27 56	38 05	300	65	2474.6	82.0	74.43	246.6
IP*b* 16 43½	32 56	38 56	300	51	2539.8	65.2	77.44	240.0
IP*c* 11 43¼	37 56	39 33	300	37	2587.6	47.8	80.57	235.2
IP*d* 6 43½	42 56	39 57	300	24	2618.8	31.2	84.04	232.2
	49 39½	40 09	403.5	12	2634.5	15.7	87.46	307.9
								1261.9

In the firft column are the angles at the pole contained between the perpendicular and the feveral meridians differing by 5° of longitude.

In the fecond column, the departed longitude 22° 56' being increafed by the differences of longitude, make the fucceffive longitudes come to.

In the third column are the fucceffive latitudes paffed thro' in failing from the place fet out from to the greateft latitude.

In the fourth and fifth columns are the differences between the longitudes and latitudes in the fecond and third columns.

In the fixth column are the meridional parts to the fucceffive latitudes; and in the feventh column are the meridional diff. of latitudes.

The eight and ninth columns contain the courfes and diftances between the places anfwering to the fecond and third columns.

The numbers in the third, eighth, and ninth columns, are found by working the logarithmic proportions on a wafte paper; but the work is here omitted, as it is fo eafily fupplied.

Now the column of diftances being fummed up amounts to 1261.9; which being doubled, gives 2523.8 miles for the diftance between the two places.

And the courfes the fhip muft fteer are, 1ft, N. 74° 43'W.; 2d, N. 77° 44'W.; 3d, N. 80° 57'W.; 4th, N. 84° 04'W.; 5th, N. 87° 46'W.; 6th, S. 87° 46'W.; 7th, S. 84° 04'W.; 8th, S. 80° 57'W.; 9th, S. 77° 44'W.; 10th, S. 74° 43'W.: and on thefe courfes fhe muft run the refpective diftances ftanding againft them.

Having now fhown the method of folving the different cafes of navigation mathematically, and fuppofing the courfe of the fhip and diftance run to be always exactly known, we fhall now proceed to give an account of thofe mechanical methods by which the fhip's courfe is obferved, and the frequent variations and errors in it corrected at convenient times.

§ 7. *Of the Log-line and Compafs.*

1. The method commonly made ufe of for meafuring a fhip's way at fea, or how far fhe runs in a given fpace of time, is by the Log-line, and Half-minute Glafs.

2. The log, fig. 3. is generally about a quarter of an inch thick, and five or fix inches from the angular point *a* to the circumference *b*. It is balanced by a thin plate of lead, nailed upon the arch, fo as to fwim perpendicularly in the water, with about ⅔ impreffed under the furface. The line is faftened to the log by means of two legs *a* and *b*, fig. 2. one of which paffes thro' a hole *a* at the corner, and is knotted on the oppofite fide; whilft the other leg is attached to the arch by a pin *b*, fixed in another hole, fo as to draw out occafionally. By thefe legs the log is hung *in equilibrio*, and the line, which is united to it, is divided into certain fpaces, which are in proportion to an equal number of geographical miles, as a half minute or quarter minute is to an hour of time. Plate CLXI.

3. Thefe fpaces are called *knots*, becaufe at the end of each of them there is a piece of twine with knots in it, inreeved between the ftrands of the line, which fhews how many of thefe fpaces or knots are run out during the half minute. They commonly begin to be counted at the diftance of about 10 fathom or 60 feet from the log; that fo the log, when it is hove overboard, may be out of the eddy of the fhip's wake before they begin to count; and for the more ready difcovery of this point of commencement, there is commonly faftened at it a piece of red rag.

4. The log being thus prepared, and hove overboard from the poop, and the line veered out (by the help of a reel (fig. 4.) that turns eafily, and about which it is wound) as faft as the log will carry it away, or rather as the fhip fails from it, will fhew, according to the time of veering, how far the fhip has run in a given time, and confequently her rate of failing.

5. A degree of a meridian, according to the exacteft meafures, contains about 69.545 Englifh miles; and each mile by the ftatute being 5280 feet, therefore a degree of a meridian will be about 367,200 feet; whence the $\frac{1}{60}$ of that, *viz.* a minute, or nautical mile, muft contain 6120 ftandard feet; confequently, fince ½ minute

$\frac{1}{2}$ minute is the $\frac{1}{120}$ part of an hour, and each knot being the ſame part of a nautical mile, it follows, that each knot will contain the $\frac{1}{120}$ of 6120 feet, *viz.* 51 feet.

6. Hence it is evident, that whatever number of knots the ſhip runs in half a minute, the ſame number of miles ſhe will run in one hour, ſuppoſing her to run with the ſame degree of velocity during that time; and therefore it is the general way to heave the log every hour to know her rate of ſailing: but if the force or direction of the wind vary, and not continue the ſame during the whole hour; or if there has been more ſail ſet, or any ſail handed, that ſo the ſhip has run ſwifter or ſlower in any part of the hour than ſhe did at the time of heaving the log; then there muſt be an allowance made accordingly for it, and this muſt be according to the diſcretion of the artiſt.

7. Sometimes, when the ſhip is before the wind, and there is a great ſea ſetting after her, it will bring home the log, and conſequently the ſhip will ſail faſter than is given by the log. In this caſe it is uſual, if there be a very great ſea, to allow one mile in ten, and leſs in proportion, if the ſea be not ſo great. But for the generality, the ſhip's way is really greater than that given by the log; and therefore, in order to have the reckoning rather before than behind the ſhip, (which is the ſafeſt way), it will be proper to make the ſpace on the log-line between knot and knot to conſiſt of 50 feet inſtead of 51.

8. If the ſpace between knot and knot on the log-line ſhould happen to be too great in proportion to the half-minute glaſs, *viz.* greater than 50 feet, then the diſtance given by the log will be too ſhort; and if that ſpace be too ſmall, then the diſtance run (given by the log) will be too great: therefore, to find the true diſtance run in either caſe, having meaſured the diſtance between knot and knot, we have the following proportion, *viz.*

As the true diſtance, 50 feet, is to the meaſured diſtance; ſo are the miles of diſtance given by the log, to the true diſtance in miles that the ſhip has run.

Example I. Suppoſe a ſhip runs at the rate of $6\frac{1}{4}$ knots in half a minute; but meaſuring the ſpace between knot and knot, I find it to be 56 feet: Required the true diſtance in miles.

Making it, As 50 feet is to 56 feet, ſo is 6.25 knots to 7 knots; I find that the true rate of ſailing is 7 miles in the hour.

Example II. Suppoſe a ſhip runs at the rate of $6\frac{1}{2}$ knots in half a minute; but meaſuring the ſpace between knot and knot, I find it to be only 44 feet: Required the true rate of ſailing.

Making it, As 50 feet is to 44 feet, ſo is 6.5 knots to 5.72 knots; I find that the true rate of ſailing is 5.72 miles in the hour.

9. Again, ſuppoſing the diſtance between knot and knot on the log-line to be exactly 50 feet, but that the glaſs is not 30 ſeconds; then, if the glaſs require longer time to run than 30 ſeconds, the diſtance given will be too great, if eſtimated by allowing one mile for every knot run in the time the glaſs runs; and, on the contrary, if the glaſs requires leſs time to run than 30 ſeconds, it will give the diſtance ſailed too ſmall. Conſequently, to find the true diſtance in either caſe, we muſt meaſure the time the glaſs requires to run out (by the method in the following article); then we have the following proportion, *viz.*

As the number of ſeconds the glaſs runs, is to half a minute, or 30 ſeconds; ſo is the diſtance given by the log, to the true diſtance.

Example I. Suppoſe a ſhip runs at the rate of $7\frac{1}{2}$ knots in the time the glaſs runs; but meaſuring the glaſs, I find it runs 34 ſeconds: Required the true diſtance ſailed.

Making it, As 34 ſeconds is to 30 ſeconds, ſo is 7.5 to 6.6; I find that the ſhip ſails at the rate of 6.6 miles an hour.

Example II. Suppoſe a ſhip runs at the rate of $6\frac{1}{2}$ knots; but meaſuring the glaſs, I find it runs only 25 ſeconds: Required the true rate of ſailing.

Making it, As 25 ſeconds is to 30 ſeconds, ſo is 6.5 knots to 7.8 knots; I find that the true rate of ſailing is 7.8 miles an hour.

10. In order to know how many ſeconds the glaſs runs, you may try it by a watch or clock that vibrates ſeconds; but if neither of theſe be at hand, then take a line, and to the one end faſtening a plummet, hang the other upon a nail or peg, ſo as the diſtance from the peg to the centre of the plummet be $39\frac{1}{5}$ inches: then this put into motion will vibrate ſeconds; *i. e.* every time it paſſes the perpendicular, you are to count one ſecond; conſequently, by obſerving the number of vibrations that it makes during the time the glaſs is running, we know how many ſeconds the glaſs runs.

11. If there be an error both in the log-line and half-minute glaſs, *viz.* if the diſtance between knot and knot and the log-line be either greater or leſs than 50 feet, and the glaſs runs either more or leſs than 30 ſeconds; then the finding out the ſhip's true diſtance will be ſomewhat more complicate, and admit of three caſes, *viz.*

Case I. If the glaſs runs more than 30 ſeconds, and the diſtance between knot and knot be leſs than 50 feet, then the diſtance given by the log-line, viz. by allowing 1 mile for each knot the ſhip ſails while the glaſs is running, will always be greater than the true diſtance, ſince either of theſe errors gives the diſtance too great. Conſequently, to find the true rate of ſailing in this caſe, we muſt firſt find (by Art. 8.) the diſtance, on the ſuppoſition that the log-line is only wrong, and then with this (by Art. 9.) we ſhall find the true diſtance.

Example. Suppoſe a ſhip is found to run at the rate of 6 knots; but examining the glaſs, I find it runs 35 ſeconds; and meaſuring the log-line, I find the diſtance between knot and knot to be but 46 feet: Required the true diſtance run.

Firſt, (by Art. 8.) We have the following proportion, viz. As 50 feet : 46 feet :: 6 knots : 5.52 knots. Then (by Art. 9.) As 35 ſeconds : 30 ſeconds :: 5.52 knots : 4.73 knots. Conſequently the true rate of ſailing is 4.73 miles an hour.

Case II. If the glaſs be leſs than 30 ſeconds, and the place between knot and knot be more than 50 feet; then the diſtance given by the log will always be leſs than the true diſtance, ſince either of theſe errors leſſens the true diſtance.

Example. Suppoſe a ſhip is found to run at the rate of 7 knots; but examining the glaſs, I find it runs only 25 ſeconds; and meaſuring the ſpace between

tween knot and knot on the log-line, I find it is 54 feet: Required the true rate of failing.

Firft, (by Art 9.) As 25 feconds : 30 feconds : : 7 knots : 8.4 knots. Then (by Art 8.) As 50 feet : 54 feet : : 8.4 knots : 9.072 knots. Confequently the true rate of failing is 9.072 miles an hour.

Case III. If the glafs runs more than 30 feconds, and the fpace between knot and knot be greater than 50 feet; or if the glafs runs lefs than 30 feconds, and the fpace between knot and knot be lefs than 50 feet: then, fince in either of thefe two cafes the effects of the errors are contrary, it is plain the diftance will fometimes be too great, and fometimes too little, according as the greater quantity of the error lies; as will be evident from the following examples.

Example I. Suppofe a fhip is found to run at the rate of $9\frac{1}{2}$ knots per glafs; but examining the glafs, it is found to run 36 feconds; and by meafuring the fpace ketween knot and knot, it is found to be 58 feet: Required the true rate of failing.

Firft, (by Art. 8.) As 50 feet : 58 feet : : 9.5 knots : 11.02 knots. Then (by Art. 9.) As 38 feconds : 30 feconds : : 11.02 knots : 8.7 knots. Confequently the fhip's true rate of failing is 8.7 miles an hour.

Example II. Suppofe a fhip runs at the rate of 6 knots per glafs; but examining the glafs, it is found to run only 20 feconds; and by meafuring the log-line, the diftance between knot and knot is found to be but 38 feet: Required the true rate of failing.

Firft, (by Art. 8.) As 50 feet : 38 feet : : 6 knots : 4.56 knots. Then (by Art. 9.) As 20 feconds : 30 feconds : : 4.56 knots : 6.84 knots. Confequently the true rate of failing is 6.83 miles an hour.

But if in this cafe it happen, that the time the glafs takes to run be to the diftance between knot and knot, as 30, the feconds in half a minute, is to 50, the true diftance between knot and knot; then it is plain, that whatever number of feconds the glafs confifts of, and whatever number of feet is contained between knot and knot, yet the diftance given by the log-line will be the true diftance in miles.

12. Though the method of meafuring the fhip's way by the log-line, defcribed in the foregoing articles, be that which is now commonly made ufe of; yet it is fubject to feveral errors, and thefe very confiderable. For, firft, the half-minute or quarter-minute glaffes (by which and the log the fhip's way is determined) are feldom or never true, becaufe dry and wet weather have a great influence on them; fo that at one time they may run more, and at another time fewer, than 30 feconds; and it is evident that a fmall error in the glafs will caufe a fenfible one in the fhip's way. Again, the chief property of the log is to have it fwim upright, or perpendicular to the horizon: but this is too often wanting in logs, becaufe few feamen examine whether it is fo or not, and generally take it upon truft, being fatisfied if it weigh a little more at the ftern than the head. And from this there flows an error in the reckoning; for if the log does not fwim upright, it will not hold water, nor remain fteady in the place where it is heaved, fince the leaft check in the hand in veering the line will make it come up feveral feet: this repeated will make the errors become fathoms, and perhaps knots, which, how infignificant foever they appear, are miles and parts of miles, and amount to a good deal in a long voyage. Another inconvenience attending the log-line is its ftretching and fhrinking; for when a new line is firft ufed, let it be ever fo well ftretched upon the deck, and meafured as true as poffible, yet after wetting it fhrinks confiderably; and confequently to be the better affured of the fhip's way by the log-line, we ought to meafure and alter the knots on it every time before we ufe it; but this is feldom done oftener than once a-week, and fometimes not above once or twice in a whole voyage: alfo when the line is meafured to its greateft degree of fhrinking, it is generally left there; and when, by much ufe, it comes to ftretch again, it is feldom or never mended, though it will ftretch beyond what it firft fhrunk. Thefe and many other errors, too well known, attending that method of meafuring the fhip's way by the log-line, plainly accounts for a great many errors committed in reckonings. So it is to be wifhed, that either this method were improved or amended, or that fome other method lefs fubject to error were found out.

13. The meridian and prime vertical of any place cuts the horizon in 4 points, at 90 degrees diftance from one another, viz. *North*, *South*, *Eaft* and *Weft*; that part of the *meridian* which extends itfelf from the place to the *north* point of the *horizon* is called the *north line*; that which tends to the *fouth* point of the horizon is called the *fouth line*; and that part of the *prime vertical* which extends towards the right hand of the obferver, when his face is turned to the *north*, is called the *eaft line*; and laftly, that part of the *prime vertical* which tends towards the left hand is called the *weft line*; the four points in which thefe lines meet the *horizon* are called the *cardinal points*.

14. In order to determine the courfe of the winds, and to difcover their various alterations or fhiftings, each quadrant of the horizon, intercepted between the meridian and prime vertical, is ufually divided into eight equal parts, and confequently the whole horizon into thirty-two; and the lines drawn from the place on which the obferver ftandeth, to the points of divifion in his horizon, are called *rhumb-lines*; the four principal of which are thofe defcribed in the preceding article, each of them having its name from the cardinal point in the horizon towards which it tends: the reft of the rhumb-lines have their names compounded of the principal lines on each fide of them, as in the figure (Plate CII. N° 1.); and over whichfoever of thefe lines the courfe of the wind is directed, that wind takes its name accordingly.

15. The inftrument commonly ufed at fea for directing the fhip's way is called the Mariner's Compass; which confifts of a card and two boxes. The card is a circle made to reprefent the horizon, whofe circumference is quartered and divided into degrees, and alfo into thirty-two equal parts, by lines drawn from the centre to the feveral points of divifion, called *points of the compafs*. On the back-fide of the card, and juft below the fouth and north line, is fixed a fteel needle with a brafs cupola, or hollow centre in the middle, which is placed upon the end of a fine pin, upon which the card may eafily turn about: the needle is touched with a loadftone, by which a certain virtue is infufed into it, that makes it (and confequently the fouth and north line on the card above it) hang nearly in the plane of the meridian; by which means the fouth and

north lines on the card produced would meet the horizon in the south and north points; and consequently all the other lines on the card produced would meet the horizon in the respective points.

Plate CCII. 16. The card is represented in N° 1. in which you may observe, that the capital letters N, S, E, W, denote the four cardinal points, *viz.* N the *North*, S the *South*, &c. and the small letter *b* signifies the word *by*. The *rhumbs* in the middle between any two of the cardinals are expressed by the letters denoting these cardinals, that which denotes the point lying in the meridian having the precedence; thus the rhumb in the middle between the north and east is expressed N. E. which is to be read *North-east*; also S. W. denotes the *South-west* rhumb, &c.: the other rhumbs are expressed according to their situation with respect to these middle rhumbs and the nearest cardinals, as is plain from the foresaid figure.

17. The card is put into a round box, made for it, having a pin erected in the middle, upon which the hollow centre of the needle is fixed, so as the card may lie horizontal, and easily vibrate according to the motion of the needle: the box is covered over with a smooth glass, and is hung in a brass hoop upon two cylindrical pins, diametrically opposite to one another; and this hoop is hung within another brass circle, upon two pins at right angles with the former. These two circles, and the box, are placed in another square wooden box, so that the innermost box, and consequently the card, may keep horizontal which way soever the ship heels.

18. Since the meridians do all meet at the poles, and there form certain angles with one another; and since, if we move ever so little towards the east or west, from one place to another, we thereby change our meridian, and in every place the east and west line being perpendicular to the meridian; it follows, that the east and west line in the first place will not coincide with the east and west line in the second, but be inclined to it at a certain angle: and consequently all the other rhumb-lines at each place will be inclined to each other, they always forming the same angles with the meridian. Hence it follows, that all rhumbs, except the four cardinals, must be curves or helispherical lines, always tending towards the pole, and approaching it by infinite gyrations or turnings, but never falling into it. Thus let P (N° 2.) be the pole, EQ an arch of the equator, PE, PA, &c. meridians, and EFGHKL any rhumb: then because the angles PEF, PFG, &c. are by the nature of the rhumb-line equal, it is evident that it will form a curve-line on the surface of the globe, always approaching the pole P, but never falling into it; for if it were possible for it to fall into the pole, then it would follow, that the same line could cut an infinite number of other lines at equal angles, in the same point; which is absurd.

19. Because there are 32 rhumbs (or points in the compass) equally distant from one another, therefore the angle contained between any two of them adjacent will be 11° 15', viz. $\frac{1}{32}$ part of 360°; and so the angle contained between the meridian and the N*b*E, will be 11° 15', and between the meridian and the NNE will be 22° 30'; and so of the rest, as in the following table.

A Table of the Angles which every $\frac{1}{4}$ Point of the Compass makes with the Meridian.

North	*South*	*Points*	D.	M.	*North*	*South*
		$\frac{1}{4}$	02	49		
		$\frac{1}{2}$	05	37

§ 8. *Concerning Currents, and how to make proper allowances.*

1. Currents are certain settings of the stream, by which all bodies (as ships, &c.) moving therein, are compelled to alter their course or velocity, or both; and submit to the motion impressed upon them by the current.

Case I. If the current sets just with the course of the ship, *i. e.* moves on the same rhumb with it; then the motion of the ship is increased, by as much as is the drift or velocity of the current.

Example. Suppose a ship sails SE*b*S at the rate of 6 miles an hour, in a current that sets SE*b*S 2 miles an hour: Required her true rate of sailing.

Here it is evident that the ship's true rate of sailing will be 8 miles an hour.

Case II. If the current sets directly against the ship's course, then the motion of the ship is lessened by

Practice

by as much as is the velocity of the current.

Example. Suppoſe a ſhips ſails SSW at the rate of 10 miles an hour, in a current that ſets NNE 6 miles an hour: Required the ſhip's true rate of ſailing.

Here it is evident that the ſhip's true rate of ſailing will be 4 miles an hour. Hence it is plain,

Cor. I. If the velocity of the current be leſs than the velocity of the ſhip, then the ſhip will get ſo much a-head as is the difference of theſe velocities.

Cor. II. If the velocity of the current be greater than that of the ſhip, then the ſhip will fall ſo much a-ſtern as is the difference of theſe velocities.

Cor. III. Laſtly, If the velocity of the current be equal to that of the ſhip, then the ſhip will ſtand ſtill; the one velocity deſtroying the other.

Case III. If the current thwarts the courſe of the ſhip, then it not only leſſens or augments her velocity, but gives her a new direction compounded of the courſe ſhe ſteers, and the ſetting of the current, as is manifeſt from the following

Lemma. If a body at A (N° 26.) be impelled by two forces at the ſame time, the one in the direction AB capable to carry that body from A to B in a certain ſpace of time, and the other in the direction AD capable to carry it from A to D in the ſame time; complete the parallelogram ABCD, and draw the diagonal AC; then the body at A, agitated by theſe two forces together, will move along the line BC, and will be in the point C at the end of the time in which it would have moved along AD or AB with the forces ſeparately applied.

Hence the ſolution of the following examples will be evident.

Example I. Suppoſe a ſhip ſails (by the compaſs) directly ſouth 96 miles in 24 hours, in a current that ſets eaſt 45 miles in the ſame time: Required the ſhip's true courſe and diſtance.

Plate CCIII

Geometrically. Draw AD (ſee N° 26.) to repreſent the ſouth and north line of the ſhip at A, which make equal to 96; from D draw DC perpendicular to AD, equal to 45; and join AC. Then C will be the ſhip's true place, AC her true diſtance, and the angle CAD the true courſe. To find which,

By Calculation;

Firſt, For the true courſe DAC, it will be, (by rectangular trigonometry),

As the apparent diſtance AD	96	1.98227
is to the current's motion DC	45	1.65321
ſo is radius		10.00000
to the tangent of the true courſe DAC	25°, 07′	9.67094

conſequently the ſhip's true courſe is S 25° 07′ E, or SSE 2° 37′ eaſterly.

Then for the true diſtance AC, it will be, (by rectangular trigonometry),

As the ſine of the courſe A	25°, 07′	9.62784
is to the departure DC	45	1.65321
ſo is radius		10.00000
to the true diſtance AC	106	2.02537

Example. Suppoſe a ſhip ſails SE 120 miles in 20 hours, in a current that ſets W*b*N at the rate of 2 miles an hour: Required the ſhip's true courſe and diſtance ſailed in that time.

Geometrically. Having drawn the compaſs NESW (N° 27.) let C repreſent the place the ſhip ſailed from; draw the SE line CA, which make equal to 120; then will A be the place the ſhip caped at.

Practice

From A draw AB parallel to the W*b*N line CD, equal to 40, the motion of the current in 20 hours, and join CB; then B will be the ſhip's true place at the end of 20 hours, CB her true diſtance, and the angle SCB her true courſe. To find which,

By Calculation;

In the triangle ABC, are given CA 120, AB 40, and the angle CAB equal to 34° 45′, the diſtance between the E*b*S and SE lines, to find the angles B and C, and the ſide CB.

Firſt, For the angles C and B, it will be, (by oblique trigonometry),

As the ſum of the ſides CA and AB	160	2.20412
is to their difference	80	1.90309
ſo is the tang. of half the ſum of the angles B and C	73°, 07′	10.51783
to the tang. of half their diff.	59, 45	10.21680

conſequently the angle B will be 131, 52, and the angle ACB 14° 23′. Hence the true courſe is S 30° 37′ E, or SSE 2° 07′ eaſterly.

Then for the true diſtance CB, it will be, (by oblique trigonometry),

As the ſine of B	131°, 52′	9.87198
is to AC	120	2.07918
ſo is the ſine of A	33°, 45′	9.74474
to the true diſtance CB	89.53	1.95194

Example III. Suppoſe a ſhip coming out from ſea in the night, has ſight of Scilly light, bearing NE*b*N diſtance 4 leagues, it being then flood tide ſetting ENE 2 miles an hour, and the ſhip running after the rate of 5 miles an hour: Required upon what courſe and how far ſhe muſt ſail to hit the Lizard, which bears from Scilly E½S diſtance 17 leagues.

Geometrically. Having drawn the compaſs NESW (N° 28.) let A repreſent the ſhip's place at ſea, and draw the NE*b*N line AS, which make equal to 12 miles; ſo S will repreſent Scilly.

From S draw SL equal to 51 miles, and parallel to the E½S line; then L with repreſent the Lizard.

From L draw LC parallel to the ENE line, equal to 2 miles, and from C draw CD equal to 5 miles meeting AL in D; then from A draw AB parallel to CD meeting LC produced in B; and AB will be the required diſtance, and SAB the true courſe. To find which,

By Calculation;

In the triangle ASL are given the ſide AS equal to 12 miles, the ſide SL equal to 51, and the angle ASL equal to 118° 07′, the diſtance between the NE*b*N and W½N lines; to find the angles SAL and SLA. Conſequently, (by oblique trigonometry), it will be,

As the ſum of the ſides AS and SL	63	1.79934
is to their difference	39	1.59106
ſo is the tang of half the ſum of the angles SAL and SLA	30°, 56′	9.77763
to the tang. of half their diff.	20°, 21′	9.56935

conſequently the angle SAL, will be 51° 17′; and ſo the direct bearing of the Lizard from the ſhip will be N 85° 02′ E, or E*b*N 6° 17′ E; and for the diſtance AL, it will be, (by oblique trigonometry),

Practice

As the ſine of SAL	51°, 17'	9.89223
is to SL	51	1.70757
ſo is the ſine of ASL	118°, 07'	9.94546
to AL	57.65	1.76080

the diſtance between the ſhip and the Lizard.

Again, in the triangle DLC, are given the angle L equal to 17° 32', the diſtance between the ENE and N 85° 02' E lines; the ſide LC, equal to 2 miles, the current's drift in an hour; and the ſide CD, equal to 5 miles, the ſhip's run in the ſame time. Hence for the angle D, it will be, (by oblique trigonometry),

As the ſhip's run in 1 hour DC	5	0.69897
is to the ſine of L	17°, 32'	9.47894
ſo is the current's drift LC	2	0.30103
to the ſine of D	6°, 55'	9.08100

conſequently, ſince by conſtruction the angle LAB is equal to the angle LDC, the courſe the ſhip muſt ſteer is S 88°, 03' E.

Then for the diſtance AB, it will be, (by oblique trigonometry),

As the ſine of B	155°, 33'	9.61689
is to AL	57.65	1.76080
ſo is the ſine of L	17.32	9.47894
to AB	41.96	1.62285

conſequently, ſince the ſhip is ſailing at the rate of 5 miles an hour, it follows, that in ſailing $8^h\ 24^m$ S 88° 03' E, ſhe will arrive at the Lizard.

Example IV. A ſhip from a certain headland in the latitude of 34° 00' north, ſails SE*b*S 12 miles in 3 hours, in a current that ſets between north and eaſt; and then the ſame headland is found to bear WNW, and the ſhip to be in the latitude of 33° 52' north: Required the ſetting and drift of the current.

Geometrically. Having drawn the compaſs NESW (N° 29.) let A repreſent the place of the ſhip, and draw the SE*b*S line AB, equal to 12 miles, alſo the ESE line AC.

Set off from A upon the meridian AD, equal to 8 miles, the difference of latitude, and through D draw DC parallel to the eaſt and weſt line WE, meeting AC in C. Join C and B with the right line BC; then C will be the ſhip's place, the angle ABC the ſetting of the current from the SE*b*S line, and the line BC will be the drift of the current in 3 hours. To find which,

By Calculation;

In the triangle ABC, right-angled at D, are given the difference of latitude AD equal to 8 miles, the angle DAC equal to 67° 30'. Whence for AC, the diſtance the ſhip has ſailed, it will be

As radius		10.00000
is to the diff. of latitude AD	8	0.90309
ſo is the ſecant of the courſe DAC	67°, 30'	10.41716
to the diſtance run AC	20.9	1.32025

Again, in the triangle ABC, are given AB equal to 12 miles, AC equal to 20.9, and the angle BAC equal to 30° 45', the diſtance between the SE*b*S and ESE lines. Whence, for the angle at B, it will be,

As the ſum of the ſides AC and AB	32.9	1.51720
is to their difference	8.9	0.94930
ſo is the tang. of half the ſum of the angles B and C	73°, 07'	10.51806
to tang. of ½ their diff.	41°, 43' ½	9.95025

conſequently the angle B is 114° 51'; and ſo the ſetting of the current will be N 81° 06' E, or E*b*E 2° 21' E. Then for BC, the current's drift in 3 hours, it will be,

As the ſine of B	114°, 51'	9.92700
is to the diſtance run AC	20.9	1.32025
ſo is the ſine of A	33°, 45'	9.74474
to BC	12.8	1.10719

the current's drift in 3 hours; and conſequently the current ſets E*b*N 2° 21' E 4.266 miles an hour.

Practice

§. 9. *Concerning the* Variation *of the* Compass, *and how to find it from the true and obſerved* Amplitudes *or* Azimuths *of the ſun.*

1. The variation of the compaſs is how far the north or ſouth point of the needle ſtands from the true ſouth or north point of the horizon towards the eaſt or weſt; or it is an arch of the horizon intercepted between the meridian of the place of obſervation and the magnetic meridian.

2. It is abſolutely neceſſary to know the variation of the compaſs at ſea, in order to correct the ſhip's courſe; for ſince the ſhip's courſe is directed by the compaſs, it is evident that if the compaſs be wrong, the true courſe will differ from the obſerved, and conſequently the whole reckoning differ from the truth.

3. The ſun's true amplitude is an arch of the horizon comprehended between the true eaſt or weſt point thereof, and the centre of the ſun at riſing or ſetting; or it is the number of degrees, &c. that the centre of the ſun is diſtant from the true eaſt or weſt point of the horizon, towards the ſouth or north.

4. The ſun's magnetic amplitude is the number of degrees that the centre of the ſun is from the eaſt or weſt point of the compaſs, towards the ſouth or north point of the ſame at riſing or ſetting.

5. Having the declination of the ſun, together with the latitude of the place of obſervation, we may from thence find the ſun's true amplitude, by the following aſtronomic propoſition, viz.

As the co-ſine of the latitude
is to the radius
So is the ſine of the ſun's declination
to the ſine of the ſun's true amplitude
which will be north or ſouth according as the ſun's declination is north or ſouth.

Example. Required the ſun's true amplitude in the latitude of 41° 50' north, on the 23d day of April 1731.

Firſt, I find (from the tables of the ſun's declination) that the ſun's declination the 23d of April is 15° 54' north; then for the true amplitude, it will be, by the former analogy,

As the co-ſine of the lat.	41° 50'	9.87221
is to radius		10.00000
ſo is the ſine of the decl.	15°, 54',	9.43769
to the ſine of the amplit.	21, 35,	9.56548

which is north, becauſe the declination is north at that time; and conſequently, in the latitude of 40° 50' north, the ſun riſes on the 23d of April 21° 35' from the eaſt part of the horizon towards the north, and ſets ſo much from the weſt the ſame way.

6. The ſun's true azimuth is the arch of the horizon intercepted between the meridian and the vertical circle paſſing through the centre of the ſun at the time of obſervation.

7. The

PRACTICE

7. The ſun's magnetic azimuth is the arch of the horizon, intercepted between the magnetic meridian and the vertical, paſſing through the ſun.

8. Having the latitude of the place of obſervation, together with the ſun's declination and altitude at the time of obſervation, we may find his true azimuth after the following method, viz.

Make it,

As the tangent of half the complement of the latitude is to the tangent of half the ſum of the diſtance of the ſun from the pole and complement of the altitude

So is the tangent of half the difference between the diſtance of the ſun from the pole and complement of the altitude

To the tangent of a fourth arch

which fourth arch added to half the complement of the latitude will give a fifth arch, and this fifth arch leſſened by the complement of the latitude will give a ſixth arch.

Then make it,

As the radius

is to the tangent of the altitude

ſo is the tangent of the ſixth arch

to the co-ſine of the ſun's azimuth

which is to be counted from the ſouth or north, to the eaſt or weſt, according as the ſun is ſituated with reſpect to the place of obſervation.

If the latitude of the place and declination of the ſun be both north or both ſouth, then the declination taken from 90° will gives the ſun's diſtance from the pole; but if the latitude and declination be on contrary ſides of the equator, then the declination added to 90° will give the ſun's diſtance from the neareſt pole to the place of obſervation.

EXAMPLE. In the latitude of 51° 32' north, the ſun having 19° 39' north declination, his altitude was found by obſervation to be 38° 18: Required the azimuth.

By the firſt of the foregoing analogies, it will be

As the tangent of ½ the complement of the latitude	19°, 14'	9.54269
is to the tangent of ½ the ſum of the diſtance of the ſun from the pole and complement of the altitude	61 „ 01	10.25655
ſo is the tangent of half their difference -	9 „ 19	7.21499
to the tang. of a 4th arch	40 „ 20	9.92885

which fourth arch 40° 20', added to 19° 14', half the complement of the latitude, gives a fifth arch 59° 34'; and this fifth arch leſſened by 38° 28', the complement of the latitude, gives the ſixth arch 21° 06'; then for the azimuth, it will be, by the ſecond of the preceding analogies,

As radius - - -		10.00000
is to the tang. of the altitude	38°, 18'	9.89749
ſo is the tang. of the ſixth arch	21 „ 06 -	9.58644
to the co-ſine of the azimuth	72 „ 15 -	9.48393

which, becauſe the latitude is north and the ſun ſouth of the place of obſervation, muſt be counted from the ſouth towards the eaſt or weſt; and conſequently, if the altitude of the ſun was taken in the morning, the azimuth will be S 72° 15' E, or ESE 4° 45' E; but if the altitude was taken in the afternoon, the azimuth will be S 72° 15' W, or WSW 4° 45' weſterly.

PRACTICE

9. Having found the ſun's true amplitude or azimuth by the preceding analogies, and his magnetic amplitude or azimuth by obſervation, it is evident, if they agree, there is no variation; but if they diſagree, then if the true and obſerved amplitudes at the riſing or ſetting of the ſun be both of the ſame name, *i. e.* either both north, or both ſouth, their difference is the variation; but if they be of different names, *i. e.* one north and the other ſouth, their ſum is the variation. Again, if the true and obſerved azimuth be both of the ſame name, *i. e.* either both eaſt or both weſt, their difference is the variation: but if they be of different names, their ſum is the variation: And to know whether the variation is eaſterly, obſerve this general rule, viz.

Let the obſerver's face be turned to the ſun: then if the true amplitude or azimuth be to the right-hand of the obſerved, the variation is eaſterly; but if be to to the left, weſterly.

To explain which, Let NESW (N° 30.) repreſent a compaſs, and ſuppoſe the ſun is really E*b*S at the time of obſervation, but the obſerver ſees him off the eaſt point of the compaſs, and ſo the true amplitude or azimuth of the ſun is to the right of the magnetic or obſerved; here it is evident that the E*b*S point of the compaſs ought to lie where the eaſt point is, and ſo the north where the N*b*W is; conſequently the north point of the compaſs is a point too far eaſt, *i. e.* the variation in this caſe is eaſterly. The ſame will hold when the amplitude or azimuth is taken on the weſt ſide of the meridian. Plate CCIII

Again, let the true amplitude or azimuth be to the left-hand of the obſerved. Thus, ſuppoſe the ſun is really E*b*N at the time of obſervation, but the obſerver ſees him off the eaſt point of the compaſs, and ſo the true amplitude or azimuth to the left of the obſerved: Here it is evident that the E*b*N point of the compaſs ought to ſtand where the eaſt point is, and ſo the north where the N*b*E point is; conſequently the north point of the compaſs lies a point too far weſterly; ſo in this caſe the variation is weſt. The ſame will hold when the ſun is obſerved on the weſt ſide of the meridian.

EXAMPLE I. Suppoſe the ſun's true amplitude at riſing is found to be E 14° 20' N, but by the compaſs it is found to be E 26° 12': Required the variation, and which way it is.

Since they are both the ſame way, therefore

From the magnetic amplitude -	E 26°, 12' N.
take the true amplitude -	E 14 , 20 N.
and there remains the variation -	11 , 52 E.

which is eaſterly, becauſe in this caſe the true amplitude is the right of the obſerved.

EXAMPLE II. Suppoſe the ſun's true amplitude at ſetting is W 34° 26' S, and his magnetic amplitude W 23° 13' S: Required the variation, and which way it is.

Since they lie both the ſame way, therefore

From the ſun's true amplitude -	W 43°, 26' S.
take his magnetic amplitude -	W 23 , 13 S.
there remains the variation -	11 , 13 W.

which

which is westerly, because the true amplitude, in this case, is to the left-hand of the observed.

Example III. Suppose the sun's true altitude at rising is found to be 13° 24' N, and his magnetic E 12° 32' S: Required the variation, and which way it lies.

Since the true and observed amplitudes lie different ways, therefore

To the true amplitude	-	E 13°, 24' N.
add the magnetic amplitude	-	E 12, 32 S.
the sum is the variation	-	25, 56 W.

which is westerly, because the true amplitude is, in this case, to the left of the observed.

Example IV. Suppose the sun's true altitude at setting is found to be W 8° 24' N, but his magnetic amplitude is W 10° 13' S: Required the variation.

To the true amplitude	-	W 8°, 24' N.
add the magnetic -	-	W 10, 13 S.
the sum is the variation	-	18, 37 E.

which is easterly, because the true amplitude is to the right of the observed.

Example V. Suppose the sun's true azimuth at the time of observation is found to be N 86° 40' E, but by the compass it is N 73° 24' E: Required the variation, and which way it lies.

From the sun's true azimuth	-	N 86°, 40' E.
take the magnetical -	-	N 73, 24 E.
there remains the variation	-	13, 16 E.

which is easterly, because the true azimuth is to the right of the observed.

Example VI. Suppose the sun's true azimuth is S 3° 24' E, and the magnetical S 4° 36' W: Required the variation, and which way it lies.

To the true azimuth -	-	S 3°, 24' E.
add the magnetical azimuth	-	S 4, 36 W.
the sum is the variation	-	8, 00 W.

which is westerly, because the true azimuth is, in this case, to the left of the observed.

10. The variation of the compass was first observed at London, in the year 1580, to be 11° 15' easterly, and in the year 1622 it was 6° 0' E.; also in the year 1634, it was 4° 05' E. still decreasing, and the needle approaching the true meridian, till it coincided with it, and then there was no variation; after which, the variation began to be westerly; and in the year 1672, it was observed to be 2° 30' W.; also in the year 1683, it was 4° 30' W; and since that time the variation still continues at London to increase westerly; but how far it will go that way, time and observations will probably be the only means to discover.

Again, at Paris, in the year 1640, the variation was 3° 00' E.; and in the year 1666, there was no variation; but in the year 1681, it was 2° 30' W. and still continues to go westerly.

In short, from observations made in different parts of the world, it appears, that in different places the variation differs both as to its quantity and denomination, it being east in one place, and west in another; the true cause and theory of which, for want of a sufficient number of observations, has not as yet been fully explained.

§ 10. *The Method of keeping a Journal at sea; and how to correct it, by making proper allowance for the Lee-way, Variation*, &c.

1. Leeway is the angle that the rhumb-line, upon which the ship endeavours to sail, makes with the rhumb she really sails upon. This is occasioned by the force of the wind or surge of the sea, when she lies to the windward, or is close-hauled, which causes her to fall off and glide sideways from the point of the compass she capes at. Thus let NESW (N° 31.) represent the compass; and suppose a ship at C capes at, or endeavours to sail upon, the rhumb C*a*; but by the force of the wind, and surge of the sea, she is obliged to fall off, and make her way good upon the rhumb C*b*: then the angle *a*C*b* is the lee-way; and if that angle be equal to one point, the ship is said to make one point lee-way; and if equal to two points, the ship is said to make two points lee-way, &c.

The quantity of this angle is very uncertain, because some ships, with the same quantity of sail, and with the same gale, will make more lee-way than others; it depending much upon the mould and trim of the ship, and the quantity of water that she draws. The common allowances that are generally made for the lee-way, are as follow.

1. If a ship be close hauled, has all her sails set, the water smooth, and a moderate gale of wind, she is then supposed to make little or no lee-way.

2. If it blow so fresh as to cause the small sails be handed, it is usual to allow one point.

3. If it blow so hard that the top-sails must be close reeft, then the common allowance is two points for lee-way.

4. If one top-sail must be handed, then the ship is supposed to make between two and three points lee-way.

5. When both top-sails must be handed, then the allowance is about four points for lee-way.

6. If it blows so hard as to occasion the fore-course to be handed, the allowance is between $5\frac{1}{2}$ and 6 points.

7. When both main and fore-courses must be handed, then 6 or $6\frac{1}{2}$ points are commonly allowed for lee-way.

8. When the mizen is handed, and the ship is trying a-hull, she is then commonly allowed about 7 points for lee-way.

3. Though these rules are such as are generally made use of, yet since the lee-way depends much upon the mould and trim of the ship, it is evident that they cannot exactly serve to every ship; and therefore the best way is to find it by observation. Thus, let the ship's wake be set by a compass in the poop, and the opposite rhumb is the true course made good by the ship; then the difference between this and the course given by the compass in the binacle, is the lee-way required. If the ship be within sight of land; then the lee-way may be exactly found by observing a point on the land which continues to bear the same way, and the distance between the point of the compass

pass it lies upon, and the point the ship capes at, will be the lee-way. Thus, suppose a ship at C, is lying up NW*b*, towards A; but instead of keeping that course, she is carried on the NNE line CB, and consequently the point B continues to bear the same way from the ship: Here it is evident, that the angle ACB, or the distance between the N*b*W line that the ship capes at, and the NNE line that the ship really sails upon, will be the lee-way.

4. Having the course steered, and the lee-way, given; we may from thence find the true course by the following method, *viz.* Let your face be turned directly to the windward; and if the ship have her larboard tacks on board, count the lee-way from the course steered towards the right hand; but if the starboard tacks be an board, then count it from the course steered towards the left hand. Thus, suppose the wind at north, and the ship lies up within 6 points of the wind, with her larboard tacks on board, making one point lee-way; here it is plain, that the course steered is ENE, and the true course E*b*N: also suppose the wind is at NNW, and the ship lies up within $6\frac{1}{2}$ points of the wind, with her starboard tack on board, making $1\frac{1}{2}$ point lee-way; it is evident that the true course, in this case, is WSW.

5. We have shewed, in the last section, how to find the variation of the compass; and from what has been said there, we have this general rule for finding the ship's true course, having the course steered and the variation given, viz. Let your face be turned towards the point of the compass upon which the ship is steered; and if the variation be easterly, count the quantity of it from the course steered towards the right hand; but if westerly, towards the left hand; and the course thus found is the true course steered. Thus, suppose the course steered is N*b*E, and the variation one point easterly; then the true course steered will be NNE: Also suppose, the course steered is NE*b*E, and the variation one point westerly; then, in this case, the true course will be NE; and so of others.

Hence, by knowing the lee-way variation, and course steered, we may from thence find the ship's true course; but if there be a current under foot, then that must be tried, and proper allowances made for it, as has been shown in the section concerning *Currents*, from thence to find the true course.

6. After making all the proper allowances for finding the ship's true course, and making as just an estimate of the distance as we can; yet by reason of the many accidents that attend a ship in a day's running, such as different rates of sailing between the times of heaving the log; the want of due care at the helm by not keeping her steady, but suffering her to yaw and fall off; sudden storms, when no account can be kept, &c.; the latitude by account frequently differs from the latitude by observation: and when that happens, it is evident there must be some error in the reckoning; to discover which, and where it lies, and also how to correct the reckoning, you may observe the following rules.

1st, If the ship sail near the meridian, or within 2 or $2\frac{1}{2}$ points thereof; then if the latitude by account disagrees with the latitude by observation, it is most likely that the error lies in the distance run; for it is plain, that in this case it will require a very sensible error in the course to make any considerable error in the difference of latitude, which cannot well happen if due care be taken at the helm, and proper allowances be made for the lee-way, variation, and currents. Consequently, if the course be pretty near the truth, and the error in the distance run regularly through the whole, we may, from the latitude obtained by observation, correct the distance and departure by account, by the following analogies, viz.

As the dfference of latitude by account
is to the true difference of latitude,
So is the departure by account
to the true departure,
And so is the direct distance by account
to the true direct distance.

The reason of this is plain: for let AB (N° 33.) denote the meridian of the ship at A, and suppose the ship sails upon the rhumb AE near the meridian, till by account she is found in C, and consequently her difference of latitude by account is AB; but by observation she is found in the parallel ED, and so her true difference of latitude is AD, her true distance AE, and her true departure DE; then, since the triangles ABC ADE are similar, it will be AB : AD : : BC : DE, and AB : AD : : AC : AE.

Example. Suppose a ship from the latitude of 45° 20′ north, after having sailed upon several courses near the meridian for 24 hours, her difference of latitude is computed to be upon the whole 95 miles southerly, and her departure 34 miles easterly; but by observation she is found to be in the latitude of 43° 10′ north, and consequently her true difference of latitude is 130 miles southerly: then for the true departure, it will be, As the difference of latitude by account 95 is to the true difference of latitude 130; so is the departure by account 34 to the true departure 46.52, and so is the distance by account 100.9 to the true distance 138.

2dly, If the courses are for the most part near the parallel of east and west, and the direct course be within $5\frac{1}{2}$ or 6 points of the meridian; then if the latitude by account differs from the observed latitude, it is most probable that the error lies in the course or distance, or perhaps both; for in this case it is evident, the departure by account will be very nearly true; and thence by the help of this, and the true difference of latitude, may the true course and direct distance be readily found by *Case* 4. *of Plane Sailing*.

Example. Suppose a ship from the latitude of 43° 50′ north, after having sailed upon several courses near the parallel of east and west, for the space of 24 hours, is found by dead reckoning to be in the latitude of 42° 45′ north, and to have made 160 miles of westing; but by a good observation the ship is found to be in the latitude of 42° 35′ north: Required the true course, and direct distance sailed.

With the true difference of latitude 75 miles, and departure 160 miles, we shall find (by *Case* 4. *of Plane Sailing*) the true course to be S. 64° 53′ W. and the direct distance 176.7 miles.

3dly, If the courses are for the most part near the middle of the quadrant, and the direct course within 2 and 6 points of the meridian; then the error may be either in the course or in the distance, or in both, which

which will cause an error both in the difference of latitude and departure; to correct which, having found the true difference of latitude by observation, with this, and the direct distance by dead reckoning, find a new departure (by *Case* 3. *of Plane Sailing*;) then half the sum of this departure, and that by dead reckoning, will be nearly equal to the true departure; and consequently with this, and the true difference of latitude, we may (by *Case* 4. *of Plane Sailing*) find the true course and distance.

Example. Suppose a ship from the latitude of 44° 38′ north, sails between south and east upon several courses, near the middle of the quadrant, for the space of 24 hours, and is then found by dead reckonings to be in the latitude of 42° 15′ north, and to have made of easting 136 miles; but by observation she is found to be in the latitude of 42° 04′ north: Required her true course and distance.

With the true distance of latitude 154 miles, and the direct distance by dead reckoning 197.4, you will find (by *Case* 3. *of Plane Sailing*) the new departure to be 123.4, and half the sum of this and the departure by dead reckoning will be 123.7 the true departure; then with this, and the true difference of latitude, you will find (by *Case* 4. *of Plane Sailing*), the true course to be S. 39° 00′ E. and the direct distance 198.2 miles.

7. In keeping a ship's reckoning at sea, the common method is to take from the log-board the several courses and distances sailed by the ship last 24 hours, and to transfer these together with the most remarkable occurrences into the log-book, into which also are inserted the courses corrected, and the difference of latitude and difference of longitude made good upon each; then the whole day's work being finished in the log-book, if the latitude by account agree with the latitude by observation, the ship's place will be truly determined; if not, then the reckoning must be corrected according to the preceding rules, and placed in the journal.

The form of the Log-book and Journal, together with an example of 2 days work, you have here subjoined.

Note, to express the days of the week, they commonly use the characters by which the sun and planets are expressed, *viz.* ☉ denotes *Sunday*, ☽ *Monday*, ♂ *Tuesday*, ☿ *Wednesday*, ♃ *Thursday*, ♀ *Friday*, and ♄ denotes *Saturday*.

§ 11. *The Form of the Log-Book, with the Manner of working Days Works at Sea.*

			144.2		125.0

Hence the ship, by account, has come to the latitude of 47° 46′ north, and has differed her longitude 2° 5′ westerly; so this day I have made my way good S. 31° 31′ W. distance 157.4 miles.

At noon the Lizard bore from me N. 31° 31′ E. distance 157.4 miles; and having observed the latitude, I found it agreed with the latitude by account.

Hence the ship, by account, has come to the latitude of 47° 17' north, and has differed her longitude 49' easterly; consequently she has got 1° 16' to the westward of the Lizard, and has made her way good the last 24 hours 849° 08' E, distance 44.3 miles.

At noon the Lizard bore from me north 17° 7' east, distance 170.6 miles.

This day I had an observation, and found the latitude by account to disagree with the latitude by observation by 11 minutes, I being so much further to the southward than by dead reckoning, which by the third of the preceding rules I correct as in the Journal.

A Journal from the Lizard towards Jamaica in the ship Neptune, *J. M.* commander.

Inland NAVIGATION. See CANAL, and TRADE.

NAUMACHIA, in antiquity, a ſhew or ſpectacle among the ancient Romans, repreſenting a ſea-fight.

NAUMBURG, a town of Germany, in the circle of Upper Saxony, capital of the county of Saxe-Naumburg, ſituated on the river Sala, in E. Long. 11. 20. N. Lat. 51. 12.

NAUPACTUS, or NAUPACTUM, (anc. geogr.), the extreme or outmoſt town of the Ætolians, formerly belonging to the Locrians, but adjudged by Philip to the former: ſo called from the ſhipbuilding there carried on, and ſituated near Antirrhium on the Corinthian bay. *Naupactus*, the epithet. Now *Lepanto*, a port-town of Achaia or Livadia, on the north ſide of the gulf of that name. E. Long. 22. 20. N. Lat. 38. 0.

NAUPORTUS, or NAUPORTUM, (anc. geogr.), a town on a cognominal river, towards its ſource, in Pannonia Superior. The reaſon of the name, according to Pliny, is, that the ſhip Argo, after coming up the Danube, the Save, and the Laubach, was thence carried on mens ſhoulders over the Alps into the Adriatic. The river Nauportus riſes in the Alps, near Longaticum, at the diſtance of ſix miles from the town Nauportum; which was a colony of the Tauriſci, a people on the confines of Noricum. Now *Upper Laubach* in Carinthia, on the river Laubach. E. Long. 14. 40. N. Lat. 46. 28.

NAUSEA, or SICKNESS; a retching or propenſity and endeavour to vomit, ariſing from ſomething which irritates the ſtomach.

NAUTILUS, in zoology, a genus belonging to the order of vermes teſtacea. The ſhell conſiſts of one ſpiral valve, divided into ſeveral apartments by partitions. There are 17 ſpecies, chiefly diſtinguiſhed by particularities in their ſhells.

Bonani obſerves, that this genus of ſhell-fiſh is very well named from the Greek ναυτιλος, which ſignifies both "a ſhip," and "a ſailor;" for that the ſhells of all the nautili carry the appearance of a ſhip with a very high poop. Different authors, both ancient and modern, have called the nautilus by the names of *pompilus*, *nauplius*, *nauticus*, *ovum polypi*, *polypus teſtaceus;* and the French call it *le voilier.* It is by ſome imagined, that men firſt learned the art of navigation from this animal. See *Hiſtory of* NAVIGATION.

The moſt remarkable diviſion of the nautili is into the thin and thick-ſhelled kinds. The firſt is called *nautilus papyraceus;* and its ſhell is indeed no thicker than a piece of paper when out of the water. This ſpecies is not at all faſtened to its ſhell; but there is an opinion, as old as the days of Pliny, that this creature creeps out of its ſhell, and goes on ſhore to feed. When this ſpecies is to ſail, it expands two of its arms on high, and between theſe ſupports a membrane, which it throws out on this occaſion: this ſerves for its ſail, and the two other arms it hangs out of its ſhell, to ſerve occaſionally either as oars or as a ſteerage; but this laſt office is generally ſerved by the tail. When the ſea is calm, it is frequent to ſee numbers of theſe creatures diverting themſelves in this manner: but as ſoon as a ſtorm riſes, or any thing gives them diſturbance, they draw in their legs, and take in as much water as makes them ſpecifically heavier than that in which they float; and then they ſink to the bottom. When they riſe again, they void this water by a number of holes, of which their legs are full. The other nautilus, whoſe ſhell is thick, never quits that habitation. This ſhell is divided into 40 or more partitions, which grow ſmaller and ſmaller as they approach the extremity or centre of the ſhell: between every one of theſe cells and the adjoining ones there is a communication by means of a hole in the centre of every one of the partitions. Through this hole there runs a pipe of the whole length of the ſhell. It is ſuppoſed by many, that by means of this pipe the fiſh occaſionally paſſes from one cell to another; but this ſeems by no means probable, as the fiſh muſt undoubtedly be cruſhed to death by paſſing through it. It is much more likely that the fiſh always occupies the largeſt chamber in its ſhell; that is, it lives in the cavity between the mouth and the firſt partition, and that it never removes out of this; but that all the apparatus of cells, and a pipe of communication which we ſo much admire, ſerves only to admit occaſionally air or water into the ſhell, in ſuch proportion as may ſerve the creature in its intentions of ſwimming.

Some authors call this ſhell the *concha margaritifera:* but this can be only on account of the fine colour on its inſide, which is more beautiful than any other mother-of-pearl; for it has not been obſerved that this ſpecies of fiſh ever produced pearls. It muſt be obſerved, that the polypus is by no means to be confounded with the paper-ſhelled nautilus, notwithſtanding the great reſemblance in the arms and body of the incloſed fiſh; nor is the cornu ammonis, ſo frequently found foſſile, to be confounded with the thick-ſhelled nautilus, though the concamerations and general ſtructure of the ſhell are alike in both; for there are great and eſſential differences between all theſe genera.

NAVY, the fleet or ſhipping of a prince or ſtate. See MARINE.

The management of the Britiſh navy-royal under the lord high admiral of Great Britain, is entruſted to principal officers and commiſſioners of the navy, who hold their places by patent. The principal officers of the navy are four, viz. the treaſurer, whoſe buſineſs it is to receive money out of the exchequer, and to pay all the charges of the navy, by warrant from the principal officers: comptroller, who attends and controuls all payment of wages, is to know the rates of ſtores, to examine and audit all accounts, &c.: ſurveyor, who is to know the ſtates of all ſtores, and ſee wants ſupplied; to eſtimate repairs, charge boatſwains, &c. with what ſtores they receive, and at the end of each voyage to ſtate and audit accounts: clerk of the acts, whoſe buſineſs it is to record all orders, contracts, bills, warrants, &c.

The commiſſioners of the navy are five: the firſt executes that part of the comptroller's duty which relates to the comptrolling the victualler's accounts; the ſecond, another part of the ſaid comptroller's duty relating to the account of the ſtorekeepers of the yard; the third has the direction of the navy at the port of Portſmouth; the fourth has the ſame at Chatham; and the fifth at Plymouth. There are alſo other commiſſioners at large, the number more or

leſs

lefs according to the exigencies of public affairs; and fince the increafe of the royal navy, thefe have feveral clerks under them, with falaries allowed by the king.

The victualling of the royal navy hath formerly been undertaken by contract; but is now managed by commiffioners, who hold their office on Tower-hill, London. The navy-office is where the whole bufinefs concerning the navy is managed by the principal officers and commiffioners.

The royal navy of Great Britain is now in a very flourifhing ftate, having been diligently kept up in late reigns, as the natural ftrength of the kingdom. When it is complete, it is divided into three fquadrons, diftinguifhed by the colours of the flags carried by the refpective admirals belonging to the fame, viz. *red*, *white*, and *blue;* the principal commander of which bears the title of *admiral:* and each has under him a vice-admiral and a rear-admiral, who are likewife flag-officers.

Navy-*Exercife*. See Exercise.

Navy-*Difcipline* or *Regulations*. See Maritime *State*.

NAXIA, or Naxos, a confiderable ifland of the Archipelago, 25 miles in length, and 88 in circumference. The whole ifland is covered with orange, olive, lemon, cedar, citron, pomegranate, fig, and mulberry-trees; and there are a great many fprings and brooks. This ifland has no harbour; and yet they carry on a confiderable trade in barley, wine, figs, cotton, filk, flax, cheefe, falt, oxen, fheep, mules, and oil. They burn only oil of maftic, though olive-oil is exceeding cheap. It is inhabited both by Greeks and Latins, who live in great dread of the Turks: for when the meaneft of their fhips appear here, they always wear red caps like galley-flaves, and tremble before the loweft officer; but, as foon as they are gone, they put on their caps of velvet. The ladies are fo vain, that, when they return out of the country, they have 40 women in their train, half on foot and half on affes, one of whom carries a napkin or two, another a petticoat, another a pair of ftockings, and fo on; which is a very ridiculous fight to ftrangers. There are four archbifhops fees in this ifland, and a great many villages; but fo thin of people, that the whole ifland does not contain above 8000 inhabitants. The higheft mountain is *Zia*, which fignifies "the mountain of Jupiter." There are but few antiquities, except fome fmall remains of the temple of Bacchus. Some fay they have mines of gold and filver; however, there is one of emery, which is fo common here, and fo cheap, that the Englifh often ballaft their fhips therewith.

Naxos, or *Naxia*, a confiderable town, and capital of the ifle of Naxos, over-againft the ifle of Paros, with a caftle and two archbifhops fees, the one Greek and the other Latin. The greateft part of the inhabitants are Greeks. E. Long. 25. 51. N. Lat. 37. 8.

NAXUS (anc. geogr.), the moft remarkable of the Cyclades, 18 miles to the eaft of Delos; called *Strongyle*, then *Dia*, and *Dionyfias*. Some have called it *Sicily the Lefs*. Now called *Naxia*, *Nixia*, or *Naxos*. E. Long. 26. 5. N. Lat. 36. 30.

Naxus (anc. geogr.), a town of Crete, famous for its hones, called *Lapis Naxius*. Another of Sicily, built by the Chalcidian; fituate on the fouth fide of Mount Taurus, deftroyed by Dionyfius the tyrant; from whofe ruins Tauromenium, built by Timoleon, either arofe or was increafed, (Plutarch).

NAZARENES, in church-hiftory, a name originally given to all Chriftians in general, on account that Jefus Chrift was of the city of Nazareth; but afterwards reftrained to a fet of heretics, whofe religion confifted of a ftrange jumble of Judaifm and Chriftianity, obferving at the fame time the Mofaical law, and the rites of the Chriftian religion.

NAZARETH (anc. geogr.), a town of Galilee near mount Tabor, fituate on an eminence; the place of the annunciation or conception of our Saviour, and of his refidence till he entered on his public miniftry at 30 years of age.

NAZARITES, among the Jews, perfons who, either of themfelves, or by their parents, were dedicated to the obfervation of Nazaritefhip. They were of two forts; namely, fuch as were bound to this obfervance only for a fhort time, as a week or a month; or thofe who were bound to it all their lives. All that we find peculiar in the latter's way of life is, that they were to abftain from wine and all intoxicating liquors, and never to fhave or cut off the hair of their heads. The firft fort of Nazarites were, moreover, to avoid all defilement; and if they chanced to contract any pollution before the term was expired, they were obliged to begin afrefh. Women as well as men might bind themfelves to this vow.

NAZIANZEN. See Gregory *Nazianzen*.

NEALED, among feamen, is ufed when the founding is deep water clofe to the fhore; as alfo when the fhore is fandy, clayey, oozy, or foul and rocky ground.

NEALING, or rather Annealing, a term ufed for the preparing of feveral matters, by heating or baking them in the oven, or the like.

NEAPED. When a fhip wants water, fo that fhe cannot get out of the harbour, off the ground, or out of the dock, the feamen fay fhe is *neaped*, or *beneaped*.

NEAPOLIS (anc. geogr.), a city of the Higher Egypt, in the Nomos Panopolitanus, between Thebæ to the fouth, and Panopolis to the north, on the eaft fide of the Nile. Otherwife called *Caene*.—A fecond Neapolis of Babylonia, fituate near the Euphrates, on the fouth fide.—A third of Campania, an ancient town, and a colony from Cumæ, called at firft *Parthenope*, from the tomb of the firen of that name, (Velleius, Pliny, Strabo); accounted a Greek city, and a great ftickler for Greek ufages, (Livy, Tacitus). Its hot baths were in nothing inferior to thofe of Baiæ, according to Strabo: at two miles diftance from it ftands the monument of Virgil, held in religious veneration by learned pofterity. The Younger Pliny relates, that Virgil's birthday was more religioufly obferved by Silius Italicus than his own, efpecially at Naples, where he reforted to his tomb as to a temple. The city is wafhed by river Sebethus. Virgil feigns the nymph Sebethis to prefide over the ftream. Now *Naples*, capital of the kingdom of that name; E. Long. 15. 12. N. Lat. 41. 6.—A fourth, Neapolis of Caria, near the Meander, (Ptolemy).—A fifth, an inland town of Cyrenaica, fituate between Ptolemais and Arfinoe, (Ptolemy);

Neat ‖ Necessity.

lemy); and to be diftinguifhed from the Cænopolis, or Neapolis, on the eaft border of the fame province, (id.).—A fixth, of Ionia, (Strabo); which belonged firft to the Ephefians, but afterwards to the Samians, who exchanged Marathefium, a more diftant city, for a nearer.—A feventh, Neapolis of Macedonia Adjecta, fituate at the diftance of 12 miles to the eaft of Philippi, (Antonine).—An eighth, Neapolis of Pifidia, on the borders of Galatia, fituate between Amblada and Pappa, (Ptolemy).—A ninth, of Samaria, the ancient *Sichem*, which fee; fo called upon its reftoration by the Romans, (Coin, Pliny, Jofephus).—A tenth, of Sardinia, fituate on the fouth-weft fide of the ifland, 30 miles to the north of Metalla: now called *Neapoli*.—An eleventh, of the Regio Syrtica, called alfo *Leptis*.—A twelfth, of Zeugitana on the Mediterranean, to the eaft of Clypea, and fouth of the Promontorium Mercurii.

NEAT or NET *Weight*, the weight of a commodity alone, clear of the cafk, bag, cafe, or even filth. See NET.

NEBIO, or NEBBIO, a ruined city of Italy, on the north fide of the ifland of Corfica, with a bifhop's fee, whofe bifhop refides at San Florenzo, from which it is a mile diftant.

NEBO (anc. geogr.), a very high mountain, a part of the mountains Abarim, and their higheft top, whither Mofes was ordered to afcend to take a view of the land of Canaan, and there die. Situate in the land of Moab, over-againft Jericho: with a cognominal town at its foot (Ifaiah) belonging to the Reubenites, which afterwards returned to the Moabites; in Jerome's time defolate; eight miles to the fouth of Hefhbon.

NEBUCHADNEZZAR. See NABUCHADNEZZAR.

NEBULY, or NEBULEE, in heraldry, is when a coat is charged with feveral little figures, in form of words running within one another, or when the outline of a bordure, ordinary, &c. is indented or waved.

NECESSITY, whatever is done by a neceffary caufe, or a power that is irrefiftible; in which fenfe it is oppofed to freedom. See METAPHYSICS, n° 78—80.

NECESSITY, in law, as it implies a defect of will, excufes from the guilt of crimes. See CRIME.

Blackft. Comment.

Compulfion and inevitable *neceffity* are a conftraint upon the will, whereby a man is urged to do that which his judgment difapproves; and which, it is to be prefumed, his will (if left to itfelf) would reject. As punifhments are therefore only inflicted for the abufe of that free-will which God has given to man, it is highly juft and equitable that a man fhould be excufed for thofe acts which are done through unavoidable force and compulfion.

1. Of this nature, in the firft place, is the obligation of *civil fubjection*, whereby the inferior is conftrained by the fuperior to act contrary to what his own reafon and inclination would fuggeft: as when a legiflator eftablifhes iniquity by a law, and commands the fubject to do an act contrary to religion or found morality. How far this excufe will be admitted *in foro confcientiæ*, or whether the inferior in this cafe is not bound to obey the divine rather than the human law, it is not our bufinefs to decide; though, among the cafuifts, it is believed the queftion will hardly bear a doubt. But, however that may be, obedience to the laws in being is undoubtedly a fufficient extenuation of civil guilt before the municipal tribunal. The fheriff who burnt Latimer and Ridley in the bigotted days of queen Mary, was not liable to punifhment from Elizabeth for executing fo horrid an office; being juftified by the commands of that magiftracy which endeavoured to reftore Superftition, under the *holy* aufpices of its mercilefs fifter, Perfecution.

Neceffity.

As to perfons in private relations, the principal cafe where conftraint of a fuperior is allowed as an excufe for criminal mifconduct, is with regard to the matrimonial fubjection of the wife to her hufband: for neither a fon or a fervant are excufed for the commiffion of any crime, whether capital or therwife, by the command or coercion of the parent or mafter; though in fome cafes the command or authority of the hufband, either exprefs or implied, will privilege the wife from punifhment, even for capital offences. And therefore if a woman commit theft, burglary, or other civil offences againft the laws of fociety, by the coercion of her hufband, or even in his company, which the law conftrues a coercion, fhe is not guilty of any crime; being confidered as acting by compulfion, and not of her own will. Which doctrine is at leaft 1000 years old in this kingdom, being to be found among the laws of king Ina the Weft-Saxon. And it appears, that, among the northern nations on the continent, this privilege extended to any woman tranfgreffing in concert with a man, and to any fervant that committed a joint offence with a freeman: the male or freeman only was punifhed, the female or flave difmiffed; "*procul dubio quod alterum libertas, alterum neceffitas impelleret.*" But (befides that, in our law, which is a ftranger to flavery, no impunity is given to fervants, who are as much free agents as their mafters) even with regard to wives, this rule admits of an exception in crimes that are *mala in fe*, and prohibited by the law of nature; as murder, and the like: not only becaufe thefe are of a deeper dye; but alfo, fince in a ftate of nature no one is in fubjection to another, it would be unreafonable to fcreen an offender from the punifhment due to natural crimes, by the refinements and fubordinations of civil fociety. In treafon alfo, (the higheft crime which a member of fociety can, as fuch, be guilty of), no plea in coverture fhall excufe the wife; no prefumption of the hufband's coercion fhall extenuate her guilt: as well becaufe of the odioufnefs and dangerous confequence of the crime itfelf, as becaufe the hufband, having broken through the moft facred tie of focial community by rebellion againft the ftate, has no right to that obedience from a wife, which he himfelf as a fubject has forgotten to pay. In inferior mifdemefnors alfo, we may remark another exception, that a wife may be indicted and fet in the pillory *with* her hufband, for keeping a brothel: for this is an offence touching the domeftic œconomy or government of the houfe, in which the wife has a principal fhare; and is alfo fuch an offence as the law prefumes to be generally conducted by the intrigues of the female fex. And in all cafes where the wife offends alone, without the company

pany or coercion of her hufband, fhe is refponfible for her offence as much as any feme-fole.

2. Another fpecies of compulfion or neceffity is what our law calls *durefs per minas;* or threats and menaces, which induce a fear of death or other bodily harm, and which take away for that reafon the guilt of many crimes and mifdemefnors, at leaft before the human tribunal. But then that fear which compels a man to do an unwarrantable action ought to be juft and well-grounded; fuch, "*qui cadere poffit in virum conftantem, non timidum et meticulofum,*" as Bracton expreffes it, in the words of the civil law. Therefore, in time of war or rebellion, a man may be juftified in doing many treafonable acts by compulfion of the enemy or rebels, which would admit of no excufe in the time of peace. This, however, feems only, or at leaft principally, to hold as to pofitive crimes, fo created by the laws of fociety, and which therefore fociety may excufe; but not as to natural offences, fo declared by the law of God, wherein human magiftrates are only the executioners of divine punifhment. And therefore though a man be violently affaulted, and hath no other poffible means of efcaping death but by killing an innocent perfon, this fear and force fhall not acquit him of murder; for he ought rather to die himfelf than efcape by the murder of an innocent. But in fuch a cafe he is permitted to kill the affailant; for there the law of nature, and felf-defence its primary canon, have made him his own protector.

3. There is a third fpecies of neceffity, which may be diftinguifhed from the actual compulfion of external force or fear; being the refult of reafon and reflection, which act upon and conftrain a man's will, and oblige him to do an action which without fuch obligation would be criminal. And that is, when a man has his choice of two evils fet before him, and, being under a neceffity of choofing one, he choofes the leaft pernicious of the two. Here the will cannot be faid freely to exert itfelf, being rather paffive than active; or, if active, it is rather in rejecting the greater evil than in choofing the lefs. Of this fort is that neceffity, where a man by the commandment of the law is bound to arreft another for any capital offence, or to difperfe a riot, and refiftance is made to his authority: it is here juftifiable, and even neceffary, to beat, to wound, or perhaps to kill, the offenders, rather than permit the murderer to efcape, or the riot to continue. For the prefervation of the peace of the kingdom, and the apprehending of notorious malefactors, are of the utmoft confequence to the public; and therefore excufe the felony, which the killing would otherwife amount to.

4. There is yet another cafe of neceffity, which has occafioned great fpeculation among the writers upon general law; *viz.* whether a man in extreme want of food or clothing may juftify ftealing either, to relieve his prefent neceffities. And this both Grotius and Puffendorf, together with many other of the foreign jurifts, hold in the affirmative; maintaining by many ingenious, humane, and plaufible reafons, that in fuch cafes the community of goods, by a kind of tacit conceffion of fociety, is revived. And fome even of our lawyers have held the fame; though it feems to be an unwarranted doctrine, borrowed from the notions of fome civilians: at leaft it is now antiquated, the law of England admitting no fuch excufe at prefent. And this its doctrine is agreeable not only to the fentiments of many of the wifeft ancients, particularly Cicero, who holds, That *fuum cuique incommodum ferendum eft, potius quam de alterius commodis detrahendum;* but alfo to the Jewifh law, as certified by king Solomon himfelf: "If a thief fteal to fatisfy his foul when he is hungry, he fhall reftore fevenfold, and fhall give all the fubftance of his houfe:" which was the ordinary punifhment for theft in that kingdom. And this is founded upon the higheft reafon: for mens properties would be under a ftrange infecurity, if liable to be invaded according to the wants of others; of which wants no man can poffibly be an adequate judge, but the party himfelf who pleads them. In England efpecially, there would be a peculiar impropriety in admitting fo dubious an excufe: for by the laws fuch fufficient provifion is made for the poor by the power of the civil magiftrate, that it is impoffible that the moft needy ftranger fhould ever be reduced to the neceffity of thieving to fupport nature. The cafe of a ftranger is, by the way, the ftrongeft inftance put by baron Puffendorf, and whereon he builds his principal arguments: which, however they may hold upon the continent, where the parfimonious induftry of the natives orders every one to work or ftarve, yet muft lofe all their weight and efficacy in England, where charity is reduced to a fyftem, and interwoven in our very conftitution. Therefore our laws ought by no means to be taxed with being unmerciful, for denying this privilege to the neceffitous; efpecially when we confider, that the king, on the reprefentation of his minifters of juftice, hath a power to foften the law, and to extend mercy in cafes of peculiar hardfhip. An advantage which is wanting in many ftates, particularly thofe which are democratical: and thefe have in its ftead introduced and adopted, in the body of the law itfelf, a multitude of circumftances tending to alleviate its rigour. But the founders of our conftitution thought it better to veft in the crown the power of pardoning particular objects of compaffion, than to countenance and eftablifh theft by one general undiftinguifhing law.

NECHO, king of Egypt, began his reign 69 B.C. and was killed eight years after by Sabacon king of Ethiopia. Pfammiticus his fon fucceeded him, and was the father of Necho II. who reigned in the 616 B. C. This Necho II. is celebrated in hiftory for attempting, though in vain, to cut a canal from the Nile to the Arabian gulf. He fent the Phœnicians to fail round Africa by fea, defeated Jofias and the Babylonians, and gained many victories; but he was conquered in his turn by Nebuchadnezzar, who confined him within his ancient kingdom.

NECK, in anatomy, is that flender part fituated between the head and trunk of the body. See ANATOMY, n° 30.

NECROMANCY, or NEGROMANCY, a fpecies of divination performed by raifing the dead, and extorting anfwers from them. See DIVINATION.

NECTAR, among ancient poets, the drink of the fabulous deities of the heathens; in contradiftinction from their folid food, which was called *ambrofia.*

NECTARINE, a fruit differing in nothing from the common peach, of which it is a fpecies, than in having a fmoother rind and a firmer pulp. See PERSICA.

NECTARIUM, from *nectar*, the fabled "drink of

Nectarium. of the gods;" defined by Linnæus to be a part of the corolla, or apendage to the petals, appropriated for containing the honey, a ſpecies of vegetable ſalt under a fluid form, that oozes from the plant, and is the principal food of bees and other inſects.

Notwithſtanding this definition, which ſeems to conſider the nectarium as neceſſary a part of the corolla as the petals; it is certain that all flowers are not provided with this appendage, neither indeed is it eſſential to fructification.

Milne's Bot. Dict.

There is, beſides, a manifeſt impropriety in terming the nectarium a part of the corolla. Linnæus might, with equal propriety, have termed it a part or appendage of the ſtamina, calix, or pointal, as the appearance in queſtion is confined to no particular part of the flower, but is as various in point of ſituation as of form. The truth is, the term *nectarium* is exceedingly vague; and, if any determinate meaning can be affixed to it, is expreſſive of all the ſingularities which are obſerved in the different parts of flowers.

The tube, or lower part of flowers with one petal, Linnæus conſiders as a true nectarium, becauſe it is generally found to contain the ſweet liquor formerly mentioned. This liquor Pontedera compares to that called *amnios* in pregnant animals, which enters the fertile or impregnated ſeeds: but that this is not at leaſt its ſole uſe, is evident from this circumſtance, that the honey or liquor in queſtion is to be found in flowers where there are either no ſeeds, or thoſe, from the want of male organs, cannot be impregnated. Thus the male flowers of nettle and willow; the female flowers of ſea-ſide laurel, and black bryony; the male and female flowers of clutia, higgelaria, and butcher's broom, all abound with the honey or nectar alluded to.

Dr Vaillant was of opinion, that the nectarium was an eſſential part of the corolla; for which reaſon he diſtinguiſhed the ſingular appearances in fennel-flower and columbine, by the name of *petals:* the coloured leaves which are now termed the *petals*, he denominates the *flower-cup*.

That the nectarium, however, is frequently diſtinct from the petals, is evident, both from the well-known examples juſt mentioned, as likewiſe from the flowers of monkſhood, hellebore, iſopyrum, fennel-flower of Crete, barrenwort, graſs of Parnaſſus, chocolate-nut, cherleria, and ſauvageſia.

Theſe general obſervations being premiſed, we proceed to take a nearer and more particular view of the principal diverſities, both in form and ſituation, of this ſtriking appendage to the flower. 1. In many flowers the nectarium is ſhaped like a ſpur or horn; and that either in flowers of one petal, as valerian, water-milfoil (*urticularia*), butter-wort, and calves-ſnout; or in ſuch as have more than one, as lark-ſpur, violet, fumatory, balſam, and orchis. 2. In the following plants, the nectarium is properly a part of the corolla, as lying within the ſubſtance of the petals: ranunculus, lily, iris, crown-imperial, water-leaf, mouſe-tail, ananas or pine-apple, dog's-tooth violet, piperidge buſh, valliſneria, hermannia, uvularia, and ſwertia. 3. The nectarium is frequently placed in a ſeries or row within the petals, though entirely unconnected with their ſubſtance. In this ſituation it often reſembles a cup, as in narciſſus. A nectarium of this kind is ſaid by Linnæus to crown the corolla. The following are examples: daffodil, ſea-daffodil, campion, viſcous campion, ſwallow-wort, ſtapelia, cynanchum, nepenthes, cherleria, balſam-tree, African ſpiræa, witch-hazel, olax, and paſſion-flower. 4. In Indian creſs, buckler muſtard, Barbadoes cherry, and monotropa, the nectarium is ſituated upon or makes part of the calix. 5. The nectarium in baſtard flower-fence is ſeated upon the antheræ or tops of the ſtamina; whence the name *adenanthera*, or *glandular anthera*, which has been given to this genus of plants. In the following liſt it is placed upon the filaments: bean-caper, bay, fraxinella, marvel of Peru, bell-flower, lead-wort, roëlla, and commelina. 6. In hyacinth, flowering-ruſh, ſtock July-flower, and rocket, the nectarium is placed upon the ſeed-bud. 7. In honey-flower, orpine, buck-wheat, collinſonia, lathræa, navel-wort, mercury, clutia, kiggelaria, ſea-ſide laurel, and African ſpiræa, it is attached to the common receptacle. Laſtly, in ginger, nettle, dyer's weed, heart-ſeed, coſtus, turmeric, grewia, baſtard orpine, vanelloe, ſkrew-tree, and willow, the nectarium is of a very ſingular conſtruction, and cannot properly fall under any of the foregoing heads.

In diſcriminating the genera, the nectarium often furniſhes an eſſential character.

Plants which have the nectarium diſtinct from the petals, that is, not lodged within their ſubſtance, are affirmed by Linnæus to be generally poiſonous. The following are adduced as examples: monk's hood, hellebore, columbine, fennel-flower, graſs of Parnaſſus, barren-wort, oleander, marvel of Peru, bean-caper, ſucculent ſwallow-wort, fraxinella, and honey-flower.

Necydalis, Needle.

NECYDALIS, in zoology, a genus of inſects belonging to the order of coleoptera. The feelers are ſetaceous; the elytra are ſhorter and narrower than the wings; the tail is ſimple. There are 11 ſpecies, chiefly diſtinguiſhed by the ſize and figure of their elytra.

NEEDLE, a very common little inſtrument or utenſil, made of ſteel, pointed at one end, and pierced at the other, uſed in ſewing embroidery, tapeſtry, &c.

Needles make a very conſiderable article in commerce, though there is ſcarce any commodity cheaper, the conſumption of them being almoſt incredible. The ſizes are from n° 1. the largeſt, to n° 25. the ſmalleſt. In the manufacture of needles, German and Hungarian ſteel are of moſt repute.

In the making of them, the firſt thing is to paſs the ſteel through a coal-fire, and under a hammer, to bring it out of its ſquare figure into a cylindrical one. This done, it is drawn through a large hole of a wire-drawing iron, and returned into the fire, and drawn thro' a ſecond hole of the iron, ſmaller than the firſt; and thus ſucceſſively from hole to hole, till it has acquired the degree of fineneſs required for that ſpecies of needles; obſerving every time it is to be drawn, that it be greaſed over with lard, to render it more manageable. The ſteel thus reduced to a fine wire, is cut in pieces of the length of the needles intended. Theſe pieces are flatted at one end on the anvil, in order to form the head and eye: they are then put into the fire, to ſoften them farther; and thence taken out and pierced at each extreme of the flat part on the anvil, by force of a puncheon of well-tempered ſteel, and laid on a leaden block to bring out, with another puncheon,

Needle. cheon, the little piece of fteel remaining in the eye. The corners are then filed off the fquare of the heads, and a little cavity filed on each fide of the flat of the head; this done, the point is formed with a file, and the whole filed over: they are then laid to heat red-hot on a long narrow iron, crooked at one end, in a charcoal fire; and when taken out thence, are thrown into a bafon of cold water to harden. On this operation a good deal depends; too much heat burns them, and too little leaves them foft; the medium is learned by experience. When they are thus hardened, they are laid in an iron fhovel on a fire more or lefs brifk in proportion to the thicknefs of the needles; taking care to move them from time to time. This ferves to temper them, and take off their brittlenefs; great care here too muft be taken of the degree of heat. They are then ftraightened one after another with the hammer, the coldnefs of the water ufed in hardening them having twifted the greateft part of them.

The next procefs is the polifhing them. To do this, they take 12,000 or 15,000 needles, and range them in little heaps againft each other on a piece of new buckram fprinkled with emery-duft. The needles thus difpofed, emery-duft is thrown over them, which is again fprinkled with oil of olives; at laft the whole is made up into a roll, well bound at both ends. This roll is then laid on a polifhing table, and over it a thick plank loaden with ftones, which two men work backwards and forwards a day and a half, or two days, fucceffively; by which means, the roll thus continually agitated by the weight and motion of the plank over it, the needles withinfide being rubbed againft each other with oil and emery, are infenfibly polifhed. After polifhing, they are taken out, and the filth wafhed off them with hot water and foap: they are then wiped in hot bran, a little moiftened, placed with the needles in a round box, fufpended in the air by a cord, which is kept ftirring till the bran and needles be dry. The needles thus wiped in two or three different brans, are taken out and put in wooden veffels, to have the good feparated from thofe whofe points or eyes have been broke either in polifhing or wiping; the points are then all turned the fame way, and fmoothed with an emery-ftone turned with a wheel. This operation finifhes them, and there remains nothing but to make them into packets of 250 each.

Dipping Needle, or *Inclinatory Needle*, a magnetical needle, fo hung, as that, inftead of playing horizontally, and pointing out north and fouth, one end dips, or inclines to the horizon, and the other points to a certain degree of elevation above it.

The dipping-needle was invented in the year 1576, by one Robert Norman a compafs-maker at Wapping. The occafion of the difcovery, according to his own account was, that it being his cuftom to finifh and hang the needles of his compaffes before he touched them, he always found, that immediately after the touch, the north-point would bend or incline downward, under the horizon; infomuch that, to balance the needle again, he was always forced to put a piece of wax on the fouth-end as a counterpoife. The conftancy of this effect led him at length to obferve the precife quantity of the dip, or to meafure the greateft angle which the needle would make with the horizon; and this at London he found to be 71° 50′. In 1723 Mr Graham made a great many obfervations on the dipping-needle, and found the angle to be between 74 and 75 degrees. Mr Nairne, in 1772, found it to be fomewhat above 72°. It is not certain whether the dip varies, as well as the horizontal direction, in the fame place. The trifling difference between Mr Forman and Mr Nairne, would lead us to imagine that the dip was unalterable; but Mr Graham, who was a very accurate obferver, makes the difference more confiderable. It is certain, however, from a great number of experiments and obfervations, that the dip is variable in different latitudes, and that it increafes in going northwards. It appears from a table of obfervations made with the marine dipping-needle in a voyage towards the north pole, in 1773, that in lat. 60. 18. the dip was 75°; and in lat 70. 45. it was 77° 52′; in lat. 80. 12. it was 81° 52′; and in lat. 80. 27. it was 82° $2\frac{1}{2}$′,

Several authors have endeavoured to apply this difcovery of the dip to the finding of the latitude; and Mr Bond attempted to apply it to the finding of the longitude alfo; but for want of obfervations and experiments, he could not make any progrefs. The affair was farther profecuted by Mr Whifton, who publifhed a treatife on the longitude, and for fome time imagined it was poffible to find it exactly by means of the dip of the needle; yet he at laft defpaired of it, for the following reafons. 1. The weaknefs of the magnetic power. 2. The concuffion of the fhip, which he found it exceeding difficult to avoid fo much as was neceffary for the accuracy of the experiments. 3. The principal objection was an irregularity in the motions of all magnetic needles, both horizontal and dipping, by which they, within the compafs of about a degree, vary uncertainly backward and forward; even fometimes, in a few hours time, without any evident caufe. For a particular account of thefe variations both of the horizontal and dipping needle, fee the article Variation.

Mr Nairne, an ingenious inftrument-maker in London, made a dipping-needle in 1772 for the board of longitude, which was ufed in the voyage towards the north-pole. This is reprefented Plate CCIV. fig. 1. The needle AA is 12 inches long, and its axis, the ends BB of which are made of gold alloyed with copper, refts on friction-wheels CCCC, of four inches diameter, each end on two friction-wheels; which wheels are balanced with great care. The ends of the axes of the friction-wheels, are likewife of gold alloyed with copper, and moved in fmall holes made in bell-metal; and oppofite to the ends of the axes of the needle, and the friction-wheels, are flat agates, fet in at DDD, finely polifhed. The magnetic needle vibrates within a circle of bell-metal, EEE, divided into degrees and half degrees; and a line, paffing through the middle of the needle to the ends, points to the divifions. The needle of this inftrument was balanced, before it was made magnetical; but by means of a crofs, the ends of which are FFFF, (contrived by the reverend Mr Mitchell) fixed on the axis of the needle, on the arms of which are cut very fine fcrews to receive fmall buttons, that may be fcrewed nearer or farther from the axis, the needle may be adjufted both ways to a great nicety, after being made magnetical, by reverfing the poles, and changing the fides of the needle. GG are two levels, by which the line of o degrees of the inftrument

ſtrument is ſet horizontal, by means of the four adjuſting ſcrews LLLL; H is the perpendicular axis, by which the inſtrument may be turned, that the divided face of the circle may front the eaſt or weſt; to this axis is fixed an index I, which points to an oppoſite line on the horizontal plate K when the inſtrument is turned half round; MMMM are ſcrews which hold the glaſs-cover to keep the needle from being diſturbed by the wind. When this needle is conſtructed for ſea, it is ſuſpended by an univerſal joint on a triangular ſtand, and adjuſted vertically by a plumb-line and button above the divided circle and the dovetail work at the upper 90; and the diviſions on the circle are adjuſted ſo as to be perpendicular to the horizon by the ſame plumb-line, and an adjoining ſcrew; and when it is adjuſted, a pointer annexed to a ſcrew, which ſerves to move the divided circle, is fixed at the loweſt 90. Whenever the inſtrument is uſed to find the dip, it muſt be ſo placed that the needle may vibrate exactly in the magnetic meridian.

Magnetical NEEDLE, in navigation, a needle touched with a loadſtone, and ſuſtained on a pivot or centre; on which playing at liberty, it directs itſelf to certain points in or under the horizon; whence the magnetical needle is of two kinds, viz. horizontal and inclinatory. See the article MAGNET.

Horizontal needles are thoſe equally balanced on each ſide the pivot that ſuſtains them; and which, playing horizontally with their two extremes, point out the north and ſouth points of the horizon. For their application and uſe, ſee the article COMPASS.

In the conſtruction of the horizontal needle, a piece of pure ſteel is provided; of a length not exceeding ſix inches, leſt its weight ſhould impede its volubility; very thin, to take its verticity the better; and not pierced with any holes, or the like, for ornament ſake, which prevent the equable diffuſion of the magnetic virtue. A perforation is then made in the middle of its length, and a braſs-cap or head ſoldered on, whoſe inner cavity is conical, ſo as to play freely on a ſtyle or pivot headed with a fine ſteel point. The north point of the needle in our hemiſphere is made a little lighter than the ſouthern; the touch always deſtroying the balance, if well adjuſted before, and rendering the north end heavier than the ſouth, and thus occaſioning the needle to dip.

The method of giving the needle its verticity or directive faculty, has been ſhewn already under the article MAGNET; but if, after touching, the needle be out of its equilibrium, ſomething muſt be filed off from the heavier ſide, till it balance evenly.

Needles in ſea-compaſſes are uſually made of a rhomboidal or oblong form: we have given their ſtructure already under the article COMPASS.

The needle is not found to point preciſely to the north, except in very few places; but deviates from it more or leſs in different places, and that too at different times; which deviation is called its *declination* or *variation from the meridian*. See the article VARIATION.

NEEDLE-*Fiſh*. See SYNGNATHUS.

NEEDLES, in geography, two capes or headlands at the weſt end of the Iſle of Wight, which it is is very difficult to paſs on account of the ſands and rocks.

NEFASTI DIES, in Roman antiquity, an appellation given to thoſe days wherein it was not allowed to adminiſter juſtice, uſually marked in the kalendar by N. or N. P. *i. e. nefaſtus prima*.

NEGAPATAN, a town of Aſia, in the peninſula on this ſide the Ganges, and on the coaſt of Coromandel. It was firſt a colony of the Portugueſe, but was taken from them by the Dutch. The factory purchaſe very little beſides tobacco and long linen cloths; however, the Dutch have thought proper to erect a ſort here. It is ſituated in E. Long. 79. 10. N. Lat. 11. 15.

NEGATION, in logic, an act of the mind affirming one thing to be different from another; as that the ſoul is not matter. See LOGIC.

NEGATIVE, in general, ſomething that implies a negation: thus we ſay, negative quantities, negative powers, negative ſigns, &c.

NEGATIVE *Electricity*. See the article ELECTRICITY *paſſim*. See alſo POSITIVE *Electricity*.

NEGOMBO, a ſea-port town of Aſia, on the weſt coaſt of Ceylon. It has a ſort built by the Portugueſe, which was taken from them by the Dutch in 1640. E. Long. 80. 25. N. Lat. 17. 0.

NEGRIL POINT, the moſt weſterly promontory of the iſland of Jamaica.

NEGROES, properly the inhabitants of Nigritia or Negroland in Africa, called alſo *Blacks* and *Moors*; but this name is now given to all the *Blacks*.

The origin of the Negroes, and the cauſe of this remarkable difference from the reſt of the human ſpecies, has much perplexed the naturaliſts. Mr Boyle has obſerved, that it cannot be produced by the heat of the climate: for though the heat of the ſun may darken the colour of the ſkin, yet experience does not ſhow that it is ſufficient to produce a new blackneſs like that of the Negroes.

In Africa itſelf, many nations of Ethiopia are not black; nor were there any blacks originally in the Weſt Indies. In many parts of Aſia, under the ſame parallel with the African region inhabited by the blacks, the people are but tawny. He adds, that there are Negroes in Africa beyond the ſouthern tropic; and that a river ſometimes parts nations, one of which is black, and the other only tawny. Dr Barriere alleges, that the gall of Negroes is black, and being mixed with their blood is depoſited between the ſkin and ſcarf-ſkin. However, Dr Mitchel of Virginia, in the Philoſophical Tranſactions n° 476, has endeavoured by many learned arguments to prove, that the influence of the ſun in hot countries, and the manner of life of their inhabitants, are the remote cauſes of the colour of the Negroes, Indians, &c. Se AMERICA, n° 48—51. and COLOUR *of the Human Species*.

Negroes are brought from Guinea, and other coaſts of Africa, and ſent to the colonies in America, to cultivate tobacco, ſugar, indigo, &c. and in Mexico and Peru to dig in the mines; and this commerce, however indefenſible on the foot of religion or humanity, is now carried on by all the nations that have ſettlements in the Weſt Indies. Thoſe Negroes make the beſt ſlaves who are brought from Angola, Senegal, Cape Verd, the river Gambia, the kingdoms of Joloffes, &c. There are various ways of procuring them: ſome, to avoid famine, ſell themſelves, their

Negroland. their wives and children, to their princes or other great men; others are made prifoners of war; and great numbers are feized in excurfions made for that very purpofe by the petty princes into one another's territories, in which it is ufual to fweep away all, without diftinction of age or fex.

NEGROLAND, or NIGRITIA, a country of Africa, lying next to Guinea towards the north, and extending from 18° of weft to 150° of eaft longitude, and from 10° to 20° of north latitude. On the north it is bounded by Zaara or the Defart; on the eaft, by countries unknown; on the fouth, by Guinea; and on the weft, by the Atlantic Ocean; and is watered by the great river Niger or Senegal, which runs through it from eaft to weft. The Europeans have fettlements on the coafts of this country, efpecially near the mouths of the Niger and Gambia, which laft is fuppofed to be a branch of the former. A great many nations inhabit the banks of the rivers; fome Pagans, fome Mohammedans, of different languages, and independent of one another. The country is fruitful, efpecially along the rivers; abounding in rice, Guinea grain, and Indian corn, where it is cultivated; and with cocoa-nuts, plantains, pulfe, palm-trees, and tropical fruits; nor is it deftitute of cattle, and a variety of other animals, particularly fuch as abound in Guinea.

Negroland is fertilized by the overflowing of its rivers the Senegal and Gambia, as Egypt is by the Nile. It hath not yet been afcertained whether the Gambia is a branch of the Senegal or not. As far as the Europeans have penetrated up the country, they appear to be diftinct; and the Mundingo Negroes report that the Gambia has a different origin. The entrance into the Niger or Senegal river is narrow and fomewhat difficult, by reafon of its immoveable bar and fandy fhoals, as well as the feveral iflands at the mouth of it, and the feveral canals and marfhes that clog it: but after failing up eight or ten leagues, it is found broad and deep, and fit to carry large veffels; and, excepting about five or fix leagues on each fide above the mouth, which is fandy and barren ground, the banks are covered with ftately trees and villages, and the country in general is fertile and well watered; for, like the Nile, this river overflows its banks for many leagues, and enriches the land to a great degree, though, for want of fkill, the inhabitants do not reap the advantages which they might obtain from its fertility. The people on both fides of the river live as near to it as they can, and feed great herds of cattle, fowing large and fmall millet, the former of which is called by us *Turkey wheat*, in great quantities, and with great increafe. If the river fails of overflowing at its ufual feafon, a great fcarcity, if not a downright famine, never fails to enfue in the adjacent country; and, even when it overflows regularly, it breeds fuch vaft flights of grafshoppers and infects, as quite darken the air, and frequently eat up all the product of the earth: in which cafe the only remedy the people have is to kill thofe infects and eat them; which they do either by pounding in leathern bags, and then boiling them in milk, or, which is reckoned the more delicious method, by frying or broiling them over a light blaze, in a frying-pan full of holes. Thus the legs and wings of the infects are burnt off, and the reft of the body is fufficiently roafted to be eaten as a dainty, which they look upon to be very wholefome and nourifhing. Negroland ‖ Negropont.

To the eaft, north-eaft, and fouth-eaft of the ifland of Senegal, the country, as far as it is known, is over-run with woods and marfhes; the Senegal, Gambia, and Sherbro, which are looked upon by fome as branches of one immenfe river, paffing through it in their way to the Atlantic Ocean. During the rainy months, which begin in July, and continue to October, they lay the whole country under water; and indeed the fudden rife of thefe rivers is incredible to fuch as are not acquainted with the violent rains that fall between the tropics. At Galam, 900 miles from the mouth of the Senegal, the waters rife 150 feet perpendicular from the bed of the river. At the ifland of Senegal, the river rifes gradually, during the rainy feafon, above 20 feet perpendicular over part of that flat coaft; which of itfelf fo frefhens the water, that fhips lying at anchor, at the diftance of three leagues from its mouth, generally make ufe of it, and fill their water there for their voyage home. When the rains are at an end, which ufually happens in October, the intenfe heat of the fun foon dries up thofe ftagnating waters which lie on the higher parts, and the remainder from lakes and marfhes, in which are found all forts of dead animals. At laft, thofe too are quite dried up; and then the effluvia that arife are almoft quite infupportable. At this feafon the winds blow fo hot from the land, that they may be compared to the heat proceeding from the mouth of an oven, and they bring with them an intolerable fmell. The wolves, tigers, lions, and other wild beafts, then refort to the river, keeping their body under water, and only their fnout above it for the fake of breathing. The birds foar to an immenfe height in the air, and fly a vaft way over the fea, where they continue till the wind changes, and comes from the weft. See SENEGAL, GUINEA, GOLD-*Coaft*, and SLAVE-*Coaft*.

NEGROMANCY. See NECROMANCY.

NEGROPONT, anciently *Eubœa*, an ifland of the Archipelago, ftretching along the eaftern coaft of Achaia or Livadia, from which it is feparated by a narrow channel called the *Euripus*. This ftrait is fo narrow, that the ifland is joined to the continent by a bridge thrown over it; and, here it is thought, there was formerly an ifthmus. The irregulary of the tides in the Euripus hath from the remoteft antiquity been very remarkable, and this irregularity is found to be connected with the age of the moon. From the three laft days of the old moon to the eighth day of the new moon, and from the 14th to the 20th day inclufive, they are regular; but on the other days they are irregular, flowing 12, 13, or 14 times in the fpace of 24 hours, and ebbing as often. The ifland is 90 miles long and 25 broad in the wideft part; and produces corn, oil, fruit, and cattle, in great abundance. The only place in the ifland worth notice is the capital, which is alfo called *Negropont*; and which is walled, and contains about 15,000 inhabitants; but the Chriftians are faid to be much more numerous than the Turks. The captain bafhaw, or admiral of Turkey, who is alfo governor of the city, the ifland, and the adjacent continent of Greece, refides here; and the harbour, which is very fafe and fpacious, is feldom

without a fleet of galleys, ready to be put to sea againſt the pirates and the Malteſe. A part of the bridge between the city and the coaſt of Greece, conſiſts of a drawbridge no longer than juſt to let a galley paſs through.

NEHEMIAH, a canonical book of the Old Teſtament, ſo called from the name of its author. Nehemiah was born in Babylon during the captivity, and ſucceeded Ezra in the government of Judah and Jeruſalem. He was a Jew, and was promoted to the office of cup-bearer to Artaxerxes Longimanus king of Perſia; when the opportunities he had of being daily in the king's preſence, together with the favour of Eſther the queen, procured him the favour of being authoriſed to repair and fortify the city of Jeruſalem in the ſame manner as it was before its deſtruction by the Babylonians. On his going to Jeruſalem, he finiſhed the rebuilding of the walls in 52 days, and dedicated the gates of the city with great ſolemnity. He then reformed ſome abuſes which had crept in among his countrymen, particularly the extortion of the uſurers, by which the poor were ſo oppreſſed as to be forced to ſell their lands and children for ſupport: after which he returned to Perſia, and came back again with a new commiſſion, by virtue of which he regulated every thing relating both to the ſtate and religion of the Jews. The hiſtory of theſe tranſactions is the ſubject of this book.

NEISSE, a handſome town of Sileſia in Germany, and the reſidence of the biſhop of Breſlaw, who has a magnificent palace here. The air is very wholeſome, and proviſions are cheap; the inhabitants carry on a great trade in wine and linen. This place ſuffered greatly by an inundation and fire in 1729. It was taken by the Pruſſians in 1741, who augmented the fortifications after the peace in 1742, and built a citadel to which they gave the name of *Pruſſia*. It is ſeated on a river of the ſame name; in E. long. 17. 35. N. lat. 50. 32.

NELSON (Robert), a learned and pious Engliſh gentleman, was the ſon of Mr John Nelſon a conſiderable Turkey merchant, and was born in June 1656. He had the firſt part of his education at St Paul's ſchool, London; but the principal part was under a private tutor in his mother's houſe, after which he ſtudied at Trinity College, Cambridge. In 1680 he was choſen a fellow of the Royal Society; being probably inclined to receive that honour out of reſpect to his friend and ſchool-fellow Dr Edmund Halley, for whom he had a particular regard, and in whoſe company he ſet out on his travels abroad the December following. In the road to Paris, they ſaw the remarkable comet which gave riſe to the cometical aſtronomy by Sir Iſaac Newton; and our author, apparently by the advantage of his fellow-traveller's inſtructions, ſent a deſcription of it to Dr, afterwards archbiſhop, Tillotſon, by whom he was very much eſteemed. From Paris he went with his fellow-traveller to Rome, where he fell into the acquaintance of Lady Theophila Lucy, widow of Sir Kingſmill Lucy of Broxburne in Hertfordſhire, bart. and ſecond daughter of George earl of Berkeley, who ſoon diſcovered a ſtrong paſſion for him: this concluded in marriage, after his arrival in England in 1682. But it was ſome time before ſhe confeſſed to Mr Nelſon the change of her religion; which was owing to her converſations at Rome with cardinal Philip Howard, who was grandſon of the earl of Arundel, the collector of the Arundelian marbles, &c. and had been raiſed to the purple by pope Clement X. in May 1675. Nor was this important alteration of her religious ſentiments confined to her own mind, but involved in it her daughter by her firſt huſband, whom ſhe drew over to her new religion; and her zeal for it prompted her even to engage in the public controverſy then depending. She is the ſuppoſed authoreſs of a piece written in 1686, 4to, under the title of, "A diſcourſe concerning a judge of controverſy in matters of religion, ſhewing the neceſſity of ſuch a judge."

This misfortune touched her huſband very nearly. He employed not only his own pen, but thoſe of his friends Dr Tillotſon and Dr Hickes, to recover her: but all proved ineffectual; and ſhe continued in the communion of the church of Rome till her death. She was a perſon of fine ſenſe and underſtanding. Dr Tillotſon particularly laments her caſe on that account; and even ſeems not to be entirely free from all apprehenſions of the influence ſhe might have upon her huſband in this important affair. But Mr Nelſon's religion was too much the reſult of his learning and reaſon to be ſhaken by his love, which was equally ſteady and inviolable. Her change of religion made no change in his affections for her; and when ſhe relapſed into ſuch a bad ſtate of health as obliged her to go and drink the waters at Aix, he attended her thither in 1688: and not liking the proſpect of the public affairs at home, he proceeded to make a ſecond trip to Italy, taking his lady, together with her ſon and daughter by her former huſband, along with him. He returned through Germany to the Hague, where he ſtaid ſome time with lord Durſley, who was married to his wife's ſiſter.

From the Hague he arrived in England, in the latter end of 1691; where, being averſe to the Revolution, he declared himſelf a nonjuror, and left the communion of the church of England. In this laſt point he had conſulted Dr Tillotſon, and followed his opinion, who thought it no better than a trick, deteſtable in any thing, and eſpecially in religion, to join in prayers where there was any petition which was held to be ſinful. Thus, notwithſtanding their difference of opinion in this caſe, the friendſhip between them remained the ſame; and the good archbiſhop expired in his friend's arms in 1694.

Our author's new character unavoidably threw him into ſome new connections. Among theſe we find mentioned particularly Mr Kettlewell, who had reſigned his living at Coleſhill in Warwickſhire on account of the new oaths, and afterwards reſided in London. This pious and learned divine alſo agreed with him in leaving the communion of the eſtabliſhed church; yet at the ſame time perſuaded him to engage in the general ſervice of piety and devotion; obſerving to him, that he was very able to compoſe excellent books of that kind, which would be apt to do more good as coming from a layman. This addreſs correſponded with the truly catholic ſpirit of our author; who accordingly publiſhed many works of piety, which are deſervedly eſteemed.

At the ſame time, he engaged zealouſly in every public

public scheme for the honour and interest, as well as for propagating the faith, and promoting the practice of true Christianity, both at home and abroad; severa proposals for building, repairing, and endowing churches, and charity-schools particularly.

Upon the death of Dr William Lloyd, the deprived bishop of Norwich, in the end of the year 1709, he returned to the communion of the church of England. Dr Lloyd was the last surviving of the deprived bishops by the Revolution, except Dr Kenn, by whose advice Mr Nelson was determined in this point. Mr Nelson's tutor, Dr George Bull, bishop of St David's, dying before the expiration of this year, he was easily prevailed upon by that prelate's son, to draw up an account of his father's life and writings, as he had maintained a long and intimate friendship with his Lordship, which gave him an opportunity of being acquainted with his solid and substantial worth. The life was published in 1713; and, as our author had long before laboured under a constitutional weakness, which had brought on an asthma and dropsy in the breast, the distemper grew to such a height soon after the publication of that work, that, for the benefit of the air, he retired at length to Kensington, where he expired on the 16th of January 1714-15. He left his whole estate to pious and charitable uses; particularly to charity-schools.

NEMAUSUS, or NEMAUSUM, (anc. geog.) the capital of the Arecomici in Gallia Narbonensis; a colony, (Coin), with the surname *Augusta*, (Inscription). In it stands a Roman amphitheatre, which is still almost entire. Now *Nismes* in Languedoc.

NEMEA, (Strabo, Livy); a river of Achaia, running between Sicyon and Corinth, the common boundary of both territories, and falling into the Corinthian bay.

NEMEA, (anc. geog.), situated between Cleonæ and Philus in Argolis; whether town, district, or other thing, uncertain: there a grove stood in which the Argives celebrated the Nemean games, and there happened all the fabulous circumstances of the Nemean lion. The district Nemea is called *Bembinadia*, (Pliny); a village, *Bembina*, standing near Nemea, (Strabo). Stephanus places Nemea in Elis; though not in, but on, the borders of Elis; Pliny, erroneously, in Arcadia. In the adjoining mountain is still shewn the den of the lion, distant 15 stadia from the place *Nemea*, (Pausanias); in which stands a considerable temple of Jupiter Nemæus and Cleonæus, from the vicinity of these two places. This place gave name to the Nemæan games, celebrated every third year.

NEMEAN GAMES, so called from Nemea, a village between the cities of Cleonæ and Philus, where they were celebrated every third year. The exercises were chariot-races, and all the parts of the Pentathlum. These games were instituted in memory of Opheltes or Archemorus, the son of Euphetes and Creusa, and who was nursed by Hypsipele; who leaving him in a meadow while she went to shew the besiegers of Thebes a fountain, at her return found him dead, and a serpent twined about his neck: whence the fountain, before called *Langia*, was named *Archemorus;* and the captains, to comfort Hypsipyle, instituted these games. Others ascribe their institution to Hercules, after his victory over the Nemean lion. Others allow, that they were instituted first in honour of Archemorus; but intermitted, and revived again by Hercules. The victors were crowned with parsley, an herb used at funerals, and feigned to have sprung from Archemorus's blood.

NEMESIANUS (Aurelius Olympius), a Latin poet, born at Carthage, who wrote a poem on the chace, intitled *Cynegeticon*, and four eclogues, which are still extant. This poet lived under the reign of Carus and his sons Carinus and Numerianus, about the year 281. People were so fond of his poem in the eighth and ninth centuries, that young men were obliged to read it in the public schools.

NEMESIS, in Pagan worship, the daughter of Jupiter and Necessity, or, according to others, of Oceanus and Nox, had the care of revenging the crimes which human justice left unpunished. She was also called *Adrastæa*, because Adrastus king of Argos first raised an altar to her; and *Rhamnusia*, from her having a magnificent temple at Rhamnus in Attica. She had likewise a temple at Rome in the Capitol. She is represented with a stern countenance, holding a whip in one hand, and a pair of scales in the other.

NEMINE CONTRADICENTE, "none contradicting it;" a term chiefly used in parliament when any thing is carried without opposition.

NEMOURS, a town of the Isle of France in the Gatinois, with the title of a duchy. It is seated on the river Loing, in E. long. 2. 45. N. lat. 48. 15.

NENIA, or NÆNIA, in the ancient poetry, a kind of funeral song sung to the music of flutes at the obsequies of the dead. Authors represent them as sorry compositions, sung by hired women-mourners called *Præficæ*. The first rise of these Nenia is ascribed to the physicians. In the heathen antiquity the goddess of tears and funerals was called *Nenia;* whom some suppose to have given that name to the funeral song, and others to have taken her name from it.

NEOMAGUS, (Ptolemy); NOVIOMAGUS, (Antonine); a town of the Regni in Britain: now thought to be Guildford in Surry, (Lhuyd); or Croydon, (Talbot). But Camden takes it to be Woodcote, two miles to the south of Croydon; where traces of an ancient town are still to be seen.

NEOMAGUS, (Ptolemy;) *Noviomagus*, (Antonine;) a town of the Triviri on the Moselle. Now *Numagen*, 14 miles east, below Triers.

NEOMAGUS, (Ptolemy;) *Noviomagus Lexoviorum*, (Antonine;) a town of Gallia Celtica. Now *Lisieux*, in Normandy.

NEOMAGUS, (Ptolemy;) *Noviomagus Nemetum*, (Antonine). Now *Spire*, a city of the Palatinate, on the left or west side of the Rhine.

NEOMAGUS, (Ptolemy); a town of Gallia Narbonensis, on the confines of the Tricastini. Now *Nyons* in Dauphiné.

NEOMENIA, or NOUMENIA, a festival of the ancient Greeks, at the beginning of every lunar month, which, as the name imports, was observed upon the day of the new moon, in honour of all the gods, but especially Apollo, who was called *Neomenios*, because the sun is the fountain of light, and whatever distinction of times and seasons may be taken from other planets, yet they are all owing to him as the original of those borrowed rays by which they shine.

The games and public entertainments at thefe feftivals were made by the rich, to whofe tables the poor flocked in great numbers. The Athenians at thefe times offered folemn prayers and facrifices for the profperity of their country during the enfuing month. See GAMES.

The Jews had alfo their neomenia, or feaft of the new moon, on which peculiar facrifices were appointed; and on this day they had a fort of family entertainment and rejoicing. The moft celebrated neomenia of all others was that at the beginning of the civil year, or firft day of the month Tifri, on which no fervile labour was performed: they then offered particular burnt-facrifices, and founded the trumpets of the temple. The modern Jews keep the neomenia only as a feaft of devotion, which any one may obferve or not as he pleafes.

NEOPHYTES, "new plants;" a name given by the ancient Chriftians, to thofe heathens who had newly embraced the faith; fuch perfons being confidered as regenerated, or born anew by baptifm. The term *neophytes* has been alfo ufed for new priefts, or thofe juft admitted into orders, and fometimes for the novices in monafteries. It is ftill applied to the converts made by the miffionaries among the infidels.

NEPA, in zoology, a genus of infects belonging to the order of hemiptera. The roftrum is inflected; the antennæ are fhorter than the thorax; and the hind-feet are hairy and fitted for fwimming. There are feven fpecies.

NEPER, or NAPIER (John), baron of Merchifton in Scotland, whofe high attainments in many branches of ufeful literature render his memory valuable, was born in 1550. He had a peculiar turn to mathematical inveftigations and ufeful inventions: among the latter may be ranked that inftrument called *Neper's Rods* or *Bones*, to facilitate the multiplication and divifion of large numbers; and his invention of logarithms have fpread his fame throughout the world. This difcovery was contained in his *Canon mirabilis Logarithmorum*, dedicated to prince Charles, and publifhed in 1614. In his *Rabdologia*, publifhed in 1616, he mentions another fpecies of thofe numbers; when, finding his health declining, he engaged Mr Briggs to profecute that ufeful laborious fcheme. Befides his abilities in thefe calculations, he is faid to have wrote an *Expofition on the Revelation*: an undertaking in which his rare talents in reafon and computation could however afford him no advantages; nor is he remembered by it. He died in 1622.

NEPER's *Rods*, or *Bones*, an inftrument invented by J. Neper, baron of Merchifton in Scotland, whereby the multiplication and divifion of large numbers is much facilitated.

As to the conftruction of NEPER's *Rod*: Suppofe the common table of multiplication to be made upon a plate of metal, ivory, or pafteboard, and then conceive the feveral columns (ftanding downwards from the digits on the head) to be cut afunder; and thefe are what we call *Neper's rods for multiplication*. But then there muft be a good number of each; for as many times as any figure is in the multiplicand, fo many rods of that fpecies (*i. e.* with that figure on the top of it) muft we have; though fix rods of each fpecies will be fufficient for any example in common affairs: there muft be alfo as many rods of o's.

But before we explain the way of ufing thefe rods, there is another thing to be known, *viz.* that the figures on every rod are written in an order different from that in the table. Thus the little fquare fpace or divifion in which the feveral products of every column are written, is divided into two parts by a line acrofs from the upper angle on the right to the lower on the left; and if the product is a digit, it is fet in the lower divifion; if it has two places, the firft is fet in the lower, and the fecond in the upper divifion; but the fpaces on the top are not divided: alfo there is a rod of digits, not divided, which is called the *index rod*, and of this we need but one fingle rod. See the figure of all the different rods, and the index, feparate from one another, in Plate CCI. fig. 1.

Multiplication by NEPER's *Rods*. Firft lay down the index-rod; then on the right of it fet a rod, whofe top is the figure in the higheft place of the multiplicand: next to this again, fet the rod, whofe top is the next figure of the multiplicand; and fo on in order, to the firft figure. Then is your multiplicand tabulated for all the nine digits; for in the fame line of fquares ftanding againft every figure of the index rod, you have the product of that figure; and therefore you have no more to do but to transfer the products and fum them. But in taking out thefe products from the rods, the order in which the figures ftand obliges you to a very eafy and fmall addition: thus, begin to take out the figure in the lower part, or unit's place, of the fquare of the firft rod on the right; add the figure in the upper part of this rod to that in the lower part of the next, and fo on; which may be done as faft as you can look on them. To make this practice as clear as poffible, take the following example.

Example: To multiply 4768 by 385. Having fet the rods together for the number 4768 (*ibid.* n° 2.) againft 5 in the index, I find this number, by adding

according to the rule, - -	23840
Againft 8, this number - -	38144
Againft 3, this number - -	14304
Total product - -	1835680

To make the ufe of the rods yet more regular and eafy, they are kept in a flat fquare box, whofe breadth is that of ten rods, and the length that of one rod, as thick as to hold fix (or as many as you pleafe) the capacity of the box being divided into ten cells, for the different fpecies of rods. When the rods are put up in the box (each fpecies in its own cell diftinguifhed by the firft figure of the rod fet before it on the face of the box near the top) as much of every rod ftands without the box as fhews the firft figure of that rod: alfo upon one of the flat fides without and near the edge, upon the left hand, the index rod is fixed; and along the foot there is a fmall ledge; fo that the rods when applied are laid upon this fide, and fupported by the ledge, which makes the practice very eafy; but in cafe the multiplicand fhould have more than nine places, that upper face of the box may be made broader. Some make the roads with four different faces, and figures on each for different purpofes.

Divifion by NEPER's *Rods*. Firft tabulate your divifor; then you have it multiplied by all the digits, out of which you may choofe fuch convenient divifors as will

will be next lefs to the figures in the dividend, and write the index anfwering in the quotient, and fo continually till the work is done. Thus 2179788, divided by 6123, gives in the quotient 356.

Having tabulated the divifor 6123, you fee that 6123 cannot be had in 2179; therefore take five places, and on the rods find a number that is equal or next lefs to 21797, which is 18369; that is, 3 times the divifor: wherefore fet 3 in the quotient, and fubftract 18369 from the figures above, and there will remain 3428; to which add 8, the next figure of the dividend, and feek again on the rods for it, or the next lefs, which you will find to be five times; therefore fet 5 in the quotient, and fubtract 30615 from 34288, and there will remain 3673; to which add 8, the laft figure in the dividend, and finding it to be juft 6 times the divifor, fet 6 in the quotient.

NEPETA, Catmint, or *Nep;* a genus of the gymnofpermia order, belonging to the didynamia clafs of plants. There are 14 fpecies; the moft remarkable is the cataria, common nep, or catmint. This is a native of many parts of Britain, growing about hedges and in wafte places. The ftalk is a yard high, and branched; the leaves are hoary; the flowers flefh-coloured, growing verticillate in fpikes at the tops of the branches: the middle fegment of the lower lip is fpotted with red. The plant has a bitter tafte, and ftrong fmell, not unlike pennyroyal. An infufion of this plant is reckoned a good cephalic and emmenagogue; being found very efficacious in chlorotic cafes. Two ounces of the expreffed juice may be given for a dofe. It is called *catmint*, becaufe cats are very fond of it, efpecially when it is withered; for then they will roll themfelves on it, and tear it to pieces, chewing it in their mouths with great pleafure. Mr Ray mentions his having tranfplanted fome of the plants of this fort from the fields into his garden, which were foon deftroyed by the cats; but the plants which came up from feeds in his garden efcaped: this verifies an old proverb, *viz.* "If you fet it, the cats will eat it; if you fow it, the cats will not know it." Mr Withering is of opinion, that where there is a quantity of plants growing together, the cats will not meddle with them; but Mr Millar affures us, that he has frequently tranfplanted one of thefe plants from another part of the garden, within two feet of which, fome came up from feeds; in which cafe the latter have remained unhurt, when the former have been torn to pieces and deftroyed: he acknowledges, however, that, where there is a large quantity of the herb growing together, they will not meddle with it. This plant is very hardy, and is eafily propagated by feeds. If fown upon a poor dry foil, the plants will not grow too rank, but will continue longer, and appear much handfomer, than in rich ground, where they grow too luxuriant, and have not fo ftrong a fcent.

NEPHEW, a term relative to uncle and aunt, fignifying a brother's or fifter's fon; who, according to the civil law, is in the third degree of confanguinity, but according to the canon in the fecond.

NEPHRITIC, fomething that relates to the kidneys. See Kidney.

Nephritic *Wood, (lignum nephriticum)*, a wood of a very denfe and compact texture, and of a fine grain, brought to us from New Spain in fmall blocks, in its natural ftate, and covered with its bark. It is to be chofen of a pale colour, found and firm, and fuch as has not loft its acrid tafte; but the fureft teft of it is the infufing it in water: for a piece of it infufed only half an hour in cold water, gives it a changeable colour, which is blue or yellow, as varioufly held to the light. If the vial it is in be held between the eye and the light, the tincture appears yellow; but if the eye be placed between the light and the vial, it appears blue. We often meet with this wood adulterated with others of the fame pale colour; but the dufkifh black hue of the bark is a ftriking character of this.

The tree is the *coatli* of Hernandez. It grows to the height of our pear-tree, and its wood while frefh is much of the fame texture and colour; the leaves are fmall and oblong, not exceeding half an inch in length, or a third of an inch in breadth; the flowers are fmall, of a pale-yellow colour, and oblong fhape, ftanding in fpikes: the cups they ftand in are divided into five fegments at the edge, and are covered with a reddifh down. This is the beft defcription of the tree that can be collected from what has been hitherto written of it; nobody having yet had an opportunity of taking its true characters.

This wood is a very good diuretic, and is faid to be of great ufe with the Indians in all difeafes of the kidneys and bladder, and in fuppreffion of urine, from whatever caufe. It is alfo recommended in fevers, and in obftructions of the vifcera. The way of taking it among the Indians is only an infufion in cold water.
